- Removed the remaining SPDM OTCM-2 (Special Purpose Dexterous Manipulator/ORU Tool Changeout Mechanism #2) thermal covers, reconfigured some of the wrist blankets and flaps, and inspected the Shoulder Roll joint of SPDM Arm #2 for possible MLI (Multi-Layered Insulation) interference. None was seen. *[WVS (Wireless Video System) helmet cam video was also obtained for ground analysis.]*

Additionally, two get-ahead tasks were completed:

- Searching for a misplaced PIP (Push-in-Place) pin that was lost during EVA-2 on Flight 10A in a CBM. *[Ground controllers opened and closed the CBM petals, but the PIP pin was not located despite search of the entire location];*
- Releasing the Node-2 Nadir CBM launch locks in preparation for “Leonardo” MPLM (Multi-Purpose Logistics Module) docking later in the year (STS-126/ULF-2).

Besides the aborted patch panel reconfiguration, also not accomplished was the get-ahead of removing the JLP (JEM Experiment Logistics Module Pressurized Section) trunnion covers.

Official start time of the spacewalk was 6:04pm EDT, about 24 min ahead of timeline, and it ended at 12:28am. Total EVA duration (PET = Phase Elapsed Time) was 6h 24min. It was the 108th spacewalk for ISS assembly & maintenance and the 80th from the station (58 from Quest, 22 from Pirs, 28 from Shuttle) totaling 492h 47min, the 12th for Expedition 16 (totaling 84h 55min) and the 9th so far this year. After today's EVA, a total of 137 spacewalkers (105 NASA astronauts, 21 Russians, and 11 astronauts representing Japan-1, Canada-4, France-1, Germany-2 and Sweden-3) have logged a total of 681h 9min outside the station on building, outfitting and servicing. It was also the 130th spacewalk involving U.S. astronauts.

After crew wakeup at ~1:30pm EDT yesterday, ending the 8.5-hr sleep period, the Airlock Crewlock (A/L CL) hatch was cracked at ~2:55pm for a hygiene break/with mask prebreathe for Behnken & Foreman after spending the night on 10.2 psi campout. Around 3:05pm, the hatch was closed again by Peggy Whitson, the IV (Intravehicular Crewmember) in charge, for EVA preparations in 10.2 psi, followed by EMU purge & prebreathe. Afterwards, the IV supported CL depressurization and EV1/EV2 egress (EMUs switched to batteries at 6:04pm).

As part of pre-EVA activities, FE-1 Malenchenko powered down the ham radio equipment in SM (Service Module) and FGB at ~2:40am EDT to prevent RF interference with the EMUs during the spacewalk.

Before her breakfast and EVA-support activities as IV, CDR Peggy Whitson

completed another session with the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop for downlink, as suggested on her discretionary "job jar" task list. During the day, the ground downlinked the Actiwatch data file from the HRF-1 for medical analysis and planning report preparation.

[To monitor the crewmember's sleep/wake patterns and light exposure, Peggy wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]

FE-1 Yuri Malenchenko began his "day" by attending to the current experiment session with the Russian/German TEKh-20 Plasma Crystal-3+ (Plazmennyyi-Kristall/PK-3+) payload, activating the turbopump in the Service Module (SM)'s Transfer Compartment (PkhO) for keeping the vacuum chamber (ZB) in the SM Work Compartment (RO) evacuated. The turbopump was then deactivated again this morning at ~4:55am EDT before sleeptime. *[Main objective of PK-3 is to study dust plasma wave propagation and dispersion ratio at a specified power of HF discharge, pressure, and a varied number of particles.]*

Afterwards, Malenchenko terminated his MBI-12 SONOKARD experiment session (his 12th), started last night, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

FE-2-16 Garrett Reisman performed his second session with the biomed experiment INTEGRATED IMMUNE (Validating Procedures for Monitoring Crew member Immune Function), collecting wet saliva samples first thing in post-sleep. *[IMMUNE protocol requires the collection to occur first thing post-sleep, before eating, drinking and brushing teeth, and all samples are stored at ambient temperature. Along with NUTRITION (Nutritional Status Assessment), INTEGRATED IMMUNE samples & analyzes participant's blood, urine, and saliva before, during and after flight for changes related to functions like bone metabolism, oxidative damage and immune function to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints.]*

The strategy uses both long and short duration crewmembers as study subjects. The saliva is collected in two forms, dry and liquid. The dry samples are collected at intervals during the collection day using a specialized book that contains filter paper. The liquid saliva collections require that the crewmember soak a piece of cotton inside their mouth and place it in a salivette bag; there are four of the liquid collections during docked operations.]

In the SM, the FE-1 took another set of air readings to check for potentially harmful atmospheric contaminants with the CMS (Countermeasure System) part of the GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, which uses preprogrammed microchips to measure H₂CO (Formaldehyde, methanal), CO and NH₃ (Ammonia), taking one measurement per microchip;

Later, Malenchenko transferred CWC (Contingency Water Container) #1053 to the Russian Segment (RS) for the periodic (about twice a month) replenishing of the Elektron oxygen generator's water supply for electrolysis, filling the KOV thermal loops' EDV container. Once filled, the EDV was connected to the BPK transfer pump for processing. *[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]*

CWCs with water from Endeavour's fuel cells were transferred to the ISS by Shuttle crewmembers.

MS3 Doi conducted cargo transfer activities between Shuttle and ISS, including updating the transfer list.

FE-1 Malenchenko completed his series of regular maintenance tasks for today, by

-

- Continuing transferring and stowing discarded equipment & trash on Progress 28P,
- Performing routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables,
- Conducting the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the FGB-to-Soyuz tunnel, and the FGB-to-Node passageway *[this is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons, and one of the two Russian SKV air conditioners off (SKV-1).]*,
- Completing the periodic collection & deletion of readings on the MOSFET (metal oxide semiconductor field-effect transistor) radiation sensor reader/

- display of the RBO-3-2 Matryoshka-R anthropomorphic (human torso) "phantoms" located inside the station for sophisticated radiation studies, collecting radiation measurements every 15 minutes around the clock;
- Continuing the transfer of potable water from the BV1 tank of Progress M-63/28P to EDV storage containers, begun earlier *[filling of the empty Progress BV1 & BV2 tanks with urine will be scheduled later]*,
 - Supporting the BIO-5 Rasteniya-2 ("Plants-2") experiment, which researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}), by monitoring the greenhouse, taking pictures and downloading them to the ground, and, working from the Russian "available time" suggestions list,
 - Performing the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).

After return and ingress of Bob & Mike from EVA-4 this morning at 12:28am, CDR Whitson took charge of the usual post-EVA activities, i.e., photographing the EMU/space suit gloves and overgloves while still pressurized, recharging the EMUs with water from PWR (Payload Water Reservoir), then reconnecting the LTAs (Lower Torso Assemblies) to the EMUs and capping the UIA (Umbilical Interface Assembly), initiating and monitoring the regeneration of the METOX (Metal Oxide) CO₂ filter canisters, initiating the discharge/recharge process on the EMU batteries in the BSA (Battery Stowage Assembly), turning around the DCS-760 EVA camera (including downloading its EVSA and glove photographs), and reconfiguring EVA tools.

FE-2 Leo Eyharts conducted the periodic checkup on active U.S. payloads, i.e., cleaning the ANITA (Analyzing Interferometer for Ambient Air) inlet plus inspecting and filter cleaning of the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. *[The CGBA incubator is controlled from the ground, with automatic video downlinked to Earth. ANITA continues to collect data every six seconds and downlinks the data daily to the ground team. ANITA monitors low levels of potential gaseous contaminants in the ISS cabin atmosphere with a capability of simultaneously monitoring 32 gaseous contaminants. The experiment is testing the accuracy and reliability of this technology as a potential next-generation atmosphere trace-gas monitoring system for ISS and future spacecraft. This is a cooperative investigation with ESA.]*

A new voluntary task item added to the U.S. "job jar" task list for Peggy was to update the onboard reference "library" of CDs with new disks for the 1J/A Stage and

weed out outdated disks for discarding.

Eyharts & Reisman, the two rotating ISS-16 Flight Engineers, had another two hours set aside on their schedules for generic handover activities (where crewmembers are scheduled together to complete various designated standard tasks for familiarizing the new station resident with procedures, caveats, etc.).

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2-16), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Yuri transferred the crew's exercise data file to the MEC (Medical Equipment Computer) laptop for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week). For Reisman, it was the first onboard CEVIS exercise session.

Sleeptime for the ISS crew began this morning at 5:00am, for the Shuttle crew at 5:30am. For both crews workday began today at 1:30pm EDT. Main activities of the ensuing day (FD12): Late Inspection (survey of Orbiter starboard & port wings plus nose cap), putting CMG-2 back into the steering law, transferring the U.S. EXPRESS Rack 3 to the Columbus module, preparations for EVA-5 on FD13 (Saturday, 3/22), and campout by Behnken & Foreman.

ATV Update (Flight Day 12): Yesterday (3/20), ATV "Jules Verne" continued nominal stationkeeping at the Parking point 2000 km in front of the ISS. Per the plan, no ATV maneuvers were performed. The first two (of four) stationkeeping maneuvers to maintain the Parking point, SK1_1 and SK1_2, were to take place today (3/21) at 9:14:38am and 9:49:28am, respectively. ATV is planned to leave the Parking point on 3/27 (1:58:33am EDT). As reported yesterday, ATV power consumption is slightly higher (200-300 W) than predicted. The current hypothesis is that one or two MLI (Multi-Layered Insulation) blankets may have been lost during launch or venting activities. At this point, there is no impact to nominal operations. However, it is possible that contingency battery operations could be affected by the additional Pressurized Module shell heater load. ESA is investigating options for confirming whether the MLI blankets are loose or missing.

ASN-M R&R Update: RSC-Energia has conducted several tests of the newly installed BSK Common Power Switching timer of the SUBK Onboard Complex Control System, switching from the ASN-M Satellite Navigation System's NVM-1 Navigation Computer Module to the second string, NVM-2. The tests were successful. Today, the ASN will be switched back to the primary NVM-1. ASN-M

is critically required for ATV docking, and both NVM computers must be functioning properly.

ISS Crew Sleep Shift Planning: To synchronize the ISS crew's timeline with STS-123/1J/A docking and subsequent docked activities, Peggy's, Yuri's and Leo's wake/sleep cycle has undergone a number of shifts which started on 3/11. For the next four days, the wake/sleep shift schedule is as follows (all times EDT):

FD12	Wake: 1:30pm (3/21) – 4:00am (3/22) Sleep: 4:00am – 12:30pm (3/22)
FD13	Wake: 12:30pm (3/22) – 4:00am (3/23) Sleep: 4:00am – 12:30pm (3/23)
FD14	Wake: 12:30pm (3/23) – 3:30am (3/24) Sleep: 3:30am – 12:00pm (3/24)
FD15	Wake: 12:00pm (3/24) – 3:30am (3/25) Sleep: 3:30am – 12:00pm (3/25)

No CEO photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 8:33am EDT [= epoch]*):

Mean altitude -- 340.9 km

Apogee height -- 341.7 km

Perigee height -- 340.2 km

Period -- 91.35 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0001092

Solar Beta Angle -- 48.4deg (magnitude increasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 181 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53469

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

- 3/21 (FD12) – Late heat shield inspection w/OBSS; ER3 rack transfer to COL & mating
- 3/22 (FD13) – EVA-5 to assemble OBSS KAU & stow OBSS, install MISSE-6s, inspect SARJ (~5:23pm)
- 3/23 (FD14) – Day off; MSG rack transfer to COL
- 3/24 (FD15) – STS-123/Endeavour undocking (~7:56pm)
- 3/26 (FD17) – STS-123/Endeavour deorbit (5:59pm); landing @ KSC

(7:01pm).

03/14/08 -- ATV1 "Jules Verne" CAM (Collision Avoidance Maneuver) Demo, -5m/s, 4:00am-5:30am EDT;
03/19/08 -- ATV1 "Jules Verne" parking point (loiter) arrival 8:00am EDT ~1200 mi. in front of ISS;
03/27/08 -- ATV1 end of loiter; leave parking point - ~2:00am;
03/29/08 -- ATV1 Demo Day 1
03/31/08 -- ATV1 Demo Day 2
04/03/08 -- ATV1 Demo Day 3 (docking) ~10:39am EDT
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch - ~7:16am (*CDR Sergei Volkov, FE Oleg Kononenko, SFP Yi So-yeon*)
04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~8:43am
04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)
05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
05/25/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS
05/27/08 -- STS-124/Discovery/1J docking
06/05/08 -- STS-124/Discovery/1J undocking
08/07/08 -- ATV1 undocking
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
2QTR CY09 -- STS-128/17A - MPLM, last crew rotation

05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**

3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2

4QTR CY09 -- STS-130/19A - MPLM

1QTR CY10 – STS-131/ULF4

2QTR CY10 -- STS-132/20A – Node-3 + Cupola

3QTR CY10 – STS-133/ULF5.

ISS On-Orbit Status 03/20/08

All ISS systems continue to function nominally, except those noted previously or below. *STS-123-1J/A Flight Day (FD) 10/11. Crew sleep/wake cycle today: Sleep 5:00am–1:30pm; wake 1:30pm–5:00am tomorrow. FD10 was off-duty for both crews.*

After wakeup yesterday at ~1:30pm EDT and before breakfast, CDR Peggy Whitson completed another session with the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop, as suggested on her discretionary "job jar" task list. *[To monitor the crewmember's sleep/wake patterns and light exposure, Peggy wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

Peggy also set up her current Actiwatch data in a data file for downlink from the HRF-1 for medical analysis and planning report preparation by the ground.

FE-2 Leo Eyharts performed his first session with the biomed experiment INTEGRATED IMMUNE (Validating Procedures for Monitoring Crew member Immune Function), collecting wet saliva samples first thing in post-sleep. FE-2-16 Garrett Reisman will have his second INTEGRATED IMMUNE saliva collection later today after wake-up (~1:30pm). *[IMMUNE protocol requires the collection to occur first thing post-sleep, before eating, drinking and brushing teeth, and all samples are stored at ambient temperature. Along with NUTRITION (Nutritional Status Assessment), INTEGRATED IMMUNE samples & analyzes participant's blood, urine, and saliva before, during and after flight for changes related to functions like bone metabolism, oxidative damage and immune function to develop and validate*

an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects. The saliva is collected in two forms, dry and liquid. The dry samples are collected at intervals during the collection day using a specialized book that contains filter paper. The liquid saliva collections require that the crewmember soak a piece of cotton inside their mouth and place it in a salivette bag; there are four of the liquid collections during docked operations.]

Right after day's begin, FE-1 Yuri Malenchenko continued supporting the experiment session with the Russian/German TEKh-20 Plasma Crystal-3+ (Plazmennyi-Kristall/PK-3+) payload by activating the turbopump in the Service Module (SM)'s Transfer Compartment (PkhO) for keeping the vacuum chamber (ZB) in the SM Work Compartment (RO) evacuated. The turbopump was deactivated again this morning at ~4:55am EDT before sleeptime. *[Main objective of PK-3 is to study dust plasma wave propagation and dispersion ratio at a specified power of HF discharge, pressure, and a varied number of particles.]*

Eyharts & Reisman filled out the regular FFQ (Food Frequency Questionnaire), Leo's fifth, Garrett's first, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA/ESA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

In the U.S. Airlock, CDR Whitson made preparations for tonight's EVA-4, initiating re-charge on two DCS-760 camera batteries for the EMU Prebreathe period. *[Using the camera's plugged-in battery charger, the charging process takes at least three hours.]*

The FE-1 conducted the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various Russian segment (RS) hatchways, including the FGB-to-Soyuz tunnel, and the FGB-to-Node passageway. *[This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons, and one of the two Russian SKV air conditioners off (SKV-1).]*

Yuri also completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water*

and EDV-U urine container, replacement of the KOV EDV for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]

Leo Eyharts & Garrett Reisman, the two rotating ISS-16 Flight Engineers, had 2h 15min set aside on their schedules for generic handover activities (where crewmembers are scheduled together to complete various designated standard tasks for familiarizing the new station resident with procedures, caveats, etc.).

Working from the Russian “available time” suggestions list, Yuri Malenchenko performed the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).

A second task list item for the FE-1 for FD10 was the daily monitoring, picture-taking and downloading for the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}).

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2, FE-2-16), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Yuri transferred the crew's exercise data file to the MEC laptop for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

For Reisman, it was the first onboard TVIS exercise session. *[For the first seven TVIS runs, Garrett is using SPD (Subject Positioning Device) top assemblies to help get acclimated to running on the treadmill in the weightless environment. For keeping his exercise data file, Reisman selected his own PCMCIA memory card.]*

Eyharts prepared his video recording of yesterday's treadmill exercise run for the ground to route & record it onto a VTR (Video Tape Recorder) for later downlink.

CDR Whitson set up the Node-2 camera to provide video of the JLP (JEM Experiment Logistics Module Pressurized Section) to the ground. Later she reinstalled the Node-2 cap to support Robotics ops TV coverage tonight.

Before going into their sleep period this morning, the joint crew had an hour to

review timeline and procedures for EVA-4. Afterwards, Leo & Garrett performed a Robotics operation, pre-positioning Arm-2 of the SPDM (Special Purpose Dexterous Manipulator) to bring its OTCM (ORU {On-orbit Replaceable Unit} Tool Changeout Mechanism) closer to the OTP (ORU Temporary Platform) to facilitate removal of its thermal sock blanket by the spacewalkers (a get-ahead task). *[Only a single-joint maneuver was required for the re-positioning.]*

At ~4:45am, shortly before sleep time, Yuri set up the Russian MBI-12 SONOKARD (Sonocard) payload and started his 12th experiment session, using a sports shirt from the SONOKARD kit with a special device in the pocket for testing a new method for acquiring physiological data without using direct contact on the skin. Measurements are recorded on a data card for return to Earth. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

For both crews, workday began today at 1:30pm EDT. Bob Behnken (EV1) & Mike Foreman (EV2) are currently on "Campout" (*nachalo desaturatsiy* = desaturation start) in the A/L CL (Crewlock), after hatch closure this morning at ~4:40am. The two spacewalkers performed PBA (Portable Breathing Apparatus) mask prebreathe for denitrogenation, while readying their tools & equipment, then depressed the CL from 14.7 to 10.2 psi for their sleep period. *[For the Campout, fresh METOX (Metal Oxide) canisters were installed in the A/L for CO₂ control.]*

After wakeup, ending the 8.5-hr sleep period, the Airlock Crewlock (CL) hatch will be cracked at ~2:13pm for a hygiene break/with mask prebreathe for Foreman & Behnken, after spending the night on 10.2 psi campout. Around 3:23pm, the hatch will be closed again by Peggy Whitson (who supports all Campout preps and post-EVA activities as IV/Intravehicular Crewmember) for EVA preparations in 10.2 psi, followed by EMU purge & prebreathe. Afterwards, Peggy supports CL depressurization and EV1/EV2 egress.

EVA-4 Preview: Nominally, EVA-4 begins at ~6:28pm and lasts approximately 6h 10min, ending at ~12:38am. Its major objectives are to:

1. Replace RPCM (Remote Power Controller Module) S02B-D on the S0 truss;
2. Conduct T-RAD (Tile Repair Ablator Dispenser) demo in the Shuttle PLB;
3. Release Node-2 ACBM (Active Common Berthing Mechanism) launch locks;
4. Perform get-ahead tasks (install covers on JLP stbd nadir/zenith trunnions,

- port nadir/zenith trunnions and keel pin trunnion; remove OTCM-2 sock cover; inspect Z1 toolbox for any MMOD (Micrometeoroid/Orbital Debris) damage that may have been “collateral” to the D-handle impact, etc.); and
5. Clean up worksite & ingress.

After post-EVA cleanup tomorrow morning, sleeptime for the ISS crew begins at ~5:00am, at ~5:30am for the Shuttle crew.

Columbus Update:

- During EVA-4, a partial powerdown of the Columbus module is required (3:35pm-12:25am EDT), resulting in half of its lights switched off, IMV (Intermodular Ventilation) supply fan off, and ATU-2 (Audio Terminal Unit 2) off.
- BIOLAB: Further troubleshooting in work; will request space on 1J/A to return some items. Cold stowage of the samples in the TCU1 (Thermal Control Unit 1) is being monitored.
- FSL (Fluid Science Laboratory): Troubleshooting activities are on hold until after the 1J/A joint mission.
- SOLAR (Solar Monitoring Observatory): Powered and functioning nominal.
- EuTEF (European Technology Exposure Facility): Powered and functioning nominal.

ATV Update (Flight Day 11):

- Yesterday (3/19), ATV “Jules Verne” successfully performed five maneuvers, as follows:
 - TV2_1: began at 1:30:03am EDT, $\Delta V = 2.15$ m/s
 - TV2_2: began at 2:15:41am, $\Delta V = 2.14$ m/s (the original TV2_2 was planned to be “no burn” (0 m/s) and was thus deleted; TV2_3 was re-named TV2_2)
 - IF1: began at 6:21:02am, $\Delta V = 0.14$ m/s
 - IF2: began at 7:06:48am, $\Delta V = 0.02$ m/s
 - IF3: began at 7:51:04am, $\Delta V = 1.32$ m/s
- Based on ATV GPS (Global Positioning System) data, specialists estimate the post-maneuver state to have been within 100 m in semi-major axis of ATVCC/Toulouse prediction. In addition, NASA-GSFC successfully performed coherent TDRSS tracking before and after the maneuvers that confirmed the maneuver results. ATVCC reported that all maneuvers were nominal. Following the maneuvers, the ATV successfully arrived at the Parking point 2000 km in front of the ISS, where it is currently positioned.
- To maintain the Parking point, two stationkeeping maneuvers, SK1_1 & SK1_2, are planned for tomorrow (3/20) at 9:13:50am & 10:04:41am, respectively. ATV is scheduled to leave the Parking point on 3/27.
- TsUP-Moscow also tested the SM Kurs-P system today in preparation for

ATV-1 rendezvous. Set 2 was tested on DO-15; while the readiness signal was not obtained, the Kurs designers deemed the test successful because they have seen this signature before. Set 1 was tested on DO-1, and the nominal readiness signal was obtained at 5:11:42pm.

- ATV is exhibiting slightly (~200-300 W) more power consumption than expected. Data indicate that its electronic boxes are drawing less, but its heaters more than nominal. Among the possible causes under assessments are one or two missing or loose thermal MLI (Multi-Layered Insulation) blankets. When ATV approaches the ISS, a thorough external inspection will precede any docking attempts (which could be impeded by loose insulation).

ASN-M Internal Transition Failure: RSC-Energia has traced the failure of switching over to the ASN-M Satellite Navigation System's NVM-1 Navigation Computer Module (one of two) to the suspected Common Power Switching timer (BSK DB2) of the Onboard Complex Control System (SUBK). Its removal & replacement is scheduled for tonight. ASN-M is critically required for ATV docking.

VolSci Preview: Three optional activities for the Voluntary Science program on days 3/25 & 3/26 were suggested to Peggy & Garrett for their choice. Selection is required by tonight. *[The session choices are: (1) LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System), (2) USND (Ultrasound) relocation & checkout; and (3) SLAMMD (Space Linear Acceleration Mass Measurement) – Body Mass Measurement.]*

Shuttle Update: Currently under consideration is the plan to have Endeavour land one revolution (~92 min) earlier than originally planned on 3/26, to take advantage of the first daylight landing opportunity. This will require a small sleep shift for the Shuttle crew of an additional 15 min earlier on FD14 & FD15 but is only a minimal impact for the ISS crew.

ISS Crew Sleep Shift Planning: To synchronize the ISS crew's timeline with STS-123/1J/A docking and subsequent docked activities, Peggy's, Yuri's and Leo's wake/sleep cycle has undergone a number of shifts which started on 3/11. For the next five days, the wake/sleep shift schedule is as follows (all times EDT):

FD11	Wake: 1:30pm (3/20) – 5:00am (3/21) Sleep: 5:00am – 1:30pm (3/21)
FD12	Wake: 1:30pm (3/21) – 4:00am (3/22) Sleep: 4:00am – 12:30pm (3/22)
FD13	Wake: 12:30pm (3/22) – 4:00am (3/23) Sleep: 4:00am – 12:30pm (3/23)

FD14	Wake: 12:30pm (3/23) – 3:30am (3/24) Sleep: 3:30am – 12:00pm (3/24)
FD15	Wake: 12:00pm (3/24) – 3:30am (3/25) Sleep: 3:30am – 12:00pm (3/25)

No CEO photo targets uplinked for today.

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 8:10am EDT [= epoch]*):

Mean altitude -- 341.1 km

Apogee height -- 342.2 km

Perigee height -- 340.1 km

Period -- 91.36 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0001558

Solar Beta Angle -- 45.5deg (magnitude increasing)

Orbits per 24-hr. day -- 15.76

Mean altitude gain in the last 24 hours -- 359 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53453

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

- 3/20 (FD11) – EVA-4 to demonstrate T-RAD, replace RPCM, get-aheads (~6:28pm)
- 3/22 (FD13) – EVA-5 to assemble OBSS KAU & stow OBSS, install MISSE-6s, inspect SARJ (~5:23pm)
- 3/24 (FD15) – STS-123/Endeavour undocking (~7:55pm)
- 3/26 (FD17) – STS-123/Endeavour deorbit; landing (KSC);

03/14/08 -- ATV1 “Jules Verne” CAM (Collision Avoidance Maneuver) Demo, -5m/s, 4:00am-5:30am EDT;

03/19/08 -- ATV1 “Jules Verne” parking point (loiter) arrival 8:00am EDT ~1200 mi. in front of ISS;

03/27/08 – ATV1 end of loiter; leave parking point - ~2:00am;

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking) ~10:39am EDT

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch - ~7:16am (Sergei Volkov, Oleg Kononenko, Yi So-yeon)

04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~8:43am

04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)
 05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
 05/14/08 -- Progress M-64/29P launch
 05/16/08 -- Progress M-64/29P docking (DC1)
 05/25/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS
 05/27/08 -- STS-124/Discovery/1J docking
 06/05/08 -- STS-124/Discovery/1J undocking
 08/07/08 -- ATV1 undocking
 08/12/08 -- Progress M-65/30P launch
 08/14/08 -- Progress M-65/30P docking (SM aft port)
 08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
 09/09/08 -- Progress M-64/29P undocking (from DC1)
 09/10/08 -- Progress M-66/31P launch
 09/12/08 -- Progress M-66/31P docking (DC1)
 10/01/08 -- **NASA 50 Years**
 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
 10/12/08 -- Soyuz TMA-13/17S launch
 10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
 10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
 10/18/08 -- STS-126/Discovery/ULF2 docking
 10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
 11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
 11/20/08 -- **ISS 10 Years**
 11/26/08 -- Progress M-67/32P launch
 11/28/08 -- Progress M-67/32P docking (SM aft port)
 12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
 12/06/08 -- STS-119/Discovery/15A docking
 12/15/08 -- STS-119/Discovery/15A undocking
 1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
 05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
 3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
 4QTR CY09 -- STS-130/19A - MPLM
 1QTR CY10 -- STS-131/ULF4
 2QTR CY10 -- STS-132/20A – Node-3 + Cupola
 3QTR CY10 -- STS-133/ULF5.

ISS On-Orbit Status 03/19/08

All ISS systems continue to function nominally, except those noted previously or below. *STS-123-1J/A Flight Day (FD) 9/10. Crew sleep cycle today: Sleep 5:00am–1:30pm; wake 1:30pm–5:00am tomorrow.*

Three more major mission steps were accomplished:

1. SPDM (Special Purpose Dexterous Manipulator) “Dextre”, with repositioned arms, was successfully stowed on the U.S. Lab PDGF (Power & Data Grapple Fixture) *(and is looking very cool)*;
2. SLP (Spacelab Pallet) was returned to the Shuttle PLB (Payload Bay) for re-berthing; and
3. SSRMS (Space Station Remote Manipulator System) was “walked off” the Node-2 PDGF onto MT/MBS (Mobile Transporter/Mobile Base System) PDGF-3 and maneuvered into position for today’s MT translation from Worksite 6 (WS6) to WS4.

[During commanding of the SPDM’s body (“waist”) roll joint to stowage mode, it rotated in the opposite direction than expected, due to a sign mistake (polarity inversion, i.e., a plus-sign instead of a minus-sign) in the DMCS (Dexterous Manipulator Control Software) configuration file. Flight Controllers worked around this in real time, and the crew was able to maneuver the SPDM LEE (Latching End Effector) onto the LAB PDGF without further ado. Work is underway at CSA/MDA to write a corrective software patch.]

After yesterday’s wakeup at ~2:30pm EDT and before breakfast, CDR Peggy Whitson completed another session with the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and filling in questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for downlink, as suggested on her discretionary “job jar” task list. *[To monitor the crewmember’s sleep/wake patterns and light exposure, Peggy wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log*

entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]

FE-2-16 Garrett Reisman performed his first session with the biomed experiment INTEGRATED IMMUNE (Validating Procedures for Monitoring Crew member Immune Function), collecting wet saliva samples. Later in the day, FE-2 Leo Eyharts readied the equipment for his own saliva collection tonight. *[IMMUNE protocol requires the collection to occur first thing post-sleep, before eating, drinking and brushing teeth, and all samples are stored at ambient temperature. Along with NUTRITION (Nutritional Status Assessment), INTEGRATED IMMUNE samples & analyzes participant's blood, urine, and saliva before, during and after flight for changes related to functions like bone metabolism, oxidative damage and immune function to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects. The saliva is collected in two forms, dry and liquid. The dry samples are collected at intervals during the collection day using a specialized book that contains filter paper. The liquid saliva collections require that the crewmember soak a piece of cotton inside their mouth and place it in a salivette bag; there are four of the liquid collections during docked operations.]*

FE-1 Yuri Malenchenko continued preparations for operating the Russian/German TEKh-20 Plasma Crystal-3 Plus (PK-3+) experiment payload. *[After unstowing and setting up the hardware yesterday in the Service Module (SM), leak checking of the electronics box and evacuation of the vacuum work chamber (ZB) in the SM Work Compartment (RO) with the turbopump, Malenchenko today conducted more hardware testing and calibration, uploaded new software from a USB stick, checked out the software installation and verified the readiness of the experiment. After starting the turbo pump right after wake-up and conducting additional leak checking on the ZB during the "day", the FE-1 deactivated the turbopump this morning at ~4:55am EDT. The resulting log file was then downloaded to laptop for downlink via BSR-TM. The experiment is performed on plasma, i.e., fine particles charged and excited by HF (high frequency) radio power inside the evacuated work chamber. Main objective is to obtain a homogeneous plasma dust cloud at various pressures and particle quantities with or without superimposition of an LF (low frequency) harmonic electrical field. The experiment is conducted in automated mode. PK-3+ has more advanced hardware and software than the previously used Russian PKE-Nefedov payload.]*

Later, Malenchenko performed IFM (In-flight Maintenance) in the SM, removing an amplifier of the STTS audio subsystem behind comm panel 6 and replacing it with a spare unit. A functional test of the R&R afterwards was successful. *[The old amplifier had been scavenged from SM comm panel #2 on 6/26/07.]*

CDR Whitson and MS3 Doi conducted a brief EPO (Educational Payload Operations) demo for the Japanese Aerospace Exploration Agency (JAXA), with Takao being photographed while taking payload samples (plant seeds, eggs, DVD) from a CTB (Cargo Transfer Bag) for demo, then restowing them in the bag.

Working in the JLP (JEM Experiment Logistics Module Pressurized Section), Takao Doi & Rick Linnehan assembled two JTVE (JEM Television Equipment) booms in preparation for Flight 1J (which delivers the JEM “Kibo” Laboratory). The assembled booms were stowed for now in the JLP.

After the crew reported excessive noise from the CCAA (Common Cabin Air Assembly) air conditioner in Node-2, CDR Whitson took air flow and sound level measurements in the “Harmony” module based on various fan speed settings. Engineers are assessing the data. *[On 1/10, the Node-2 CCAA fan was reduced to 4000 rpm as a temporary measure to reduce the noise level, but higher fan speeds are necessary to move the air sufficiently once the crew quarters and exercise equipment are installed in Node-2.]*

In the SM, Leo Eyharts set up the video equipment for filming his subsequent workout on the TVIS (Treadmill with Vibration Isolation & Stabilization) for biomechanical evaluation of his performance and assessment of the hardware status by ground engineers. The camera gear was torn down and stowed afterwards.

Yuri conducted the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various Russian segment (RS) hatchways, including the FGB-to-Soyuz tunnel, and the FGB-to-Node passageway. *[This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons, and one of the two Russian SKV air conditioners off (SKV-1).]*

In the SM, the FE-1 took readings of potentially harmful atmospheric contaminants with the CMS (Countermeasure System) part of the GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, which uses preprogrammed microchips to measure H₂CO (Formaldehyde, methanal), CO and NH₃ (Ammonia), taking one measurement per microchip;

Air samples were also collected by Peggy with a U.S. GSC (Grab Sample Container) at the center of the Lab, SM and Columbus.

Malenchenko completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of*

replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]

Before sleeptime this morning, Garrett conducted the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Peggy performed the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier’s condensate tank, filling a CWC (Contingency Water Container, #1054) with the collected water slated for processing. No samples were required this time. *[Estimated offload time before reaching the tank’s neutral point (leaving ~6 kg in the tank): ~30 min.]*

Working from the Russian “available time” suggestions list, Yuri Malenchenko performed the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).

A second task list item for the FE-1 for FD9 was the daily monitoring, picture-taking and downloading for the BIO-5 Rasteniya-2 (“Plants-2”) experiment which researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}).

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Yuri transferred the crew’s exercise data file to the MEC (Medical Equipment Computer) laptop for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

The FE-1 also took the periodic sensor readings of the Russian “Pille-MKS” (MKS = ISS) radiation dosimetry experiment which has ten sensors placed at various locations in the Russian segment (DC1, SM starboard & port cabin windows, ASU toilet facility, control panel, etc.). *[Nine of the ten dosimeters are read manually.]*

The ISS crew began their sleeptime this morning at 5:00am, the Shuttle crew at

5:30am. For both crews, workday began today at 1:30pm EDT (but it's mostly a well-deserved off-duty day).

Tonight at ~7:08pm (8:08am tomorrow in Tokyo), crewmembers CDR Whitson, CDR Gorie and MS3 Doi are scheduled to receive a VIP call from Japan's Prime Minister Yasuo Fukuda, accompanied by Minister of Education, Culture, Sports, Science & Technology Kisaburo Tokai, JAXA Astronaut Chiaki Mukai, and five Junior High students.,

Later, at ~8:58pm, both flight crew will engage in an interactive PAO TV interview with three U.S. media clients,- CBS News (Meg Oliver), NBC News (Tom Costello) and WMUR-TV (Tom Griffith).

At ~3:43am tomorrow morning, Bob Behnken (EV1) and Mike Foreman (EV2) will begin their "campout" in the A/L with hatch closure and depressurization of the CL (Crewlock) from 14.7 to 10.2 psi, followed by mask prebreathe. Sleep time for the ISS crew begins at ~5:00am. *[For the Campout, fresh METOX (Metal Oxide) canisters will be installed in the A/L for CO₂ control. EVA-4 will begin at ~6:28pm and last approximately 6.5 hrs, ending at ~12:58am. Its major objectives are: (1) Replace an RPCM (Remote Power Controller Module); (2) conduct TRAD (Tile Repair Ablator Dispenser) demo in the Shuttle PLB; (3) clean up worksite & ingress.]*

MT Transfer: At 2:12pm-4:12pm, the Mobile Transporter, carrying the MBS and SSRMS, moves from WS6 to WS4 on the main truss on IMCA (Integrated Motor/Controller Assembly) string A.

Columbus FSL Update: Ground teams have attempted another FSL (Fluid Science Laboratory) troubleshooting by swapping to the redundant Bus (MIL Bus B) and activating the FSL ISPR (International Standard Payload Rack). However, voltage and amperage checks during the RPDA (Remote Power Distribution Assembly) activation were off-nominal. Any further troubleshooting activities are on hold until next week, after the 1J/A joint mission. A new connector for FSL will be flown on Flight 1J (not on Soyuz 16S).

ASN-M Internal Transition Failure: RSC-Energia is troubleshooting a problem with the ASN-M Satellite Navigation System, critically required for ATV docking, which failed a switchover to its NVM-1 Navigation Computer Module (one of two). After first suspecting NVM-1 as failed, specialists now believe the problem is in the Common Power Switching timer (BSK DB2) of the Onboard Complex Control System (SUBK), but this needs to be confirmed ASAP. If so, the BSK will be replaced tomorrow or on Friday (3/21). Energia never had a similar failure in the

ISS and “hopes all functionality can be restored for supporting ATV operations”.

ISS Crew Sleep Shift Planning: To synchronize the ISS crew’s timeline with STS-123/1J/A docking and subsequent docked activities, Peggy’s, Yuri’s and Leo’s wake/sleep cycle is undergoing a number of shifts which started on 3/11. For the next six days, the wake/sleep shift schedule is as follows (all times EDT):

FD10	Wake: 1:30pm (3/19) – 5:00am (3/20) Sleep: 5:00am – 1:30pm (3/20)
FD11	Wake: 1:30pm (3/20) – 5:00am (3/21) Sleep: 5:00am – 1:30pm (3/21)
FD12	Wake: 1:30pm (3/21) – 4:00am (3/22) Sleep: 4:00am – 12:30pm (3/22)
FD13	Wake: 12:30pm (3/22) – 4:00am (3/23) Sleep: 4:00am – 12:30pm (3/23)
FD14	Wake: 12:30pm (3/23) – 3:30am (3/24) Sleep: 3:30am – 12:00pm (3/24)
FD15	Wake: 12:00pm (3/24) – 3:30am (3/25) Sleep: 3:30am – 12:00pm (3/25)

No CEO photo targets uplinked for today.

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 7:49am EDT [= epoch]*):

Mean altitude -- 340.7 km

Apogee height -- 341.3 km

Perigee height -- 340.2 km

Period -- 91.35 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0000825

Solar Beta Angle -- 42.1deg (magnitude increasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 93 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53437

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

- 3/19 (FD10) – Half-day off duty; EVA-4 preparations
- 3/20 (FD11) – EVA-4 to demonstrate T-RAD, replace RPCM, SPDM to Lab (~6:28pm)
- 3/22 (FD13) – EVA-5 to assemble OBSS KAU & stow OBSS, install MISSE-

- 6s, inspect SARJ (~5:23pm)
- 3/24 (FD15) – STS-123/Endeavour undocking (~7:55pm)
- 3/26 (FD17) – STS-123/Endeavour deorbit (~7:33pm); landing (KSC) -- ~8:35pm;

03/14/08 -- ATV1 “Jules Verne” CAM (Collision Avoidance Maneuver) Demo, -5m/s, 4:00am-5:30am EDT;

03/19/08 -- ATV1 “Jules Verne” parking point (loiter) arrival 8:00am EDT ~1200 mi. in front of ISS;

03/27/08 – ATV1 end of loiter; leave parking point - ~2:00am;

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking) ~10:39am EDT

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch - ~7:16am (Sergei Volkov, Oleg Kononenko, Yi So-yeon)

04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~8:43am

04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)

ISS On-Orbit Status 03/18/08

All ISS systems continue to function nominally, except those noted previously or below. *STS-123-1J/A Flight Day (FD) 8/9. Crew sleep cycle today: Sleep 6:00am–2:30pm; wake 2:30pm–5:00am tomorrow.*

EVA-3 was completed successfully by Rick Linnehan and Bob Behnken in 6h 53m, accomplishing most of its objectives.

[During the spacewalk, Linnehan (EV1) & Behnken (EV2) –

- 1. Installed the OTP (ORU {On-Orbit Replaceable Unit} Temporary Platform) and THA (Tool Holder Assembly) on the SPDM (Special Purpose Dexterous Manipulator),*
- 2. Removed MLI (Multi-Layered Insulation) thermal blankets,*
- 3. Installed the CLPA (Camera, Light & Pan/Tilt Assembly) on the SPDM,*
- 4. Cleaned up & configured the SLP (Spacelab Pallet) for return [to be transferred with the SSRMS (Space Station Remote Manipulator System) from the POA (Payload ORU Attachment) to the Orbiter PLB (Payload Bay) tomorrow evening (FD9)],*
- 5. Transferred the spare SSRMS yaw joint from the PLB to stowage on the ESP-2 (External Stowage Platform 2),*
- 6. Transferred two spare DCSUs (Direct Current Switching Units) from the PLB to stowage on the ESP-2,*
- 7. Transferred the LWAPA (Light Weight Adapter Plate Assembly) for installation on the Columbus EPF (External Payload Facility) and prepared for the installation of two MISSE-6 (Materials International Space Station Experiment) payloads,*
- 8. Removed the MCAS EBCS (Mobil Common Attachment System External Berthing Camera System) cover flap as a get-ahead, and*
- 9. Stowed the JLP (JEM Experiment Logistics Module Pressurized Section) trunnion covers on a handrail for future installation.*

Tasks not completed:

- MISSE-6B was not installed [its pip pins could not be properly aligned &*

locked for final installation on the LWAPA; MISSE-6B was returned to the PLB sidewall carrier],

- *MISSE-6A was not removed from the PLB carrier for installation due to lack of remaining EVA time [the MISSE-6 units will be added to EVA-5, probably replacing TBA-5 (Trundle Bearing Assembly 5) re-installation. EVA-4 will remain unchanged] , and*
- *Some SPDM thermal MLI covers were left in place for later removal [viz., an EP blanket, the OTCM-2 (ORU Tool Changeout Mechanism 2) sock, and the flaps on SPDM joint 2-7].*

Official start time of the spacewalk was 6:51pm EDT, about 32 min ahead of timeline, and it ended at 1:44am. Total EVA duration (PET = Phase Elapsed Time) was 6h 53min. It was the 107th spacewalk for ISS assembly & maintenance and the 79th from the station (57 from Quest, 22 from Pirs, 28 from Shuttle) totaling 486h 23min, the 11th for Expedition 16 (totaling 78h 31min) and the 8th so far this year. After today's EVA, a total of 135 spacewalkers (103 NASA astronauts, 21 Russians, and 11 astronauts representing Japan-1, Canada-4, France-1, Germany-2 and Sweden-3) have logged a total of 674h 45min outside the station on building, outfitting and servicing. It was also the 129th spacewalk involving U.S. astronauts.

After wakeup at ~2:30pm EST yesterday, ending the 8.5-hr sleep period before the spacewalk, the Airlock Crewlock (A/L CL) hatch was cracked at ~3:10pm for a hygiene break/with mask prebreathe for Linnehan and Behnken, after spending the night on 10.2 psi campout. Around 3:30pm, the hatch was closed again by IVs (Intravehicular Crewmembers) for EVA preparations in 10.2 psi, followed by EMU purge & prebreathe. Afterwards, IVs supported the CL depressurization and EV1/ EV2 egress (EMUs switched to batteries at 6:51pm).

As part of pre-EVA activities, FE-1 Malenchenko powered down the ham radio equipment in SM (Service Module) and FGB at ~2:30am EST to prevent RF interference with the EMUs during the spacewalk.

Before her breakfast and EVA-support activities as IV, CDR Peggy Whitson completed another session with the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop for downlink, as suggested on her discretionary "job jar" task list. *[To monitor the crewmember's sleep/wake patterns and light exposure, Peggy wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

Yuri Malenchenko made preparations for another run of the Russian/German TEKh-20 Plasma Crystal-3 Plus (PK-3+) experiment payload, the second of Expedition 16, by unstowing the hardware, installing it in the SM for operation and photographing the setup. The images were downlinked to TsUP via BSR-TM for inspection, and the FE-1 performed the initial leak check of the PK-3 Electronics Box before its evacuation. More work to come tomorrow. *[The experiment is performed on plasma, i.e., fine particles charged and excited by HF (high frequency) radio power inside a vacuum work chamber. Main objective is to obtain a homogeneous plasma dust cloud at various pressures and particle quantities with or without superimposition of an LF (low frequency) harmonic electrical field. The experiment is conducted in automated mode. PK-3+ has more advanced hardware and software than the previously used Russian PKE-Nefedov payload.]*

For Garrett Reisman's upcoming first session with the biomed experiment "Integrated Immune", Peggy Whitson set up the equipment needed to support saliva collection. *[Along with NUTRITION (Nutritional Status Assessment), Integrated Immune (Validating Procedures for Monitoring Crew member Immune Function) samples & analyzes participant's blood, urine, and saliva before, during and after flight for changes related to functions like bone metabolism, oxidative damage and immune function to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects. The saliva is collected in two forms, dry and liquid. The dry samples are collected at intervals during the collection day using a specialized book that contains filter paper. The liquid saliva collections require that the crewmember soak a piece of cotton inside their mouth and place it in a salivette bag; there are four of the liquid collections during docked operations. The on-orbit blood samples are collected right before undocking and returned on the Shuttle so that analysis can occur with 48 hours of the sampling. This allows assays that quantify the function of different types of white blood cells and other active components of the immune system. Samples are secured in the MELFI (Minus-Eighty Laboratory Freezer for ISS). Also included are entries in a fluid/medications intact log, and a stress-test questionnaire to be filled out by the subject at begin and end. Urine is collected during a 24-hour period, conventionally divided into two twelve-hour phases: morning-evening and evening-morning.]*

During the spacewalk, which MS2 Foreman supported as IV, Whitson and MS3 Doi continued configuring the JLP today. *[Activities included rotation of the DMS (Data Management System) rack, retrieving two hard dummy panels from the rack standoff, assembling a dummy panel and installing it to the rack standoff. In preparation for Flight 1J, Takao & Peggy retrieved a JEM (Japanese Experiment Module) equipment bag as well as two JTVE (JEM Television Equipment) booms which for their assembly tomorrow (they will then remain in the JLP for their*

eventual deployment during Flight 1J's EVA-2.]

After the spacewalkers' ingress this morning at 1:44am, post-EVA activities by Whitson, Linnehan, Foreman and Behnken in the Airlock (A/L) consisted of recharging the EMU/spacesuits with water from PWR (Payload Water Reservoir), then reconnecting the LTAs (Lower Torso Assemblies) to the EMUs and capping the UIA (Umbilical Interface Assembly), initiating and monitoring the regeneration of the METOX (Metal Oxide) CO₂ filter canisters, initiating the discharge/recharge process on the EMU batteries in the BSA (Battery Stowage Assembly), turning around the DCS-760 EVA camera (including downloading its photographs), and reconfiguring EVA tools.

After the EVA, Eyharts & Reisman maneuvered the SSRMS to re-grapple the SPDM and feed operational power to it for its heaters. The SPDM LEE (Latching End Effector) was then commanded to release the SLP, after which Dextre was maneuvered by SSRMS to an overnight park position.

Tonight at ~5:00pm, Eyharts & Reisman, joined by PLT Gregory Johnson, will command both SPDM arms in stow position and, at ~7:30pm, relocate Dextre for stowage on the U.S. Lab PDGF (Power & Data Grapple Fixture).

After releasing Dextre, Garrett and Greg will move the SSRMS over to grapple the SLP, detach it from the POA and transfer it to the Orbiter for berthing in the PLB. This activity should be completed by ~12:00midnight.

FE-1 Malenchenko hooked up the necessary "plumbing" and compressor for transferring potable water from the BV1 tank of Progress M-63/28P to an EDV storage container. *[The water transfer, monitored by Yuri several times during the "day", at first was by self-flow (under its own tank pressure), then using the compressor pump via a GZhS gas/liquid separator, to remove air bubbles in the water. The BV2 Rodnik tank was emptied of its water by Yuri on 2/14. Filling of the empty Progress BV1 & BV2 tanks with urine will be scheduled later.]*

Yuri conducted the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various Russian segment (RS) hatchways, including the FGB-to-Soyuz tunnel, and the FGB-to-Node passageway. *[This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons, and one of the two Russian SKV air conditioners off (SKV-1).]*

The FE-1 also completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

FE-2 Eyharts performed periodic maintenance on the U.S. OGS (Oxygen Generation System), activating the WDS (Water Delivery System) from a filled PWR (Payload Water Reservoir), then deactivating it, leaving the PWR stowed in front of it. *[Like the Russian Elektron, OGS produces O₂ from water by electrolysis, dumping the also generated H₂ (hydrogen) through venting.]*

Malenchenko spent several hours on transferring discarded equipment and waste to Progress 28P and loading the spacecraft-turned-trash can preparatory to its separation on 4/1 for destructive reentry, tracking transfers in the IMS (Inventory Management System).

Reisman, as Eyharts before him, had 60 minutes for himself for general orientation (station familiarization & acclimatization), as is standard daily rule for the first two weeks after starting station residency.

Later, before sleeptime this morning (6:00am), Yuri conducted the daily IMS maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Working from the Russian "available time" suggestions list, Yuri Malenchenko performed the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).

A second task list item for the FE-1 for FD7 was the daily monitoring, picture-taking and downloading for the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}).

Despite their busy timelines, all ISS crewmembers had time scheduled yesterday (as well as tonight after wakeup) for conducting their regular physical exercise.

The ISS crew began their sleeptime this morning at 6:00am, the Shuttle at 6:30am. For both crews, currently asleep, workday begins later today at 2:30pm EDT.

KOB-2 TCS Pump Update: After some more testing by TsUP-Moscow, RSC-Energia has determined that micro pump #1 (one of two) in the 4SPN1 replaceable pump panel of the SM TCS (SOTR, Thermal Control Systems)'s KOB-2 loop is failed. Its replacement will be planned pending launch of spare hardware (not

currently onboard). At present, thermal loop KOB-2 is active with its alternate twin-pump package 4SPN2, with KOB-1 available as redundant backup. *[Each of the two SOTR KOB loops has two redundant pump panels with two redundant pumps each. While in the early years of Mir and ISS the pumps were integral to the SPN panels, the current design allows them to be replaced without requiring an entire new SPN block.]*

ATV Update (Flight Days 7, 8, 9): No phasing or rendezvous burns were performed during FDs 7, 8, & 9. PDE-4 (Propulsion Drive Electronics #4) was successfully re-integrated on 3/15 (FD7) at 6:06am EDT as part of the recovery from the FDIR actions during the MC1-2 burn. The switch to CPF-2 (Communication Processor Formatter #2) was completed successfully on 3/17 (FD9) at 4:30am. The next scheduled burns are TV1_1 and TV1_2 today (3/18) at 6:30:34pm & 7:16:45pm. They will be performed with the OCS (main engines) and in helium (He) pressurant configuration B, which exercises the redundant set of He pressure regulators and is the first time these regulators will be used for an OCS burn. They have been used previously with the ACS (attitude control thrusters) and have performed nominally, as also during the initial post-insertion pressurization.

ISS Crew Sleep Shift Planning: To synchronize the ISS crew's timeline with STS-123/1J/A docking and subsequent docked activities, Peggy's, Yuri's and Leo's wake/sleep cycle is undergoing a number of shifts which started on 3/11. For the next six days, the wake/sleep shift schedule is as follows (all times EDT):

FD9	Wake: 2:30pm (3/18) – 5:00am (3/19) Sleep: 5:00am – 1:30pm (3/19)
FD10	Wake: 1:30pm (3/19) – 5:00am (3/20) Sleep: 5:00am – 1:30pm (3/20)
FD11	Wake: 1:30pm (3/20) – 5:00am (3/21) Sleep: 5:00am – 1:30pm (3/21)
FD12	Wake: 1:30pm (3/21) – 4:00am (3/22) Sleep: 4:00am – 12:30pm (3/22)
FD13	Wake: 12:30pm (3/22) – 4:00am (3/23) Sleep: 4:00am – 12:30pm (3/23)
FD14	Wake: 12:30pm (3/23) – 3:30am (3/24) Sleep: 3:30am – 12:00pm (3/24)

No CEO photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 8:45am EDT [= epoch]):*

Mean altitude -- 340.8 km

Apogee height -- 341.6 km

Perigee height -- 340.1 km

Period -- 91.35 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0001138

Solar Beta Angle -- 38.3 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 35 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53422

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

- 3/19 (FD10) – Half-day off duty; EVA-4 preparations
- 3/20 (FD11) – EVA-4 to demonstrate T-RAD, replace RPCM, SPDM to Lab (~6:28pm)
- 3/22 (FD13) – EVA-5 to assemble OBSS KAU & stow OBSS, install MISSE-6s, inspect SARJ (~5:23pm)
- 3/24 (FD15) – STS-123/Endeavour undocking (~7:55pm)
- 3/26 (FD17) – STS-123/Endeavour deorbit (~7:33pm); landing (KSC) -- ~8:35pm;

03/14/08 -- ATV1 “Jules Verne” CAM (Collision Avoidance Maneuver) Demo, -5m/s, 4:00am-5:30am EDT;

03/19/08 -- ATV1 “Jules Verne” parking point (loiter) arrival 8:00am EDT ~1200 mi. in front of ISS;

03/27/08 -- ATV1 end of loiter; leave parking point - ~2:00am;

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking) ~10:39am EDT

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch - ~7:16am (Sergei Volkov, Oleg Kononenko, Yi So-yeon)

04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~8:43am

04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)

05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/25/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS

05/27/08 -- STS-124/Discovery/1J docking

06/05/08 -- STS-124/Discovery/1J undocking

08/07/08 -- ATV1 undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
4QTR CY09 -- STS-130/19A - MPLM
1QTR CY10 -- STS-131/ULF4
2QTR CY10 -- STS-132/20A – Node-3 + Cupola
3QTR CY10 -- STS-133/ULF5.

ISS On-Orbit Status 03/17/08

All ISS systems continue to function nominally, except those noted previously or below. *1J/A Flight Day 7/8 (FD7/8). Underway: Week 22 of Increment 16. Crew sleep cycle today: Sleep 6:00am–2:30pm; wake 2:30pm–6:00am tomorrow.*

After wake-up yesterday at ~3:30pm, CDR Peggy Whitson completed another session with the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop for downlink, as suggested on her discretionary "job jar" task list. *[To monitor the crewmember's sleep/wake patterns and light exposure, Peggy wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

First activity on the FD7 schedules of FE-1-16 Garrett Reisman & MS1 Bob Behnken was to work with CSA (Canadian Space Agency) ground engineers in using the SSRMS (Space Station Remote Manipulator System) to grapple the SPDM PDGF (Special Purpose Dexterous Manipulator/Power & Data Grapple Fixture) and then conduct diagnostics and "Brake Run-in" (BRIT) tests on the newly assembled Dextre robot. *[SPDM LEE (Latching End Effector) and body ("waist") roll joint diagnostics all passed, as did the BRIT joint tests on the arms except for Arm-2's WP (Wrist Pitch) joint which exceeded the expected joint travel after brake application. Subsequent analysis showed that all SPDM arm brakes are actually meeting specifications (i.e., have adequate braking torque), but that the BRIT and diagnostic tests do not provide an accurate indication of proper brake holding torque, conservatively showing a "false fail" result. Based on this analysis, the crew was given the Go to stow the SPDM arms for EVA-3. SPDM performance during the dexterous arm maneuvers was completely nominal. SSRMS will release the SPDM PDGF shortly before EVA-3 tonight, leaving SPDM unpowered for the*

duration of the spacewalk.]

FE-2 Leo Eyharts worked in the JLP (JEM Experiment Logistics Module Pressurized Section) and Node-2 to install HHGRs (Hatch Handle Guide Rings) and decals on their hatches, to help prevent the hatch handles from being stowed in the wrong position. Also installed was the EVA hatch window cover to the Node-2 zenith hatch.

CDR Whitson powered down the MSG (Microgravity Science Glovebox) in the Lab and removed all InSPACE (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions) and InSPACE-2 hardware as well as MSG video equipment for stowage. *[Peggy also stowed remaining video tapes, the last coil assembly and all vial assemblies.]*

Afterwards, Whitson disconnected the MLC (MSG Laptop Computer) and configured the MSG for its transfer to the Columbus module. *[The transfer of the rack from Lab to COL is scheduled for 3/23 (FD14, Sunday, ~9:00pm).]*

First task for FE-1 Yuri Malenchenko after wakeup was to set up the hardware for the Russian MBI-21 PNEVMOKARD experiment and to conduct the session, his fourth (which forbids moving or talking during data recording). The experiment is controlled from the RSE-Med A31p laptop, equipped with new software, and uses the TENZOPLUS sphygmomanometer to measure arterial blood pressure. *[PNEVMOKARD (Pneumocard) is an attempt to obtain new scientific information to refine the understanding about the mechanisms used by the cardiorespiratory system and the whole body organism to spaceflight conditions. By recording (on PCMCIA cards) the crewmember's electrocardiogram, impedance cardiogram, low-frequency phonocardiogram (seismocardiogram), pneumotachogram (using nose temperature sensors), and finger photoplethysmogram, the experiment supports integrated studies of (1) the cardiovascular system and its adaptation mechanisms in various phases of a long-duration mission, (2) the synchronization of heart activity and breathing factors, as well as the cardiorespiratory system control processes based on the variability rate of physiological parameters, and (3) the interconnection between the cardiorespiratory system during a long-duration mission and the tolerance of orthostatic & physical activities at the beginning of readaptation for predicting possible reactions of the crewmembers organism during the their return to ground.]*

Reisman & Doi worked in the JLP on continuing its activation and preparation for the arrival of the JEM (Japanese Experiment Module) "Kibo" later this year.

[Garrett & Takao rotated the module racks back to their nominal position and reconfigured JLP for the JEMRMS (JEM Robotic Manipulator System), ICS (Inter Orbit Communication System), Saibo, Ryutai and the JRSR (JEM Resupply

Stowage Rack) racks. Rack translations within the JLP are scheduled during Flight 1J after the JLP is relocated to its final location on the JEM.

Background: **Saibo** ("living cell") is a Japanese multipurpose experiment/payload rack system on the ISS that transports, stores and supports subrack facilities such as the CB (Clean Bench) and CBEF (Cell Biology Experiment Facility) equipment by providing structural interfaces, power, data, cooling, water and other items needed to operate science experiments in microgravity. **Ryutai** ("fluid") is a Japanese multipurpose experiment/payload rack system to support the FPEF (Fluid Physics Experiment Facility), SCOF (Solution Crystallization Observation Facility), PCRF (Protein Crystallization Research Facility) and the IPU (Image Processing Unit) by providing structural interfaces, power, data, cooling, water and other items needed to operate science experiments in micro-G.]

The CDR upgraded the EXPRESS Rack 2 IC (Interface Controller) computer with the new software (Release 5), then readied the A31p laptop for ops by running a batch file.

Starting a new round of RS (Russian Segment) ventilation system maintenance, the FE-1 cleaned "Group A" fan grilles in the Service Module (SM).

Malenchenko also completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables plus the weekly collection of the toilet flush counter (SPK-U), water supply (SVO) readings and POTOK parameters for calldown to TsUP/Moscow. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC (Contingency Water Container) from the Lab humidifier. Weekly SOZh reports (on Sundays) to TsUP/Moscow deal with number & dates of water and urine containers, counter readings of water consumption & urine collection, plus data and total operating time of the Russian POTOK-150MK (150 micron) air filter unit of the SOGS air revitalization subsystem.]*

Later, Yuri conducted the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various Russian segment (RS) hatchways, including the FGB-to-Soyuz tunnel, and the FGB-to-Node passageway. *[This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons, and one of the two Russian SKV air conditioners off (SKV-1).]*

After completion of N₂ (nitrogen) transfer from the Shuttle to ISS (~23 lbs), Reisman took down the transfer equipment. *[By IMMT (ISS Mission Management Team)]*

decision this morning, no O₂ (oxygen) will be pumped over since the transferable amount (10-14 lbs before reaching the ORCA 2100 psi threshold) is too small to justify using the lifetime-limited ORCA (Oxygen Recharge Compressor Assembly). The operational cycles allowed under Flight Rule for the ORCA's diaphragm pump have already been modified by waiver from 280,000 to 373,000 cycles. A replacement ORCA will be delivered to KSC in December this year.]

Reisman, as Eyharts before him, had 60 minutes for himself for general orientation (station familiarization & acclimatization), as is standard daily rule for the first two weeks after starting station residency.

Working from the Russian "available time" suggestions list, Yuri Malenchenko conducted the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).

A second task list item for the FE-1 for FD7 was the daily monitoring, picture-taking and downloading for the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}).

At ~10:15pm EDT last night, both crews participated in a PAO TV event via Ku- & S-band with KMOX-Radio, St. Louis, MO (Jon Grayson), WEWS-TV, Cleveland, OH (Curtis Jackson), and WBZ-TV, Boston, MA (Ken MacLeod). Topics included the Dextre robotic system assembly, upcoming EVA-3 activities, importance of the newly installed Japanese module, Reisman's arrival to and Eyharts' return from the ISS, and the astronauts' hometown connections.

Whitson and Eyharts reconfigured the DCS-760 EVA camera with 28-mm lens, leaving it on station power until the EMU prebreathe period tomorrow morning, and initiated charging of two camera batteries in the A/L BSA (Airlock Battery Stowage Assembly) for at least 3 hrs.

Despite their busy timelines, all ISS crewmembers had time scheduled yesterday (as well as tonight after wakeup) for conducting their regular physical exercise.

Before going into their sleep period this morning, the joint crew had an hour to review timeline and procedures for EVA-3.

For both crews, currently asleep, workday begins later today at 2:30pm EDT. Rick Linnehan (EV1) and Bob Behnken (EV2) are on "Campout" (*nachalo desaturatsiy* =

desaturation start) in the A/L CL (Crewlock), after hatch closure this morning at ~4:45am. The two spacewalkers performed PBA (Portable Breathing Apparatus) mask prebreathe for denitrogenation, while readying their tools & equipment, then depressed the CL from 14.7 to 10.2 psi for their sleep period. *[For the Campout, fresh METOX (Metal Oxide) canisters were installed in the A/L for CO₂ control.]*

EVA-3 Preview: EVA-3 begins at ~7:23pm and lasts approximately 6.5 hrs, ending at ~2:00am. Its major objectives are: (1) Install OTP/THA (ORU Tool Platform/Tool Holder Assembly), (2) clean up SLP, (3) transfer MISSE-6 & LWAPA (Light-Weight Adaptor Plate Assembly) and install on Columbus, (4) transfer one spare SSRMS yaw joint and two DCSUs (Direct Current Switching Units) from Shuttle PLB (Payload Bay) to ESP-2 (External Stowage Platform 2), (5) install two CLPAs (Camera, Light, PTU Assemblies) on SPDM, and (6) clean up worksite & ingress.

KOB-2 TCS Pump Switchover: Yesterday, one of the four micro pumps in the SM TCS (Thermal Control Systems)'s KOB-2 loop switched over to the backup pump in replaceable pump panel 4SPN1. Nominal software response was to deactivate the Russian SKV-2 air conditioner and turn on the 4SPN2 pump panel. SKV-2 was then reactivated by TsUP-Moscow through ground commanding without issues.

Engineers suspect that one 4SPN1 pump has failed (both pumps are still well within their expected lifetime of ~6500 hrs, viz.: N1~4864 hrs, N2~3425 hrs). At present, thermal loop KOB-2 is active with its alternate twin-pump package 4SPN2, with KOB-1 available as redundant backup. The failed pump package 4SPN1 will be investigated. There is no spare hardware onboard.

ISS Crew Sleep Shift Planning: To synchronize the ISS crew's timeline with STS-123/1J/A docking and subsequent docked activities, Peggy's, Yuri's and Leo's wake/sleep cycle is undergoing a number of shifts which started on 3/11. For the next six days, the wake/sleep shift schedule is as follows (all times EDT):

FD8	Wake: 2:30pm (3/17) – 6:00am (3/18) Sleep: 6:00am – 2:30pm (3/18)
FD9	Wake: 2:30pm (3/17) – 6:00am (3/18) Sleep: 6:00am – 2:30pm (3/18)
FD10	Wake: 1:30pm (3/19) – 5:00am (3/20) Sleep: 5:00am – 1:30pm (3/20)
FD11	Wake: 1:30pm (3/20) – 5:00am (3/21) Sleep: 5:00am – 1:30pm (3/21)
FD12	Wake: 1:30pm (3/21) – 4:00am (3/22) Sleep: 4:00am – 12:30pm (3/22)
FD13	Wake: 12:30pm (3/22) – 4:00am (3/23) Sleep: 4:00am – 12:30pm (3/23)

No CEO photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 8:39am EDT [= epoch]*):

Mean altitude -- 340.9 km

Apogee height -- 341.3 km

Perigee height -- 340.4 km

Period -- 91.35 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0000658

Solar Beta Angle -- 34.2 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.76

Mean altitude gain in the last 24 hours -- 500 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53406

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

- 3/17 (FD8) – EVA-3 to transfer ORUs, cleanup SLP, install MISSE-6, etc. (~7:23pm)
- 3/20 (FD11) – EVA-4 to demonstrate T-RAD, do get-aheads (~6:28pm)
- 3/22 (FD13) – EVA-5 to stow OBSS, TBDs (~5:23pm)
- 3/24 (FD15) – STS-123/Endeavour undocking (~7:55pm)
- 3/26 (FD17) – STS-123/Endeavour deorbit (~7:33pm); landing (KSC) -- ~8:35pm;

03/14/08 -- ATV1 "Jules Verne" CAM (Collision Avoidance Maneuver) Demo, -5m/s, 4:00am-5:30am EDT;

03/19/08 -- ATV1 "Jules Verne" parking point (loiter) arrival 8:00am EDT ~1200 mi. in front of ISS;

03/27/08 -- ATV1 end of loiter; leave parking point - ~2:00am;

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking) ~10:39am EDT

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch - ~7:16am (Sergei Volkov, Oleg Kononenko, Yi So-yeon)

04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~8:43am

04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)

05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/25/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS
05/27/08 -- STS-124/Discovery/1J docking
06/05/08 -- STS-124/Discovery/1J undocking
08/07/08 -- ATV1 undocking
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
4QTR CY09 -- STS-130/19A - MPLM
1QTR CY10 -- STS-131/ULF4
2QTR CY10 -- STS-132/20A – Node-3 + Cupola
3QTR CY10 -- STS-133/ULF5.

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 03/16/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – 1J/A Flight Day 6/7 (FD6/7). Ahead: Week 22 of Increment 16. Crew sleep cycle today: Sleep 7:00am–3:30pm; wake 3:30pm–6:00am tomorrow.*

More good news!

SPDM Dextre was checked out and is working nominally with both arms.

[The waist-up-only robot from Canada arrived in space in nine separate pieces that are being assembled in the current spacewalks. Each of the two arms has seven joints; in addition, SPDM (Special Purpose Dexterous Manipulator) Dextre can pivot at the “waist”. Its grippers (hands) have built-in socket wrenches, cameras & lights. Only one arm is movable at a time, to keep the robot stable and avoid a two-arm collision. Dextre can be attached to MT (Mobile Transporter) to translate along the stations rail tracks, or alternately to the SSRMS (Space Station Remote Manipulator System) to swing to places where the railcart can’t go. What a supercool helper!]

EVA-2 was completed successfully by Rick Linnehan and Mike Foreman in 7h 8m, accomplishing all its objectives.

[During the spacewalk, Linnehan (EV1) & Foreman (EV2) –

- 1. Removed SPDM Arms #1 & #2 from the SLP FSE (Spacelab Pallet Flight Support Equipment); the arms were then temporarily stowed on an SLP bracket. During removal of the EDFs (Expandable Diameter Fasteners) from both arms, the crew encountered difficulty in releasing the fasteners. A pry bar was required on both arms to finally release the fasteners, - a critically important and fortunate accomplishment;*
- 2. Mated both Arm #1 & Arm #2 to Dextre’s main body; and*
- 3. Removed several of the 19 MLI (Multi-Layered Insulation) thermal covers from Arms #1 & #2; teams are still assessing what thermal covers are left and which covers need to be removed on EVA-3 tomorrow night.*

Official start time of the spacewalk was 7:48pm EDT, about 35 min ahead of timeline, and it ended at 2:56am. Total EVA duration (PET = Phase Elapsed Time) was 7h 8min. It was the 106th spacewalk for ISS assembly & maintenance and the 78th from the station (56 from Quest, 22 from Pirs, 28 from Shuttle) totaling 479h 30min, the 10th for Expedition 16 (totaling 71h 38min) and the 7th so far this year. After today's EVA, a total of 133 spacewalkers (101 NASA astronauts, 21 Russians, and 11 astronauts representing Japan-1, Canada-4, France-1, Germany-2 and Sweden-3) have logged a total of 667h 52min outside the station on building, outfitting and servicing. It was also the 128th spacewalk involving U.S. astronauts.]

After the EVA, SSRMS re-grappled SPDM and power was re-applied. This allowed the SPDM arms and body to be brought to life (i.e., operational status) for the first time. Diagnostic tests were successfully performed overnight on both arms. Dextre's final assembly is scheduled to be completed tomorrow night on EVA-3. On the following day (FD9), SPDM will be grappled by the SSRMS and relocated to the U.S. Lab PDGF (Power & Data Grapple Fixture).

After the spacewalkers' ingress this morning at 2:56am, post-EVA activities by Peggy Whitson, Rick Linnehan, Mike Foreman and Bob Behnken and Leo Eyharts in the Airlock (A/L) consisted of recharging the EMU/spacesuits with water from PWR (Payload Water Reservoir), then reconnecting the LTAs (Lower Torso Assemblies) to the EMUs and capping the UIA (Umbilical Interface Assembly), initiating and monitoring the regeneration of the METOX (Metal Oxide) CO₂ filter canisters, initiating the discharge/recharge process on the EMU batteries in the BSA (Battery Stowage Assembly), and reconfiguring EVA tools. *[A temporary blower failure of the CDRA (Carbon Dioxide Removal System) at 6:35am had no impact on METOX regeneration. CDRA was reactivated at 7:08am and is currently running.]*

During the EVA, CDR Whitson and MS3 Doi worked in the JAXA JLP (JEM Experiment Logistics Module Pressurized Section) to complete its outfitting and preparation for the arrival of the JEM (Japanese Experiment Module) "Kibo" later this year. *[Peggy and Takao rotated the module racks to obtain temperature readings of its shell (required to support an engineering evaluation of the thermal math models in case the JLP trunnion covers are not installed during one of the next EVAs), then released rack launch restraints, removed rack closeouts, installed pivot fittings and K-Bar assemblies and secured knee braces for the JEMRMS (JEM Robotic Manipulator System), ICS (Inter Orbit Communication System), Saibo, Ryutai and the JRSR (JEM Resupply Stowage Rack) racks. Rack translations within the JLP are planned during Flight 1J after the JLP is relocated to its final location on the JEM.]*

Background: **Saibo** ("living cell") is a Japanese multipurpose experiment/payload

rack system on the ISS that transports, stores and supports subrack facilities such as the CB (Clean Bench) and CBEF (Cell Biology Experiment Facility) equipment by providing structural interfaces, power, data, cooling, water and other items needed to operate science experiments in microgravity. **Ryutai** (“fluid”) is a Japanese multipurpose experiment/payload rack system to support the FPEF (Fluid Physics Experiment Facility), SCOF (Solution Crystallization Observation Facility), PCRf (Protein Crystallization Research Facility) and the IPU (Image Processing Unit) by providing structural interfaces, power, data, cooling, water and other items needed to operate science experiments in micro-G.]

In the Service Module (SM), FE-1 Malenchenko deinstalled the JAXA-3DPC (Japan Aerospace Exploration Agency-3D Photon Crystals) crystal growth experiment and transferred it to the Shuttle for return to Earth. *[The experiment had been running since 1/22 and was turned off by Yuri on 1/31. Its purpose was to grow photonic crystals in microgravity using particles in electrolytic solutions that will be fixed using ultraviolet light in a process referred to as photocuring, after self-organization and ordering of colloid nanoparticles in an electrolyte solution with subsequent fixation in an elastic gel matrix.]*

Malenchenko also unstowed a spare BRPK air/liquid condensate separator unit, flushed it out with clean water (to remove any sediments that may have accumulated as a result of length storage) and installed it in the BRPK-1 line of the SRV-K2M Condensate Water Recovery System.

As the spacewalk went on, Eyharts set up and conducted the periodic (monthly) O-OHA (On-Orbit Hearing Assessment) test, a 30-min NASA EHS (Environmental Health Systems) examination to assess the efficacy of acoustic countermeasures, using a special MEC (Medical Equipment Computer) laptop application. It was Leo’s second onboard O-OHA session. *[The O-OHA audiography test involves minimum audibility measurements for each ear over a wide range of frequencies (0.25-10 kHz) and sound pressure levels, with the crewmembers using individual-specific Phononics earphones, Bose ANC headsets and the SLM (sound level meter). To conduct the testing, the experimenter is supported by special EarQ software on the MEC, featuring an up/down-arrow-operated slider for each test frequency that the crewmember moves to the lowest sound pressure level at which the tone can still be heard. The baseline test is required not later than about Flight Day 14 for each new Expedition and is then generally performed once per month. Note: There have been temporary hearing deficits documented on some U.S. and Russian crewmembers, all of which recovered to pre-mission levels.]*

Later, Eyharts also installed 22 newly arrived white U.S. RAM (Radiation Area Monitor) dosimeters in the ISS, documenting their deployment photographically, and collected 18 used blue RAMs deployed on 8/13/07, for return on 1J/A.

Before sleeptime, Yuri successfully repaired the broken Multimeter instrument. *[The activities began with FE-1 setting up the MWA (Maintenance Work Area), followed by the soldering of new battery terminal wires to the Multimeter.]*

For both crews, currently asleep, workday begins today at 3:30pm EDT.

After crew wakeup, Leo will remove the deactivated InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions) hardware from the MSG (Microgravity Science Glovebox) for stowage.

Before breakfast, as suggested on her discretionary “job jar” task list, Peggy Whitson will complete another “overnight” run with the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and filling in questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for downlink. *[To monitor the crewmember’s sleep/wake patterns and light exposure, Peggy put on a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.]*

First thing for Yuri after wakeup will be to set up the hardware for the Russian MBI-21 PNEVMOKARD experiment and conduct the session, his fourth (which forbids moving or talking during data recording). The experiment is controlled from the RSE-Med A31p laptop, equipped with new software, and uses the TENZOPLUS sphygmomanometer to measure arterial blood pressure. *[PNEVMOKARD (Pneumocard) is an attempt to obtain new scientific information to refine the understanding about the mechanisms used by the cardiorespiratory system and the whole body organism to spaceflight conditions. By recording (on PCMCIA cards) the crewmember’s electrocardiogram, impedance cardiogram, low-frequency phonocardiogram (seismocardiogram), pneumotachogram (using nose temperature sensors), and finger photoplethysmogram, the experiment supports integrated studies of (1) the cardiovascular system and its adaptation mechanisms in various phases of a long-duration mission, (2) the synchronization of heart activity and breathing factors, as well as the cardiorespiratory system control processes based on the variability rate of physiological parameters, and (3) the interconnection between the cardiorespiratory system during a long-duration mission and the tolerance of orthostatic & physical activities at the beginning of readaptation for predicting possible reactions of the crewmembers organism during the their return to ground.]*

Starting a new round of RS ventilation system maintenance, the FE-1 will work in

the SM, cleaning "Group A" fan grilles.

Afterwards, Yuri will also conduct the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various Russian segment (RS) hatchways, including the FGB-to-Soyuz tunnel, and the FGB-to-Node passageway. *[This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons, and one of the two Russian SKV air conditioners off (SKV-1).]*

Also later today, Behnken and Reisman will conduct a brake run-in test on the newly installed SPDM arms and then stow the arms in pre-EVA-3 configuration. *[There are no temperature concerns with SPDM powered off.]*

At ~4:45am tomorrow morning, Rick Linnehan (EV1) and Bob Behnken (EV2) will begin their "campout" in the A/L with hatch closure and depressurization of the CL (Crewlock) from 14.7 to 10.2 psi, followed by mask prebreathe. Sleep time for the ISS crew begins at 6:00am. *[For the Campout, fresh METOX (Metal Oxide) canisters will be installed in the A/L for CO₂ control. EVA-3 will begin at ~7:25am and last approximately 6.5 hrs, ending at ~2:00am. Its major objectives are: (1) Install OTP/THA (ORU Tool Platform/Tool Holder Assembly), (2) clean up SLP, (3) transfer MISSE-6 & LWAPA (Light-Weight Adaptor Plate Assembly) and install on Columbus, (4) transfer one spare SSRMS yaw joint and two DCSUs (Direct Current Switching Units) from Shuttle PLB (Payload Bay) to ESP-2 (External Stowage Platform 2), (5) install two CLPAs (Camera, Light, PTU Assemblies) on SPDM, and (6) clean up worksite & ingress.]*

Despite their busy timelines, all ISS crewmembers had time scheduled yesterday (as well as tonight after wakeup) for conducting their regular physical exercise.

Transfers: Middeck transfers are going well; no concerns. N₂ (nitrogen) transfer is complete (~23 lbs transferred).

ATV "Jules Verne" Status Update: On 3/14 (Friday), ATV1 performed two maneuvers. Immediately prior to the start of the second burn, PDE-4 (Propulsion Drive Electronics #4) was disabled by an FDIR (Fault Detection, Isolation & Recovery) signal reacting to a temperature threshold violation in a temperature sensor (thermistor T406). Alarms were also observed during the first burn which did not reach the FDIR threshold. Between maneuvers, ATVCC/Toulouse attempted unsuccessfully to reset the alarm counter; thus, the FDIR was triggered at the start of the second burn, disabling PDE-4. The maneuver was completed nominally on three PDEs. To date, all three incidents involving PDE disabling have been associated with other equipment FDIRs (a helium regulator and two

thermistors). All three incidents have been resolved with no loss of vehicle functionality or redundancy. All ATV1 systems are performing nominally. The next burn is planned for 3/18 (Tuesday) at 6:41pm EDT. ATV1 enters parking position on 3/19 at 9:00am.

ISS Crew Sleep Shift Planning: To synchronize the ISS crew's timeline with STS-123/1J/A docking and subsequent docked activities, Peggy's, Yuri's and Leo's wake/sleep cycle is undergoing a number of shifts which started on 3/11. For the next six days, the wake/sleep shift schedule is as follows (all times EDT):

FD7	Wake: 3:30pm (3/16) – 6:00am (3/17) Sleep: 6:00am – 2:30pm (3/17)
FD8	Wake: 3:30pm (3/17) – 6:00am (3/18) Sleep: 6:00am – 2:30pm (3/18)
FD9	Wake: 2:30pm (3/18) – 5:00am (3/19) Sleep: 5:00am – 1:30pm (3/19)
FD10	Wake: 1:30pm (3/19) – 5:00am (3/20) Sleep: 5:00am – 1:30pm (3/20)
FD11	Wake: 1:30pm (3/20) – 5:00am (3/21) Sleep: 5:00am – 1:30pm (3/21)
FD12	Wake: 1:30pm (3/21) – 4:00am (3/22) Sleep: 4:00am – 12:30pm (3/22)

Weekly Science Update (Expedition Sixteen -- Week 21)

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): Radiation measurements continue to be performed in the PIRS module. Radiation measurements continue to be performed in the PIRS module. Next memory card exchange took place at 3/14.

ANITA: Completed.

BCAT-3 (Binary Colloidal Alloy Test 3): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): In progress.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaborate Immagini Televisive - Space 2): Data collected during the first in-flight session have been down-linked and are under analysis. Engineering assessment provided good results: the system was calibrated within the expected 1 mm accuracy. Scientific analysis is going on. Data collected during second in-flight session are still to be downlinked. The scientific protocols were fully executed in both sessions

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): In progress.

EuTEF (European Technology Exposure Facility): DEBIE-2 showed regular link errors and was switched off on 3/9. DOSTEL: On-going science acquisition. EuTEMP: Currently inactive as planned. EVC: first EVC pictures were received on 3/6. Further commissioning was performed on 3/14 with a first successful picture acquisition run. During a second sequence with different parameters, however, again no HRD (high rate data) could be received. Under further investigation. EXPOSE: On-going science acquisition. FIPEX: Sensor units RAM3, RAM4 and ZENITH8 were switched on. However, FIPEX showed link errors and was switched off again. MEDET: Successful MEDET commanding from User Home Base on 3/10. On-going science acquisition. PLEGPAY: Further commissioning to be planned. TRIBOLAB: In Stand-by mode.

Fluid Science Laboratory (FSL): The FSL Facility commissioning is on hold pending restoration of a LAN (Local Area Network) cable connection.

GEOFLOW: Troubleshooting on FSL LAN cable repair was successfully performed. However, damage on the MIL-STANDARD bus connector was observed (two pins are missing). Start of GEOFLOW is pending further FSL troubleshooting. FSL FCE (Facility Core Element) locking was performed for 1J/A docking.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): In progress.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal

Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION/REPOSITORY: "Leo, thanks for your attention to detail in completing the FD30 Nutr/Rep session! The barcode information conveyed via crew notes was very helpful."

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): "Peggy, thanks for completing your Actiwatch download. We have downlinked your data and sent it to the PI. We have placed on your task list your last scheduled sleep logging session for next week. Thanks for the extra sleep logging."

SOLAR (Solar Monitoring Observatory): Anomaly on platform pointing mode under further investigation. No science acquisition possible so far.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Thank you, Peggy, for completing the additional SWAB session off the Voluntary Science list. The extra data collected will assist the PI in a comparison between the previous

samples in the USL and those you recently collected from the new modules that they would not have originally been able to obtain. “

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: In progress.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels):
Further attempts made to reduce condensation in ECs (Experiment Containers) by continuous flushing and by flushing only 2 EC's at a time (to increase the flow / pressure) did not reduce the condensation significantly. The condensation presented a major challenge on high-resolution picture quality for the crew activity on 3/10. To recover, an additional video session was proposed during the fixation because the fixation fluid clears the EC windows. During the ground commanding after the photo activity, two BIOLAB (BLB) anomalies occurred which lead to a loss of centrifugation and temperature control for ~4:20 versus the 2 hours that was originally foreseen. Fixation & washing was planned during the night from 3/11 to 3/12. Multiple BLB anomalies occurred on both rotors. Troubleshooting did not allow to perform any fixation on 3/12 or 3/13. Rotor B was blocked and could not provide a 1-g stimulus since 3/11. The 4 EC's from Rotor A (0-g condition) were transferred to BLB TCU at +4degC to slow down the growth and will be downloaded on 1J/A. 4 EC's of Rotor B have yet to be retrieved by the crew from the blocked Rotor B. Anomalies during WAICO-Run#1 imply major impact on science return.

CEO (Crew Earth Observation): Ongoing.

No CEO photo targets uplinked for today.

CEO photography can be studied at this “Gateway” website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (as of this morning, 8:17am EDT [= epoch]):

Mean altitude -- 340.4 km

Apogee height -- 341.1 km

Perigee height -- 339.6 km

Period -- 91.34 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0001149

Solar Beta Angle -- 29.9 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 124 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53390

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

- 3/17 (FD8) – EVA-3 to transfer ORUs, cleanup SLP, install MISSE-6, etc. (~7:23pm)
- 3/20 (FD11) – EVA-4 to demonstrate T-RAD, do get-aheads (~6:28pm)
- 3/22 (FD13) – EVA-5 to stow OBSS, TBDs (~5:23pm)
- 3/24 (FD15) – STS-123/Endeavour undocking (~7:55pm)
- 3/26 (FD17) – STS-123/Endeavour deorbit (~7:33pm); landing (KSC) -- ~8:35pm;

03/14/08 -- ATV1 “Jules Verne” CAM (Collision Avoidance Maneuver) Demo, -5m/s, 4:00am-5:30am EDT;

03/19/08 -- ATV1 “Jules Verne” parking point (loiter) arrival 8:00am EDT ~1200 mi. in front of ISS;

03/27/08 – ATV1 end of loiter; leave parking point - ~2:00am;

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking) ~10:39am EDT

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch - ~7:16am

04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~8:43am

04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)

05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/25/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS

05/27/08 -- STS-124/Discovery/1J docking

06/05/08 -- STS-124/Discovery/1J undocking

08/07/08 -- ATV1 undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC

10/18/08 -- STS-126/Discovery/ULF2 docking

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
4QTR CY09 -- STS-130/19A - MPLM
1QTR CY10 – STS-131/ULF4
2QTR CY10 -- STS-132/20A – Node-3 + Cupola
3QTR CY10 – STS-133/ULF5.

ISS On-Orbit Status 03/15/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – 1J/A Flight Day 5 (FD5). Crew sleep cycle today: Sleep 7:00am–3:30pm; wake 3:30pm–7:00am tomorrow.*

Node-2/JLP vestibule outfitting, JLP ingress & JLP rack reconfigurations successfully accomplished! The first Japan-made human-rated space facility is now in operation. ***Arigato Gozaimasu!***

[After completing outfitting the Node-2 vestibule to the JAXA JLP (JEM Experiment Logistics Module Pressurized Section), including removing CBM (Common Berthing Mechanism) hardware, installing several utility jumpers & taking air samples, crewmembers, led by “high-productivity” Peggy Whitson, ingressed the module three hours early (~9:20pm EDT). This allowed the reconfiguring of three JLP racks (including relocating rack front stowage to Node-2 in preparation for the racks transfer to the JEM during Flight 1J, plus retrieving two bags from behind a rack that contain K-Bars and pivot fittings) to be completed right away, rather than tonight (FD6) as planned. FD6 timeline replanning includes troubleshooting/repair of the broken ISS Multimeter.]

Also, **power was successfully applied to the SPDM PSU** (Special Purpose Dexterous Manipulator/Power Switching Unit) at 10:10pm after the SSRMS (Space Station Remote Manipulator System) was connected, as planned, to Dextre’s PDGF (Power & Data Grapple Fixture). *[The SSRMS will remain grappled for power except when needed to support EVAs. EVA-2 will be executed tonight per the nominal plan except the OTCM-2 (ORU Tool Changeout Mechanism 2) thermal “sock” (cover) will not be removed until later.]*

Before sleeptime this morning, FE-2 Eyharts worked in Node-2 to install an Orbiter IWIS RSU (Internal Wireless Instrumentation System/Remote Sensor Unit) that will be connected to the IWIS accelerometer on the Shuttle to measure structural dynamics.

Afterwards, Leo re-equipped the CSI-02 (CGBA Science Insert #2) component of the CGBA-5 (Commercial Generic Bioprocessing Apparatus #5) incubator payload with a Petri dish, inserting it with new material in the CGBA along with a support plate and other parts. Two used Petri dishes were trashed. *[The CGBA incubator is controlled from the ground, with automatic video downlinked to Earth.]*

FE-1 Malenchenko took situational photography of a bonding strip on the VPrK ventilator on the ATV (Automated Transfer Vehicle) airduct, to support the ground in coming up with a backup option.

Also before sleeptime, -

- Yuri performed the periodic (generally monthly) service of the ESA/RSC-Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS), removing its PCMCIA memory card from the AST spectrometer and replacing it with a new card; completed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM); conducted the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur); and stowed trash & discarded equipment on Progress 28P, to be jettisoned on 4/7;
- In the JLP, Peggy successfully checked out the NPRV (Negative Pressure Relief Valve) and ELPS (Emergency Lighting & Power Supply), then monitored N₂ (nitrogen transfer from the Shuttle to ISS, to be terminated tonight by the Shuttle crew (expected total ~20lbs), and
- Eyharts spent about an hour on handover activities with Reisman, who assumes Leo’s FE-2 position after Shuttle departure.

A D-shaped handle with a small MMOD (Micrometeoroid/Orbital Debris)-caused hole, brought onboard from EVA-1, was deburred and taped for protection, to be used on upcoming EVAs for carrying gear.

After a final review of EVA-2 procedures for tonight, the crew turned in at ~7:00am this morning for a good “night’s” sleep.

For both crews, currently asleep, workday begins later today at 3:30pm EDT. After hatch closure this morning at ~6:40am, EV1 Rick Linnehan and EV2 Mike Foreman are on “Campout” (*nachalo desaturatsiy* = desaturation start) in the A/L CL (Crewlock). The two spacewalkers performed PBA (Portable Breathing Apparatus) mask prebreathe for denitrogenation, while readying their tools & equipment, then

depressed the CL from 14.7 to 10.2 psi for their sleep period. *[For the Campout, fresh METOX (Metal Oxide) canisters are installed in the A/L for CO₂ control.]*

After wakeup at 3:30pm, ending the 8.5-hr sleep period on 10.2 psi before the spacewalk, the CL hatch will be cracked (i.e., temporarily repressurized) at ~4:10pm for a hygiene break/with mask prebreathe for Foreman and Linnehan. Around 5:20pm, the hatch will be closed again for EVA preps in 10.2 psi, followed by EMU purge & prebreathe. Afterwards, Peggy and Bob Behnken will support CL depressurization, and EV1 & EV2 will egress around 8:23pm. *[EVA-2 will last approximately 7.0 hrs, ending at ~3:28am (ISS crew sleep begins at 7:00am). Its major objectives are: (1) stow SPDM Arm 1 & 2 ; (2) install SPDM, (3) remove thermal covers including the “get-aheads” from EVA-1; (4) clean up the SLP (Spacelab Pallet) for its return to the PLB (Payload Bay), (5) clean up worksite & ingress.]*

Before breakfast, as suggested on her discretionary “job jar” task list, Peggy Whitson will complete another “overnight” run with the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and filling in questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop for downlink. *[To monitor the crewmember’s sleep/wake patterns and light exposure, Peggy wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list.]*

A second new “job jar” item for Peggy is to fill out the regular FFQ (Food Frequency Questionnaire) on the MEC (Medical Equipment Computer). *[By means of these FFQs, U.S. astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins.]*

Before crew egress at ~8:23pm, FE-2-16 Garrett Reisman will set up the SSRMS for the spacewalk, releasing the SPDM and maneuvering the robotarm to the APFR (Articulated Portable Foot Restraint) install position. During EVA-2, Garrett will support Rick and Mike with the SSRMS and afterwards regapple the SPDM to continue providing power to its SPU.

ISS Crew Sleep Shift Planning: To synchronize the ISS crew’s timeline with STS-123/1J/A docking and subsequent docked activities, Peggy’s, Yuri’s and Leo’s wake/

sleep cycle is undergoing a number of shifts which started on 3/11. For the next six days, the wake/sleep shift schedule is as follows (all times EDT):

FD6	Wake: 3:30pm (3/15) – 7:00am (3/16) Sleep: 7:00am – 3:30pm (3/16)
FD7	Wake: 3:30pm (3/16) – 6:00am (3/17) Sleep: 6:00am – 2:30pm (3/17)
FD8	Wake: 3:30pm (3/17) – 6:00am (3/18) Sleep: 6:00am – 2:30pm (3/18)
FD9	Wake: 2:30pm (3/18) – 5:00am (3/19) Sleep: 5:00am – 1:30pm (3/19)
FD10	Wake: 1:30pm (3/19) – 5:00am (3/20) Sleep: 5:00am – 1:30pm (3/20)
FD11	Wake: 1:30pm (3/20)– 5:00am (3/21) Sleep: 5:00am – 1:30pm (3/21)

ISS Orbit (as of this morning, 8:13am EDT [= epoch]):

Mean altitude -- 340.5 km

Apogee height -- 341.3 km

Perigee height -- 339.7 km

Period -- 91.34 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0001173

Solar Beta Angle -- 25.4 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 92 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53374

Significant Events Ahead (all dates Eastern Time, some changes possible.):

- 3/15 (FD6) – EVA-2 to continue SPDM assembly (~8:23pm)
- 3/17 (FD8) – EVA-3 to transfer ORUs, cleanup SLP, install MISSE-6, etc. (~7:23pm)
- 3/20 (FD11) – EVA-4 to demonstrate T-RAD, do get-aheads (~6:28pm)
- 3/22 (FD13) – EVA-5 to stow OBSS, TBDs (~5:23pm)
- 3/24 (FD15) – STS-123/Endeavour undocking (~7:55pm)
- 3/26 (FD17) – STS-123/Endeavour deorbit (~7:33pm); landing (KSC) -- ~8:35pm;

03/14/08 -- ATV1 “Jules Verne” CAM (Collision Avoidance Maneuver) Demo, -5m/s, 4:00am-5:30am EDT;

03/19/08 -- ATV1 “Jules Verne” parking point (loiter) arrival 8:00am EDT ~1200 mi. in front of ISS;

03/27/08 – ATV1 end of loiter; leave parking point - ~2:00am;

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2
 04/03/08 -- ATV1 Demo Day 3 (docking) ~10:39am EDT
 04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
 04/08/08 -- Soyuz TMA-12/16S launch - ~7:16am
 04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~8:43am
 04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)
 05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
 05/14/08 -- Progress M-64/29P launch
 05/16/08 -- Progress M-64/29P docking (DC1)
 05/25/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS
 05/27/08 -- STS-124/Discovery/1J docking
 06/05/08 -- STS-124/Discovery/1J undocking
 08/07/08 -- ATV1 undocking
 08/12/08 -- Progress M-65/30P launch
 08/14/08 -- Progress M-65/30P docking (SM aft port)
 08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
 09/09/08 -- Progress M-64/29P undocking (from DC1)
 09/10/08 -- Progress M-66/31P launch
 09/12/08 -- Progress M-66/31P docking (DC1)
 10/01/08 -- **NASA 50 Years**
 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
 10/12/08 -- Soyuz TMA-13/17S launch
 10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
 10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
 10/18/08 -- STS-126/Discovery/ULF2 docking
 10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
 11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
 11/20/08 -- **ISS 10 Years**
 11/26/08 -- Progress M-67/32P launch
 11/28/08 -- Progress M-67/32P docking (SM aft port)
 12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
 12/06/08 -- STS-119/Discovery/15A docking
 12/15/08 -- STS-119/Discovery/15A undocking
 1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
 05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
 3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
 4QTR CY09 -- STS-130/19A - MPLM
 1QTR CY10 – STS-131/ULF4
 2QTR CY10 -- STS-132/20A – Node-3 + Cupola
 3QTR CY10 – STS-133/ULF5.

ISS On-Orbit Status 03/14/08

All ISS systems continue to function nominally, except those noted previously or below. *STS-123/1J/A Flight Day 4 (FD4). Crew sleep cycle today: sleep 8:00am–4:30pm; wake 4:30pm–7:00am tomorrow.*

Mission 1J./A's EVA-1 was completed successfully by Rick Linnehan & Garrett Reisman in 7h 1m, accomplishing all its objectives (no get-aheads).

[During the spacewalk, Linnehan (EV1) & Reisman (EV2) –

- 1. Prepared the JAXA JLP (JEM Experiment Logistics Module Pressurized Section) for its transfer, i.e. –*
 - a. opened and secured the protective flap over the Node-2 topside (zenith) hatch viewport for the internal CBCS (Centerline Berthing Camera System),*
 - b. removed 8 PCBM (Passive Common Berthing Mechanism) contamination protection covers,*
 - c. demated & stowed JLP LTA (Launch-to-Activation) connectors & installed protective caps on the LTA receptacles;*
- 2. Performed Part 1 Assembly of the SPDM (Special Purpose Dexterous Manipulator), i.e. –*
 - a. released two OTCMs (ORU Tool Changeout Mechanisms) from the launch locations on the SLP (Spacelab Pallet),*
 - b. installed the OTCMs on the SPDM,*
 - c. released the OTP EDFs (ORU Temporary Platform Expandable Diameter Fasteners),*
 - d. inspected the SLP PDGF (Power & Data Grapple Fixture) horseshoe connectors;*
- 3. Took photographs of the SPDM, and*
- 4. Installed a protective wire tie over the sharp edge divot discovered during Flight 1A on the Airlock (A/L) handrail.*

Official start time of the spacewalk was 9:18pm EDT, about 5 min ahead of timeline, and it ended at 4:19am. Total EVA duration (PET = Phase Elapsed Time) was 7h

1min. It was the 105th spacewalk for ISS assembly & maintenance and the 77th from the station (55 from Quest, 22 from Pirs, 28 from Shuttle) totaling 472h 22min, and the 9th for Expedition 16 (totaling 64h 30min) and the 6th so far this year. After today's EVA, a total of 131 spacewalkers (99 NASA astronauts, 21 Russians, and 11 astronauts representing Japan-1, Canada-4, France-1, Germany-2 and Sweden-3) have logged a total of 660h 44min outside the station on building, outfitting and servicing. It was also the 127th spacewalk involving U.S. astronauts.]

In addition, Japan's JLP module was successfully installed on the Node-2 "Harmony" zenith dock at ~3:00am. *[Dom Gorie & Takao Doi, supported by Bob Behnken & Leo Eyharts, maneuvered the SSRMS (Space Station Remote Manipulator System) to grapple the JLP in the cargo bay, unberth it and transfer it to the Node-2 topside CBM. All motorized bolts were properly engaged to firmly hold the experiment container at its place, and the standard leak check on the vestibule between it and the Node-2 port was started, to be concluded tonight after crew wake-up. JLP ingress is scheduled afterwards, at around 12:30am EDT.]*

SPDM Power Glitch: The overnight Robotics troubleshooting with a quickly developed and uplinked software patch was unsuccessful and has not restored power to the SPDM in the SLP for activating "Keep-Alive" heaters (however, thermal blankets were left in place during EVA-1 to provide adequate protection). With the RWS (Robotics Workstation) software thus exonerated, a closer review of SLP drawings revealed a design error as most likely cause: in configuring the 1553-bus harness architecture on the SLP, MIL-1553 Standards were not followed, resulting in two bi-directional receivers (amplifiers) directly connected to each other without proper bus termination, causing comm "reflection" between the POA (Payload ORU Attachment) and the SLP PDGF (Power & Data Grapple Fixture) on the 1553 bus. The decision was made to try providing Dextre with power via the SSRMS by connecting it to the SPDM PDGF as soon as possible. The originally scheduled SSRMS-grappling of the OBSS (Orbiter Boom Sensor System) in the PLB (Payload Bay) and its subsequent handoff to the SRMS (Shuttle Remote Manipulator System) for "parking" will still be performed tonight (since SRMS is already in the grapple position), but immediately following, the PDGF will be grappled with the SSRMS to provide power. If this works as expected, the sequence of SSRMS maneuvers on later days will also be modified to ensure that the Canadarm-2 remains connected to the SPDM except during EVA-2 and EVA-3, until Dextre is free of the dysfunctional SLP (which apparently underwent Integration Testing at KSC that was flawed).

After wakeup at ~4:30pm EDT last night, ending the 8.5-hr sleep period on 10.2 psi before the spacewalk, the Airlock Crewlock (A/L CL) hatch was cracked (i.e., temporarily repressurized) at ~5:10pm for a hygiene break/with mask prebreathe

for Garrett and Rich, the hatch was closed again at ~5:55pm for EVA preps in 10.2 psi, followed by EMU purge & prebreathe. Afterwards, IVs supported the CL depressurization and EV1/EV2 egress (EMUs switched to batteries at 9:18pm).

After the spacewalkers' ingress at 4:19am, post-EVA activities by CDR Whitson and FE-2 Eyharts in the A/L consisted of recharging the EMU/spacesuits with water from PWR (Payload Water Reservoir), then reconnecting the LTAs (Lower Torso Assemblies) to the EMUs and capping the UIA (Umbilical Interface Assembly), initiating and monitoring the regeneration of the METOX (Metal Oxide) CO₂ filter canisters, initiating the discharge/recharge process on the EMU batteries in the BSA (Battery Stowage Assembly), and reconfiguring EVA tools.

A new item added to the "job jar" list for Peggy was to perform the regular update of the three "Warning" procedures books with about a dozen new pages reflecting the newly changed station makeup.

Tasks on Yuri Malenchenko's "available time" suggestions list for last night were the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder), and the daily monitoring, picture-taking and downloading for the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}).

Leo Eyharts also worked in Node-2 to disassemble and remove the CBCS.

For both crews, currently asleep, workday begins later today at 4:30pm EDT. After their 8.5-hr. sleep period, the ISS crew will support the transfer of the OBSS with the SSRMS from the Shuttle PLB for handoff to the SRMS, then grapple the SPDMM PDGF with the SSRMS and make preparations for tomorrow night's EVA-2.

Before breakfast, as suggested on her discretionary "job jar" task list, Peggy Whitson will complete another "overnight" run with the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop for downlink. *[To monitor the crewmember's sleep/wake patterns and light exposure, Peggy put on a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

Other crew activities after 4:30pm and during the night until 7:00am are to include such items as –

- Peggy Whitson concluding the leak check of the JLP/Node-2 vestibule, turning off the MKAM (Minimum Keep-Alive Monitor) fan after check status and shell temperature and some initial outfitting to provide Node-2 power, then following up with completion of outfitting;
- FE-1 Malenchenko taking air samples at JLP hatch opening using the Russian AK-1M and IPD-CO samplers, joined by other crewmembers collecting samples with the CSA-CP (Compound Specific Analyzer-Combustion Products), CDMK (Carbon Dioxide Monitoring Kit) and GSC (Grab Sample Container) instruments,
- Ingress in JLP by Takao. Peggy, Yuri and Rick (with crewmembers being advised to don PPE (Personal Protective Equipment) surgical masks and goggles until 30 min have elapsed after JPL ingress and later stow the masks for LiOH changeout),
- The periodic (generally monthly) service of the ESA/RSC-Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS) by Malenchenko, removing its PCMCIA memory card from the AST spectrometer and replacing it with a new card,
- A checkout of the JLP's NPRV (Negative Pressure Relief Valve) and ELPS (Emergency Lighting & Power Supply) by Whitson,
- Yuri stowing trash and discarded equipment on Progress 28P, to be jettisoned on 4/7,
- Eyharts and Reisman spending about an hour on handover activities with Reisman, who will assume Leo's FE-2 position after Shuttle departure, and
- Peggy monitoring N₂ (nitrogen transfer from the Shuttle to ISS, already in progress since this morning (expected total ~20lbs).

In addition, the FE-1 will continue the extended leak checking of the spare BZh Liquid Unit (#056) for the Elektron O₂ generator by checking the unit's pressure and charging it once again with pressurized N₂ from the BPA-M Nitrogen Purge Unit (#23) to 1 atm (1 kg/cm²). The last test pressurization was on 3/11. *[During Elektron operation, the inert gas locked up in the BZh has the purpose to prevent dangerous O₂/H₂ mixing. A leaking BZh cannot be used.]*

ATV "Jules Verne" Update (Flight Day 5): All ATV systems continue to perform nominally. Early this morning, the ATV successfully performed the CAM (Collision Avoidance Maneuver) Demonstration. The maneuver began at 3:57:35am EDT. Based on the ATV GPS (Global Positioning System) satellite data, ballistics specialists estimate that the CAM delta-V was approximately 5.3 m/s, which

includes the effects of the first MSU (Monitoring & Safing Unit) attitude maneuver to sun pointing. The total delta-V for the operation, including the CAM and the post-CAM attitude maneuvers, is estimated at 7.1 m/s, which is within the expected range. The FTC (Fault Tolerant Computer) reset to exit Survival mode occurred at 5:35am. MSU1 was switched off at 6:53am, and MSU2 was switched off at 7:01am. At 7:23am, ATV-CC reported that the vehicle was restored to the nominal configuration. *[The MSU computer is based on dual redundant lane processor architecture using special software for highly critical functions. Among else, it detects a Red Button CAM request by the ISS crew or ATV-CC/Toulouse; it also can automatically determine the necessity of a CAM upon detecting an abnormal ATV kinetic state or system failure, and executes the CAM, ensuring ISS safety. It then controls the ATV for up to 24 hours, thus assuming a major role in the ATV Survival mode.]*

ISS Crew Sleep Shift Planning: To synchronize the ISS crew's timeline with STS-123/1J/A docking and subsequent docked activities, Peggy's, Yuri's and Leo's wake/sleep cycle is undergoing a number of shifts which started on 3/11. For the next six days, the wake/sleep shift schedule is as follows (all times EDT):

FD5	Wake: 4:30pm (3/14) – 7:00am (3/15) Sleep: 7:00am – 3:30pm (3/15)
FD6	Wake: 3:30pm (3/15) – 7:00am (3/16) Sleep: 7:00am – 3:30pm (3/16)
FD7	Wake: 3:30pm (3/16) – 6:00am (3/17) Sleep: 6:00am – 2:30pm (3/17)
FD8	Wake: 3:30pm (3/17) – 6:00am (3/18) Sleep: 6:00am – 2:30pm (3/18)
FD9	Wake: 2:30pm (3/18) – 5:00am (3/19) Sleep: 5:00am – 1:30pm (3/19)
FD10	Wake: 1:30pm (3/19) – 5:00am (3/20) Sleep: 5:00am – 1:30pm (3/20)

ISS Orbit (as of this morning, 7:34am EDT [= epoch]):

Mean altitude -- 340.6 km

Apogee height -- 341.3 km

Perigee height -- 339.8 km

Period -- 91.35 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.00011

Solar Beta Angle -- 20.7 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 80 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53358

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

- 3/15 (FD6) – EVA-2 to continue SPDM assembly if power restored (~8:23pm)
- 3/17 (FD8) – EVA-3 to transfer ORUs, cleanup SLP, install MISSE-6, etc. (~7:23pm)
- 3/20 (FD11) – EVA-4 to demonstrate T-RAD, do get-aheads (~6:28pm)
- 3/22 (FD13) – EVA-5 to stow OBSS, TBDs (~5:23pm)
- 3/24 (FD15) – STS-123/Endeavour undocking (~7:55pm)
- 3/26 (FD17) – STS-123/Endeavour deorbit (~7:33pm); landing (KSC) -- ~8:35pm;

03/14/08 -- ATV1 "Jules Verne" CAM (Collision Avoidance Maneuver) Demo, -5m/s, 4:00am-5:30am EDT;

03/19/08 -- ATV1 "Jules Verne" parking point (loiter) arrival 8:00am EDT ~1200 mi. in front of ISS;

03/27/08 -- ATV1 end of loiter; leave parking point - ~2:00am;

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking) ~10:39am EDT

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch - ~7:16am

04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~8:43am

04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)

05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/25/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS

05/27/08 -- STS-124/Discovery/1J docking

06/05/08 -- STS-124/Discovery/1J undocking

08/07/08 -- ATV1 undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC

10/18/08 -- STS-126/Discovery/ULF2 docking

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
4QTR CY09 -- STS-130/19A - MPLM
1QTR CY10 – STS-131/ULF4
2QTR CY10 -- STS-132/20A – Node-3 + Cupola
3QTR CY10 – STS-133/ULF5.

ISS On-Orbit Status 03/13/08

All ISS systems continue to function nominally, except those noted previously or below. *Crew sleep cycle today: sleep 8:00am–4:30pm; wake 4:30pm–8:00am tomorrow.*

STS-123/Endeavour docked smoothly last night at 11:49pm EDT at the PMA-2 (Pressurized Mating Adapter-2) port, 24 minutes behind schedule (due to loss of target lock by the CW (Continuous Wave) laser of the Shuttle's TCS (Trajectory Control Sensor) during the manual rendezvous phase, requiring manual lock re-acquisition). The RPM (R-Bar Pitch Maneuver) started at 10:26pm and was successfully completed at 10:34pm, with Whitson and Malenchenko taking 200-300 close-up photographs of Endeavour's bottom heatshield. The station now hosts ten occupants again as Mission 1J/A is underway. *[At the point of docking, Peggy Whitson rang the traditional ship's bell and announced "Endeavour landed!" The combined crew is comprised of ISS CDR Whitson, FE-1 Yuri Malenchenko, FE-2 Léopold Eyharts, STS CDR Dominic Gorie, PLT Gregory Johnson, MS1 Robert Behnken, MS2 Mike Foreman, MS3 Takao Doi (Japan), MS4 Rick Linnehan, and MS5/FE-2-16 Garrett Reisman who replaces Eyharts as FE-2, as the latter returns on the Endeavour as MS-5.]*

After the docking, the station was reoriented as usual to minimize the risk of micrometeoroid/debris impacts upon the Shuttle (-x-axis in velocity vector, +z-axis in local vertical, i.e. Shuttle trailing).

After hatches open at 1:36am, the new crew was welcomed aboard the ISS and given the mandatory 25-min. safety briefing.

CDR Whitson then configuring the transfer equipment which allows the Shuttle to supply oxygen (O₂) to the ISS PBAs (Portable Breathing Apparatus) in support of pre-EVA mask prebreathe for denitrogenation.

Before the airduct between ISS and the Shuttle was installed for ventilation, FE-1 Malenchenko performed the standard Orbiter atmosphere sampling using the Russian AK-1M sampler.

Yuri also switched USOS/RS (US Segment/Russian Segment) comm systems to their mated-flight mode.

Garrett Reisman assisted MS-3 Doi on the Orbiter deck in releasing the SLP-D1 PRLA (Spacelab Pallet Payload Retention Latch Assembly), after which PLT Johnson and MS1 Behnken maneuvered the SRMS (Shuttle Remote Manipulator System) to grapple and transfer the SLP, which carries the SPDM (Special Purpose Dexterous Manipulator), to the POA (Payload ORU Attachment) on the Robotics MBS/MT (Mobile Base System/Mobile Transporter) where it was berthed. *[Dextre is too large to be assembled in the Shuttle cargo bay since it would interfere with cargo bay closure in an emergency. It will therefore be assembled at the MBS on the main truss, at Workstation 6 (WS6).]*

SPDM Power Glitch: After successful SLP PDGF (Power & Data Grapple Fixture) connection to the POA, with electrical connectivity confirmed, repeated attempts to activate the SPDM PSU (Power Switching Unit) for powering on the “keep-alive” heaters were unsuccessful. Engineers are suspecting a software timing issue, i.e., too little time for the Lab RWS (Robotics Work Station) between applying power to the PSU and establishing data comm. A software patch is in work to modify the timer settings to increase the time span. It is expected that the patch will be available on orbit in 24-48 hrs. There are no thermal constraints with the SPDM on the POA as long as all blankets remain installed. There exists a thermal limit (TTL) of ~5 days for the OTCM1 (ORU Tool Changeout Mechanism 1), but no constraints for OTCM2. If the patch is unsuccessful, an alternate power-up path would be tried from the SSRMS (Space Station Remote Manipulator System) by latching it to the SLP PDGF. If still unsuccessful, thermal limitation can be extended if EVA-1 & EVA-2 are modified to leave the current thermal protection blankets in place.

Other crew activities after the SLP transfer included:

- *Transfer of IELKs:* Garrett Reisman transferred his IELK (Individual Equipment Liner Kit) from the Shuttle to the Soyuz TMA-11/15S crew return vehicle where Yuri Malenchenko installed it for the new FE-2. Leo Eyharts' IELK was pulled out and temporarily stowed for return on a future flight.
- *Sokol leak test:* Malenchenko and Reisman also performed the standard leak checkout on Garrett's Sokol space suit which he would wear as a Soyuz passenger, then set it up for “drying out”.
- *Food Frequency Questionnaire:* Leo Eyharts filled out the regular FFFQ (Food Frequency Questionnaire), his fourth, on the MEC (Medical

Equipment Computer) *[by means of these FFQs, NASA/ESA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins];*

- *EVA-1 Preparations:* For tonight's first spacewalk by Linnehan and Reisman, Peggy Whitson worked in the Airlock (A/L), installing the REBAs (Rechargeable EVA Battery Assemblies) in the EMUs (checkout of REBA-powered suit equipment and tools was waived to get back on the timeline after the delayed docking), while Reisman configured the A/L E/L (Equipment Lock) and Peggy and Leo later set up the DCS-760 camera for the EVA and initiated charging the DCS battery (at least 3 hrs).

In preparation for tonight's transfer of the "Kibo" JLP (Japanese Experiment Logistics Module-Pressurized Section) from the cargo bay to the Node-2 zenith (upper) CBM (Common Berthing Mechanism), Eyharts powered up the CBCS (Centerline Berthing Camera System) at the zenith hatch for a video checkout of the setup from the Orbiter Shuttle and later deactivated it again.

Yuri Malenchenko worked with the ground on activating of the Elektron oxygen generator at 32 amps, first pressurizing the BZh Liquid Unit with N₂ (nitrogen) via laptop and later monitoring the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating. *[During nominal operations a gas analyzer is utilized to detect hydrogen (H₂) in the O₂ line (which could cause overheating) but is not included in the control algorithm until 10 minutes after Elektron startup. A new EMI filter, recently (2/9) installed on the Elektron's current stabilizer (FPP ST-64), is designed to prevent RFI (radio frequency interference) with the ATV/Automated Transfer Vehicle).]*

Before sleep time, Malenchenko terminated the regeneration process on absorbent bed #1 of the Russian BMP (Harmful Impurities Removal System). Bake-out of bed #2 will follow tonight after wake-up (~5:03pm). *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods.]*

Working from the voluntary "available time" suggestions list, Yuri Malenchenko conducted the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).

A second task list item for the FE-1 this morning was the daily monitoring, picture-

taking and downloading for the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}).

For both crews, currently asleep, workday begins later today at 4:30pm EDT. Rick Linnehan and Garrett Reisman are on "Campout" (*nachalo desaturatsiy* = desaturation start) in the A/L CL (Crewlock), after hatch closure this morning at ~7:40am. The two spacewalkers performed PBA (Portable Breathing Apparatus) mask prebreathe for denitrogenation, while readying their tools & equipment, then depressed the CL from 14.7 to 10.2 psi for their sleep period. *[For the Campout, fresh METOX (Metal Oxide) canisters are installed in the A/L for CO₂ control.]*

The CL hatch will be cracked (i.e., temporarily repressurized) at ~5:10pm tonight for a hygiene break/with mask prebreathe for Reisman and Linnehan. Around 5:55pm, the hatch will be closed again for EVA preps in 10.2 psi, followed by EMU purge & prebreath. Afterwards, Peggy and Mike will support CL depressurization, and EV1 & EV2 will egress around 9:23pm. *[EVA-1 will last approximately 6.5 hrs, ending at ~4:00am (ISS crew sleep begins at 8:00am). Its major objectives are: (1) prepare for JLP unberthing in cargo bay; (2) install OTCM2 with the Node-2 PDGF-based SSRMS, (3) remove and install OTCM1 (with SSRMS); (4) prepare for SPDM assembly, leaving thermal covers intact; (5) cleanup & ingress.]*

ATV "Jules Verne" Update (Flight Day 4): All ATV systems continue to perform nominally. Yesterday, ATV successfully performed two additional maneuvers to test PDE (Propulsion Drive Electronics) thruster configuration B (PDE-3 & -4). The first burn, TP1, began at 9:12:23am EDT, with a delta-V of 6.21 m/s; the second, TP2, at 10:01:29am, with a delta-V of 6.12 m/s. Both PDEs and He (helium) pressure regulation performed nominally, and ATV-CC/Toulouse reported that the boosts were nominal. Based on ATV GPS (Global Positioning System) data, specialists estimate that the post-maneuver state was within 100 m in semi-major axis of ATV-CC prediction. In addition, NASA-GSFC successfully performed coherent TDRSS tracking before and after the maneuver that confirmed the maneuver results. Per the nominal plan, at 1:55pm ATV performed an attitude slew (for a Helium purge), during which a thruster temperature differential alarm was annunciated that resulted in PDE-2 being switched off by the ATV FDIR (Fault Detection, Isolation & Recovery) system, although the ATV completed the slew maneuver nominally. Toulouse believes the cause to be FDIR thresholds set too low, and efforts are underway to update the limit settings, after which the PDE will be re-integrated into the propulsive system. At this time, there is no reason to believe that this anomaly is related to the earlier problem with the Helium pressurant system that resulted in PDE-2 being shut down.

Columbus Update: BLBGB (BIOLAB Glovebox) remains inoperable; one of its two rotors is jammed, rendering four ECs (Experiment Containers) on the other centrifuge inaccessible. The remaining four ECs (of 8 total) are recovered and secured in the TCU (Thermal Control Unit) for return. FSL (Fluid Science Laboratory) is not working, pending restoration with a new bus connector. SOLAR is working but degraded due to a technical problem. EuTEF: six of 9 experiments are running; three are in troubleshooting process.

ISS Crew Sleep Shift Planning: To synchronize the ISS crew's timeline with STS-123/1J/A docking and subsequent docked activities, Peggy's, Yuri's and Leo's wake/sleep cycle is undergoing a number of shifts which started on 3/11. For the next six days, the wake/sleep shift schedule is as follows (all times EDT):

FD4	Wake: 4:30pm (3/13) – 8:00am (3/14) Sleep: 8:00am – 4:30pm (3/14)
FD5	Wake: 4:30pm (3/14) – 7:00am (3/15) Sleep: 7:00am – 3:30pm (3/15)
FD6	Wake: 3:30pm (3/15) – 7:00am (3/16) Sleep: 7:00am – 3:30pm (3/16)
FD7	Wake: 3:30pm (3/16) – 6:00am (3/17) Sleep: 6:00am – 2:30pm (3/17)
FD8	Wake: 2:30pm (3/17) – 6:00am (3/18) Sleep: 6:00am – 2:30pm (3/18)
FD9	Wake: 2:30pm (3/18) – 5:00am (3/19) Sleep: 5:00am – 1:30pm (3/19)

ISS Orbit (*as of this morning, 8:44am EDT [= epoch]*):

Mean altitude -- 340.6 km

Apogee height -- 341.5 km

Perigee height -- 339.8 km

Period -- 91.35 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.000131

Solar Beta Angle -- 16.0 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 173 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53343

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

- 3/13 (FD4) – EVA-1 to install “Kobi” JLP and OTCMs on SPDM “Dextre” (~9:23pm)
- 3/15 (FD6) – EVA-2 to continue SPDM assembly if power restored

- (~8:23pm)
- 3/17 (FD8) – EVA-3 to transfer ORUs, cleanup SLP, install MISSE-6, etc. (~7:23pm)
- 3/20 (FD11) – EVA-4 to demonstrate T-RAD, do get-aheads (~6:28pm)
- 3/22 (FD13) – EVA-5 to stow OBSS, TBDs (~5:23pm)
- 3/24 (FD15) – STS-123/Endeavour undocking (~7:55pm)
- 3/26 (FD17) – STS-123/Endeavour deorbit (~7:33pm); landing (KSC) -- ~8:35pm;

03/14/08 -- ATV1 “Jules Verne” CAM (Collision Avoidance Maneuver) Demo, -5m/s, 4:00am-5:30am EDT;

03/19/08 -- ATV1 “Jules Verne” parking point (loiter) arrival 8:00am EDT ~1200 mi. in front of ISS;

03/27/08 – ATV1 end of loiter; leave parking point - ~2:00am;

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking) ~10:39am EDT

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch - ~7:16am

04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~8:43am

04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)

05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/25/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS

05/27/08 -- STS-124/Discovery/1J docking

06/05/08 -- STS-124/Discovery/1J undocking

08/07/08 -- ATV1 undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC

10/18/08 -- STS-126/Discovery/ULF2 docking

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-67/32P launch

11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
4QTR CY09 -- STS-130/19A - MPLM
1QTR CY10 – STS-131/ULF4
2QTR CY10 -- STS-132/20A – Node-3 + Cupola
3QTR CY10 – STS-133/ULF5.

ISS On-Orbit Status 03/12/08

All ISS systems continue to function nominally, except those noted previously or below. *Crew wake/sleep cycle today: sleep 6:30am–3:00pm; wake 3:00pm–8:00am tomorrow.*

STS-123/Endeavour continues its chaser flight for tonight's docking at ~11:25pm EDT, to begin ISS Stage 1J/A. (Catch-up rate ~480 nmi. per revolution of ~92 min). *[Hatch opening is expected at ~1:08am, followed by: Safety Briefing, Soyuz seat liner transfer (for the Eyharts/Reisman exchange), SRMS (Shuttle Remote Manipulator System)- transfer of SLP-D1 (Spacelab Pallet Deployable 1), carrying SPDM "Dextre", from Shuttle cargo bay to POA (Payload ORU Attachment) on MBS (Mobile Base System) at ~2:30am, and preparations for the first spacewalk, EVA-1, to be conducted by EV1 Linnehan & EV2 Reisman on 3/13 (~9:23pm EDT), preceded by their "overnight" Campout tomorrow (6:43am-7:45pm) in the Airlock (A/L) for denitrogenation/pre-breathe. Main objectives of the nominal 16-day mission: Installation of the 18,490-lbs ELM-PS or JLP (Japanese Experiment Logistics Module-Pressurized Section) and the 3,400-lbs Canadian SPDM (Special Purpose Dexterous Manipulator) "Dextre", delivering new ISS-16 crewmember Garrett Reisman & bringing Léopold Eyharts back home, and conducting a total of five EVAs. Landing will nominally take place at KSC on FD17 (3/26) at ~8:35pm EDT.]*

Early this morning, before begin of today's sleep period (6:30am), the ISS crew completed a number of pre-docking preparations. (See yesterday's *On-Orbit Status report for pre-midnight activities.*)

After installing the BPMSU (Battery Powered Speaker Microphone Unit) last night, with its dual drag-through cables, including VDS VTR (Video Distribution System/ Video Tape Recorder) bypass cables for passing video to and from the station on the Lab's starboard side and allowing the station to receive video from the Orbiter on the Lab's port side, CDR Whitson this morning configured the DCS-760 digital cameras in the Service Module (SM) for tonight's RPM (R-bar Pitch Maneuver) photo shoot. *[The two cameras, one with 400mm lens (Peggy), the other with an*

800mm lens (Yuri), were equipped with fully charged batteries transferred from the A/L by Leo Eyharts, and freshly formatted flash storage cards.]

FE-1 Malenchenko used the Russian AK-1M sampler to take pre-docking air samples in the SM and FGB. He will perform another sampling post-docking immediately after the standard all-hands safety briefing (~1:30am).

The CDR set up the updated DOUG (Dynamic Orbital Ubiquitous Graphics) laptop software at the Lab RWS (Robotics Workstation) in preparation for the upcoming pre-Robotics review of SSRMS (Space Station Remote Manipulator System) procedures during 1J/A.

Afterwards, Whitson performed the one-hour pressurization process on the PMA-2 (Pressurized Mating Adapter #2), followed by leak checking and additional preparations of the PMA for the Shuttle's docking *[leaving the pressurization jumper gear connected for the post-docking leak checks tonight].*

In preparation for upcoming urine transfer to the Progress M-63/28P Rodnik BV1 water tank, Malenchenko conducted the regular compressor test activation to inflate and pressurize the cargo ship's BV1 tank bladder. *[The pressurization of the collapsed bladder of the Rodnik water storage tank is conducted as a leak check, preparatory to the liquid waste transfer to the tank for disposal. Each of the two spherical Rodnik tanks consists of a hard shell with a soft membrane (bladder) composed of elastic fluoroplastic. The bladder is used to expel water from the tank by compressed air pumped into the tank volume surrounding the membrane.]*

In the Columbus module, FE-2 Eyharts finished close-out activities on the completed BLB/WAICO #1 (BIOLAB/Waving & Coiling of Arabidopsis Roots at Different g-levels) experiment which were stopped yesterday by an anomaly with the centrifuges. *[During the WAICO finalization and fixation, the centrifuges, which are required for the fixation process (injection of formaldehyde into the ECs/Experiment Containers), became locked and would not rotate, despite repeated power cycling by ground controllers and Eyharts. Ground teams were to develop a plan for Leo to move the WAICO samples into the TCU (Thermal Control Unit).]*

FE-1 Malenchenko completed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Yuri also performed the IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Working from the voluntary "available time" suggestions list, Yuri Malenchenko conducted the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).

A second task list item for the FE-1 this morning was the daily monitoring, picture-taking and downloading for the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}).

Before sleep time, Malenchenko terminated the regeneration process on absorbent bed #1 of the Russian BMP (Harmful Impurities Removal System). Bake-out of bed #2 will follow tonight after wake-up (~5:03pm). *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods.]*

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1). More exercise sessions are scheduled tonight before docking.

After their 8.5-hr. sleep period ends later today at ~3:00pm, the crew will complete final pre-docking activities:

- Verification of the readiness of the DCS-760 digital cameras for the RPM photography of Endeavour, followed later (~10:24pm) by the rapid-fire RPM shooting session (Whitson & Malenchenko);
- Configuring the Russian telephone/telegraph subsystem (STTS) to its pre-docking settings, which includes setting up the VHS (UHF) channel to the approaching Shuttle Orbiter (Malenchenko); after the docking, the FE-1 will switch USOS/RS (US Segment/Russian Segment) comm systems to their mated-flight mode;
- Preparation of the headset extension cable from the FGB PGO (Instrumentation Cargo Compartment) communications panel to the SM to support the RPM session (Eyharts);
- Retrieving and stowing the four FMK (Formaldehyde Monitoring Kit) units deployed by Peggy on 3/10 in the Lab and SM to catch any atmospheric formaldehyde (Eyharts).

Additionally, Leo will

- Close the Lab science window shutters to protect against thruster plume contamination,
- Set up and later activate the timers marking beginning and end of Peggy's and Yuri's Orbiter bottomside photo session, and
- Prepare to shoot video of the approach and docking of Endeavour.

Before the docking, the FE-1 is scheduled to conduct his fifth recharging of the Motorola Iridium-9505A satellite phone brought up on Soyuz 15S, a monthly routine job. *[After retrieving it from its location in the TMA-11/15S descent module (BO) at ~6:00pm EDT, Yuri will initiate the recharging of its lithium-ion battery, monitoring the process every 10-15 minutes as it takes place. Upon completion at ~7:30pm, the phone is to be returned inside its SSSP Iridium kit and stowed back in the BO's operational data files (ODF) container. The satphone accompanies returning ISS crews on Soyuz reentry & landing for contingency communications with SAR (Search-and-Rescue) personnel after touchdown (e.g., after an "undershoot" ballistic reentry). The Russian-developed procedure for the monthly recharging has been approved jointly by safety officials. During the procedure, the phone is left in its fire-protective fluoroplastic bag with open flap. The Iridium 9505A satphone uses the Iridium constellation of low-Earth orbit satellites to relay the landed Soyuz capsule's GPS (Global Positioning System) coordinates to helicopter-borne recovery crews. The older Iridium-9505 phones were first put onboard Soyuz in August 2003. The newer 9505A phone, currently in use, delivers 30 hours of standby time and three hours of talk, up from 20 and two hours, respectively, on the older units.]*

Afterwards, in preparation for docking (~11:25pm) and subsequent hardmate, the crew configures the Russian MCS (Motion Control System) for the automatic "PMA-2 Arrival" mode, an operational sequence used to monitor Orbiter arrival at the PMA-2. *[At "Capture Confirmed", ISS attitude will be immediately set to "free drift" to allow dampening out relative motions of ISS and Endeavour (with the ODS dampers/shock absorbers), then maneuvers to "Mated TEA" (Torque Equilibrium Attitude) to account for the new overall configuration with Endeavour docked.]*

ATV Update (Flight Day 3): All ATV systems continue to perform nominally. Yesterday, the ATV successfully performed two maneuvers to test the nominal PDE (Propulsion Drive Electronics) configuration (PDE-1 & -2). The first maneuver, TE1, began at 11:01:09am EDT and had a delta-V of 6.00 m/s. The second maneuver, TE2, began at 12:12:39pm, with a delta-V of 5.92 m/s. Both PDEs performed nominally, and ATV-CC (ATV Control Center/Toulouse) reported that the boosts and He (helium) pressure regulators were nominal. Based on ATV GPS (Global Positioning System) satellite data, ballistics specialists estimate that the post-

maneuver state was within 100 m in semi-major axis of the ATV-CC prediction. As planned, another pair of 6 m/s test burns was executed today (3/12) with PDE-3 and -4, at 9:20am & 10:05am respectively, to exercise the other set of He regulators. Both of them were successful. ATV is resuming the now slightly delayed mission plan. Between now and Parking Orbit Departure, Toulouse will catch up on the timeline to preserve the originally planned dates of the Demo Days and Docking.

ISS Crew Sleep Shift Planning: To synchronize the ISS crew's timeline with STS-123/1J/A docking and subsequent docked activities, Peggy's, Yuri's and Leo's wake/sleep cycle is undergoing a number of shifts which started on 3/11. For the next six days, the wake/sleep shift schedule is as follows (all times EDT):

FD3	Wake: 3:00pm (3/12) – 8:00am (3/13) Sleep: 8:00am – 4:30pm
FD4	Wake: 4:30pm (3/13) – 8:00am (3/14) Sleep: 8:00am – 4:30pm
FD5	Wake: 4:30pm (3/14) – 7:00am (3/15) Sleep: 7:00am – 3:30pm
FD6	Wake: 3:30pm (3/15) – 7:00am (3/16) Sleep: 7:00am – 3:30pm
FD7	Wake: 3:30pm (3/16) – 6:00am (3/17) Sleep: 6:00am – 2:30pm
FD8	Wake: 2:30pm (3/17) – 6:00am (3/18) Sleep: 6:00am – 2:30pm

ISS Orbit (as of this morning, 8:40am EDT [= epoch]):

Mean altitude -- 340.8 km

Apogee height -- 341.7 km

Perigee height -- 339.9 km

Period -- 91.35 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0001377

Solar Beta Angle -- 11.1 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 160 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53327

Significant Events Ahead (all dates Eastern Time, some changes possible.):

03/12/08 -- STS-123/Endeavour/1J/A docking – ~11:25pm EDT

- 3/13 (FD3) – Use SRMS to transfer SLP-D1 with SPDM to ISS (POA) (~1:30am)
- 3/13 (FD4) – EVA-1 to install “Kibo” JLP and start SPDM “Dextre”

assembly (~9:23pm)

- 3/15 (FD6) – EVA-2 to continue SPDM assembly (~8:23pm)
- 3/17 (FD8) – EVA-3 to transfer ORUs, cleanup SLP, install MISSE-6, etc. (~7:23pm)
- 3/20 (FD11) – EVA-4 to demonstrate T-RAD, do get-aheads (~6:28pm)
- 3/22 (FD13) – EVA-5 to stow OBSS, TBDs (~5:23pm)
- 3/24 (FD15) – STS-123/Endeavour undocking (~7:55pm)
- 3/26 (FD17) – STS-123/Endeavour deorbit (~7:33pm); landing (KSC) -- ~8:35pm;

03/14/08 -- ATV1 “Jules Verne” CAM (Collision Avoidance Maneuver) Demo, -5m/s, 3:56am EDT;

03/19/08 -- ATV1 “Jules Verne” parking point (loiter) arrival 8:00am EDT ~1200 mi. in front of ISS;

03/27/08 – ATV1 end of loiter; leave parking point - ~2:00am;

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking) ~10:39am EDT

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch - ~7:16am

04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~8:43am

04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)

05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/25/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS

05/27/08 -- STS-124/Discovery/1J docking

06/05/08 -- STS-124/Discovery/1J undocking

08/07/08 -- ATV1 undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC

10/18/08 -- STS-126/Discovery/ULF2 docking

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
4QTR CY09 -- STS-130/19A - MPLM
1QTR CY10 – STS-131/ULF4
2QTR CY10 -- STS-132/20A – Node-3 + Cupola
3QTR CY10 – STS-133/ULF5.

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osp/iss_reports/index.htm

ISS On-Orbit Status 03/11/08

All ISS systems continue to function nominally, except those noted previously or below. *Crew wake/sleep cycle today: wake-up 2:00am; sleep 12:00noon (4-hr "nap"); wake-up 4:00pm – 6:30am (tomorrow).*

STS-123/Endeavour (ISS-1J/A) lifted off spectacularly in darkness early this morning right on time (2:28am EDT) with all systems performing nominally, for rendezvous with ISS tomorrow (3/12, Wednesday) and docking at approximately 11:25pm EDT. The Orbiter is carrying the seven-member crew of Commander Dominic L. Gorie, Pilot Gregory H. Johnson and Mission Specialists Richard M. Linnehan, Robert L. Behnken, Michael J. Foreman, Takao Doi and Garrett E. Reisman. Reisman will replace Léopold Eyharts as ISS Flight Engineer 2, who returns on 3/26 (nominal) with STS-123. STS-123 is the 122nd space shuttle flight, the 21st flight for Endeavour, the 25th flight to the station and the second of six Shuttle flights planned for 2008 (including the Hubble Service Mission 4). Its primary payloads are the 18,490-lbs Japanese Experiment Logistics Module-Pressurized Section (ELM-PS or JLP) and the 3,400-lbs Canadian Special Purpose Dexterous Manipulator (SPDM) "Dextre". **We are off to another great mission!**

Before breakfast & first exercise, Whitson, Malenchenko and Eyharts completed a full session with the Russian crew health monitoring program's medical assessment MO-9/Biochemical Urinalysis. Afterwards, the FE-1 closed out and stowed the Urolux hardware. *[MO-9 is conducted every 30 days (and also before and after EVAs) and is one of five nominal Russian medical tests adopted by NASA for U.S. crewmembers for IMG PHS (Integrated Medical Group/Periodic Health Status) evaluation as part of the "PHS/Without Blood Labs" exam. The analysis uses the sophisticated in-vitro diagnostic apparatus Urolux developed originally for the Mir program. Afterwards, the data are entered in the MEC (Medical Equipment Computer)'s special IFEP software (In-Flight Examination Program).]*

/In the Columbus module, FE-2 Eyharts performed close-out activities on the

completed BLB/WAICO #1 (BIOLAB/Waving & Coiling of Arabidopsis Roots at Different g-levels) experiment, shutting down all unused subsystems, removing the ECs (Experiment Containers) from the incubator for final stowage in the BLBG TCU (BLBGlovebox Thermal Control Unit 1), set at +4 degC, and removing the video tape from the camcorder. *[The WAICO samples, which required a 14-day growing period, will be returned on Flight 1J/A along with the video tape.]*

FE-1 Malenchenko continued the long-term leak checking of the spare BZh Liquid Unit (#056) for the Elektron O₂ generator by charging the unit once again with pressurized N₂ from the BPA-M Nitrogen Purge Unit (#23) to 1 atm (1 kg/cm²), for the subsequent periodic pressure check. The last test pressurization was on 1/9/08. *[During Elektron operation, the inert gas locked up in the BZh has the purpose to prevent dangerous O₂/H₂ mixing. A leaking BZh cannot be used.]*

CDR Whitson serviced the prime CSA-CP (Compound Specific Analyzer-Combustion Products), replacing its battery with a fresh one (#1167).

The three crewmembers had their standard periodic PMC (Private Medical Conference) via S- & Ku-band audio/video.

Working from the voluntary “available time” suggestions list, Yuri Malenchenko conducted the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR) and VELO bike with bungee cord load trainer (FE-1).

Peggy Whitson then transferred the crew’s exercise data file to the MEC laptop for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

The crew had an early dinner at ~10:30am (no lunch break today) and then began their sleep time at 12:00noon EDT as first step in the extensive sleep cycle shifting ahead.

After waking up from the 4-hr. “nap” at ~4:00pm later today, Leo Eyharts will move to the U.S. Airlock to start charging eight camera batteries in preparation for tomorrow night’s RPM (R-bar Pitch Maneuver) photo shoot by Whitson and

Malenchenko. Charging will be conducted on two sets of four batteries simultaneously, each one requiring at least three hours. *[The RPM will begin at ~10:24pm EDT in bright sunlight, followed by TORVA (Twice Orbital Rate V-bar Approach) initiation at ~10:35pm and V-bar arrival (310 ft in front of the station) at 10:46pm. Being below the ISS, the Orbiter will overtake it, passing through its "R-bar" radius vector at ~600 ft range while doing a slo-mo somersault for brief exposure of its belly to Peggy's & Yuri's cameras, then getting further ahead and rising up to match the station's orbital rate (velocity), followed by for lining up, starting final approach and concluding with docking at PMA-2 (Pressurized Mating Adapter 2).]*

Also for the upcoming high-pressure RPM photo activity, much of Whitson's attention later tonight and throughout the night will be on formatting the necessary camera storage devices. *[Formatting, in a Kodak DCS 760 camera on station power, will be performed on a total of eight 1GB EVA Flash Cards, each one taking ~20 minutes. Afterwards, the reformatted cards are to be transferred to the SM (Service Module) for the DCS 760 camera configuration to get ready for the RPM documentation.]*

Peggy will also perform the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling a CWC (Contingency Water Container, #1054) with the collected water slated for processing. Two samples are required this time for return to Earth. *[Estimated offload time before termination (leaving ~6 kg in the tank): ~35 min.]*

Yuri Malenchenko's first job tonight after the nap will be the periodic servicing of the Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The regen process will be terminated tomorrow before sleeptime, at ~5:20am EDT. Regeneration of bed #2 follows after wake-up. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods.]*

The FE-1 is also scheduled to set up the equipment for his third session with the Russian experiment MBI-18 DYKHANIE ("respiration", "breathing"), then to tag up with ground specialists and conduct the session, finally closing down and stowing the equipment. *[Dykhanie-1 uses two body belts (PG-T/thoracic, PG-A/abdominal), a calibrator, resistor, mouthpiece, etc., to study fundamental physiological mechanisms of the external breathing function of crewmembers under long-duration orbital flight conditions. During the experiment, physiological measurements are taken and recorded with a pneumotachogram, a thoracic pneumogram, an abdominal pneumogram, and pressure data in the oral cavity. All experimentally derived plus salient environmental data along with personal data of the subject are recorded on PCMIA card for return to the ground at end of the*

Expedition. Objectives include determining the dynamics of the relationship between thoracic (pectoral) and abdominal breathing function reserves and their realization potential during spontaneous breathing, the coordinated spontaneous respiratory movements in terms of thoracic and abdominal components of volumetric, time & rate parameters of spontaneous respiratory cycle, identification of the features of humoral-reflex regulation of breathing by dynamics of ventilation sensitivity of thoracic and abdominal components to chemoreceptor stimuli, etc. Overall, the experiment is intended to provide a better understanding of the basic mechanisms of pulmonary respiration/gas exchange gravitational relations of cosmonauts.]

In preparation for the upcoming docking, Leo will work on the Columbus FSL (Fluid Science Laboratory), temporarily re-attaching the FSL FCE (Facility Core Element) drawer structure to the rack by means of the four launch fixations bolts used during COL launch, as he did on 2/27 for the reboost. *[Afterwards, the launch captive bolts will be removed again and the protective gap covers re-installed. The need for the lock-down of the FCE was indicated by an updated structural analysis.]*

Eyharts is also scheduled to collect a Return-to-Ground water sample from the ITCS MTL (Internal Thermal Control System/Moderate Temperature Loop) in the Lab (LAB1D5 port) and another one later from the LTL (Low Temperature Loop) in Node-2.

For use by the Shuttle crew during the docked phase with the Orbiter, the CDR will unstow and configure the BPMSU (Battery Powered Speaker Microphone Unit) with its dual drag-through cable string and QDs (quick disconnects), along with video adapter cables *[The long dual strings, one going through Node-2 to the Lab, the other further on to Node-1 and its connecting modules, will be plugged in at a drag-through QD assembly at the PMA-2, with one half assigned to the station, the other to the Shuttle.]*

Also later tonight, FE-1 Yuri Malenchenko will set up the equipment for the Russian MBI-18 DYKHANIE ("respiration", "breathing") experiment, then conducted the session, supported by ground specialist tagup, later closing down ops and stowing the equipment. *[Dykhane-1 gear uses two belts (PG-T/thoracic, PG-A/abdominal), a calibrator, resistor, mouthpiece, etc., to study fundamental physiological mechanisms of the external breathing function of crewmembers under long-duration orbital flight conditions. During the experiment, physiological measurements taken and recorded involve a pneumotachogram, thoracic pneumogram, abdominal pneumogram, and pressures in the oral cavity. All experimentally derived and salient environmental data along with personal data of the subject are recorded on PCMIA card for return to the ground at end of the Expedition. Objectives include determining the dynamics of the relationship between thoracic (pectoral) and*

abdominal breathing function reserves and their realization potential during spontaneous breathing, the coordinated spontaneous respiratory movements in terms of thoracic and abdominal components of volumetric, time & rate parameters of spontaneous respiratory cycle, identification of the features of humoral-reflex regulation of breathing by dynamics of ventilation sensitivity of thoracic and abdominal components to chemoreceptor stimuli, etc. Overall, the experiment is intended to provide a better understanding of the basic mechanisms of pulmonary respiration/gas exchange gravitational relations of cosmonauts.]

(Post-midnight onboard activities will be covered in tomorrow's Daily On-Orbit Report.)

ATV Update (Flight Day 2): All ATV systems are performing nominally. Yesterday, the ATV PDE-2 (Propulsion Drive Electronics #2) was successfully re-integrated at ~3:00pm EDT, returning the ATV to the nominal propulsion configuration with the redundant system available. Afterwards, the PDE was successfully used to complete an attitude slew maneuver to return to Yaw Steering, the nominal ATV attitude control mode. Two test maneuvers using Configuration A (PDE-1 & -2) were scheduled for today (11:01am/12:12pm). Tomorrow (3/12), two additional test maneuvers will be performed using Configuration B (PDE-3 & -4), at 9:20am and 10:05am. The CAM (Collision Avoidance Maneuver) Test 1 is scheduled on 3/13 at 6:00am-10:00am and the CAM Demo now on 3/14 at 3:56am. Twelve more burns will be conducted in the ensuing days, with final arrival at the "loiter" position in Parking Orbit on 3/19 (~8:00am) at about 1200 mi. in front of ISS.

FSL Update: Yesterday's troubleshooting of the FSL (Fluid Science Laboratory) Rack was unsuccessful. After powering on, data readouts were erratic. Further inspection showed that a jumper cable has a broken connector (J3), with two pins missing. FSL cannot be activated in this state.

SSC-13 Failure: As per crew report this morning, the SSC-13 (Station Support Computer 13) has failed (not loading its Operating System). The laptop is currently turned off, and the plan is to try reloading the hard drive.

ERNO Safety Issue: The recent installation of the ERNO (Entwicklungsring Nord) box by FE-2 Eyharts on the FSL starboard panel still needs to be assessed for safety by NASA & ESA before it can be activated (which is not planned for the next several weeks). *[The primary purpose of this SDTO (Station Development Test Objective) is to assess the on-orbit performance of various radiation devices inside the ERNO box. This hardware includes: LEON-2 CPU (Central Processing Unit) developed by ATMEL/France and ESA, new memory devices, large SRAM (Static Random Access Memory)-based FPGAs (Field-Programmable Gate Arrays), and MEMS (Microelectromechanical Systems) sensors. The radiation-hardened LEON-*

2 microprocessor chip is the first implementation of a LEON CPU-core in silicon, with SPARC compliance. SPARC (Scalable Processor Architecture), invented by Sun Microsystems Inc., is an open set of technical specifications that any person or company can license and use to develop microprocessors and other semiconductor devices based on published industry standards.]

ISS Crew Sleep Shift Planning: To synchronize the ISS crew's timeline with STS-123/1J/A docking and subsequent docked activities, Peggy's, Yuri's and Leo's wake/sleep cycle is undergoing a number of shifts which started today. For the next six days, the wake/sleep shift schedule is as follows (all times EDT):

FD2	Wake: 4:00pm (3/11) – 6:30am (3/12) Sleep: 6:30am – 3:00pm
FD3	Wake: 3:00pm (3/12) – 8:00am (3/13) Sleep: 8:00am – 4:30pm
FD4	Wake: 4:30pm (3/13) – 8:00am (3/14) Sleep: 8:00am – 4:30pm
FD5	Wake: 4:30pm (3/14) – 7:00am (3/15) Sleep: 7:00am – 3:30pm
FD6	Wake: 3:30pm (3/15) – 7:00am (3/16) Sleep: 7:00am – 3:30pm
FD7	Wake: 3:30pm (3/16) – 6:00am (3/17) Sleep: 6:00am – 2:30pm

ISS Orbit (as of this morning, 9:34am EDT [= epoch]):

Mean altitude -- 341.0 km

Apogee height -- 342.0 km

Perigee height -- 340.0 km

Period -- 91.35 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0001473

Solar Beta Angle -- 6.2 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 231 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53312

Significant Events Ahead (all dates Eastern Time, some changes possible.):

03/12/08 -- STS-123/Endeavour/1J/A docking – ~11:25pm EDT

03/14/08 -- ATV1 “Jules Verne” CAM (Collision Avoidance Maneuver) Demo, -5m/s, 3:56am EDT;

03/19/08 -- ATV1 “Jules Verne” parking point (loiter) arrival 8:00am EDT ~1200 mi. in front of ISS;

03/24/08 -- STS-123/Endeavour/1J/A undocking -- ~7:55pm;

03/26/08 -- STS-123/Endeavour/1J/A deorbit – ~7:33pm; landing (KSC) -- ~8:35pm;
 03/27/08 – ATV1 end of loiter; leave parking point - ~2:00am;
 03/29/08 -- ATV1 Demo Day 1
 03/31/08 -- ATV1 Demo Day 2
 04/03/08 -- ATV1 Demo Day 3 (docking) ~10:39am EDT
 04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
 04/08/08 -- Soyuz TMA-12/16S launch - ~7:16am
 04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~8:43am
 04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)
 05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
 05/14/08 -- Progress M-64/29P launch
 05/16/08 -- Progress M-64/29P docking (DC1)
 05/25/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS
 05/27/08 -- STS-124/Discovery/1J docking
 06/05/08 -- STS-124/Discovery/1J undocking
 08/07/08 -- ATV1 undocking
 08/12/08 -- Progress M-65/30P launch
 08/14/08 -- Progress M-65/30P docking (SM aft port)
 08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
 09/09/08 -- Progress M-64/29P undocking (from DC1)
 09/10/08 -- Progress M-66/31P launch
 09/12/08 -- Progress M-66/31P docking (DC1)
 10/01/08 -- **NASA 50 Years**
 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
 10/12/08 -- Soyuz TMA-13/17S launch
 10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
 10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
 10/18/08 -- STS-126/Discovery/ULF2 docking
 10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
 11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
 11/20/08 -- **ISS 10 Years**
 11/26/08 -- Progress M-67/32P launch
 11/28/08 -- Progress M-67/32P docking (SM aft port)
 12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
 12/06/08 -- STS-119/Discovery/15A docking
 12/15/08 -- STS-119/Discovery/15A undocking
 1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
 05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
 3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
 4QTR CY09 -- STS-130/19A - MPLM
 1QTR CY10 – STS-131/ULF4
 2QTR CY10 -- STS-132/20A – Node-3 + Cupola

3QTR CY10 – STS-133/ULF5.

ISS On-Orbit Status 03/10/08

All ISS systems continue to function nominally, except those noted previously or below. *Russian Holiday: International Women's Day ("held over" from 3/8). Underway: Week 21 of Increment 16.*

After consulting with Col-CC (Columbus Control Center) specialists, FE-2 Eyharts set up a video camcorder in front of the FSL RIC (Fluid Science Laboratory Rack Interface Controller) to monitor its LEDs, then performed an uplinked troubleshooting procedure on the FSL facility, using wire cutter, wire stripper and crimp tools in an effort to repair its LAN (Local Area Network) jumper that could not be connected with the UIP (Utility Interface Panel) J46 LAN-1 connector last week.

Later, Eyharts conducted photo documentation of the completed WAICO (Waving & Coiling of Arabidopsis Roots at Different g-levels) experiment, first configuring the DCS-760 camera equipment, then removing the ECs (Experiment Containers) from the centrifuge, taking imagery inside the BGB (BIOLAB Glovebox) and afterwards replacing the ECs on the gravity-simulating centrifuge.

In the Lab, CDR Whitson connected the regular ITCS LTL (Internal Thermal Control System/Low Temperature Loop) coolant jumper at the LAB1D6 rack in support of ground-commanded activation, at 4:00am-6:00am EDT, of the U.S. CDRA (Carbon Dioxide Removal Assembly). *[CDRA was turned on to reduce cabin CO₂ level prior to 1J/A docking.]*

Yuri Malenchenko completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV for the Elektron-intended water, and processing U.S. condensate*

water as it becomes available in a filled CWC (Contingency Water Container) from the Lab humidifier.]

CDR Whitson performed the periodic deployment of four passive FMK (formaldehyde monitoring kit) sampling assemblies in the Lab (at P3, below CEVIS) and SM (at the most forward handrail, on panel 307) for two days, to catch any atmospheric formaldehyde on a collector substrate for subsequent analysis on the ground. *[Two monitors each are usually attached side by side, preferably in an orientation with their faces perpendicular to the direction of air flow.]*

Working from the voluntary “available time” suggestions list, Yuri Malenchenko conducted the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

After the U.S. MCA (Major Constituent Analyzer) executed another ground-commanded “rapid sampling” auto sequence, Malenchenko performed the (currently daily) cabin air repress with O₂ from Progress 28P storage (SrPK).

Later, MCA mode was changed by the ground to standard sequence of four times each in Lab, Node-1, Airlock, Node-2 and Columbus.

At ~8:25am EDT, the Expedition 16 crew conducted the standard pre-handover teleconference (via S/G2 audio) with the Expedition 17 crew which is currently at GCTC (Gagarin Cosmonaut Training Center) at Star City (Zvezdnyi Gorodok), near Moscow.

At ~10:45am, Peggy and Yuri linked up with ground specialists at MCC-H for a 15-min debrief to discuss the images downlinked from their recent (3/7) Shuttle RPM (R-bar Pitch Maneuver) skill training. *[The skill training prepares the crew for the bottom side mapping of the Endeavour at the arrival of STS-123/1J/A on Wednesday. During the RPM at ~600 ft from the station, the ISS crew will have only ~90 seconds for taking high-resolution digital photographs of all tile areas and door seals on the Orbiter, to be downlinked for launch debris assessment. Thus, time available for the shooting will be very limited, requiring great coordination between the two headset-equipped photographers and the Shuttle.]*

At ~4:27am, Leo Eyharts powered up the SM's amateur radio equipment (Kenwood

VHF transceiver with manual frequency selection, headset, and power supply), to conduct, at 4:32am, a ham radio exchange in French with students at the Lycee mixte René Gosse, Clermont L'Herault, F-34800, France. *[Named after René Gosse who was shot by the German Gestapo in 1943, the "Lycee" stands in the very heart of the medieval city of Clermont l'Herault, a renowned tourist place of about 6,000 inhabitants, situated in the Languedoc area, one of the sunniest regions of France. Most of its buildings date from the 14th century and are located on the site of an ancient Dominican monastery. The recently restored chapel of the Penitents, built in southern Gothic style, is still used both by the school to accommodate exams and conferences and by the town council as a cultural centre for various artistic events. Questions to Leo were uplinked by ARISS (Amateur Radio on ISS) beforehand. "Have you ever had a fish in the station? If so how did you manage to contain the water in which he lived? How did it move? How did it bear the take-off?"; "Why don't you build a station on the moon rather than in space?"; "What is your feeling when you are out of the station and you look at the Earth and space?"; "What is the first sensation you feel when you work outside the station?"; "What are the temperatures outside and inside the station?"; "How do you perceive the Sun from the international space station? Does it look like the one we can see from the Earth?"; "Do the molecules made or transformed in space keep the same properties when they are brought back to the Earth?"]*

ATV Update: ATV-1 "Jules Verne" lifted off on time Saturday night at 11:03:11pm EST. Ascent and the circularization burn by the upper stage were nominal.

Separation from the Ariane 5 upper stage occurred at 12:09:42am. Deployment of solar arrays and PCE (Proximity Communications Equipment) antenna boom were also nominal. Yesterday (Sunday), ATVCC (ATV Control Center/Toulouse) deferred the first two phasing burns, TP1 (9:06am EDT) and TP2 (9:40am EDT), to first analyze an apparent problem with PDE-2 (Propulsion Drive Electronics #2), one of four PDEs, each one of which controls 7 of the 28 ACS (Attitude Control System) thrusters and one of the four OCS (Orbit Correction System) engines. Rescheduling the TP burns and any impact on tomorrow's scheduled CAM test remained undetermined this morning.

ISS Crew Sleep Shift Planning: To synchronize the ISS crew's timeline with STS-123/1J/A docking and subsequent docked activities, the wake/sleep cycle of Peggy, Yuri and Leo will undergo a number of shifts which, for an on-time launch tomorrow morning at 2:28am, start tomorrow (FD1). For the first six days, the wake/sleep shift schedule is as follows (all times EDT):

- FD1
 - Wake: 2:00am – 12:00noon
 - Sleep: 12:00noon – 4:00pm ("nap")

- FD2
 - Wake: 4:00pm (3/11) – 6:30am (3/12)
 - Sleep: 6:30am – 3:00pm
- FD3
 - Wake: 3:00pm (3/12) – 8:00am (3/13)
 - Sleep: 8:00am – 4:30pm
- FD4
 - Wake: 4:30pm (3/13) – 8:00am (3/14)
 - Sleep: 8:00am – 4:30pm
- FD5
 - Wake: 4:30pm (3/14) – 7:00am (3/15)
 - Sleep: 7:00am – 3:30pm
- FD6
 - Wake: 3:30pm (3/15) – 7:00am (3/16)
 - Sleep: 7:00am – 3:30pm

No CEO photo targets uplinked for today.

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 9:27am EDT [= epoch]*):

Mean altitude -- 341.2 km

Apogee height -- 342.0 km

Perigee height -- 340.4 km

Period -- 91.36 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0001254

Solar Beta Angle -- 1.2 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 180 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53296

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS (JLP) – 2:28am EDT, for a record 16+1+2 mission duration, incl. 5 EVAs;

03/12/08 -- ATV1 “Jules Verne” CAM (Collision Avoidance Maneuver) demo, 3:59:28am EDT; orbit raising burns;

03/12/08 -- STS-123/Endeavour/1J/A docking – ~11:27pm EDT
 03/19/08 -- ATV1 “Jules Verne” parking point (loiter) arrival 8:00am EDT ~1200 mi. in front of ISS;
 03/24/08 -- STS-123/Endeavour/1J/A undocking -- ~7:55pm;
 03/26/08 -- STS-123/Endeavour/1J/A deorbit – ~7:33pm; landing (KSC) -- ~8:35pm;
 03/27/08 – ATV1 end of loiter; leave parking point - ~2:00am;
 03/29/08 -- ATV1 Demo Day 1
 03/31/08 -- ATV1 Demo Day 2
 04/03/08 -- ATV1 Demo Day 3 (docking) ~10:39am EDT
 04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
 04/08/08 -- Soyuz TMA-12/16S launch - ~7:16am
 04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~8:43am
 04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)
 05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
 05/14/08 -- Progress M-64/29P launch
 05/16/08 -- Progress M-64/29P docking (DC1)
 05/25/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS
 05/27/08 -- STS-124/Discovery/1J docking
 06/05/08 -- STS-124/Discovery/1J undocking
 08/07/08 -- ATV1 undocking
 08/12/08 -- Progress M-65/30P launch
 08/14/08 -- Progress M-65/30P docking (SM aft port)
 08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
 09/09/08 -- Progress M-64/29P undocking (from DC1)
 09/10/08 -- Progress M-66/31P launch
 09/12/08 -- Progress M-66/31P docking (DC1)
 10/01/08 -- **NASA 50 Years**
 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
 10/12/08 -- Soyuz TMA-13/17S launch
 10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
 10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
 10/18/08 -- STS-126/Discovery/ULF2 docking
 10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
 11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
 11/20/08 -- **ISS 10 Years**
 11/26/08 -- Progress M-67/32P launch
 11/28/08 -- Progress M-67/32P docking (SM aft port)
 12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
 12/06/08 -- STS-119/Discovery/15A docking
 12/15/08 -- STS-119/Discovery/15A undocking
 1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
 05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**

3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
4QTR CY09 -- STS-130/19A - MPLM
1QTR CY10 – STS-131/ULF4
2QTR CY10 -- STS-132/20A – Node-3 + Cupola
3QTR CY10 – STS-133/ULF5.

ISS On-Orbit Status 03/09/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday -- off-duty day for CDR Whitson, FE-1 Malenchenko & FE-2 Eyharts. Ahead: Week 21 of Increment 16.*

After a flawless, precise on-time launch last night at 11:03:04 pm EST at Kourou/French Guiana, ATV1 Jules Verne is on its way to the ISS (see *photo below*). [Currently entering a period of test and orbit raising maneuvers, the European automated freighter will start "loitering" on 3/19 about 1200 miles ahead of ISS (which at that time is busy with STS-123/1J/A), then will begin maneuvering at 3/27, conduct checkout Demos toward an IMMT Go/No Go decision on 4/2, and Docking on 4/3 (start Final Approach: ~6:10am EDT, contact SM aft port: ~10:20am.)]

Aboard the ISS, Léopold Eyharts performed the last sampling of his second session with the NASA/JSC experiment NUTRITION w/Repository, collecting a final urine sample upon wakeup for storage in the MELFI (Minus-Eighty Laboratory Freezer for ISS). The sampling kit was then stowed away. *[The current NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R +30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

Yuri Malenchenko completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including ASU toilet facilities systems/replaceables plus the weekly collection of the toilet flush counter (SPK-U), water supply (SVO) readings and POTOK parameters

for calldown to TsUP/Moscow. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC (Contingency Water Container) from the Lab humidifier. Weekly SOZh reports (on Sundays) to TsUP/Moscow deal with number & dates of water and urine containers, counter readings of water consumption & urine collection, plus data and total operating time of the Russian POTOK-150MK (150 micron) air filter unit of the SOGS air revitalization subsystem.]*

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR) and VELO bike with bungee cord load trainer (FE-1, FE-2).

After a ground-commanded "rapid sampling" auto sequence by the U.S. MCA (Major Constituent Analyzer), Malenchenko performed another cabin air repress with O₂ from Progress 28P storage (SrPK). Later, MCA mode was changed by the ground to standard sequence of four times each in Lab, Node-1, Airlock, Node-2 and Columbus.

The FE-1 Malenchenko worked a number of standard maintenance/service tasks on Russian Segment (RS) systems from the voluntary "available time" suggestions list. Specifically, Yuri -

- Ran the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder);
- Performed the daily monitoring, picture-taking and downloading on the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP), including recharging the water tank of the greenhouse as required;
- Conducted the periodic collection and logging of accumulated data of seven Bubble Dosimeter detectors of the "Matryoshka-R" radiation payload suite (RBO-3-2) installed at various exposure locations in the RS, using the special Bubble Dosimeter Reader *[the complex Matryoshka payload suite is designed for sophisticated radiation studies]*;
- Performed another session of the Russian GFI-8 "Uragan" (hurricane) earth-imaging program, using the Japanese HDV (High Definition) video camera provided by SFP Charles Simonyi to shoot video of the Pyrenees, Western Mediterranean, Spain, African & Madagascar terrain left of track, Azores &

Canary Islands, US Southern Coastline, Cuba, the Caribbean Sea right of track; and

- Completed his ninth run of the Russian DZZ-2 "Diatomeya" ocean observations program *[using the NIKON F-5 digital still camera with 80-200 mm lens and the SONY PD-150P camcorder at medium zoom for continuous nonstop video, focusing on high production zones and associated oceanic phenomena in the Atlantic Ocean (Newfoundland Island coastline, West Saharan offshore areas, and US coastline).]*

CWC Update: An updated CWC (Contingency Water Container) "cue card" was uplinked for the crew's reference. *[The new card (16-0018W) lists 35 CWCs (~1355.2 L total) for the four types of water identified on board: technical water (792.9 L, for Elektron, flushing, hygiene), potable water (559.6 L), condensate water (2 L), waste/EMU dump and other (0.7 L). Of the 35 containers, 12 CWCs with technical water (519.9 L) and 2 CWCs with potable water (88.7 L) must be cleared for Wautersia bacteria by MCC-H before use.]*

Did you know? –

- Jules Verne had a total mass 20,750 kg (45,746 lbs) at liftoff and carries 5752 kg of ATV propellant (Demos, ISS Reboost/Attitude Control, Contingency), 860 kg ISS refuel propellant, 20 kg oxygen gas, 280 kg water, and 1150 kg varied dry cargo.
- STS-122/1E Atlantis, besides crewmember rotation, accomplished the following payload/cargo transfers:
 - Cargo Bay hardware upmass to ISS: 29,105 lbs (i.e., Columbus 26,627 lbs; SOLAR 751 lbs; EuTEF 658 lbs; NTA 1069 lbs);
 - ISS hardware downmass in Cargo Bay: 2242 lbs (i.e., NTA 1039 lbs; CMG: 1203 lbs);
 - Shuttle Middeck Resupply to ISS: 2079 lbs (i.e., SARJ DLA; OTSD/ORU Transfer Stowage Device);
 - ISS return items in Shuttle Middeck: 2022 lbs (i.e., BMRRM (largest ORU returned in middeck, 242 lbs), TBA/Trundle Bearing Assembly, 8 CPAs/Controller Panel Assemblies.

No CEO photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 8:48am EDT [= epoch]):*

Mean altitude -- 341.4 km

Apogee height -- 342.6 km

Perigee height -- 340.2 km
Period -- 91.36 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0001732
Solar Beta Angle -- -3.8 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 138 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 53280

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS (JLP) -- 2:28am EDT, for a record 16+1+2 mission duration, incl. 5 EVAs;
03/12/08 -- ATV1 "Jules Verne" CAM (Collision Avoidance Maneuver) demo, 3:59:28am EDT; orbit raising burns;
03/12/08 -- STS-123/Endeavour/1J/A docking -- ~11:27pm EDT
03/19/08 -- ATV1 "Jules Verne" parking point (loiter) arrival 8:00am EDT ~1200 mi. in front of ISS;
03/24/08 -- STS-123/Endeavour/1J/A undocking -- ~7:55pm;
03/26/08 -- STS-123/Endeavour/1J/A deorbit -- ~7:33pm; landing (KSC) -- ~8:35pm;
03/27/08 -- ATV1 end of loiter; leave parking point - ~2:00am;
03/29/08 -- ATV1 Demo Day 1
03/31/08 -- ATV1 Demo Day 2
04/03/08 -- ATV1 Demo Day 3 (docking) ~10:39am EDT
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch - ~7:16am
04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~8:43am
04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)
05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
05/25/08 -- STS-124/Discovery/1J launch -- JEM PM "Kibo", racks, RMS
05/27/08 -- STS-124/Discovery/1J docking

ISS On-Orbit Status 03/08/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday -- off-duty day for CDR Whitson, FE-1 Malenchenko & FE-2 Eyharts except for housekeeping and voluntary work. >>>Tonight's BIG EVENT: Launch of ATV Jules Verne (see Ascent Timeline below).*

For his second run with the NASA/JSC experiment NUTRITION w/Repository, FE-2 Eyharts completed the all-day session, collecting urine samples for 24 hrs (to continue through tomorrow morning) and blood samples (for Serum & Heparin).

[Acting as operator and CMO (Crew Medical Officer), Peggy Whitson performed phlebotomy on Leo, i.e., drew blood samples (from an arm vein) which were first allowed to coagulate in the Repository, then spun in the HRF2 RC (Human Research Facility 2/Refrigerated Centrifuge) and finally placed in MELFI (Minus-Eighty Laboratory Freezer for ISS). The RC was later powered off after a temperature reset to limit wear on the compressor, and cleaned.

Background: NUTRITION is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight; this includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes. The Clinical Nutritional Assessment profile currently required on all U.S. Astronauts collects blood and urine samples preflight and postflight. NUTRITION expands this protocol by also capturing in-flight samples and an additional postflight sample. Furthermore, additional measurements are included for samples from all sessions, including additional markers of bone metabolism, vitamin status, and hormone and oxidative stressor tests. The results will be used to better understand the impact of countermeasures (exercise and pharmaceuticals) on nutritional status and nutrient requirements. The Clinical Nutritional Assessment profile (MR016L), first started on two Mir crewmembers and then on all ISS US crews, nominally consists of two pre-flight and one post-flight analysis of nutritional status, as well as an in-flight assessment of dietary intake using the FFQ (Food Frequency

Questionnaire). The current NUTRITION project has expanded MR016L testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]

For her chosen weekend VolSci (Voluntary Science) program today, the NASA/U. Nevada SWAB (Surface, Water & Air Biocharacterization) experiment, Dr. Whitson swabbed surface samples from several locations in the station interior plus from five random sites (selecting an air vent in the Lab, the hygiene station mirror in the Service Module {SM}, a panel in the FGB next to mirror 206, a ventilation grill in Node-2, and return ventilation air vents in Columbus). Afterwards, she also collected air samples at four locations in the Node and Lab. *[The samples were sealed in special SWAB tubes, labeled as to their location origins and prepared for return to Earth on 1J/A. SWAB started on Increment 13 before 12A docking.]*

The crew performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the SM dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the CDR's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

As part of the house cleaning, FE-1 Malenchenko conducted preventive maintenance cleaning on the FS5, FS6, FS9, VPkhO, VdPrK, & VPrK fan grilles in the SM, the V3 grille in the DC1 Docking Module, and the TsV2 fan inlet in the FGB (Funktionalnyi-Grusovoi Blok).

After his second session with the ELITE-S2 (Elaboratore Immagini Televisive - Space 2) payload yesterday (which inadvertently exceeded Flight Rule-dictated acoustic loads on the crew), Eyharts powered on the payload to allow downloading the accumulated results and later deactivated it again. *[The Italian (ASI) experiment ELITE-S2 is a human motion analysis facility for technological characterization and potential application for multifactorial movement analysis, to study the connection between brain, visualization and motion in micro-G. By recording and analyzing the three-dimensional motion of astronauts, this study should help engineers apply ergonomics into future spacecraft designs and determine the effects of weightlessness on breathing mechanisms for long-duration missions.]*

The Russian flight engineer worked a number of standard maintenance/service

tasks on Russian Segment (RS) systems from the voluntary “time permitting” suggestions list. Specifically, Yuri -

- Completed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM *[regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers];*
- Ran the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder);
- Performed the daily monitoring, picture-taking and downloading on the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP), including recharging the water tank of the greenhouse as required;
- Conducted the periodic collection and logging of accumulated data of seven Bubble Dosimeter detectors of the “Matryoshka-R” radiation payload suite (RBO-3-2) installed at various exposure locations in the RS, using the special Bubble Dosimeter Reader *[the complex Matryoshka payload suite is designed for sophisticated radiation studies];*
- Performed a session of the Russian GFI-8 "Uragan" (hurricane) earth-imaging program, using the Japanese HDV (High Definition) video camera provided by SFP Charles Simonyi to shoot video of the Pyrenees, Mediterranean coastline, Sahara, the Nile river valley, Africa, the South-Eastern States of the USA including Cape Canaveral, Cuba, Jamaica, and Latin American countries with emphasis on the coastline; and
- Completed another KPT-3 session to make observations and take aerial KPT-3 photography of environmental conditions for Russia's Environmental Safety Agency (ECON) using the Nikon D2X digital camera with SIGMA 300-800mm telephoto lens.

New task items added to the discretionary U.S. “job jar” task list for Peggy and Leo pertain to two audits – of onboard CTBs (Cargo Transfer Bags), and of the “stowage rack of the week” on the Lab -- using a new Audit function introduced last year on Increment 15 with the implementation of the laptop-based IMS 2.0 version. *[This function allows the user to setup audits of bags, kits, stowage locations, just about anything that is considered a container, via a special Audit window with a linked Object Properties window.]*

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exercise device

(CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Peggy transferred the crew's exercise data file to the MEC (Medical Equipment Computer) laptop for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~9:00am, the crewmembers held their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP/Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

Weekly Science Update (Expedition Sixteen -- Week 20)

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): Radiation measurements continue to be performed in the PIRS module. Radiation measurements continue to be performed in the PIRS module. The latest memory card exchange occurred on 2/29.

ANITA: Completed.

BCAT-3 (Binary Colloidal Alloy Test 3): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): In progress.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): In progress.

EuTEF (European Technology Exposure Facility): On 3/3 EuTEF was successfully rebooted and DHPU troubleshooting was successfully. Look-ahead plan for EUTEF science program week from 3/5 to 3/11: DOSTEL Mode 1 continuous, EXPOSE ON, DEBIE-2 ON, TRIBOLAB Stand-By mode, FIPEX activation of sensors, MEDET re-activation for continuous measurements, PLEGPAY experiment 2 run.

Fluid Science Laboratory (FSL): The FSL Facility commissioning is on hold pending restoration of a LAN (Local Area Network) cable connection.

GEOFLOW: GEOFLOW start is pending FSL LAN cable troubleshooting. "Thanks Leo for the help with the video images of FSL!"

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): In progress.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION/REPOSITORY: In progress.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems):

Ongoing.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): “Peggy, we have added the next download activity to be on your task list next week. The Actiwatch will stop taking data on 3/19 if not re-initialized. Thanks for your extra sleep logging.”

SOLAR (Solar Monitoring Observatory): On 3/4, the facility lost TM/TC control for the instruments at around 8:30am EST. Following power cycling of Feeder 1, control of the instruments’ TM and TC was restored. On 3/5, during the transition to Pointing Mode, the SOLAR platform unexpectedly went into standby mode. Control of the platform was later restored, but SOVIM science acquisition activation was postponed. On 3/6, a second attempt to bring SOLAR platform back into pointing mode was also unsuccessful. Further troubleshooting is in work.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): In progress.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: In progress.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): After the start of the WAICO run on 2/28, all ECs (Experiment Containers) have been centrifuged at 1-g for 3 days to force the orientation of the plants to a preferential growth direction. On 3/2 after WAICO run start, all 8 ECs were tilted to their 45° position, and Rotor A was stopped to provide 0-g conditions for 4 EC’s. Daily video dump is performed to assess the development pattern of the plant roots. Plant growth is nominal. The ECs show significant condensation. To achieve clearance of the EC windows by the end of the run, in order to allow for good high-resolution photos, relative humidity was decreased to 60% on 3/4 and daily BLB (BIOLAB) LSS Flushing is being performed. The end of the run is currently estimated for 3/10-11 based on plant growth. Since the BLB caution due to excessive O₂ concentration at the start of WAICO run, gas composition and pressure controls are not available, but there is no immediate science impact. O₂ sensors were switched back on 3/3 and show nominal values.

CEO (Crew Earth Observation): Through 3/6 the ground has received a total of 15,902 frames of ISS/CEO imagery for review and cataloging. “A cursory scan of imagery received this morning indicates you have acquired imagery of some of our

impact sites in both North America and Africa, promising imagery of Khartoum, Sudan, and dramatic views of what appears to be Tropical Cyclone Jockwe near Mozambique. There are probably more that we could not immediately recognize. Thanks for responding to our requests; we will provide more feedback on your imagery next week. Your recent striking image of a gigantic cumulonimbus cloud (possibly a super cell) over western equatorial Africa will be published in NASA/GSFC's Earth Observatory website this weekend. Your high oblique view with the long lens makes an excellent visual of the 3-dimensional aspect of weather systems and their structure in our atmosphere. Nice job!"

CEO photo targets uplinked for today were **Hyderabad, India** (*the frequently turbid atmosphere over India often makes it difficult to spot city targets. ISS had a nadir pass near midday as it approached from the NW. Using the long lens settings to map the urban edges of this sprawling city of nearly 7 million people*), **Addis Ababa, Ethiopia** (*as ISS approached this target from the NW at midday, the crew was to look for the Ethiopian capital city to be just left of track. Using the long lens settings for a detailed mapping of urban edges, especially near the forest and agricultural areas*), and **Tropical Cyclone Jokwe** (*DYNAMIC EVENT: The Joint Typhoon Warning Center forecast track has Jokwe making a glancing landfall on the northeastern coast of Mozambique in the early afternoon as a Category 2 storm. This course placed the storm just left of ISS track. As the station approached the system from the NW, the crew was to try for broad, short lens views of the extent of the storm, and when near nadir, try for long lens views of details of the cloud structure. Prompt downlink of DYNAMIC EVENT imagery increases its value to the media and disaster responders*).

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 7:43am EST [= epoch]*):

Mean altitude -- 341.5 km

Apogee height -- 342.7 km

Perigee height -- 340.3 km

Period -- 91.37 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0001787

Solar Beta Angle -- -8.8 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 122 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53264

Significant Events Ahead (*all dates Eastern Time, some changes possible*.):

03/08/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guiana)
 (11:03:04pm EST); -- **see below**

03/09/08 -- *Change of US Standard Time to Daylight Saving Time (at 2:00am)*

03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS (JLP) – 2:28am EDT, for a record 16+1+2 mission duration, incl. 5 EVAs;

03/12/08 -- ATV CAM (Collision Avoidance Maneuver) demo (3:59:28am EDT)

03/12/08 -- STS-123/Endeavour/1J/A docking – ~11:27pm EDT

03/19/08 -- ATV1 parking orbit (loiter) arrival (8:00am EDT)

03/24/08 -- STS-123/Endeavour/1J/A undocking -- ~7:55pm

03/26/08 -- STS-123/Endeavour/1J/A deorbit – ~7:33pm; landing (KSC) -- ~8:35pm.

03/27/08 -- ATV1 end of loiter; leave parking orbit

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking) ~10:39am EDT

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch - ~7:16am

04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~8:43am

04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)

05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/25/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS

05/27/08 -- STS-124/Discovery/1J docking

06/05/08 -- STS-124/Discovery/1J undocking

08/07/08 -- ATV1 undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC

10/18/08 -- STS-126/Discovery/ULF2 docking

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-67/32P launch

11/28/08 -- Progress M-67/32P docking (SM aft port)

12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
 12/06/08 -- STS-119/Discovery/15A docking
 12/15/08 -- STS-119/Discovery/15A undocking
 1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
 05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
 3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
 4QTR CY09 -- STS-130/19A - MPLM
 1QTR CY10 – STS-131/ULF4
 2QTR CY10 -- STS-132/20A – Node-3 + Cupola
 3QTR CY10 – STS-133/ULF5.

ATV “Jules Verne” Ascent Timeline

HH:MM:SS	<i>Critical events</i>
-05:30:00 (5:33pm EST)	** ATV Ground Segment launch readiness status (GO/NO-GO) to the ATV Launch Mission Manager ** Readiness to the ATV-CC, international partners and network ** Before start of Ariane 5 EPC*/main stage fuelling
-02:00:00	** Final ATV data exchange between ATV-CC and Kourou ** Loading of ATV latest software data in the ATV

-00:10:00	Final ATV Ground Segment Launch readiness GO status
-00:08:00	ATV in launch configuration, power autonomous
-00:07:00	Start of Ariane 5 automatic sequence
-00:00:03	Ariane 5 inertial platform release

11:03 EST	Main engine start - Ariane 5 Vulcain engine/ EPC ignition

+00:00:07	Solid boosters (EAP*) ignition and lift-off
+00:02:18	Solid boosters (EAP) separation - 138 seconds
+00:03:29	Fairing jettisoned - 209 seconds
+00:09:08	First stage (EPC)/upper stage (EPS) separation
+00:09:08	Upper stage (EPS*) engine ignition - 8 minutes

*) EPC = Etage Principal Cryotechnique/ Cryogenic main stage
 EPS = Etage a Propergols Stockable/ Storable propellant stage (upper stage)
 EAP = Etage d'Acceleration a Poudre/ Solid rocket boosters

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm

+00:17:15	** Ariane 5 end of EPS 1st thrust ** Beginning of ballistic phase - 45 minutes

+01:02:10	Ariane 5 beginning of EPS second thrust
+01:02:42	** Ariane 5 end of EPS second thrust: orbit injection ** Start of Ariane 5 SCA phase ** Start of ATV telemetry ** Initialization of the ATV propulsion system ** Check of ATV status by ATV-CC
+01:06:41	Separation of ATV from upper stage

+01:31:41	Autonomous ATV navigation control from star-trackers sensor inputs

+01:36:41	** Solar array deployment (automatic) ** Maximum duration - 10 minutes (nominal 330 seconds)
+03:06:41 (2:10am EST)	(Approx. time) Deployment of the Proximity Link boom, necessary for final approach to ISS
+06:06:41 (5:10am EST)	(Approx. time) End of Launch and Early Operations Phase (LEOP)

ISS On-Orbit Status 03/07/08

All ISS systems continue to function nominally, except those noted previously or below.

Upon wake-up, FE-1 Yuri Malenchenko terminated his MBI-12 SONOKARD experiment session (his 11th), started last night, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

Before breakfast, CDR Whitson, FE-1 Malenchenko and FE-2 Eyharts began their workday with the periodic session of the Russian biomedical routine assessments PZEh-MO-7/Calf Volume Measurement and PZEh-MO-8/Body Mass Measurement (fifth for CDR & FE-1, second for FE-2), using the IM mass measurement device which Yuri Malenchenko afterwards broke down for stowage. *[Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference pints, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures. For determining body mass in zero-G, where things are weightless but not massless, the Russian IM "scales" measure the inertial forces that arise during the oscillatory motion of a mass driven by two helical metering springs with known spring constants. By measuring the time period of each oscillation of the unknown mass (the crewmember) and comparing it to the period of a known mass, the crewmember's mass is calculated by the computer and displayed.]*

Whitson supported the second session of the ELITE-S2 (Elaboratore Immagini Televisive - Space 2) payload by Eyharts by detaching the CEVIS (Cycle Ergometer with Vibration Isolation) from the ER3 (EXPRESS Rack 3) and moving it out of the field of view of the cameras crucial to the experiment, which she then set up for capturing Leo's movement protocol. After powering up the IMU (Interface Management Unit) and calibrating the work area for the cameras, the FE-2 had ~1.5 hrs to perform the test operations while Whitson took documentary photographs and later stowed the test camera. *[The Italian (ASI) experiment ELITE-S2 is a human motion analysis facility for technological characterization and potential application for multifactorial movement analysis, to study the connection between brain, visualization and motion in micro-G. By recording and analyzing the three-dimensional motion of astronauts, this study should help engineers apply ergonomics into future spacecraft designs and determine the effects of weightlessness on breathing mechanisms for long-duration missions. For each of three protocols (e.g., MOVE, IMAGINE), a set of body landmarks are identified and reflective markers are applied on the subject who then performs prescheduled movements with the index finger tips then returns to the initial position (for example, the subject has to reach and brush, without exerting forces). The video cameras trace the trajectories of the body parts of the astronaut catching the light reflected by the markers, thus recording the kinetic and trajectory data of the movement.]*

Continuing his work on the FSL (Fluid Science Laboratory) in the Columbus module, the French flight engineer was scheduled to install the "ERNObox" structure for the FSL A31p laptop on the rack's starboard panel and established A31p power supply via SUP1 (Standard Utility Panel #1) and data connection via the UIP (Utility Interface Panel).

FE-1 Malenchenko meanwhile performed the monthly 30-min. maintenance/servicing of the toilet facility (ASU), changing out replaceable ASU parts with new components, i.e., the urine receptacle (MP) and a filter insert (F-V). The old parts were discarded as trash.

After reviewing 400 & 800mm-lens "refresher" imagery taken during the STS-122/1E Atlantis RPM (R-bar Pitch Maneuver) on 2/9, Whitson and Malenchenko conducted another regular 30-min in-cabin RPM imaging skill training, Peggy's sixth, Yuri's seventh, using DCS-760 digital still cameras to take photos of an Orbiter cut-out for practice. The photos were later downlinked for ground analysis.

[The skill training prepares crewmembers for the bottomside mapping of the Orbiter at the arrival of STS-123/1J/A next week (3/13). During the RPM at ~600 ft from the station, the ISS crew will have only ~90 seconds for taking high-resolution digital photographs of all tile areas and door seals on the Atlantis from SM windows 6 & 8, to be downlinked for launch debris assessment. Thus, time available for the

shooting will be very limited, requiring great coordination between the two headset-equipped photographers and the Shuttle.]

Afterwards, Peggy checked the DCS-760 cameras for detail & color fidelity by taking blank and white images to “clean” and calibrate the CCDs (Charge-Coupled Devices). The test photos were stored on a 1GB Microdrive PCMCIA (Portable Computer Memory Card International Adapter) and downlinked to MCC-Houston for determining which cameras will be used for the actual RPM activities before the Endeavour docking.

In the US Lab, FE-2 Eyharts set up the hardware associated with urine and blood collections for his second session of NASA’s NUTRITION/Repository experiment, scheduled on his timeline tomorrow. *[The NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

Continuing the current round of periodic preventive maintenance of RS (Russian Segment) ventilation systems, Yuri spent 90 min. in the DC1 (Docking Compartment), replacing the PF1,2 filter cartridges and cleaning the V1 & V2 fan grilles and VD1 & VD2 air ducts.

The Russian flight engineer also worked a number of standard maintenance/service tasks on RS systems, some from the voluntary “time permitting” task list.

Specifically, Yuri -

- Completed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers];*
- Conducted the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur);
- Ran the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder), and
- Performed the daily monitoring, picture-taking and downloading on the BIO-5

Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP), today also recharging the water tank of the greenhouse as required.

Whitson and Eyharts spent an hour reviewing uplinked material on 1J/A EVA tasks, then conducted a 30-min teleconference with ground specialists to discuss the spacewalks. *[Planned are five EVAs during the 1J/A docked period, - on FD4 (Linnehan & Reisman), FD6 (Linnehan & Foreman), FD8 (Linnehan & Behnken), FD11 (Foreman & Behnken), and FD13 (Foreman & Behnken). Major objectives are as follows:*

- *EVA-1: Prep & install JLP (Japanese Experiment Logistics Module – Pressurized Section) on Node-2; begin assembly of SPDM (Special Purpose Dexterous Manipulator, "Dextre");*
- *EVA-2: Assembly & activate SPDM;*
- *EVA-3: Assemble SPDM; transfer SSRMS yaw joint plus two DCSUs (Direct Current Switching Units) to ESP-2 (External Stowage Platform 2); transfer MISSE-6 (Materials ISS Experiment 6) to Columbus;*
- *EVA-4: Replace RPCM (Remote Power Controller Module); conduct TRAD (Tile Repair Ablator Dispenser) demo;*
- *EVA-5: Stow OBSS (Orbiter Boom Sensor System) on ISS S1 truss, install JLP trunnion covers, install TBA (Trundle Bearing Assembly) in starboard SARJ (Solar Alpha Rotary Joint).*

"Critical path" tasks include - on EVA-1: OTCM (ORU Tool Changeout Mechanism) installation; on EVA-2: SPDM arms assembly; on EVA-3: SPDM OTP (ORU Temporary Platform)/THA (Tool Holder Assembly), SLP (Integrated Spacelab Pallet) prep for landing, MISSE 6 & ORU transfers; on EVA-4: Node-2 port ACBM (Active Common Berthing Mechanism) launch lock removal; and on EVA-5: OBSS stowage on ISS.

Also, after SPDM assembly, Dextre must be parked on the Lab PDGF (Power & Data Grapple Fixture) and the SLP must be returned to the Shuttle cargo bay.]

FE-1 Malenchenko had another hour for conducting stowage operations in Progress M-63/28P, transferring and packing cargo for disposal in the freighter-turned-trash can, to be undocked on 4/7 for destructive reentry over the Pacific.

New task items added to the discretionary U.S. "job jar" task list for Peggy and Leo pertain to two audits – of onboard CTBs (Cargo Transfer Bags), and of the "stowage rack of the week" on the Lab -- using a new Audit function introduced last year on Increment 15 with the implementation of the laptop-based IMS 2.0 version. *[This function allows the user to setup audits of bags, kits, stowage locations, just about anything that is considered a container, via a special Audit window with a linked Object Properties window.]*

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Peggy transferred the crew's exercise data file to the MEC (Medical Equipment Computer) laptop for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~3:10am EST, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~3:25am, FE-2 Eyharts had a 15-min. teleconference with ESA Management via the IP Phone.

At ~7:55am, Leo and Peggy conducted the regular weekly 20-min. audio tagup with ESA's Col-CC (Columbus Control Center) in Oberpfaffenhofen near Munich/Germany. *[S/G-2 (Space-to-Ground 2) phone patch via SSC-10 (Station Support Computer 10)].*

At ~9:20am, Peggy, Yuri and Leo held their standard bi-weekly teleconference with the JSC Astronaut Office (Steve Lindsey), via S-band S/G-2 audio & phone patch.

At ~12:55pm, Yuri Malenchenko downlinked a phone message of greetings to TsUP-Moscow, congratulating the President of the Russian Tennis Federation, Shamil A. Tarpishchev, on an anniversary.

At ~2:51pm, the crew will have their 14th weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. *[S/G-2 (Space-to-Ground 2) phone patch via SSC-10 (Station Support Computer 10)].*

CEO photo targets uplinked for today were **South Tibesti Megafans** *(a series of large fanlike spreads of sediment, hundreds of km long and wide, extend southward from the Tibesti Mountains into the Bodélé depression of central Chad. A discontinuous overlapping pattern of stream channels, large and small, suggests that the entire surface of the megafans was formed by the action of rivers shifting across the surface. Since about 8000 years ago, the Sahara environment has dried significantly, leaving non-functioning rivers channels everywhere. Images of areas south of Tibesti are only available in low resolution: therefore crew imagery--continuous mapping swaths taken with 400- and 800 mm lenses--are needed to*

provide the detail to reveal evidence of stream process and the intersection of streams on different fan surfaces. As ISS approached the Tibesti Mountains from the NW at midday, the crew was to shoot just right of track for these features),
Baltimore Ecosystem, Maryland *(the Baltimore Ecosystem Study [BES] aims to understand metropolitan Baltimore as an ecological system. The program brings together researchers from the biological, physical, and social sciences to collect new data and synthesize existing information on how both the ecological and engineered systems of Baltimore work. As a part of the National Science Foundation's Long-Term Ecological Research [LTER] Network, researchers also seek to understand how Baltimore's ecosystems change over long time periods. ISS approach was from the NW in late morning. Looking right of track for the upper end of Chesapeake Bay and using the long lens settings to map the Baltimore urban area in detail), and*
Madrean Sky Islands *(this target is located in the northern reaches of Mexico's Sierra Madre Occidental which boast some of the richest biodiversity anywhere in North America. It is a veritable archipelago of cool, moist, higher-altitude pine-oak forested mountain ranges that dot the hot, lower Sonoran and Chihuahuan deserts of southern Arizona and New Mexico and northwestern Mexico. These climatological islands are situated in remote and rugged areas and are vestiges of cooler, wetter periods during the ice ages. ISS approach was from the NW in early afternoon sun. Using the medium resolution lens for a nadir, contextual mapping strip across the heart of this region).*

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 8:56am EST [= epoch]):*

Mean altitude -- 341.6 km

Apogee height -- 342.9 km

Perigee height -- 340.4 km

Period -- 91.37 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0001921

Solar Beta Angle -- -13.7 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 124 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53249

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

03/08/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guiana)

(11:03:04pm EST);

03/09/08 -- *Change of US Standard Time to Daylight Saving Time (at 2:00am)*

03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS

(JLP) – 2:28am EDT, for a record 16+1+2 mission duration, incl. 5 EVAs;
03/12/08 -- ATV CAM (Collision Avoidance Maneuver) demo (3:59:28am EDT)
03/12/08 -- STS-123/Endeavour/1J/A docking – ~11:27pm EDT
03/19/08 -- ATV1 parking orbit (loiter) arrival (8:00am EDT)
03/24/08 -- STS-123/Endeavour/1J/A undocking -- ~7:55pm
03/26/08 -- STS-123/Endeavour/1J/A deorbit – ~7:33pm; landing (KSC) -- ~8:35pm.
03/27/08 – ATV1 end of loiter; leave parking orbit
03/29/08 -- ATV1 Demo Day 1
03/31/08 -- ATV1 Demo Day 2
04/03/08 -- ATV1 Demo Day 3 (docking) ~10:39am EDT
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch - ~7:16am
04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~8:43am
04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)
05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
05/25/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS
05/27/08 -- STS-124/Discovery/1J docking
06/05/08 -- STS-124/Discovery/1J undocking
08/07/08 -- ATV1 undocking
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
2QTR CY09 -- STS-128/17A - MPLM, last crew rotation

05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**

3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2

4QTR CY09 -- STS-130/19A - MPLM

1QTR CY10 – STS-131/ULF4

2QTR CY10 -- STS-132/20A – Node-3 + Cupola

3QTR CY10 – STS-133/ULF5.

Note: The daily ISS On-Orbit Status reports can also be found at

http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 03/06/08

All ISS systems continue to function nominally, except those noted previously or below.

FE-1 Malenchenko started his day with an IFM (In-flight Maintenance) in the FGB (Funktsionalnyi-Grusovoi Blok), removing and replacing a sensor component of the SIT-9L Temperature Measuring System in the BR-9TsU-8 Radiotelemetry System (RTS) with a new unit, discarding the old box.

CDR Whitson performed the periodic calibration of the two CSA-O₂ (Compound Specific Analyzer-Oxygen sensor) instruments #1041 & #1052, using a calibration tank with accurately known pressure. *[Partial Pressure Oxygen (ppO₂) readings were 21.4% before and 21.3% after calibration on #1041, 23.3%/21.3% on #1052.]*

Afterwards, Whitson took the periodic CO₂ (Carbon Dioxide) measurements in the cabin atmosphere with the CDMK (CO₂ Monitoring Kit, #1013). *[Measured levels were 0.45% in the Lab, 0.43% in the SM (Service Module), 0.44% in the COL (Columbus Orbital Laboratory). 0.45% = 4,500 ppm (parts per million).]*

Later, Peggy conducted the periodic verification of IMV (Intermodular Ventilation) airflow between U.S. and Russian segment modules by taking air flow measurements using the Velocicalc meter. *[There is no direct measurement of airflow except as reflected by, and calculated from, differences in atmosphere partial pressures measured at selected points between the RS and USOS. ppCO₂ is a good yardstick since for example an increasing ppCO₂ in the Lab not reflected in the SM would indicate that Vozdukh is not receiving the air from the Lab at an efficient rate. Periodic air flow degradation checks support establishing a most effective fan cleaning schedule.]*

The CDR and FE-2 conducted an in-depth review of the upcoming 1J/A MSS (Mobile Service System) task assignments, including the new DOUG (Dynamic Onboard Ubiquitous Graphics) setup and identification of SSRMS (Space Station Remote Manipulator System) targets.

Afterwards, Peggy and Leo were joined by Yuri for a review of the summary 1J/A timeline and the commensurate plan for the ISS crew.

Having received the uplink of ATV Onboard Trainer (AOT) software via U.S. assets (OCA) overnight, Malenchenko installed the sophisticated application on the Russian RSK1 laptop and performed a health test on it. *[The AOT software shows a simulated zoomable image of the orbital region of approach with a target zone and the ATV as it closes in on the ISS. For controlling manual approaches (should they be required), the AOT provides simulated control panel images for the ATV and for the SM Simvol-Ts television display, plus text displays for station clock time and approach parameters (distance, velocities, etc.), similar to the TORU OBT.]*

FE-2 Eyharts filled out the regular FFQ (Food Frequency Questionnaire), his third, on the MEC (Medical Equipment Computer). *[By means of these FFQs, NASA/ESA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins.]*

The CDR conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. *[Updated "cue cards" based on the crew's water calldowns are sent up every other week. The current cue card (16-0018V) lists 35 CWCs (~1427.9 L total) for the four types of water identified on board: technical water (812.9 L, for Elektron, flushing, hygiene), potable water (559.6 L), condensate water (54.7 L), waste/EMU dump and other (07 L). Of the 35 containers, nine CWCs with technical water (388.9 L) cannot be used until cleared for Wautersia bacteria, and 10 CWCs with potable water (427 L), transferred from Atlantis, are not cleared for use pending analysis of samples returning on 1E.]*

The FE-1 completed the periodic monitoring, picture-taking and image/data downlinking on the BIO-5 Rasteniya-2 ("Plants-2") experiment. Today's task was extended to include recharging the water tank of the greenhouse. *[Rasteniya-2, researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). During its operation, the experiment requires regular*

daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. During the duration of the BIO-5 experiment, students of the Moscow City Palace for Youth Creativity of the Meshchansky inter-regional center #15 in Moscow) and the Prince of Oldenburg Lyceum in St. Petersburg will be cultivating plants in parallel on the ground and conducting comparative observation of plant growth and development under gravity and zero-gravity conditions. They are receiving the photo images taken by Yuri.],

In the U.S. Airlock, Whitson terminated the BSA (Battery Stowage Assembly) recharging of the second set of EMU (Extravehicular Mobility Unit) batteries, to be used in the forthcoming 1J/A spacewalks.

Peggy also conducted the periodic checkup on active U.S. payloads, i.e., cleaning the ANITA (Analyzing Interferometer for Ambient Air) inlet plus inspecting and filter cleaning of the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. *[The CGBA incubator is controlled from the ground, with automatic video downlinked to Earth. ANITA continues to collect data every six seconds and downlinks the data daily to the ground team. ANITA monitors low levels of potential gaseous contaminants in the ISS cabin atmosphere with a capability of simultaneously monitoring 32 gaseous contaminants. The experiment is testing the accuracy and reliability of this technology as a potential next-generation atmosphere trace-gas monitoring system for ISS and future spacecraft. This is a cooperative investigation with ESA.]*

With both OGS (Oxygen Generation System) and the Elektron-VM O₂ generator currently off, cabin air refreshes with O₂ are being performed by Malenchenko from Progress 28P storage (SrPK) as required.

Eyharts performed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Malenchenko took care of the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

On the subject of the failed TVIS treadmill, CDR Whitson held a 30-min. teleconference to discuss her unsuccessful troubleshooting attempts with ground specialists. TVIS continues to be off limits for the crewmembers, and they are using other exercise equipment for their workouts. *[After undergoing its regular 6-month maintenance on 3/3, a TVIS Stabilization Fault (S3) appeared at the start of its first use, rendering the exercise device unusable for the crew since then. The fault persisted after Peggy went over the treadmill yesterday to check for loose connections and other potential causes. The ground team is developing a forward plan.]*

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1, FE-2).

Afterwards, Peggy transferred the crew's exercise data file to the MEC (Medical Equipment Computer) laptop for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Leo Eyharts had another 30 min. reserved on his schedule for preparing end-of-increment/departure cleanup and prepacking.

At ~10:35am EST, Peggy and Yuri had a 15-min teleconference with ground specialists to discuss/critique the images downlinked from last month's (2/9) Shuttle RPM (R-bar Pitch Maneuver) during 1E/Atlantis final docking approach. *[The critique has the purpose to prepare the crew for the bottom side mapping of the Orbiter at the arrival of STS-123/1J/A. During the RPM at ~600 ft from the station, the ISS crew will have only ~90 seconds for taking high-resolution digital photographs of all tile areas and door seals on the Orbiter, to be downlinked for launch debris assessment. Thus, time available for the shooting will be very limited, requiring great coordination between the two headset-equipped photographers and the Endeavour CDR, Dom Gorie.]*

At ~11:25am, the CDR had a PAO TV interview with KTIV-TV in Sioux City, Iowa (Al Joens) of ~10 min, also shown on NASA TV.

At ~4:20pm, shortly before sleep time, Yuri will set up the Russian MBI-12 SONOKARD (Sonocard) payload and start his eleventh experiment session, using a sports shirt from the SONOKARD kit with a special device in the pocket for testing a new method for acquiring physiological data without using direct contact on the skin. Measurements are recorded on a data card for return to Earth. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data*

through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]

Working off his voluntary "time permitting" task list, the FE-1 also conducted the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder), and

COL Status: (1) FSL (Fluid Science Laboratory) troubleshooting by Eyharts and Col-CC (Columbus Control Center/Oberpfaffenhofen) has identified the cause of the facility's startup failure to be a cable harness disconnected from a connector. While Eyharts may be asked to try recrimping the connector to allow its plugging in, ground specialists are already at work to construct a replacement harness in time to be launched on 1J/A next week. (2) GEOFLOW cannot be started without the FSL being powered up first. (3) On 3/10 (Monday), the high-priority BIOLAB/WAICO greenhouse plant growth experiment is coming to an end of its two-week period. (4) Both external payloads, EuTEF (European Technology Exposure Facility) & SOLAR (Solar Monitoring Observatory), are running but have developed problems that are being worked. (5) Last night, Col-CC lost all communications with COL, remaining totally without comm until ~8:00am CET (Central European Time) this morning when the not-yet-understood problem was corrected.

CDRA Update: After the 3/1 IFM (In-Flight Maintenance) by Peggy Whitson on the Carbon Dioxide Removal Assembly, bypassing the erratic temperature sensor A of Bed 2 (#202) to restore CDRA to nominal operation, Bed 1 (#201) is now showing the same problem with erratic temperature readings. Work is underway to restore channel 1's function in a similar manner by 3/11, again including placing a PPL (Pre-Positioned Load) software mask on the erroneous temperature reading.

Russian Prop Transfer Repeat: Tonight, TsUP-Moscow will repeat the transfer of oxidizer (N_2O_4 , nitrogen tetroxide) to the SM's BO2 tank which was stopped yesterday morning when an SM manifold thruster caution was received, waking the crew. Tonight's transfer is scheduled for Daily Orbits DO15/16/1/2 (5:00pm-10:10pm EST). No crew involvement required.

Russian Condensate Transfer: The experimental use of the NOK-1 condensate evacuation pump of the SKV-1 air conditioner for transferring U.S. condensate from a Russian EDV container to an SM Rodnik tank proved successful and can be used

in the future. However, RSC-E cannot confirm with telemetry that the tank is receiving water, and more time is needed to determine the exact quantity of water going into the empty Rodnik. Three EDVs which have not previously carried pre-treated urine will be made available to process U.S. condensate through 15S undock (mid April). Consequently, there's no need to dump excess water overboard.

OGS Deactivation: Final deactivation of the Oxygen Generation System by Whitson was successfully completed yesterday. The previous operation ended on 10/9/07. The requirement is to activate OGS every 90 days.

ATV Update: ESA has developed a detailed timeline for the Automated Transfer Vehicle, scheduled for launch on Saturday, 3/8, at 11:03:04pm EST, and has achieved agreement with RSC-Energia on manual docking procedures and a protocol, should they become necessary, with only one new procedure yet to be incorporated. More coordination work remains to be done for the unlikely case of ATV Undocking without functioning PCE (ProxOps Communications Equipment).

MSS Readiness: The required 1J/A Robotics checkouts are complete. The MT (Mobile Transporter) was moved successfully from WS4 (Worksite 4) to WS6 yesterday (12:40pm-2:40pm EST). The MSS (Mobile Service System) is ready for 1J/A docking.

CEO photo targets uplinked for today were **B.P. Structure** (*this very small impact feature is only 2 km in diameter and estimated to be less than 120 million years old. Because of this, it is a very challenging feature to spot and has yet to be identified in any astronaut photography of the region to date. ISS approach to the target area in eastern Libya was from the NW at midday, near nadir. Trying to locate and acquire this impact with the long lens settings for detail*), **Khartoum, Sudan** (*the Sudanese capital city is located at the confluence of the White and Blue Nile Rivers just north of an extensive agricultural area. ISS had a fine nadir pass at midday. Using the long lens settings and acquire detailed views of the edges of the urban area, especially along the banks of the rivers to the N, SE and S*), and **Tropical Cyclone Jokwe** (*DYNAMIC EVENT: This late-season tropical storm is currently located just off the northern tip of Madagascar. The Joint Typhoon Warning Center forecast call for further strengthening to a Category 1 or 2 storm as it continues west-southwestward into the Mozambique Channel. ISS pass was in early afternoon and by then the system should have been well left of track. Using the short lens settings for panning, oblique views of the extent and gross cloud structure of the storm*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the

Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 8:16am EST [= epoch]):*

Mean altitude -- 341.8 km

Apogee height -- 343.2 km

Perigee height -- 340.4 km

Period -- 91.37 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0002071

Solar Beta Angle -- -18.7 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 97 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53233

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

03/08/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana) (11:03:04pm EST);

03/09/08 -- *Change of US Standard Time to Daylight Saving Time (at 2:00am)*

03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS (JLP) -- 2:28am EDT, for a record 16+1+2 mission duration, incl. 5 EVAs;

03/12/08 -- ATV CAM (Collision Avoidance Maneuver) demo (3:59:28am EDT)

03/12/08 -- STS-123/Endeavour/1J/A docking -- ~11:27pm EDT

03/19/08 -- ATV1 parking orbit (loiter) arrival (8:00am EDT)

03/24/08 -- STS-123/Endeavour/1J/A undocking -- ~7:55pm

03/26/08 -- STS-123/Endeavour/1J/A deorbit -- ~7:33pm; landing (KSC) -- ~8:35pm.

03/27/08 -- ATV1 end of loiter; leave parking orbit

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking) ~10:39am EDT

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch - ~7:16am

04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~8:43am

04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)

05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/25/08 -- STS-124/Discovery/1J launch -- JEM PM "Kibo", racks, RMS

05/27/08 -- STS-124/Discovery/1J docking

06/05/08 -- STS-124/Discovery/1J undocking

08/07/08 -- ATV1 undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
4QTR CY09 -- STS-130/19A - MPLM
1QTR CY10 – STS-131/ULF4
2QTR CY10 -- STS-132/20A – Node-3 + Cupola
3QTR CY10 – STS-133/ULF5.

Note: The daily ISS On-Orbit Status reports can also be found at

ISS On-Orbit Status 03/05/08

All ISS systems continue to function nominally, except those noted previously or below.

In the COL (Columbus Orbital Laboratory), FE-2 Leo Eyharts had an hour allotted to perform troubleshooting on a structural element which earlier (2/17) had prevented installation of a K-BAR (Knee-Brace Assembly Replacement) capture mechanism on the overhead F2 rack, as required for relocating of the MSG (Microgravity Science Glovebox) and EXPRESS Rack 3 (ER3). *[Today's troubleshooting dealt with repair and cleaning of a threaded hole on a standoff element for the right K-BAR capture fitting. The FE-2 used a vacuum cleaner to remove FOD (Foreign Object Debris) plus safety goggles, rubber gloves and a surgical mask for his protection.]*

Leo also continued COL commissioning, today unlocking (but not completely removing) the AVM (Anti-Vibration Mount) locking bolts of the module's ISFA (Intermodular Ventilation Supply Fan Assembly) and IRFA (Intermodular Ventilation Return Fan Assembly). *[The two fan assemblies are located at opposite sidewalls of the module, both behind cover panels.]*

Later, Eyharts assisted FE-1 Malenchenko in modifying (retrofitting) an air duct in the Service Module (SM) with an acoustic shield. *[With a joint crewtime of ~3 hrs allotted, work steps included establishing access to the air duct in the SM "ceiling" by removing a panel (#322), cutting the acoustic shield to size from a larger plate of the soft material with a hacksaw, installing the shield padding on panel 322, re-attaching the panel over the air duct and finally covering the acoustic shield with a piece of protective wire screen.]*

In the Lab, CDR Whitson meanwhile performed troubleshooting on ER3 (EXPRESS Rack 3) that earlier (2/25) was found to have a small leak (during demating) at the QD (Quick Disconnect) of the MTL (Moderate Temperature Loop) supply jumper hose between ER3 and the Z-panel. *[Troubleshooting steps included fully*

demating the hose, determining which side of the QD (Z-panel-side or jumper-side) had the problem if still present and, if so, examining the QD and cycling its movable parts if they are stuck. ER3 is slated to be transferred to the Columbus module as part of NASA's share in its utilization (~50%).]

In preparation for 1J/A EVA-5, Whitson had time set aside for taking torque measurements (with a Dial Torque Wrench) on three bolts of the spare TBA-5 (Trundle Bearing Assembly #5). *[Accurate running torque values are needed to determine final bolt torque settings for the fifth spacewalk, during which EV1 Bob Behnken and EV2 Mike Foreman will install the TBA in the starboard SARJ (Solar Alpha Rotary Joint).]*

After demating the BITS2-12 onboard telemetry measurement system in the SM from the BITS2-12 onboard transmitter (set #1, BP1A), FE-1 Malenchenko removed and replaced the BPA1 with a new unit brought up by Progress 28P. BITS2-12 was remated afterwards. *[The first inspection of the transmitter, located between panels 309 & 312, for possible malfunction was conducted by Yuri on 12/6/07.]*

The crew had an hour to review transfer and stowage plans for the 1J/A docked period, going through uplinked reference material (1J/A Transfer List, 1J/A Transfer Choreography, 1J/A Stowage Plan, and an overview of Stowage Requirements for the 1J/A Stage of Increment 16.). Afterwards, Peggy, Yuri and Leo held a 30-min. teleconference with ground specialists via S-band/audio to discuss transfer particulars.

In the Lab, Peggy Whitson closed down the OGS (Oxygen Generation System). *[This involved deactivating the WDS (Water Delivery System), turning off the OGS in its rack and demating the O₂ outlet QD, followed by purging the OGS H₂ (Hydrogen) sensor and re-installing the WGS on the OGS rack front.]*

With both OGS and the Elektron-VM O₂ (Oxygen) generator currently off, cabin air refreshes with O₂ are being performed by Malenchenko from Progress 28P storage (SrPK) as required.

Using the Russian IPD Draeger tube sampler (sensors 5C & 2A), Malenchenko checked for CO (Carbon Monoxide) in the SM.

Also in the Zvezda module, the FE-1 afterwards took readings of potentially harmful atmospheric contaminants with the CMS (Countermeasure System), part of the GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, which uses preprogrammed microchips to measure H₂CO (Formaldehyde, methanal), CO and

NH₃ (Ammonia), taking one measurement per microchip;

Continuing preparations in the U.S. Airlock for the five 1J/A EVAs, Whitson first inspected APFR WIF (Articulated Portable Foot Restraint/Worksite Interface Fixture) adapters for sharp edges, to aid in the ongoing spacesuit glove cut incident investigation, then terminated the BSA (Battery Stowage Assembly) recharging of the first set of EMU (Extravehicular Mobility Unit) batteries and started recharge on the second set.

As part of the current round of periodic preventive maintenance of RS (Russian Segment) ventilation systems, Yuri spent 20 min. in the Soyuz TMA-11/15S at the FGB nadir port, cleaning the screen of its BVN fan/heater assembly.

Afterwards, the Russian flight engineer conducted the periodic (monthly) functional closure test of the Vozdukh CO₂ removal system's spare emergency vacuum valves (AVK), in the spare parts kit. *[The AVKs are critical because they close the Vozdukh's vacuum access lines in the event of a malfunction in the regular vacuum valves (BVK) or a depressurization in the Vozdukh valve panel (BOA). Access to vacuum is required to vent CO₂ during the regeneration of the absorbent cartridges (PP). During nominal operation, the AVK valves remain open.]*

To support ground-conducted troubleshooting of the TVIS treadmill, CDR Whitson today had a TVIS checkout activity added to her timeline. After undergoing its regular 6-month maintenance on 3/3, a TVIS Stabilization Fault (S3) appeared during its first use, rendering the exercise device off limits for the crew all day yesterday. *[If there was no recurrence of the stabilization fault during today's checkout, Peggy was to perform a speed characterization test and download the test data as part of the nominal exercise file. The crew was then Go for using the TVIS as planned. If not, the treadmill would remain off limits until further troubleshooting, and the crew would use the other exercise hardware.]*

The FE-1 completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC (Contingency Water Container) from the Lab humidifier.]*

Yuri also conducted the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston,

Moscow, Baikonur).

In addition, working off his voluntary “time permitting” task list, Yuri –

- Conducted the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder), and
- Performed the daily monitoring, picture-taking and downloading for the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP).

At ~4:45am EST, Leo Eyharts powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply), to conduct, at 4:50am, a ham radio exchange with students at the Lycée (Secondary School) de la Borde Basse in Castres, France. Questions to Leo were uplinked by ARISS (Amateur Radio on ISS) beforehand. [*“What type of schooling and higher studies did you complete to enable you to become an astronaut? How long did you study for it?”; “What is the typical duration for a mission on board the space station (minimum & maximum?)”; “Could you describe one of the experiments that you are to conduct in the Columbus laboratory?”; “How do you resolve cases of onboard personal conflict (arguments)?”; “Do you lose the notion of time on the ISS? Do you have the same sleeping patterns as when you are on Earth?”*]

At ~7:35am, the ISS crew convened for their weekly teleconference with ISS Program Management at JSC/Houston via Private S/G2, S-band/audio.

COL Anomalies: As reported here yesterday, the FSL (Fluid Science Laboratory) rack shut down shortly after start-up and remained powered-down. Troubleshooting by Col-CC (Columbus Control Center/Oberpfaffenhofen) was performed today after Eyharts installed a NASA videocamera in front of FSL and checked a UIP (Utility Interface Panel) connector. The EuTEF (European Technology Exposure Facility) payload's Earth-viewing camera has failed to start up twice and is currently off. The SOLAR (Solar Monitoring Observatory) payload had a spontaneous reboot Monday (3/3) night and came back to nominal performance afterwards; Col-CC is assessing.

BCC Checkout Failure: Yesterday (3/3-3/4 overnight), ground teams initiated the standard two-hour checkout of BCC (Backup Control Center) swing and activation procedures that would be necessary in the event of a flight control transfer from Houston to the HSG (Houston Support Group) at TsUP-Moscow. The checkout failed when RGS-34 (Russian Groundsite 34) was unable to uplink a PPCP (PrePlanned Command Package) from MCC-Houston on DO3. For lack of time,

the backup pass uplink on DO5 was cancelled as well. HGS-M plans to re-perform the BCC Checkout at end-March. *[Purpose of the BCC Checkout is to demonstrate BCC functionality and provide proficiency training for HSR (Houston Support Room) personnel.]*

CEO photo targets uplinked for today were **Lahore, Pakistan** (*ISS had a nadir pass at midday over the Pakistan's second largest city of over 7 million people, approaching from the NW. As the station broke out of the mountains of Afghanistan, the crew was to look for this target on the northeastern part of the Indus River Plain, using the long lens settings and trying to map the urban margins*), **Mount Vesuvius** (*this famous stratovolcano is located on the west coast of Italy just east of the city of Naples. ISS pass was late morning southeastward down the Italian peninsula, and the crew was to aim just right of track for the bay of Naples and this isolated peak, using the long lens settings for details of the structure*), and **Madrean Sky Islands** (*this target is located in the northern reaches of Mexico's Sierra Madre Occidental which boast some of the richest biodiversity anywhere in North America. It is a veritable archipelago of cool, moist, higher-altitude pine-oak forested mountain ranges that dot the hot, lower Sonoran and Chihuahuan deserts of southern Arizona and New Mexico and northwestern Mexico. These climatological islands are situated in remote and rugged areas and are vestiges of cooler, wetter periods during the ice ages. On this midday pass from the NW, the crew was to use the short lens for a nadir, contextual mapping strip across the heart of this region*).

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 7:48am EST [= epoch]*):

Mean altitude -- 341.9 km

Apogee height -- 343.1 km

Perigee height -- 340.7 km

Period -- 91.37 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0001789

Solar Beta Angle -- -23.7 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 101 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53217

Significant Events Ahead (*all dates Eastern Time, some changes possible*):

03/08/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana)
(11:04pm EST);

03/09/08 -- *Change of US Standard Time to Daylight Saving Time (at 2:00am)*
03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS (JLP) – 2:28am EDT, for a record 16+1+2 mission duration, incl. 5 EVAs;
03/12/08??-- ATV CAM (Collision Avoidance Maneuver) demo
03/12/08 -- STS-123/Endeavour/1J/A docking – ~11:27pm EDT
03/18/08?? -- ATV1 parking orbit (loiter)
03/24/08 -- STS-123/Endeavour/1J/A undocking -- ~7:55pm
03/26/08 -- STS-123/Endeavour/1J/A deorbit – ~7:33pm; landing (KSC) -- ~8:35pm.
03/29/08?? -- ATV1 Demo Day 1
03/31/08?? -- ATV1 Demo Day 2
04/03/08 -- ATV1 Demo Day 3 (docking)
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch - ~7:16am
04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~8:43am
04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)
05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
05/25/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS
05/27/08 -- STS-124/Discovery/1J docking
06/05/08 -- STS-124/Discovery/1J undocking
08/07/08 -- ATV1 undocking
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD

2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
4QTR CY09 -- STS-130/19A - MPLM
1QTR CY10 – STS-131/ULF4
2QTR CY10 -- STS-132/20A – Node-3 + Cupola
3QTR CY10 – STS-133/ULF5.

ISS On-Orbit Status 03/04/08

All ISS systems continue to function nominally, except those noted previously or below.

Using the currently nonfunctional SKV-1 air conditioner setup, FE-1 Malenchenko worked with a wrench to hook up hoses and adapters, to connect it with an EDV container with U.S. Lab condensate water, then started its condensate evacuation pump (NOK-1) via laptop for transferring the condensate over to the SRV-K2M Condensate Water Processor, to prepare it for electrolysis in the Elektron oxygen generator. *[SKV-2 meanwhile continues to operate. The activities were monitored by TsUP-Moscow.]*

CDR Whitson continued her work with the InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions) experiment in the MSG (Microgravity Science Glovebox), conducting two more runs (#41 & #42) to complete the test series for the low frequencies at different current levels for the MR (magnetorheological) fluid, exchanging video tapes after each run, then removing the vial assembly and finally powering the MSG down. *[InSPACE, which is non-automated and has no ground-commanding capabilities (except for the MSG video drawer), obtains basic data on MR fluids, i.e., a new class of "smart materials" that can be used to improve or develop new brake systems, seat suspensions robotics, clutches, airplane landing gear, engine mounts, and vibration damper systems (e.g., the Dong Ting Lake Bridge in China is equipped with MR motion dampers to counteract gusts of wind). The colloidal (dispersed) particles are contained in Helmholtz coils (CAs/Coil Assemblies) in the MSG that subject them to electric fields at certain strength and frequencies. The desired strong dipolar interaction between the small colloidal particles can be achieved in micro-G simply with an external magnetic field being turned on and off. On the ground, the flow properties (rheology) of many materials, especially those making up consumer products like detergents, fabric softeners, toothpaste and paints, are similarly controlled, though not by magnetic fields but by adding a polymer. It now appears, for example, that*

new formulations of fabric softeners may perform better in space than on earth.]

Peggy Whitson and Leo Eyharts completed the regular prelaunch checkout of the Robotics complex (for which they had prepared themselves on 2/29), taking the MSS/SSRMS (Mobile Service System/Space Station Remote Manipulator System) through a series of joint-and-end effector maneuvers. *[Steps of the checkout included grappling the MBS PDGF-3 (Mobile Base System Power & Data Grapple Fixture 3), grappling & ungrapppling the Node-2 PDGF, then moving the robotarm to the 1J/A start position and finally performing a checkout of the Cupola & Lab RWS (Robotics Workstations).]*

FE-1 Malenchenko performed the periodic checkout/verification of IP-1 airflow sensors in the various RS (Russian segment) hatch openings (8) in the Service Module (SM), FGB and DC1 (Docking Compartment).

Afterwards, the FE-1 conducted the periodic/long-term inspection of the pressure hull in the DC1, taking detailed digital NIKON D2X photographs of portions of the shell behind service panel 301 to check for the presence of contamination, atmospheric condensate, micro-flora and corrosion. *[Any contamination was to be cleaned off with napkins, and the best quality photos were to be downlinked later via OCA.]*

Whitson worked in the U.S. Airlock in preparation for the five 1J/A EVAs, first starting the recharge process on EMU (Extravehicular Mobility Unit) batteries in the BSA (Battery Stowage Assembly), then checking out three PGTs (Pistol Grip Tools) and two SAFER (Simplified Aid for EVA Rescue) units. *[The PGT batteries used for the checkout are to be recharged tomorrow. The two checked-out SAFERs are #1006 & #1007.]*

Peggy also conducted the periodic (every two weeks) inspection of the RED (Resistive Exercise Device) canister bolts for re-tightening if required, followed by the monthly inspection of canister cords and RED accessories.

Yuri had two hours set aside for the periodic RS (Russian Segment) window inspection & photography, today in the SM and DC1, using a tool kit with ruler, adhesive tape, 90-deg equilateral triangle & measuring tape, the NIKON D2 X digital camera with 28-70 mm lens, a flash attachment, and sketches of the windows under scrutiny (#2 & #13 in SM, plus window VL1 in DC1) with previous detected flaws marked and flaw tables. *[Purpose of the activity is to assess the condition of the window panes for deterioration as compared to the data from previous increments (appearance of new cavities, scratches, discolorations, or spots reducing transparency, or an increase in the size of old flaws), plus photography. Then images and data tables were stored on the RSK1 laptop for*

subsequent downlink via OCA.]

Malenchenko later switched the Regul Packet communications channel from Regul Set 1 to Set 2 to support tonight's ground-commanded propellant transfer activities. *[Regul provides for two-way voice communication, digital command/program information as well as telemetry transmission via RGS (Russian Groundsites). It also has the capability to receive and transmit range, radial velocity, and time-referenced information. It is the nominal uplink path for all Russian commands and is the only subsystem that operates using the Command Radio Link (KRL). Operating at a low data rate, it is equivalent to the U.S. S-band system. There is no Russian equivalent of the U.S. high data rate Ku-band system, based on the TDRS satellites.]*

The FE-1 completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC (Contingency Water Container) from the Lab humidifier.]*

Yuri also conducted the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

In addition, working off his voluntary "time permitting" task list, Malenchenko conducted the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder), and

FE-2 Eyharts again had an hour reserved on his schedule for preparing end-of-increment/departure cleanup and prepacking.

In the SM, Leo set up the video equipment for filming his subsequent workout on the TVIS (Treadmill with Vibration Isolation & Stabilization) for biomechanical evaluation of his performance and assessment of the hardware status by ground engineers. *[He is scheduled for a similar video-recorded workout on the RED tomorrow. Peggy's and Yuri's exercise videos were filmed earlier in the Increment.]*

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS

cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Peggy transferred the crew's exercise data file to the MEC (Medical Equipment Computer) laptop for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

The crewmembers had their standard periodic PMC (Private Medical Conference) via S- & Ku-band audio/video.

At ~10:40am EST (4:40pm in France), Leo Eyharts supported two live PAO TV downlinks for ESA, one with France 2 Public Television (Laurent Delahousse) for ~6 min., the other with the Cite de l'Espace Space Museum in Toulouse (former ESA astronaut and current French minister Claudie Haigneré & Museum Director Jean-Luc Modenc with several students) for ~14 min.

At ~3:15pm, the crew will have their 13th weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. *[S/G-2 (Space-to-Ground 2) phone patch via SSC-10 (Station Support Computer 10)].*

FSL Anomalies: After Leo Eyharts successfully completed yesterday's FSL (Fluid Science Laboratory) activities in the Columbus module and Col-CC/Oberpfaffenhofen established TCS (Thermal Control System) flow to the rack, it was observed that the mass flow rate into the rack was 6 kg/hrs less than the nominal flow rate. Additionally, when Col-CC powered up the rack auxiliary power, no power draw was evident. When ground controllers re-attempted commanding the FSL rack to ON, a short current draw was observed which then returned to zero. FSL was powered off last night, and ground teams went to work determining a forward plan.

Russian Prop Transfer: After last night's transfer of fuel (UDMH, unsymmetrical dimethyl hydrazine) from Progress M-63/28P's refueling tanks to the SM's ODU (Integrated Propulsion System) BG2 tank, TsUP-Moscow is scheduled tonight to perform transfer of oxidizer (N_2O_4 , nitrogen tetroxide) to the SM's BO2 tank during Daily Orbits DO15/16/1/2 (5:50pm-11:00pm EST), pumping out N_2 (nitrogen) using the K2 compressor. No crew involvement required.

Weekend Voluntary Science: Three optional activities for the voluntary "Saturday Science" program for next weekend (3/8-3/9) were suggested to Peggy for her choice. Selection is required by tonight. *[The choices are: (1) SWAB (Surface, Water and Air Biocharacterization) collections of air & surface samples; (2)*

InSPACE-2 – three experiment runs; and (3) EPO – Careers Demo (Identify all the different steps crewmembers have taken to get to where they are today; identify all the different NASA careers that work together to prepare an astronaut for spaceflight (Objective: to motivate students to strive for a career in science, technology, engineering, and mathematics and to someday work for NASA).]

CEO photo targets uplinked for today were **Chaing Mai, Thailand** (*this sprawling metropolitan area is the economic and cultural center of northern Thailand. Because this target has not been successfully acquired in the past, the ground team requested short lens, contextual views of the region to help locate it in the future. The crew had an excellent nadir pass over this target in early afternoon sun. As ISS approached from the NW, the crew was to look for urban areas in the complex of ridges and valleys*), **Lake Eyre, Australia** (*this large, mostly dry lakebed is a landmark feature of south central Australia. Just below sea level, the drainage of about one-seventh of the continent centers here and the presence or lack of water is indicative of variation in precipitation patterns observed over the eastern half of the continent. On this mid-afternoon pass, shooting primarily nadir and left of track for contextual views of water drainage pattern*), and **Oasis Impact Crater** (*this feature in eastern Libya is about 18km in diameter. Unlike numerous other circular features in the Sahara desert, it is actually an impact site nearly 120 million years old. ISS approach was from the NW in early afternoon. With a near nadir pass, trying for long lens views with great detail*).

CEO photography can be studied at this “Gateway” website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 7:08am EST [= epoch]*):

Mean altitude -- 341.0 km

Apogee height -- 343.5 km

Perigee height -- 340.5 km

Period -- 91.37 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0002241

Solar Beta Angle -- -28.5 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 116 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53201

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

03/08/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)

(11:04pm EST);

03/09/08 -- *Change of US Standard Time to Daylight Saving Time (at 2:00am)*

03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS (JLP) – 2:28am EDT, for a record 16+1+2 mission duration, incl. 5 EVAs;
03/12/08??-- ATV CAM (Collision Avoidance Maneuver) demo
03/12/08 -- STS-123/Endeavour/1J/A docking – ~11:27pm EDT
03/18/08?? -- ATV1 parking orbit (loiter)
03/24/08 -- STS-123/Endeavour/1J/A undocking -- ~7:55pm
03/26/08 -- STS-123/Endeavour/1J/A deorbit – ~7:33pm; landing (KSC) -- ~8:35pm.
03/29/08?? -- ATV1 Demo Day 1
03/31/08?? -- ATV1 Demo Day 2
04/03/08 -- ATV1 Demo Day 3 (docking)
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch - ~7:16am
04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~8:43am
04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)
05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
05/25/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS
05/27/08 -- STS-124/Discovery/1J docking
06/05/08 -- STS-124/Discovery/1J undocking
08/07/08 -- ATV1 undocking
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
2QTR CY09 -- STS-128/17A - MPLM, last crew rotation

05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**

3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2

4QTR CY09 -- STS-130/19A - MPLM

1QTR CY10 – STS-131/ULF4

2QTR CY10 -- STS-132/20A – Node-3 + Cupola

3QTR CY10 – STS-133/ULF5.

ISS On-Orbit Status 03/03/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 20 of Increment 16.*

FE-1 Malenchenko updated software on the Russian RS1 laptop HDD (Hard Disk Drive). *[After first connecting the A31p to the AGAT external monitor (temporarily disconnected from TP2 laptop), the FE-1 "ghosted" (cloned) its HDD with Vers. 07.05 file structure from a DVD, then updated the RS1 HDD new software from an USB memory stick, and created a copy of the load.]*

Afterwards, Malenchenko conducted the periodic/long-term inspection of the pressure hull in the Service Module Working Compartment (SM RO), looking for any moisture, deposits, mold, corrosion and pitting behind panels 107, 109, 130, 134, 135, 138, 139, 452, also underneath the TVIS treadmill (where deposit was discovered earlier) and the cold plates (where SNT and STR lines are installed). *[The inspection of the hull surface, which is coated with a primer and dark-green enamel, is done using cleaning napkins to wipe the area in question if required and reporting results to the ground. The hull inspection looks for changed color and cavities; if cavities are found, they are to be measured for depth after cleaning. Digital photographs of the shell before and after the removal of deposits will be made for documentation.]*

In the COL (Columbus Orbital Laboratory), FE-2 Eyharts activated the FSL ISPR (Fluid Science Laboratory/International Standard Payload Rack) for operation. *[Activation was preceded by installation of gap closures to protect against inadvertent access to the free spaces in the FCE (Facility Core Element) drawer structure, and installation of a video bypass to allow correct VMU (Video Management Unit) function without installed EC (Experiment Container). Activation also included verification of functionality of the rack's fire indicator system.]*

Whitson and Eyharts performed the major 6-month IFM (In-flight Maintenance) job

on the TVIS (Treadmill with Vibration Isolation & Stabilization), first checking its operation, then turning its 20 amp power circuit breaker off and completing the required parts replacements after allowing it to cool down for about one hour. *[The initial ops check consisted of Peggy listening to the roller noise and watching the belt movement with the belt running unmanned at ~10 mph, to compare it later to the speed characterization test at the end of the IFM. Afterwards, the CDR performed the 6-month maintenance, inspecting the roller bearings and replacing such parts as TVIS retainer plate fasteners, clamp rope assembly screw and gyroscope wire ropes.]*

The CDR also relocated the IVCPDS/TEPC (Intravehicular Charged Particle Directional Spectrometer/Tissue Equivalent Proportional Counter), the primary radiation measurement tool in the ISS, from the SM to the COL. *[TEPC was installed on the COL1A3 panel and plugged in at the J01 outlet on the COL1AD1 panel. Dan Tani had relocated TEPC to the SM (panel 410) on 1/23/08 after it had been running in Node-2 since 12/24/07.]*

Yuri Malenchenko continued his test program with the new KPT-2 BAR-RM payload equipment begun on 2/13, today taking more measurements with the AU-1 ultrasound analyzer in the FGB and later downlinking the data via BSR-TM channel. The data are being used for experimenting with ISS leak detection. *[BAR-RM is designed to develop a procedure for detection of air leakage from ISS modules based on environmental data anomalies (temperature, humidity, ultrasound emissions) at possible leak locations. The payload, controlled from the RSK1 laptop, uses a remote infrared thermometer (Kelvin-Video), a thermohygrometer (Iva-6A), a heat-loss anemometer/thermometer (TTM-2), an ultrasound analyzer (AU-01), and a leak detector (UT2-03) to determine physical background signs of loss of ISS pressure integrity which could be indicative of leaks in the working compartments of the station. Measurements are taken in specific zones (13 in SM PkhO and 4 in DC1), both with lights & fans turned on and off.]*

Leo Eyharts had ~20 min set aside for taking situational video/photography of the Columbus module at its current status, for historic documentation.

Whitson undertook the monthly FDS PEP (Fire Detection & Suppression/Portable Emergency Provisions) safety inspection/audit. *[The IMS (Inventory Management System)-supported inspection involves verification that PFEs (portable fire extinguishers), PBAs (portable breathing apparatus), QDMAs (quick-don mask assemblies) and EHTKs (extension hose/tee kits) are free of damage to ensure their functionality, and to track shelf life/life cycles on the hardware (QDMA harness inspection was not required this time). In the USOS, there are a total of 5 PFEs and 7 PBAs, plus 7 QDMAs and 4 EHTKs.]*

FE-1 Malenchenko completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC (Contingency Water Container) from the Lab humidifier.]*

The FE-1 also conducted the daily IMS maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

In addition, working off his voluntary “time permitting” task list, Yuri –

- Conducted the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder), and
- Performed the daily monitoring, picture-taking and downloading for the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP).

FE-2 Eyharts had an hour reserved on his regular schedule for preparing end-of-increment/departure cleanup and prepacking.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-2), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Peggy then transferred the crew’s exercise data file to the MEC (Medical Equipment Computer) laptop for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Russian Prop Transfer: Tonight during Daily Orbits DO14/15/1/2 (~5:30pm-10:35pm EST), TsUP/Moscow will be transferring propellants from the Progress M-63/28P cargo ship’s BG1,2 refueling tanks to the SM’s ODU (Integrated Propulsion System) BG2 tank, while pumping out N₂ using the K2 compressor. No crew involvement required.

RPC Trip Update: RPC-3 (Remote Power Controller 3) which tripped on 2/24 in

RPCM (RPC Module) LA2B_G, was successfully closed on 2/29, as reported, followed by successful commanding of the MTL RFCA (Moderate Temperature Loop Rack Flow Control Assembly) valve in Node-1 to the correct flow position to support the US Airlock depress pump for the 1J/A EVAs. Early this morning, RPC-3 tripped again. No further troubleshooting is planned before Flight 1J/A..

U.S. Condensate Water Processing: Currently, Lab/CCAA (Common Cabin Air Assembly) condensate cannot be processed in the RS (Russian Segment), and teams are considering a water dump for lack of sufficient CWC (Contingency Water Container) stowage room. However, RSC-Energia will try a new process tomorrow of using the SKV condensate pump to transfer US water which could then be processed in the RS (for Elektron).

OGS Performance: The U.S. Oxygen Generation System continues to run nominally since activation on 2/28; it will be deactivated on 2/5 (Wednesday).

RSK1 Laptop Failure Update: After the recent unsuccessful attempts by Yuri to load the Russian RSK1 laptop with an ATV (Automated Transfer Vehicle) docking simulation application, RSC-Energia plans to uplink the CBT (Computer-based Training) package, modified for the previous software version 1.2, on 3/6 (Thursday) via U.S. OCA assets.

COL Condensate Processing: Troubleshooting is underway by ESA on hardware & procedures for processing COL condensate.

No CEO photo targets uplinked for today.

CEO photography can be viewed and studied at this "Gateway" website: <http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (as of this morning, 8:42am EST [= epoch]):

Mean altitude -- 342.1 km

Apogee height -- 343.7 km

Perigee height -- 340.4 km

Period -- 91.38 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0002442

Solar Beta Angle -- -33.3 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 137 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53186

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

03/08/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana) (~10:59pm EST);
03/09/08 -- *Change of US Standard Time to Daylight Saving Time (at 2:00am)*
03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS (JLP) – 2:28am EDT, for a record 16+1+2 mission duration, incl. 5 EVAs;
03/12/08??-- ATV CAM (Collision Avoidance Maneuver) demo
03/12/08 -- STS-123/Endeavour/1J/A docking – ~11:27pm EDT

ISS On-Orbit Status 03/02/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday -- off-duty day for CDR Whitson, FE-1 Malenchenko & FE-2 Eyharts. Ahead: Week 20 of Increment 16.*

For today's Voluntary Science program, Peggy Whitson continued her work with the InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions) experiment in the MSG (Microgravity Science Glovebox), conducting another three runs (#38, #39 and #40) to investigate higher-frequency behavior (2 Hz for #38 & #39, 5Hz for #40) at different current levels for the MR (magnetorheological) fluid with no vial change, exchanging video tapes after each run, then removing the vial assembly and finally powering the MSG down.

[InSPACE obtains basic data on MR fluids, i.e., a new class of "smart materials" that can be used to improve or develop new brake systems, seat suspensions robotics, clutches, airplane landing gear, and vibration damper systems. The colloidal (dispersed) particles are contained in CAs (Coil Assemblies) in the MSG that subject them to electric fields at certain strength and frequencies. The desired strong dipolar interaction between the small colloidal particles can be achieved in micro-G simply with an external magnetic field being turned on and off. On the ground, the flow properties (rheology) of many materials, especially those making up consumer products like detergents, fabric softeners, toothpaste and paints, are similarly controlled, though not by magnetic fields but by adding a polymer. It now appears, for example, that new formulations of fabric softeners may perform better in space than on earth.]

FE-1 Malenchenko completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including ASU toilet facilities systems/replaceables plus the weekly collection of the toilet flush counter (SPK-U) and water supply (SVO) readings for calldown to TsUP/Moscow. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U*

urine container, replacement of the KOV EDV for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC (Contingency Water Container) from the Lab humidifier. Weekly SOZh reports (on Sundays) to TsUP/Moscow deal with number & dates of water and urine containers, counter readings of water consumption & urine collection, plus data and total operating time of the Russian POTOK-150MK (150 micron) air filter unit of the SOGS air revitalization subsystem.]

After Houston flight controllers deactivated the CDRA (Carbon Dioxide Removal Assembly) early this morning (4:00am-9:00am EST) and cooling was no longer required, CDR Whitson disconnected the ITCS LTL QD (Internal Thermal Control System/Low Temperature Loop/Quick Disconnect) jumper to the CDRA rack (LAB1D6).

Working from the Russian voluntary "time permitting" task list, Yuri Malenchenko –

- Completed his eighth run of the Russian DZZ-2 "Diatomeya" ocean observations program *[using the NIKON F-5 digital still camera with 80-200 mm lens and the SONY PD-150P camcorder at medium zoom, Yuri focused on phytoplankton field blooming in early March in the sub-arctic front of the Atlantic and bioproductive processes intensifying at this time of year in the Indian Ocean due to restructuring of the monsoon circulation; also of interest were associated oceanic phenomena (cloud pattern, water surface dynamics) in the target areas, today in the Indian Ocean the Oman coastal area and the areas west of Australia, and in the Atlantic Ocean the Gulf of Saint Lawrence and the Western Sahara offshore area];*
- Conducted the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder), and
- Performed the daily monitoring, picture-taking and downloading for the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP).

At ~3:45am, the FE-1 participated in today's Presidential Election in the Russian Federation with a personal downlink at ~3:45am EST as a Crew Choice event via RGS (Russian Ground Site) VHF.

Eyharts and Whitson had their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-10 laptop), Leo at ~10:45am EST, Peggy at ~12:12pm

The crewmembers completed their regular 2.5-hr. physical workout program (about

half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1, FE-2), RED resistive exercise device (CDR) and VELO bike with bungee cord load trainer (FE-1, FE-2).

No CEO photo targets uplinked for today.

CEO photography can be viewed and studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,001 from the ISS alone).

ISS Orbit (as of this morning, 8:18am EST [= epoch]):

Mean altitude -- 342.2 km

Apogee height -- 343.9 km

Perigee height -- 340.6 km

Period -- 91.38 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0002485

Solar Beta Angle -- -38.0 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 155 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53170

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

03/08/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana)
(~11:05pm EST); **NEW**

03/09/08 -- *Change of US Standard Time to Daylight Saving Time*

03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS
(JLP) -- 2:28am EDT, 16+1+2

03/12/08 -- ATV CAM (Collision Avoidance Maneuver) demo

03/12/08 -- STS-123/Endeavour/1J/A docking -- ~11:27pm EDT

03/18/08 -- ATV1 parking orbit (loiter)

03/24/08 -- STS-123/Endeavour/1J/A undocking -- ~7:55pm

03/26/08 -- STS-123/Endeavour/1J/A deorbit -- ~7:33pm; landing (KSC) -- ~8:35pm.

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking)

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch

04/10/08 -- Soyuz TMA-12/16S docking (DC1)

04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)

05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)
 05/25/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS
 05/27/08 -- STS-124/Discovery/1J docking
 06/05/08 -- STS-124/Discovery/1J undocking
 08/07/08 -- ATV1 undocking
 08/12/08 -- Progress M-65/30P launch
 08/14/08 -- Progress M-65/30P docking (SM aft port)
 08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
 09/09/08 -- Progress M-64/29P undocking (from DC1)
 09/10/08 -- Progress M-66/31P launch
 09/12/08 -- Progress M-66/31P docking (DC1)
 10/01/08 -- **NASA 50 Years**
 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
 10/12/08 -- Soyuz TMA-13/17S launch
 10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
 10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
 10/18/08 -- STS-126/Discovery/ULF2 docking
 10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
 11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
 11/20/08 -- **ISS 10 Years**
 11/26/08 -- Progress M-67/32P launch
 11/28/08 -- Progress M-67/32P docking (SM aft port)
 12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
 12/06/08 -- STS-119/Discovery/15A docking
 12/15/08 -- STS-119/Discovery/15A undocking
 1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
 05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
 3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
 4QTR CY09 -- STS-130/19A - MPLM
 1QTR CY10 – STS-131/ULF4
 2QTR CY10 -- STS-132/20A – Node-3 + Cupola
 3QTR CY10 – STS-133/ULF5.

Note: The daily ISS On-Orbit Status reports can also be found at

ISS On-Orbit Status 03/01/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday -- off-duty day for CDR Whitson, FE-1 Malenchenko & FE-2 Eyharts except for housekeeping and voluntary work.*

The crew completed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the CDR's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

As part of the house cleaning, Malenchenko performed preventive maintenance cleaning on the FS5, FS6, FS9, VPkhO, VdPrK, VPrK & TsV2 fan grilles in the SM, DC1 Docking Module, and FGB (Funktsionalnyi-Grusovoi Blok).

Later, Peggy conducted the visual microbial (bacterial & fungal) "T+5 Day" analysis of surface samples which she collected on 2/25 with the SSK/MAS (Surface Sampling Kit/Microbial Air Sampler) at specific locations near air diffusers in the COL (Columbus Orbital Laboratory). *[The sampling analysis is performed once per month for the first three months, and once every three months thereafter. Bacterial and fungal air samples are taken at two locations in each module. The colony growth on the sampling slides is analyzed after five days of incubation in four Petri dishes. For onboard visual analysis of media slides from SSK (Surface Sampling Kit), MCDs (microbial capture devices) from WMK (Water Monitoring Kit), coliform detection bags from MWAK (Microbial Water Analysis Kit), and Petri dishes from the MAS kit, the crew has a procedure for visual inspection of samples for bacterial and fungal colony growths after appropriate incubation periods.]*

FE-2 Eyharts filled out the regular FFQ (Food Frequency Questionnaire), his second, on the MEC (Medical Equipment Computer). *[By means of these FFQs, NASA/ESA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins.]*

The CDR worked on the U.S. OGS (Oxygen Generation System), removing the PWR (Payload Water Reservoir after verifying that it was empty and replacing it with a full PWR (#2004), then reactivating the OPS WDS (Water Delivery System). *[The ground monitored the activity via S-band and returned the unit to "Process" after R&R completion. Like the Elektron, OGS produces O₂ from water by electrolysis, dumping the also generated H₂ (hydrogen) through venting.]*

Yuri Malenchenko worked a number of standard maintenance/service tasks on Russian Segment (RS) systems, specifically –

- Completing the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM *[regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers];* and - working from the Russian voluntary "time permitting" task list -
- Conducting the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder);
- Performing the periodic collection & deletion of readings on the MOSFET (metal oxide semiconductor field-effect transistor) radiation sensor reader/display of the RBO-3-2 Matryoshka-R anthropomorphic (human torso) "phantoms" located inside the station for sophisticated radiation studies, collecting radiation measurements every 15 minutes around the clock;
- Completing a run with the Russian "Uragan" (hurricane) earth-imaging program, using the Nikon D2X digital camera with 800 mm focal length lens plus video footage using the SONY HVR-Z1J digital high-definition camcorder provided last year by VC12 (Visiting Crewmember #12) Charles Simonyi *[targets uplinked for today were fires in the Volga-Akhtubinsk alluvial plain, contamination in Caspian Sea waters, Aral Sea and dust storm (if present), video footage of the Pyrenees mountains (from DC1 window 2), video footage of Pyrenees mountains (Window 2 in DC1), Patagonia Glaciers and Icebergs in the Drake Passage];* and
- Performing another KPT-3 session to make observations and take aerial

KPT-3 photography of environmental conditions for Russia's Environmental Safety Agency (ECON), using the Nikon D2X digital camera with SIGMA 300-800mm telephoto lens today to document water surface contamination in the Sevastopol port area.

A new item on the U.S. discretionary "job jar" task list for Peggy Whitson has her move the PCS (Portable Computer System) A31p laptop in the SM from the PCS-2 port to the PCS-1 port (since the latter remains powered in case the FGB fire safing response is initiated). *[Previously unable to support the higher electrical draw of the A31p, the port has meanwhile been upgraded and is ready to power the SM PCS.]*

A second new task in the "job jar" is for Leo Eyharts to start preparing end-of-increment/departure cleanup and prepacking.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1, FE-2).

Peggy then transferred the crew's exercise data file to the MEC laptop for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~5:55am EST, the crew downlinked a PAO TV message of greetings and congratulations to TsUP-Moscow for replay on March 13 at the 50th Anniversary of the liquid-fuel rocket engine manufacturing plant Proton-PM in Perm, builder of the engines for the Proton booster, headed by General Director Igor Alexandrovich Arbuzov. *["Dear Igor Alexandrovich, dear Proton team members: On behalf of the International Space Station crew we wish happy 50th Anniversary to the special enterprise for manufacturing liquid fuels rocket engines. You are the only enterprise in the country that builds first-stage engines for the Proton booster, which are recognized today as the most reliable in the world. By using your engines we have built our space home – the International Space Station. The trademark of your facility rests on exemplary work ethic, teamwork, skilled technical team, its talent and professionalism. We are certain that your sense of responsibility, the warmth of your hands and hearts applied to your work will serve our country well for many years to come. We wish your whole team and veterans of the enterprise new achievements, good health, and prosperity. We are certain that the product manufactured in Perm region will always be reliable, powerful and in great demand in Russia."]*

At ~7:15am, Yuri Malenchenko had his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop).

At ~9:00am, the crewmembers held their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP/Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

CDRA Update: After yesterday's IFM (In-Flight Maintenance) on the Carbon Dioxide Removal Assembly by Peggy Whitson, CDRA continues to operate nominally. *[CDRA Bed 2 (#202) temperature sensor A had recently shown erratic behavior and signs of degradation that reduced system functionality, causing the bed heaters to shut off during times when they should have heated the bed to "bake out" the adsorbed CO₂. In the IFM, Peggy used four pin/socket jumpers to provide connectivity between CDRA Bed 2's redundant temperature sensors B and C while bypassing the erratic temperature sensor A. After the jumpers were installed, CDRA was successfully activated.]*

RPC Trip Update: The trip of RPC-3 (Remote Power Controller 03) in RPCM (RPC Module) LA2B_G last weekend (2/24) has proved to have been due to an overcurrent. The RPC, which powers the MTL RFCA (Moderate Temperature Loop Rack Flow Control Assembly) in Node-1, used to provide more MTL flow to the US Airlock depress pump during EVAs, was closed yesterday morning and has remained closed to date, indicating the trip may have been spurious.

COL Update: Columbus module and systems are reported to perform nominally.

Weekly Science Update (Expedition Sixteen -- Week 19)

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): Radiation measurements continue to be performed in the PIRS module. Radiation measurements continue to be performed in the PIRS module. The latest memory card exchange occurred yesterday (2/29).

ANITA: Completed.

BCAT-3 (Binary Colloidal Alloy Test 3): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): In progress.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): In progress.

EuTEF (European Technology Exposure Facility): On 02/26, the EuTEF MMU (Mass Memory Unit) troubleshooting procedure has been successfully performed and DHPU (Data Handling & Power Unit) full functionality has been recovered. To date, 8 out of 9 instruments have been checked out from ground, mostly successfully but with some anomalies under assessment. On 2/27, EuTEF platform had to be powered down (“graceful shutdown”) after some erroneous TM (telemetry) was encountered. After power cycling, situation is back to nominal. The EuTEF science program via scripts will begin soon.

Fluid Science Laboratory (FSL): The FSL Facility commissioning continues this week and next week, with the following look-ahead activities for Week 20: - Last mechanical configuration;- First Fluid Science Laboratory (FSL) Rack activation and software upgrade;- Optical check-out activities;- GEOFLOW Experiment Container (EC) insertion into FSL; - GEOFLOW check-out activities; - First GEOFLOW science runs.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): In progress.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Following troubleshooting activities performed during Week 17, telemetry has been downlinked and analysed by KUBIK PD (Payload Developer). All is nominal.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION/REPOSITORY: "Leo, thank you for your attention to detail in completing the FD15 Nutr/Rep session. The information conveyed via crew notes was very helpful."

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): In progress.

SOLAR (Solar Monitoring Observatory): Some software glitches have been repeatedly encountered with the Sun Pointing Device platform, and are currently under investigation. Temperature and power monitoring is ongoing and reported as nominal. Some anomalies have also been encountered with a sub-system (DIARAD) of the SOVIM instrument, which had to be powered off until further assessment. The SOLAR instruments are currently outgassing, and some calibrations of the SOLSPEC instrument lamps and some Command Schedules for SOL-ACES are performed before the science program is started.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): In progress.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: In progress.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels):

“Thanks Leo for your great work in setting up this first BIOLAB experiment! WAICO is now running autonomously in the Incubator. We encountered a silent Caution yesterday late night during the activation of the experiment, triggered by slightly too high O₂ concentration in the LSM (Life Support Module). We have now recovered the temperature, centrifuge, illumination and humidity controls; we expect no major science impacts so far. The nominal growth period is 14 days, and we will continue to monitor the plants on a daily basis.”

CEO (Crew Earth Observation): Through 2/26 the ground has received a total of 15,305 frames of ISS/CEO imagery for review and cataloging. “After the break for STS-122 support, we are currently working through requested sessions for: South Tibesti Megafans; East Venezuela Land Use; Lake Nasser, Toshka Lakes, Egypt; Pilcomayo River Dynamics, Argentina; and the Ganges River Delta. We hope to provide feedback in the coming weeks. We have received only 137 new images since the recent crew change and look forward to more. Your recent, incredibly detailed view of Perth-Amboy, New Jersey will be published on NASA/GSFC’s Earth Observatory Website this weekend.”

CEO photo targets uplinked for today were **Lahore, Pakistan** (*weather was predicted to be clear for this nadir pass over the city of Lahore. Lahore is the second largest city in Pakistan, and is located on the banks of the River Ravi. Overlapping nadir mapping frames, taken along-track, were requested to capture a rural-urban-rural transect as ISS crossed the city from NW to SE*), **Florida Coastal Everglades, FL** (*this LTER [Long Term Ecological Research] site monitors the Everglades, Florida's "river of grass". Extensive human alteration of the surface hydrology of the region has produced numerous impacts on the Everglades' flora and fauna. ISS had a nadir pass along the southwestern coast of Florida; overlapping mapping frames of the coastal wetlands were requested*), **Central-Arizona Phoenix, AZ** (*ISS orbit track passed over the southwestern portion of the Phoenix metropolitan area - currently the focus of development in this important southwestern urban center. Study of the ecological changes that accompany urbanization in an arid climate is the focus of the Central Arizona-Phoenix LTER site. High resolution nadir frames acquired along track are useful for monitoring land use/land cover change resulting from urban development*), and **Madrean Sky Islands, N. America** (*the Madrean sky islands are enclaves of Madrean pine-oak woodlands, found at higher elevations in a complex of small mountain ranges in*

southern Arizona and New Mexico and northern Mexico. The sky islands are surrounded at lower elevations by the Sonoran and Chihuahuan deserts. Overlapping nadir mapping frames of the mountain summits and ridgelines, taken along track, were requested).

CEO photography can be viewed and studied at the websites:

<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);

<http://earthobservatory.nasa.gov/>

<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 8:04am EST [= epoch]):

Mean altitude -- 342.4 km

Apogee height -- 344.0 km

Perigee height -- 340.8 km

Period -- 91.38 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0002399

Solar Beta Angle -- -42.5 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 160 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53154

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

03/07/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)

(~11:23pm EST); docking 4/3

03/09/08 -- *Change of US Standard Time to Daylight Saving Time*

03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS (JLP) – 2:28am EDT, 16+1+2

03/12/08 -- ATV CAM (Collision Avoidance Maneuver) demo

03/12/08 -- STS-123/Endeavour/1J/A docking – ~11:27pm EDT

03/18/08 -- ATV1 parking orbit (loiter)

03/24/08 -- STS-123/Endeavour/1J/A undocking -- ~7:55pm

03/26/08 -- STS-123/Endeavour/1J/A deorbit – ~7:33pm; landing (KSC) -- ~8:35pm.

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking)

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch

04/10/08 -- Soyuz TMA-12/16S docking (DC1)

04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)

05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
 05/14/08 -- Progress M-64/29P launch
 05/16/08 -- Progress M-64/29P docking (DC1)
 05/25/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS
 05/27/08 -- STS-124/Discovery/1J docking
 06/05/08 -- STS-124/Discovery/1J undocking
 08/07/08 -- ATV1 undocking
 08/12/08 -- Progress M-65/30P launch
 08/14/08 -- Progress M-65/30P docking (SM aft port)
 08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
 09/09/08 -- Progress M-64/29P undocking (from DC1)
 09/10/08 -- Progress M-66/31P launch
 09/12/08 -- Progress M-66/31P docking (DC1)
 10/01/08 -- **NASA 50 Years**
 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
 10/12/08 -- Soyuz TMA-13/17S launch
 10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
 10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
 10/18/08 -- STS-126/Discovery/ULF2 docking
 10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
 11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
 11/20/08 -- **ISS 10 Years**
 11/26/08 -- Progress M-67/32P launch
 11/28/08 -- Progress M-67/32P docking (SM aft port)
 12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
 12/06/08 -- STS-119/Discovery/15A docking
 12/15/08 -- STS-119/Discovery/15A undocking
 1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
 05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
 3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
 4QTR CY09 -- STS-130/19A - MPLM
 1QTR CY10 – STS-131/ULF4
 2QTR CY10 -- STS-132/20A – Node-3 + Cupola
 3QTR CY10 – STS-133/ULF5.

ISS On-Orbit Status 02/29/08

All ISS systems continue to function nominally, except those noted previously or below. *Today is February's fifth Friday, because of its 29 Leap Year days; the last time February had 5 Fridays was in 1980 and next time will be in 2036.*

Before breakfast and exercise, FE-2 Eyharts performed his first PHS (Periodic Health Status) w/Blood Labs examination. CDR Whitson assisted in drawing blood and using the U.S. PCBA (Portable Clinical Blood Analyzer). The second part of PHS, Subjective Clinical Evaluation, was performed later in the day. *[The PHS exam, with PCBA analysis and clinical evaluation, is guided by special software (IFEP, In-Flight Examination Program) on the MEC (Medical Equipment Computer). While PCBA analyzes total blood composition, the blood's hematocrit is particularly measured by the Russian MO-10 protocol.]*

In preparation for 1J/A arrival and transfer of the JAXA ELM-PS (Experiment Logistics Module - Pressurized Section), called JLP for short, the CDR installed the CBCS (Centerline Berthing Camera System) at the Node-2 zenith (upper) hatch, powered it up and checked it out. Afterwards, she disconnected the CBCS electronics cables to avoid hatch "dragthroughs". *[JLP will be transferred from the Shuttle cargo bay with the SSRMS on 3/14 and berthed at the Node-2 zenith CBM (Common Berthing Mechanism) during EVA-1 (of five EVAs total) by Rick Linnehan (EV1) & Garrett Reisman (EV2).]*

Afterwards, Whitson moved to the Airlock (A/L), connected EMU (Extravehicular Mobility Unit) #3008 to the SCU (Service & Cooling Umbilical) and initiated the standard 1-hr scrubbing process on the spacesuit's cooling water loops, filtering ionic and particulate matter (via a 3-micron filter). No iodination for biocide maintenance was required this time. The cooling loops were afterwards reconfigured and the EMU water processing kit disassembled and stowed. *[This prepared EMU #3008 for use on STS-123/docked.]*

FE-1 Malenchenko had 4 hrs set aside for a major IFM (Inflight Maintenance) on the Russian Thermal Control System (STR), to restore its Loop 1 (KOB1) by removing two units (BS) containing electric recirculation pumps (ENA) on the 3SPN2 pump panel and replacing them with spares from FGB stowage. *[Such R&Rs have been done before by previous crews.]*

Later, Malenchenko transferred the KAR01 SIS-1 kit from the DC1 and set it up in the Service Module (SM) for exposure and photography in preparation for the next SFP (Spaceflight Participant), arriving on Soyuz TMA-12/16S in April. *[KAR01 SIS-1, part of the KAR experiment suite of SFP/Visiting Cosmonaut Ko San from South Korea, a researcher at Samsung Advanced Institute of Technology, studies the growth pattern of vegetable cultures like soy, rice, radish, orchid seeds and others in the zero-G environment.]*

In the COL (Columbus Orbital Laboratory), after yesterday's preparatory work on the FSL (Fluid Science Laboratory) facility, Leo Eyharts today set up and configured the CEM-L (Central Experiment Module-Lower) for its activation and initiation of the first experiment run on Monday (3/3). *[ESA will attempt to complete five experiment runs within FSL prior to Flight 1J/A.].*

Peggy Whitson powered up the MSG (Microgravity Science Glovebox) and performed another session with the InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions) experiment, today conducting runs #36 & #37, with a vial change from #002 to #007 between the runs and an increase in frequency from 0.66 Hz to 2Hz. Afterwards, the MSG was deactivated again. *[InSPACE obtains basic data on MR (magnetorheological) fluids, i.e., a new class of "smart materials" that can be used to improve or develop new brake systems, seat suspensions robotics, clutches, airplane landing gear, and vibration damper systems. The colloidal (dispersed) particles are contained in CAs (Coil Assemblies) in the MSG that subject them to electric fields at certain strength and frequencies. The desired strong dipolar interaction between the small colloidal particles can be achieved in micro-G simply with an external magnetic field being turned on and off. On the ground, the flow properties (rheology) of many materials, especially those making up consumer products like detergents, fabric softeners, toothpaste and paints, are similarly controlled, though not by magnetic fields but by adding a polymer. It now appears, for example, that new formulations of fabric softeners may perform better in space than on earth.]*

Yuri Malenchenko worked through a long list of standard maintenance/service tasks on Russian Segment (RS) systems. Specifically, the FE-1 –

- Completed the periodic (generally monthly) service of the ESA/RSC-Energia experiment ALTCRIS (Alteino Long Term monitoring of Cosmic Rays on the ISS), removing its PCMCIA memory card (#943) from the AST

spectrometer (inserted on 2/15) and replacing it with a new card (#944), then, as usual, checking the used card on the RSK1 laptop for quantity and size of files;

- Employed the Russian IPD Draeger tube and CMS (Countermeasure System) samplers to take air samples for Carbon Monoxide (CO), to verify data obtained with the IPD-CO sampler on 2/25;
- Took readings of potentially harmful contaminants in the SM with the CMS (part of the GANK-4M Real-Time Harmful Contaminant Gas Analyzer system), which uses preprogrammed microchips to measure Formaldehyde (H₂CO, methanal), CO and Ammonia (NH₃), taking one measurement per microchip;
- Performed monthly maintenance on the deactivated Russian IK0501 GA (Gas Analyzer) of the SOGS Pressure Control & Atmospheric Monitoring System by replacing its CO₂ filter assembly (BF) with a new unit from FGB stowage (done last: 1./21), then reactivating the unit;
- Completed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers];*
- Linked up with TsUP-Moscow stowage specialists at ~4:25am EST via S-band to conduct the weekly IMS (Inventory Management System) tagup, discussing stowage issues and equipment locations;
- Conducted the daily IMS maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur); and - working from the Russian voluntary “time permitting” task list -
- Completed the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder), and
- Performed the daily monitoring, picture-taking and downloading on the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP).

Peggy gathered measurements for the weekly atmospheric status check for ppO₂ (Partial Pressure Oxygen) and ppCO₂ (pp Carbon Dioxide), using the hand-held CSA-CP (Compound Specific Analyzer-Combustion Products), CSA-O₂ (CSA - Oxygen sensor) and CDMK (CO₂ Monitoring Kit). Batteries were to be replaced if necessary. *[Purpose of the 15-min activity is to trend with MCA (Major*

Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements. CSA-CP sensors (and readings) employed in the SM were #1051 (20.1%) & #1044/prime (20.3%); in Node-1 #1058 (19.0%); and in Node-2 #1045 (20.0%). O₂ sensor checks used #1052 (20.8%), #1041 (20.9%). CDMK CO₂ level in Lab was 0.5% and in SM 0.5%.]

As a fix for the erratic temperature sensor A of the CDRA (Carbon Dioxide Removal Assembly)'s absorbent bed #2, Whitson today installed a jumper cable to bypass the sensor, then supported the ground-commanded activation of CDRA (9:50am-11:50am) by connecting the regular ITCS LTL (Internal Thermal Control System/ Low Temperature Loop) coolant jumper at the LAB1D6 rack for cooling. *[The anomalous dP signature has not been explained yet, despite several days of troubleshooting.]*

Whitson and Eyharts conducted a 30-min review of new POC DOUG (Portable Onboard Computer Dynamic Onboard Ubiquitous Graphics) material, now using the new MSS (Mobile Service System) R5 software upgrade which mainly incorporates SPDM functionality into the MSS and PCS (Portable Computer System) displays. The review was for the SSRMS (Space Station Remote Manipulator System) activities scheduled on 3/4 (Tuesday). *[Next week's Robotics ops will essentially be the regular prelaunch checkout of the MSS/SSRMS complex for STS-139/1J/A, involving maneuvers to grapple the MBS PDGF-3 (Mobile Base System Power & Data Grapple Fixture 3), grapple & ungrapple the Node-2 PDGF, perform a checkout of the Cupola & Lab RWS (Robotics Workstation), and finish by moving the robotarm to the 1J/A start position.]*

Later today, before sleep time, Peggy will stand by to reconnect PCS laptops after ground specialists have finished uploading patches to the three C&C MDMs (Command & Control Multiplexer/Demultiplexer) computers. *[For loading the software patches (which deal with ATV Fire Warning and the Time Tag Queue), engineers have performed two Backup vs. Standby C&C swaps, followed by a Primary-to-Standby C&C transition about 12 hrs later. The CDR will reconnect PCSs after the C&C1 transition to Primary (C&C3 then being Backup & C&C2 Standby).]*

Leo Eyharts had another 60 minutes for himself for general orientation (station familiarization & acclimatization), as is standard daily rule for the first two weeks after starting station residency.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device

(CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1, FE-2).

Peggy then transferred the crew's exercise data file to the MEC laptop for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~3:45am EST, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~4:45am, Leo conducted the regular weekly 15-min. audio tagup with ESA's Col-CC (Columbus Control Center) in Oberpfaffenhofen near Munich/Germany. *[S/G-2 (Space-to-Ground 2) phone patch via SSC-10 (Station Support Computer 10)].*

At ~2:10pm, the crew had their twelfth weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. *[S/G-2 (Space-to-Ground 2) phone patch via SSC-10 (Station Support Computer 10)].*

OGS Activation Update: By adding some water into the US OGS (Oxygen Generation System) WDS (Water Delivery System), the ground succeeded last night in activating the OGS. The system is currently generating O₂ at a nominal 3-person equivalent rate.

COL Update: Columbus module and systems are performing nominally.

CWC Update: An updated CWC (Contingency Water Container) "cue card" was uplinked for the crew's reference. *[The new card (16-0018V) lists 35 CWCs (~1427.9 L total) for the four types of water identified on board: technical water (812.9 L, for Elektron, flushing, hygiene), potable water (559.6 L), condensate water (54.7 L), waste/EMU dump and other (07 L). Of the 35 containers, nine CWCs with technical water (388.9 L) cannot be used until cleared for Wautersia bacteria, and 10 CWCs with potable water (427 L), transferred from Atlantis, are not cleared for use pending analysis of samples returning on 1E.]*

CEO photo targets uplinked for today were Hubbard Brook, New Hampshire *(there was snow on the ground and ice on the rivers this time of year for the first of two Long Term Ecological Research [LTER] sites. The main objective from the standpoint of CEO is a record of land cover/land use change on a seasonal basis. The Hubbard Brook Experimental Forest [HBEF] is a 3,160 hectare reserve located in the White Mountain National Forest, near Woodstock, New Hampshire. The on-site research program is dedicated to the long-term study of forest and associated*

aquatic ecosystems. Overlapping imagery of this area was requested), and Plum Island Ecosystem, Maine (the second of two LTER sites for this day, the principal study site was the Plum Island Sound estuary, its coupled Parker, Rowley and Ipswich River watersheds and the adjacent coastal ocean, the Gulf of Maine. This LTER site focuses on how several aspects of global change influence organic matter and nutrients from land, ocean and marshes and how they interact with the external drivers [climate, land use, river discharge, sea level]. Overlapping imagery of this area was requested).

CEO photography can be viewed and studied at the websites:

<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);

<http://earthobservatory.nasa.gov/>

<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 5:54am EST [= epoch]):

Mean altitude -- 342.5 km

Apogee height -- 344.0 km

Perigee height -- 341.1 km

Period -- 91.39 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.000219

Solar Beta Angle -- -46.7 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Revolutions since FGB/Zarya launch (Nov. 98) -- 53137

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

03/07/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)

(~11:23pm EST); docking 04/03

03/09/08 -- *Change of US Standard Time to Daylight Saving Time*

03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS

(JLP) – 2:28am EDT, 16+1+2

03/12/08 -- ATV CAM (Collision Avoidance Maneuver) demo

03/12/08 -- STS-123/Endeavour/1J/A docking – ~11:27pm EDT

03/18/08 -- ATV1 parking orbit (loiter)

03/24/08 -- STS-123/Endeavour/1J/A undocking -- ~7:55pm

03/26/08 -- STS-123/Endeavour/1J/A deorbit – ~7:33pm; landing (KSC) -- ~8:35pm.

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking)

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch
 04/10/08 -- Soyuz TMA-12/16S docking (DC1)
 04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)
 05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
 05/14/08 -- Progress M-64/29P launch
 05/16/08 -- Progress M-64/29P docking (DC1)
 05/25/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS
 05/27/08 -- STS-124/Discovery/1J docking
 06/05/08 -- STS-124/Discovery/1J undocking
 08/07/08 -- ATV1 undocking
 08/12/08 -- Progress M-65/30P launch
 08/14/08 -- Progress M-65/30P docking (SM aft port)
 08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
 09/09/08 -- Progress M-64/29P undocking (from DC1)
 09/10/08 -- Progress M-66/31P launch
 09/12/08 -- Progress M-66/31P docking (DC1)
 10/01/08 -- **NASA 50 Years**
 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
 10/12/08 -- Soyuz TMA-13/17S launch
 10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
 10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
 10/18/08 -- STS-126/Discovery/ULF2 docking
 10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
 11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
 11/20/08 -- **ISS 10 Years**
 11/26/08 -- Progress M-67/32P launch
 11/28/08 -- Progress M-67/32P docking (SM aft port)
 12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
 12/06/08 -- STS-119/Discovery/15A docking
 12/15/08 -- STS-119/Discovery/15A undocking
 1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
 05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
 3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
 4QTR CY09 -- STS-130/19A - MPLM
 1QTR CY10 -- STS-131/ULF4
 2QTR CY10 -- STS-132/20A – Node-3 + Cupola
 3QTR CY10 -- STS-133/ULF5.

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm

Attachments:

ISS On-Orbit Status 02/28/08

All ISS systems continue to function nominally, except those noted previously or below.

For the purpose of testing the main TORU (Teleoperator Control System) receiver on Progress M-63/28P, FE-1 Malenchenko and CDR Whitson worked with ground specialists via VHF on DO3 (Daily Orbit 3) in the standard vehicle-to-vehicle TORU checkout between the Service Module (SM) and the docked Progress 28P. Progress thrusters (DPO) were inhibited and not involved. *[Crew activities focused on TORU activation, inputting commands via the RUO Rotational Hand Controller and close-out ops. TORU lets an SM-based crewmember perform the approach and docking of automated Progress vehicles in case of failure of the automated KURS system. Receiving a video image of the approaching ISS, as seen from a Progress-mounted docking television camera ("Klest"), on a color monitor ("Simvol-Ts", i.e. "symbol center") which also displays an overlay of rendezvous data from the onboard digital computer, the crewmember steers the Progress to mechanical contact by means of two hand controllers, one for rotation (RUO), the other for translation (RUD), on adjustable armrests. The controller-generated commands are transmitted from the SM's TORU control panel to the Progress via VHF radio. In addition to the Simvol-Ts color monitor, range, range rate (approach velocity) and relative angular position data are displayed on the "Klest-M" video monitor (VKU) which starts picking up signals from Progress when it is still approximately 7 km away. TORU is monitored in real time from TsUP over Russian ground sites (RGS) and via Ku-band from Houston, but its control cannot be taken over from the ground.]*

Peggy Whitson reloaded her handheld PDA (Personal Digital Assistant) with new data from SSC (Station Support Computer), i.e., an updated PDA image with all applications and a new PDA IMS (Inventory Management System) database. She also deleted some hi-res imagery to free up storage space. *[The PDA is periodically synchronized manually with the latest IMS data via wireless (WiFi) connection to the network. The IMS database can be updated from the handheld*

by using a PDA Expansion Pack and BCR (Bar Code Reader) Scanner module.]

Working a series of switches, the CDR performed a Power On/Off checkout of the new SSPCM (Solid State Power Control Module) which Dan Tani installed on 2/17 in the HRF1 (Human Research Facility Rack 1) in the US Lab.

With the Biolab WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels #1) experiment in the COL (Columbus Orbital Laboratory) now well into its first run, FE-2 Eyharts continued commissioning activities on the FSL (Fluid Science Laboratory), first removing the four launch fixation bolts installed yesterday on the front part of the CEM-L (Central Experiment Module-Lower) for the reboost, and then installing drawer handles on it. *[The remainder of CEM-L setup is scheduled tomorrow (2/29) so that FSL can be activated on Monday (3/3). ESA will attempt to complete five experiment runs within FSL prior to Flight 1J/A.]*

Later, Leo Eyharts continued activation & checkout ops on the ELITE-S2 (Elaboratore Immagini Televisive - Space 2) payload by connecting camera cables to its IMU (Interface Management Unit) and routing the cables in the Lab for another session. *[The Italian (ASI) experiment ELITE-S2 is a human motion analysis facility for technological characterization and potential application for multifactorial movement analysis, to study the connection between brain, visualization and motion in micro-G. By recording and analyzing the three-dimensional motion of astronauts, this study should help engineers apply ergonomics into future spacecraft designs and determine the effects of weightlessness on breathing mechanisms for long-duration missions.]*

Whitson configured IMV (Intermodular Ventilation) air ducting to the US Airlock (A/L) for temperature and humidity control after ground-commanded (S-band) deactivation of the A/L CCAA (Common Cabin Air Assembly) earlier today (4:00am-8:45am).

Peggy downloaded the structural dynamics data gathered by the IWIS (Internal Wireless Instrumentation System) during the overnight reboost, to be downlinked later via OCA. Afterwards, Peggy tore down the IWIS setup of RSUs (Remote Sensor Units) and cabling for stowage.

Later, the CDR turned on the MSG (Microgravity Science Glovebox) and performed another session with the InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions) experiment, today conducting run #35 (vial 002), going back again to the lowest frequency (0.66 Hz) but at higher field strength (which tends to result in significant particle structures). Afterwards, she powered down the MSG. *[InSPACE obtains basic data on MR (magnetorheological) fluids, i. e., a new class of "smart materials" that can be used to improve or develop new*

brake systems, seat suspensions robotics, clutches, airplane landing gear, and vibration damper systems. The colloidal (dispersed) particles are contained in CAs (Coil Assemblies) in the MSG that subject them to electric fields at certain strength and frequencies. The desired strong dipolar interaction between the small colloidal particles can be achieved in micro-G simply with an external magnetic field being turned on and off. On the ground, the flow properties (rheology) of many materials, especially those making up consumer products like detergents, fabric softeners, toothpaste and paints, are similarly controlled, though not by magnetic fields but by adding a polymer. It now appears, for example, that new formulations of fabric softeners may perform better in space than on earth.]

Using files uplinked from TsUP-Moscow, FE-1 Malenchenko installed new BVS (SM Computer System) software images on the KTSP1 (Central Post Computer 1) in the SM from a laptop, displaying settings for computers to be upgraded (e.g., TsVM Central Computers, TVM Terminal Computers, US-21, US-22, MDM-FGB, US-FGB).

Leo Eyharts set up the equipment for the US PHS (Periodic Health Status) assessment with blood labs, to be performed by him tomorrow using the PCBA (Portable Clinical Blood Analyzer). Preparations included an electronic function test and control analysis on the PCBA in preparation for tomorrow's blood analysis activity. *[The PHS exam, with PCBA analysis and subsequent clinical evaluation, is guided by special software (IFEP, In-Flight Examination Program) on the MEC (Medical Equipment Computer).*

Peggy Whitson conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. *[Updated "cue cards" based on the crew's water calldowns are sent up every other week. The current cue card (16-0018U) lists 36 CWCs (~1392.5 L total) for the four types of water identified on board: technical water (812.9 L, for Elektron, flushing, hygiene), potable water (559.6 L), condensate water (20 L), waste/EMU dump and other (0 L). Of the 36 containers, nine CWCs with technical water (388.9 L) cannot be used until cleared for Wautersia bacteria, and 10 CWCs with potable water (427 L), transferred from Atlantis, are not cleared for use pending analysis of samples returning on 1E.]*

CDR Whitson and FE-2 Eyharts performed the mandatory 60-min Emergency Event OBT (Onboard Training) drill for new crewmembers, for the case of rapid cabin depressurization or fire. Russian and US experts stood by at both control centers for consultation. The rule is that the Russian-led emergency exercise should be performed by every new station crewmember once within seven days after departure of the previous crew. *[Background: Purpose of the drill for new station residents is to (a) familiarize them with the location of hardware and the positions of*

valves used in emergency situations, (b) familiarize them with the translation routes to the Soyuz vehicle, (c) work through the Russian Segment (RS) hardware deactivation procedures, (d) familiarize them with the particulars of the scenario and the results of the previous US Segment (USOS) fire drill, and (d) practice crew interactions in emergency situations. Referring to EMER book crew procedures, first Peggy and Leo translated along the emergency egress path to the FGB nadir port (where Soyuz TMA-11 is currently docked), checking hardware such as the Sokol suits, cable cutters, fire extinguisher (OKR), gas masks (IPK), emergency procedures books, valve settings, hatch rubber seal & restraint integrity, etc. In the USOS the inspection focused on fireports in the Lab, Node and Airlock, readiness of CSA-CP (Compound Specific Analyzer-Combustion Products), ISS leak kit, PBAs (portable breathing assemblies) and PFEs (portable fire extinguishers), emergency procedures books, valve settings, integrity of hatch rubber seals, presence of hatch handrails, etc. The exercise was topped off by a thorough debrief with the ground via S-band. During the session, the crew simulated executing the planned emergency procedures while moving about the station. For the case of an onboard fire and for emergency descent, there are other mandatory emergency drill OBTs.]

Yuri Malenchenko continued his test program with the new KPT-2 BAR-RM payload equipment begun on 2/13, today taking measurements with the AU-1 ultrasound analyzer in the PrK Transfer Tunnel to the DC1 (Docking Compartment) and FGB GA (Pressurized Compartment) and later downlinking the data via BSR-TM channel. Measurements in the SM RO2 (large diameter) and RO1 (small diameter) sections were taken on 2/16 and 2/26. The data are being used for experimenting with ISS leak detection. [BAR-RM is designed to develop a procedure for detection of air leakage from ISS modules based on environmental data anomalies (temperature, humidity, ultrasound emissions) at possible leak locations. The payload, controlled from the RSK1 laptop, uses a remote infrared thermometer (Kelvin-Video), a thermohygrometer (Iva-6A), a heat-loss anemometer/thermometer (TTM-2), an ultrasound analyzer (AU-01), and a leak detector (UT2-03) to determine physical background signs of loss of ISS pressure integrity which could be indicative of leaks in the working compartments of the station. Measurements are taken in specific zones (13 in SM PkhO and 4 in DC1), both with lights & fans turned on and off.]

The FE-1 completed routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. [Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

Malenchenko also performed the daily IMS maintenance, updating/editing its

standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Later, Yuri conducted the daily monitoring, picture-taking and downloading on the BIO-5 Rasteniya-2 (“Plants-2”) experiment. The task included recharging the water tank of the greenhouse as required. *[Rasteniya-2, researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. During the duration of the BIO-5 experiment, students of the Moscow City Palace for Youth Creativity of the Meshchansky inter-regional center #15 in Moscow) and the Prince of Oldenburg Lyceum in St. Petersburg will be cultivating plants in parallel on the ground and conducting comparative observation of plant growth and development under gravity and zero-gravity conditions. They are receiving the photo images taken by Yuri.]*

In addition, working from the Russian voluntary “time permitting” task list, the Russian flight engineer completed the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). *[This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 16].*

At 2:55pm EST, Peggy is scheduled to conduct the periodic VHF-1 emergency communications check over NASA’s VHF (Very High Frequency) stations, today at the Dryden, Wallops and White Sands VHF sites, talking with Houston/Capcom, MSFC/PAYCOM (Payload Operation & Integration Center Communicator) and Moscow/GLAVNI (TsUP Capcom) in the normal fashion via VHF radio from a handheld microphone and any of the U.S. segment ATUs (audio terminal units). *[Purpose of the test is to verify signal reception and link integrity, improve crew proficiency, and ensure minimum required link margin during emergency (no TDRS) and special events (such as a Soyuz relocation).]*

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR) and VELO bike with bungee cord load trainer (FE-1, FE-2).

Peggy then transferred the crew’s exercise data file to the MEC (Medical Equipment Computer) laptop for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Leo had another 60 minutes for himself for general orientation (station familiarization & acclimatization), as is standard daily rule for the first two weeks after starting station residency.

At ~10:30am EST, the ISS crew held a teleconference (audio) with crewmembers of the upcoming 1J/A mission, discussing timeline, transfer and handover particulars of their joint (docked) period next month. *[Launch of STS-123/Endeavour, carrying the Canadian SPDM "Dextre" and the ELM-PS (Experiment Logistics Module - Pressurized Section) for the Japanese "Kibo" Laboratory (to follow on 5/25), is scheduled for 3/11 at 2:28am EDT, with the crew of CDR Dominic Gorie, PLT Greg Johnson, MS1/EV1/2 Bob Behnken, MS2/EV2 Mike Foreman, MS3 Takao Doi/JAXA, MS4/EV1 Rick Linnehan, and MS5/EV2/FE-2-16 Garrett Reisman. Reisman will take over the ISS FE-2 position from Léopold Eyharts who returns on Endeavour on 3/24 (landing 3/28).]*

GNC MDM Upload Update: Yesterday's uploading of new software patches to both GNC MDMs (Guidance, Navigation & Control Multiplexer/Demultiplexer) computers went well. One patch limits CMG (Control Moment Gyroscope) Gimbal Acceleration, the other controls Attitude Filter Reset.

ISS Reboost Update: The overnight ISS reboost with the SM's two KD main engines (694 lbs thrust each) and ODU props, started at 00:16am EST and completed successfully, with a slight overburn: Planned Delta-V was 3.0 m/s vs. 3.1 m/s actual, resulting in a mean altitude increase of 5.3 km (2.9 nmi). Burn duration: 123.57 sec. Preliminary results indicate that the reboost will adequately support Soyuz 16S docking, Soyuz 15S undocking, and Flight 1J/A as planned.

RSK1 Laptop Failure Update: Malenchenko's second attempt, on 2/27, to load the Russian RSK1 laptop with ATV (Automated Transfer Vehicle) docking simulator software was unsuccessful. Specialists are developing a procedure for using the previous software (vers. 1.2) for conducting the ATV CBT (Computer-based Training) on the laptop.

SRK-V Condensate Feed Unit Update: Continued attempts to troubleshoot the failed CFU (Condensate Feed Unit) pump of the Russian SRV-K (Condensate Water Processor) in the SM were unsuccessful. Energia/Moscow is developing a new plan for restoring the system.

OGS Activation Failure: Last night, the ground-commanded startup of the US OGS (Oxygen Generation System) failed in the middle of the start-up sequence, shortly into the crew's sleep period. This has been seen before and appears to be associated with a recirculation pump anomaly. After several attempts to start up the

system on Wednesday, teams decided to stand down and review data. OGS remains off at this time.

COL Update: Columbus module and systems are performing nominally.

CEO photo targets uplinked for today were **Shanghai, China** (weather satellites suggested a relatively clear day for this often smog covered city. Shanghai is the largest city in China and the eighth largest city in the world. It is situated on the banks of the Yangtze River Delta. Documenting detail within the city boundaries and land use outside of the city), **Ulawun Volcano** (the lighting will be lower than for usual requests for CEO targets. However, low light also accentuates the topographic features of most volcanoes. Ulawun volcano is the highest volcano of the Bismarck arc, and one of Papua New Guinea's most frequently active. Historical eruptions date back to the beginning of the 18th century. Twentieth-century eruptions were mildly explosive until 1967, but after 1970 several larger eruptions produced numerous lava flows, greatly modifying the summit crater), **South Tibesti Megafans** (a series of large fanlike spreads of sediment, hundreds of km long and wide, extend southward from the Tibesti Mountains into the Bodélé depression of central Chad. A discontinuous overlapping pattern of stream channels, large and small, suggests that the entire surface of the megafans was formed by the action of rivers shifting across the surface. Since about 8000 years ago, the Sahara environment has dried significantly, leaving non-functioning rivers channels everywhere. Images of areas south of Tibesti are only available in low resolution: therefore crew imagery--continuous mapping swaths taken with 400- and 800 mm lenses--are needed to provide the detail to reveal evidence of stream process and the intersection of streams on different fan surfaces), **Presqu'île Impact Crater** (there are no images of this particular impact crater in the CEO database. Presqu'île crater is 24 kilometers in diameter and is estimated to be less than 500 million years old), and **Konza Prairie, Kansas** (the focal site for the Konza Prairie Long Term Ecological Research program is the Konza Prairie Biological Station [KPBS]. KPBS is a 3,487 hectare native tallgrass prairie field research station owned by The Nature Conservancy and Kansas State University. KPBS is located in the Flint Hills region of northeastern Kansas. The Flint Hills encompasses over 50,000 square km throughout much of eastern Kansas from near the Kansas-Nebraska border south into northeastern Oklahoma and contains the largest remaining area of unplowed tallgrass prairie in North America).

CEO photography can be viewed and studied at the websites:

<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site);

<http://earthobservatory.nasa.gov/>

<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 10:07am EST [= epoch]):

Mean altitude -- 342.5 km

Apogee height -- 343.8 km

Perigee height -- 341.1 km

Period -- 91.38 min.

Inclination (to Equator) -- 51.65 deg

Eccentricity -- 0.0001991

Solar Beta Angle -- -50.7 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude gain in the last 24 hours -- 5300 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53107

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

03/07/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana)

(~11:23pm EST); docking 04/03

03/09/08 -- *Change of US Standard Time to Daylight Saving Time*

03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS –
2:28am EDT, 16+1+2

03/12/08 -- ATV CAM (Collision Avoidance Maneuver) demo

03/12/08 -- STS-123/Endeavour/1J/A docking – ~11:27pm EDT

03/18/08 -- ATV1 parking orbit (loiter)

03/24/08 -- STS-123/Endeavour/1J/A undocking -- ~7:55pm

03/26/08 -- STS-123/Endeavour/1J/A deorbit – ~7:33pm; landing (KSC) -- ~8:35pm.

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking)

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch

04/10/08 -- Soyuz TMA-12/16S docking (DC1)

04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)

05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/25/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS

05/27/08 -- STS-124/Discovery/1J docking

06/05/08 -- STS-124/Discovery/1J undocking

08/07/08 -- ATV1 undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
4QTR CY09 -- STS-130/19A - MPLM
1QTR CY10 – STS-131/ULF4
2QTR CY10 -- STS-132/20A – Node-3 + Cupola
3QTR CY10 – STS-133/ULF5.

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 02/27/08

All ISS systems continue to function nominally, except those noted previously or below.

Upon wakeup, FE--2 Eyharts performed the last sampling of his first session with the NASA/JSC experiment NUTRITION w/Repository, collecting a final urine sample for storage in the MELFI (Minus-Eighty Laboratory Freezer for ISS). The sampling kit was then stowed away. Leo's next NUTRITION/Repository activity will be his Flight Day 30 (FD30) session. *[The current NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

FE-1 Malenchenko and CDR Whitson continued the current round of periodic preventive maintenance of RS (Russian Segment) ventilation systems. *[In the Service Module (SM), Yuri cleaned the inlet fan (MTs12-4) grille of the BMP (Micropurification Unit), temporarily deactivated, after visually inspecting and photographing the grille (on panel 419). Peggy later worked in the FGB, accessing and cleaning the vent screens of specific interior closeout panels (116, 231, 316 & 431).]*

In preparation for tonight's station reboost from the two-nozzle SM main engine, the CDR installed an IWIS RSU (Internal Wireless Instrumentation System Remote Sensor Unit) in Node-2, hooking it up to UOP2 (Utility Outlet Panel 2) for power. Afterwards, Whitson configured and programmed the timing of the IWIS ICU (Interface Control Unit) for tonight's activation. *[Along with the new unit in Node-2, IWIS will monitor dynamic/vibrational responses of the ISS structure during the reboost, measured by RSUs in the Lab, Node-1, FGB and SM (in Sync Mode),*

transmitting their measurements via radio to the central NCU (Network Control Unit).]

FE-2 Eyharts set up and configured the VCA-2 (Video Camera Assembly 2) in the Columbus Orbital Laboratory (COL) module to capture the subsequent emergency drill.

All three crewmembers then performed the 90-min Columbus New Module “Delta” Emergency Procedure Drill, tailored for the new addition to the station, *[Purpose of the “Delta” OBT (Onboard Training) exercise, mandatory at no later than 7-10 days after arrival of the new module, was to familiarize the crew with COL hardware and valves used in emergency situations and with the new Ammonia Detection Kit location, hardware and cue cards, and to review new, stand-alone COL emergency procedures, including the “big picture” changes to the existing emergency procedures due to the new module addition. For example: the increased station volume increases the ISS reserve time in case of a leak (to ~1240 min, from ~1070 min); additional equipment safing would be required; the sequence of closing hatches for USOS (US Segment) leak checks will be impacted; more volume is now available for utilizing USOS atmosphere for RS (Russian Segment) leaks; while the automated response to a Rapid Depress situation for COL is consistent with the automated response for the other USOS modules, although automatically commanded COL hardware is added, etc. COL does not have PBA (Portable Breathing Apparatus) oxygen ports and no EHTKs (Extension Hose Tee Kits) for PBA, the nearest location for both being in Node-2.]*

Eyharts continued preparing the COL BLBG (Biolab Glovebox) for the upcoming experiment WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels). *[After preparing and sterilizing two sets of sample Experiment Containers (Ecs #1-4 & #5-8) yesterday, then inserting them in the BLBG TCU (Thermal Control Unit), both EC sets were installed today in the incubator for starting the experiment. The WAICO samples require a 14-day growing period and will be returned on Flight 1J/A.]*

With the Russian Elektron O₂ (oxygen) generator powered off since yesterday, CDR Whitson supported the activation of the new OGS (Oxygen Generation System) in the US Lab by configuring the OGS rack and the H₂ (hydrogen) sensor for activation. The subsequent power-up of the rack was performed from the ground via S-band/telemetry commanding. *[After the OGA (Oxygen Generation Assembly) had been running for 20 min for a leak check of the dome, Whitson reconnected the H₂ sensor QDs (Quick Disconnects), closed the rack door and re-attached the WDS (Water Delivery System) for its subsequent activation. OGS is one of the three Regenerative ELCSS system racks slated to be installed in Node 3.]*

In the Soyuz 15S spacecraft, docked at the FGB nadir port, Malenchenko turned off the gas analyzer, terminating its periodic checkup activity.

Peggy Whitson performed the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling a CWC (Contingency Water Container, #1054) with the collected water slated for processing. No samples were required this time. *[Estimated offload time before termination (leaving ~6 kg in the tank): ~30 min.]*

After the aborted software upgrade of the Russian RSE1 laptop on 2/24, Yuri Malenchenko today had 2 hrs reserved for troubleshooting the RSE1 machine, conducting a health check of the installed HDD (Hard Disk Drive) and reloading the RSE version 1.2 software for further checkout. *[With the new ATV CBT (Automated Transfer Vehicle Computer-based Training) application the crew will be able to run ATV docking simulations on the laptop.]*

Yuri conducted an audit/inventory of RS ODF (Operations Data File) cue cards for spacewalks, including assessing their condition and readiness for use on EVAs.

The FE-1 also downlinked Part 2 of the prerecorded video of "Life aboard ISS" footage filmed by Peggy with the SONY HRV-Z1 high-definition camcorder on 2/22 for use on Russian television. *[TsUP-Moscow had suggested scenes of Yuri working with the Matryoshka radiation detectors, filling the Elektron EDV container with US condensate water, and other scenes of interest to TV viewers including crewmembers washing their faces, brushing their teeth, exercising, cooking meals, conducting science research and servicing life support systems. Part 1 of the recorded footage was downlinked yesterday.]*

In preparation for tonight's station reboost, Leo Eyharts worked on the Columbus FSL (Fluid Science Laboratory), temporarily re-attaching the FSL FCE (Facility Core Element) drawer structure to the rack by means of the four launch fixations bolts used during COL launch. *[After the reboost, the launch captive bolts will be removed again and the protective gap covers re-installed. The need for the lock-down of the FCE during a reboost was indicated by an updated structural analysis.]*

The FE-1 completed routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Yuri also worked on the "Matryoshka-R" radiation payload suite (RBO-3-2),

conducting the periodic collection and logging of accumulated data of seven Matryoshka-R Bubble Dosimeter detectors installed on 2/22 at various exposure locations in the RS, using the special Bubble Dosimeter Reader. *[The complex Matryoshka payload suite is designed for sophisticated radiation studies. Three detectors now in use are positioned in spherical "Phantom" containers in the DC1, four in the stbd crew cabin, under the work table, and behind a panel (#327).]*

In addition, working from the Russian voluntary "time permitting" task list, the Russian flight engineer --

- Performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur);
- Conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder) *[This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 16];* and
- Performed the daily monitoring, picture-taking and downloading on the BIO-5 Rasteniya-2 ("Plants-2") experiment. Today's task was extended to include recharging the water tank of the greenhouse. *[Rasteniya-2, researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. During the duration of the BIO-5 experiment, students of the Moscow City Palace for Youth Creativity of the Meshchansky inter-regional center #15 in Moscow) and the Prince of Oldenburg Lyceum in St. Petersburg will be cultivating plants in parallel on the ground and conducting comparative observation of plant growth and development under gravity and zero-gravity conditions. They are receiving the photo images taken by Yuri.]*

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Peggy then transferred the crew's exercise data file to the MEC (Medical Equipment Computer) laptop for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

As most every day after his arrival, when not busy with urgent Columbus commissioning work, Leo had another 60 minutes for himself for general orientation (station familiarization & acclimatization), as is standard daily rule for the first two weeks after starting station residency.

At ~12:30pm EST, Peggy Whitson supported two interactive PAO TV interviews with US media of ~10 min each: The Hawk Eye Newspaper, Burlington, IA (Craig Neises), and KCCI-TV in Des Moines, IA (Molly Cooney).

GNC MDM Swap: At about 10:00am, Houston ground controllers started loading new software patches to both GNC MDMs (Guidance, Navigation & Control Multiplexer/Demultiplexer) computers, one to control CMG (Control Moment Gyroscope) Gimbal Acceleration, the other for Attitude Filter Reset. Executing the loading required swapping the two MDMs at ~11:30am between Prime and Backup, ending with GNC-1 being primary MDM. During the swap activities, the ISS was controlled by Russian MCS (Motion Control System) thrusters, with attitude control authority handed over from US CMG Momentum Management at 11:25am, to be returned later today (~3:50pm).

ISS Reboost: Attitude control will again be turned over to RS tonight at ~10:30pm for the duration of the planned ISS reboost. The thrust maneuver, with the SM's two-barrel KD main engine and ODU props, is scheduled for ~00:21am EST, with a planned delta-V of 3.2 m/s. Some US systems will be powered down for the maneuver and afterwards reactivated. Attitude control authority will then be returned to USOS at ~1:20am. For both MCS/thruster periods, the protective Lab science window shutters will remain closed.

MSS Software Upgrade: All MSS/SSRMS (Mobile Service System/Space Station Remote Manipulator System) software Vers. R5.0 uplinks and checkouts were successfully completed; PCS (Portable Computer System) A31p laptops were patched without issues. *[The update was required to incorporate Dextre/SPDM (Special Purpose Dexterous Manipulator) functionality into the MSS. In addition, there were a few updates to the SSRMS and MBS (Mobile Base System) behavior as well as new SPDM PCS displays. The crew's next Robotics operations will occur on the new MSS R5 software. In prep for that, the ground will uplink a brief summary of system behavior changes for the DOUG (Dynamic Onboard Ubiquitous Graphics) software review for those ops.]*

CDRA Troubleshooting Update: Carbon Dioxide Removal Assembly dP (delta Pressure) troubleshooting was completed. Nothing was found that could explain the anomalous dP signature. For the CDRA's erratic temperature sensor, a bypass jumper cable will be installed on 2/29 (Friday).

STS-123/1J/A Preview: JAXA reported that preparations for Flight 1J/A continue on schedule. Launch of STS-123/Endeavour, carrying the Canadian SPDM “Dextre” and the ELM-PS (Experiment Logistics Module - Pressurized Section) for the Japanese “Kibo” Laboratory (to be launched 5/25), is scheduled for 3/11 at 2:28am EDT, with the crew of CDR Dominic Gorie, PLT Greg Johnson, MS1/EV1/2 Bob Behnken, MS2/EV2 Mike Foreman, MS3 Takao Doi/JAXA, MS4/EV1 Rick Linnehan, and MS5/EV2/FE-2-16 Garrett Reisman. Reisman will take over the ISS FE-2 position from Léopold Eyharts who returns on Endeavour on 3/24 (landing 3/28)..

CEO photo targets uplinked for today were **Eastern Tien Shan, China** (*looking left to obtain general views of winter conditions on these mountains, especially snow pack and glacier tongues*), **Chaing Mai, Thailand** (*this is northern Thailand's largest and most culturally significant city. Chaing Mai and two neighboring cities form a major population cluster [700,000] in a mountain valley. The cities are difficult to discern from orbit. However, the valley floor where the cities are located is light gray compared with the surrounding dark green mountains. Looking left of track up the Ping River valley. General orientation views were requested*), **Saharan dust, Chad** (*Dynamic event. Spring winds are setting up in the central Sahara Desert, with dust plumes being raised from the basin just north of Lake Chad. This basin—the Bodele basin--supplies more dust to the Earth's atmosphere than any other on the planet, with some dust reaching the Americas every season. Looking left as the plumes blow towards track*), and **Ile Rouleau Impact Crater, Canada** (*this small impact crater [~4 km in diameter] lies partly under water in long, narrow Lake Mistassini. However, it is relatively easy to locate as the center uplift forms an island, close to nadir.*)

CEO photography can be viewed and studied at the websites:

<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);

<http://earthobservatory.nasa.gov/>

<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 8:31am EST [= epoch]):

Mean altitude -- 337.4 km

Apogee height -- 342.7 km

Perigee height -- 332.2 km

Period -- 91.28 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007794

Solar Beta Angle -- -54.3 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 66 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53107

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

02/28/08 -- ISS Reboost w/IWIS, SDMS (TIG 00:21am EST; delta-V~3.2 m/s; SM KD prop.sys.)

03/07/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana) (~11:23pm EST); docking 04/03

03/09/08 -- *Change of US Standard Time to Daylight Saving Time*

03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS – 2:28am EDT, 16+1+2

03/12/08 -- ATV CAM (Collision Avoidance Maneuver) demo

03/12/08 -- STS-123/Endeavour/1J/A docking – ~11:23pm

03/18/08 -- ATV1 parking orbit (loiter)

03/24/08 -- STS-123/Endeavour/1J/A undocking -- ~7:43pm

03/28/08 -- STS-123/Endeavour/1J/A landing -- ~3:00pm.

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking)

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch

04/10/08 -- Soyuz TMA-12/16S docking (DC1)

04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)

05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/25/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS

05/27/08 -- STS-124/Discovery/1J docking

06/05/08 -- STS-124/Discovery/1J undocking

08/07/08 -- ATV1 undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC

10/18/08 -- STS-126/Discovery/ULF2 docking

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
4QTR CY09 -- STS-130/19A - MPLM
1QTR CY10 – STS-131/ULF4
2QTR CY10 -- STS-132/20A – Node-3 + Cupola
3QTR CY10 – STS-133/ULF5.

ISS On-Orbit Status 02/26/08

All ISS systems continue to function nominally, except those noted previously or below.

To conclude his first session with the NASA/JSC experiment NUTRITION w/ Repository, FE-2 Eyharts completed the all-day Part 2 session, by collecting urine samples for 24 hrs, to continue through tomorrow morning. The samples were consecutively stored in the MELFI (Minus-Eighty Laboratory Freezer for ISS). Blood collections were performed by Peggy on Leo yesterday. *[The current NUTRITION/Repository project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

The CDR set up the camcorder equipment for taking video of Leo Eyharts' first PFE-OUM (Periodic Fitness Evaluation - Oxygen Uptake Measurement session on the CEVIS (Cycle Ergometer with Vibration Isolation), filmed via VTR (Video Tape Recorder) from the ground. *[The footage was downlinked afterwards for biomechanical evaluation of the exercising crewmember and assessment of the on-orbit setup of equipment during data collection and hardware status.]*

Later, Whitson and Eyharts configured the PFE-OUM equipment at the HRF-2 (Human Research Facility 2) rack for Leo's workout on the CEVIS while wearing an HRM (Heart Rate Monitor), with Peggy, as operator, obtaining measurements of the subject. *[The equipment includes the HRF PFM/PAM (Pulmonary Function Module/Photoacoustic Analyzer Module), Mixing Bag System and GDS (Gas Delivery System). After calibration of the DPFM (Differential Pressure Flowmeter), Peggy assisted in changing the loads on the ergometer and recording data. Later, the two*

crewmembers updated the evaluation protocol, deactivated & stowed the gear, and powered down the PFE-OUM laptop. Purpose of PFE-OUM is to measure aerobic capacity during exercise within 14 days after arrival on ISS, and once monthly during routine PFEs. The data allows exercise physiologists & flight doctors to assess the crew's health & fitness and to provide data for modifying & updating crew-specific exercise regimes. PFE-OUM is a collaborative effort between NASA and ESA (European Space Agency).]

Afterwards, the CDR disassembled the video setup and stowed it, then gave the Go for the ground to downlink the VTR video.

Earlier, Yuri also downlinked the prerecorded video of "Life aboard ISS" footage filmed by Peggy with the SONY HRV-Z1 high-definition camcorder on 2/22 for use on Russian television. *[TsUP-Moscow had suggested scenes of Yuri working with the Matryoshka radiation detectors, filling the Elektron EDV container with US condensate water, and other scenes of interest to TV viewers including crewmembers washing their faces, brushing their teeth, exercising, cooking meals, conducting science research and servicing life support systems. More recorded footage is to be downlinked tomorrow.]*

In the Columbus Module, Eyharts continued preparing the BLBG (Biolab Glovebox) for the upcoming experiment WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels). *[Preparations include installing the first four ECs (Experiment Containers, #1-4) in the BLBG, supporting Glovebox sterilization by the ground, preparing the ECs for operation, and installing the video cassette for the first run. After starting these activities yesterday, they fell behind the original timeline, which has delayed the actual start-up of the experiment.]*

FE-1 Malenchenko continued his test program with the new KPT-2 BAR-RM payload equipment begun on 2/13, today taking measurements with the AU-1 ultrasound analyzer at various locations in the RO1 (small diameter) section of the Service Module (SM) and later downlinking the data via BSR-TM channel. Measurements in the SM RO2 (large diameter) section were taken on 2/16. The data are being used for experimenting with ISS leak detection. *[BAR-RM is designed to develop a procedure for detection of air leakage from ISS modules based on environmental data anomalies (temperature, humidity, ultrasound emissions) at possible leak locations. The payload, controlled from the RSK1 laptop, uses a remote infrared thermometer (Kelvin-Video), a thermohygrometer (Iva-6A), a heat-loss anemometer/thermometer (TTM-2), an ultrasound analyzer (AU-01), and a leak detector (UT2-03) to determine physical background signs of loss of ISS pressure integrity which could be indicative of leaks in the working compartments of the station. Measurements are taken in specific zones (13 in SM PkhO and 4 in DC1), both with lights & fans turned on and off.]*

Whitson conducted "Week 19" sampling of potable water for chemical and microbial analysis from the SVO-ZV tap and two SRV-K taps, the latter after preliminary heating of the water (four heating cycles) and flushing. *[Peggy collected three 450 mL samples (for postflight microbial analysis) and two 750 mL samples (for postflight chemical analysis) from each of three ports (SRV-K hot, SRV-K warm, SVO-ZV) for return on STS-123/1J/A. The small amounts of water used for flushing the equipment were reclaimed from the flush bag.]*

The CDR retrieved and stowed the two FMKs (Formaldehyde Monitoring Kits) deployed by her two days ago (2/24) in the Lab (below CEVIS cycle) and SM (most forward handrail on panel 307) to catch any atmospheric formaldehyde (H_2CO , methanal) on a collector substrate for subsequent analysis on the ground.

[Formaldehyde is an intermediate in the oxidation (combustion) of methane and other carbon compounds, e.g., forest fires, in automobile exhaust, and in tobacco smoke. Small amounts of formaldehyde are produced as a metabolic byproduct in most organisms, including humans.]

In preparation for tomorrow's scheduled activation of the US OGS (Oxygen Generation System) in the Lab for its next phase of checkout, FE-1 Malenchenko supported TsUP in deactivating the Elektron O_2 generator. As part of the standard deactivation process the Elektron was purged with N_2 (nitrogen), controlled from laptop.

Meanwhile in the US Lab Peggy worked with the ground in activating the SAMS ICU (Space Acceleration Measurement System/Interface Control Unit), the control computer of the rack/drawer-based system for recording structural dynamics of the station.

Malenchenko transferred a control panel (PU) for the ATV (Automated Transfer Vehicle) to its operational location in the SM for installation.

Yuri also had ~90 min set aside for the periodic equipment servicing in the SM's ASU toilet facility, changing out replaceable parts with new components, viz., two receptacles (PR & MP), four hoses, a T-connector, an elbow fitting, an indicator, a filter insert (F-V), the pretreat container (E-K) with its hose. All old parts were discarded as trash. *[E-K contains five liters of pre-treat solution, i.e., a mix of H_2SO_4 (sulfuric acid), CrO_3 (chromium oxide, for oxidation and purple color), and H_2O (water). The pre-treat liquid is mixed with water in a dispenser (DKiV) and used for toilet flushing.]*

Afterwards, the FE-1 completed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

In addition, working from the Russian voluntary "time permitting" task list, the Russian flight engineer --

- Performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur);
- Conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder) *[This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 16];* and
- Performed the daily monitoring, picture-taking and downloading on the BIO-5 Rasteniya-2 ("Plants-2") experiment. *[Rasteniya-2, researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. During the duration of the BIO-5 experiment, students of the Moscow City Palace for Youth Creativity of the Meshchansky inter-regional center #15 in Moscow) and the Prince of Oldenburg Lyceum in St. Petersburg will be cultivating plants in parallel on the ground and conducting comparative observation of plant growth and development under gravity and zero-gravity conditions. They are receiving the photo images taken by Yuri.]*

In the FGB (Funktsionalnyi-Grusovoi Blok), the CDR did more preventive RS (Russian Segment) ventilation system maintenance, with the cleaning of the three SOTR (Thermal Control System) gas-liquid heat exchanger (GZhT4) grills not finished yesterday.

Peggy also worked on the long-term CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator, first powering it off and decabling it, then accessed its interior for removing some items, inserting a new plant habitat (Silicate Garden Habitat) on its CSI-02 (CGBA Science Insert #2) base, closing the incubator, reconnecting its cabling and powering it up. *[The CGBA incubator is controlled from the ground, with automatic video downlinked to Earth.]*

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2/PFE-OUM), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Peggy then transferred the crew's exercise data file to the MEC (Medical Equipment Computer) laptop for downlinking, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

As most every day after his arrival, when not busy with urgent Columbus commissioning work, Leo had another 60 minutes for himself for general orientation (station familiarization & acclimatization), as is standard daily rule for the first two weeks after starting station residency.

At ~8:45am EST (2:45pm in Paris), Leo Eyharts supported three interactive PAO interviews with TV/radio media in France of ~6.5 min each: TF1 French TV (Harry Roselmack), France 24 News Network (Ulysse Gosset), and Europe 1 French Radio (Alain Cirou). Questions for Leo were uplinked beforehand. [*“What is life like on the station? What are the differences with Mir?”; “Tell us about the docking of Columbus, and how are the experiments going?”; “2008 is a splendid year for Europe with a number of important space missions including yours. Is there still a competition in space now or would you say it was more about cooperation?”; “Do you sleep well, and what do you dream about?”; “Your German crewmate was not well. What would happen if you were to fall ill?”*]

At ~3:00pm, the crew had their eleventh weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. [*S/G-2 (Space-to-Ground 2) phone patch via SSC-10 (Station Support Computer 10)*].

The three station residents had their standard periodic PMC (Private Medical Conference) via S- & Ku-band audio/video.

Weekend Voluntary Science: Three optional activities for the voluntary “Saturday Science” program for next weekend (3/1, 3/2) were suggested to Peggy for her choice. Selection is required by tonight. [*The choices are: (1) InSPACE-2 – three experiment runs; (2) EPO – Careers Demo (Identify all the different steps crewmembers have taken to get to where they are today; identify all the different NASA careers that work together to prepare an astronaut for spaceflight (Objective: to motivate students to strive for a career in science, technology, engineering, and mathematics and to someday work for NASA); and (3) SWAB (Surface, Water and Air Biocharacterization) collections of air & surface samples.*]

QD Leak in Lab: Yesterday, when the crew started to demate the MTL (Moderate Temperature Loop) hose of US EXPRESS Rack 3 (ER3) in preparation for the upcoming relocation of ER3 to the Columbus Module, the QD (Quick Disconnect) leaked a small amount of coolant. The QD was immediately remated, and the leak stopped. Analysis is underway as part of ER3 relocation planning.

ISS Reboost Preview: Tomorrow night's ISS reboost with the SM main engine (2 KD thrusters & ODU props) is scheduled for shortly after midnight (00:21am EST), with a planned delta-V of (currently) 3.2 m/s. Some US systems will be powered down for the maneuver and afterwards reactivated.

SRK-V Condensate Feed Unit: Energia/Moscow is investigating an issue with the CFU (Condensate Feed Unit) of the Russian SRV-K (Condensate Water Processor) in the SM.

CEO photo targets uplinked for today were **Mount Vesuvius, Italy** (*nadir pass. Vesuvius is wooded and thus easy to detect as a darker circular area in the middle of the coastline of the Bay of Naples [just east of Naples]. Detailed imagery from low earth orbit reveals changes in topography of this active volcano. In the early 1980s an area of 80 square kilometers between the volcano and Naples was lifted up by tectonic forces, in places by 5.9 feet [1.8 meters], causing damage to houses and the harbor, and necessitating the relocation of 36,000 people. Vesuvius is famous for the catastrophic eruption in 79 A.D. that buried the towns of Herculaneum and Pompeii*), **South Tibesti Megafans, Chad** (*ISS track passed through the middle of this site. Mapping swaths left and right of track were requested. Two major rivers lead water and sediment off the southern slopes of the Tibesti Mts. In the past when central Saharan climates were wet, these now-dormant rivers flowed strongly, filling a large, permanent lake in the Lake Chad basin. In the process they created two extensive delta-like features [megafans] that have recently been recognized. Remnants of these ancient river courses may be sufficiently detailed in ISS/CEO imagery for past flow discharges to be calculated [from widths, sinuosity and other remotely sensed data]*), and **Teide Volcano, Tenerife, Canary Is.** (*ISS track passed just north of Tenerife Island. Teide Volcano forms the entire southern part of the island. Detailed images of the high, central parts were requested. This dormant volcano has recently shown signs that it might be building for another eruption. Standing 3,715 m above sea level, Teide is the third largest volcano on the planet [only the enormous volcanoes Mauna Loa and Mauna Kea are larger]. Since Tenerife Island was settled in 1402, the volcano has erupted nine times. Over the last three hundred years, eruptions have occurred every century or so, in 1706, 1798 and 1909. A new eruption in the near future may be in the offing*).

CEO photography can be viewed and studied at the websites:

<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site);
<http://earthobservatory.nasa.gov/>
<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 8:00am EST [= epoch]):

Mean altitude -- 337.5 km
Apogee height -- 342.7 km
Perigee height -- 332.3 km
Period -- 91.28 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0007738
Solar Beta Angle -- -57.3 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 57 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 53091

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*):

02/28/08 -- ISS Reboost w/IWIS, SDMS (TIG 00:21am EST; delta-V~3.2 m/s; SM KD prop.sys.)
03/07/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana) (~11:23pm EST); docking 04/03
03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS
03/12/08 -- ATV CAM (Collision Avoidance Maneuver) demo
03/13/08 -- STS-123/Endeavour/1J/A docking
03/18/08 -- ATV1 parking orbit (loiter)
03/25/08 -- STS-123/Endeavour/1J/A undocking
03/29/08 -- ATV1 Demo Day 1
03/31/08 -- ATV1 Demo Day 2
04/03/08 -- ATV1 Demo Day 3 (docking)
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)
05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
05/25/08 -- STS-124/Discovery/1J launch -- JEM PM "Kibo", racks, RMS
05/27/08 -- STS-124/Discovery/1J docking
06/05/08 -- STS-124/Discovery/1J undocking
08/07/08 -- ATV1 undocking

08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
4QTR CY09 -- STS-130/19A - MPLM
1QTR CY10 -- STS-131/ULF4
2QTR CY10 -- STS-132/20A – Node-3 + Cupola
3QTR CY10 -- STS-133/ULF5.

ISS On-Orbit Status 02/25/08

All ISS systems continue to function nominally, except those noted previously or below. **Russian Holiday:** "Defender of the Fatherland Day" (*Dyen' zaschitnika Otechestva*),- also: Men's Day (*Dyen' Muzhchin*). Underway: Week 19 of Increment 16.

Before breakfast, having reached the FD15 (Flight Day 15) mark in his flight, FE-2 Eyharts undertook his first session with the NASA/JSC experiment NUTRITION w/ Repository, today limited to two blood draws (for Serum & Heparin). *[Acting as operator and CMO (Crew Medical Officer), Peggy Whitson performed phlebotomy on Leo, i.e., drew blood samples (from an arm vein) which were first allowed to coagulate in the Repository, then spun in the HRF RC (Human Research Facility/ Refrigerated Centrifuge) and finally placed in MELFI (Minus-Eighty Laboratory Freezer for ISS). The RC was later powered off after a temperature reset to limit wear on the compressor, and cleaned. Background: NUTRITION is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight; this includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes. The Clinical Nutritional Assessment profile currently required on all U.S. Astronauts collects blood and urine samples preflight and postflight. NUTRITION expands this protocol by also capturing inflight samples and an additional postflight sample. Furthermore, additional measurements are included for samples from all sessions, including additional markers of bone metabolism, vitamin status, and hormone and oxidative stressor tests. The results will be used to better understand the impact of countermeasures (exercise and pharmaceuticals) on nutritional status and nutrient requirements. The Clinical Nutritional Assessment profile (MR016L), first started on two Mir crewmembers and then on all ISS US crews, nominally consists of two pre-flight and one post-flight analysis of nutritional status, as well as an in-flight assessment of dietary intake using the FFQ (Food Frequency Questionnaire). The current NUTRITION project expands MR016L testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow*

evaluation of post-flight nutrition and implications for rehabilitation.]

Also for Leo's FD15 mark, Dr. Whitson broke out and set up the PFE-OUM (PFE-Oxygen Uptake Measurement) equipment on the HRF-2 (Human Research Facility 2) rack, including the PFM/PAM (Pulmonary Function Module/Photoacoustic Analyzer Module), Mixing Bag System and GDS (Gas Delivery System). Data collection on Eyharts, with herself as operator, is scheduled tomorrow. *[The Periodic Fitness Evaluation with Oxygen Uptake Measurement experiment, using the CEVIS ergometer for workout, demonstrates the capability of crewmembers to perform periodic fitness evaluations with continuous oxygen consumption measurements within 14 days after arrival on ISS, and once monthly during routine PFEs. Once the capability of the pulmonary function system (PFS) to perform PFEs is verified, crewmembers will be able to integrate their monthly PFE with oxygen consumption measurements to fulfill the requirement for cardiovascular fitness evaluations during long-duration space flight.]*

On the EMCS (European Modular Cultivation System) facility, after having installed two new RBLSS (Rotor Based Life Support System) modules last week (2/21) in preparation for the upcoming Japanese CW/RW (Cell Wall/Resist Wall) experiment, the CDR today installed water tubes on the new modules. Later, the CDR also removed all cabling from EMCS in preparation for the move of ER3 (EXPRESS Rack 3) from the US Lab to the COL (Columbus Orbital Laboratory). *[The EMCS rack contains a rotating centrifuge that can support a wide range of small plant and animal experiments under partial gravity conditions. One of the new RBLSS modules is on Rotor A (position EC2, RBLSS Box 1) and the other on Rotor B (position EC2, RBLSS Box 1).]*

Also for the ER3 move to COL, Whitson decabled its ELC (ER3 Laptop Computer) and stowed it along with its cables and power supply.

FE-1 Malenchenko had another 1h 20m for cargo transfer and stowage from Progress M-63/28P to the ISS. *[28P, docked at the DC1 Docking Compartment, is currently scheduled for separation on 4/7.]*

FE-2 Eyharts continued supporting the COL BLBG (Biolab Glovebox) experiment WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels), installing the first four ECs (Experiment Containers, #1-4) in the BLBG, supporting the ground-controlled sterilization of the Glovebox, preparing the ECs for operation and installing the video cassette for the first run.

The FE-1 meanwhile conducted the periodic inventory audit of 35 Russian medical kits and items located in the Service Module (SM) medical cabinet. Purpose: to verify their availability, condition and stowage locations, weed out a number of

discarded kits, replace medications in the Emergency First Aid Kit (NP-2 #A 082) with fresh supplies, and relocate/reconfigure medical kit contents.

Malenchenko also used the AK-1M adsorber and IPD-CO Draeger tubes to perform the periodic sampling of cabin air for subsequent analysis on the ground. *[Yuri started out by taking air samples in the SM and FGB and to check for leaked-out Freon in the SM, then switched to the IPD-CO Draeger tubes sampler to check for CO (carbon monoxide) in the SM.]*

Whitson conducted microbiological sampling in Columbus, taking surface samples with the SSK (Surface Sample Kit) for the first time and air samples at mid-module, using the MAS (Microbial Air Sampler) kit and the GSC (Grab Sample Container). *[Bacterial and fungal air samples are usually taken at two locations in the module being checked. The colony growth on the MAS sampling slides is analyzed after five days of incubation in four Petri dishes. For onboard visual analysis of media slides from the SSK, the crew has a procedure for visual inspection of samples for bacterial and fungal colony growths after appropriate incubation periods.]*

Later, Yuri audited Russian IPD air samplers delivered on Progress M62/27P and re-labeled their cartridge belts for identification.

Leo Eyharts continued his support of the ELITE-S2 (Elaboratore Immagini Televisive - Space 2) payload by powering up its IMU (Interface Management Unit) to allow the ground to downlink the data from his previous session (2/22) by tele-commanding. Afterwards, he turned the IMU off again. *[The Italian (ASI) experiment ELITE-S2 is a human motion analysis facility for technological characterization and potential application for multifactorial movement analysis, to study the connection between brain, visualization and motion in micro-G. By recording and analyzing the three-dimensional motion of astronauts, this study should help engineers apply ergonomics into future spacecraft designs and determine the effects of weightlessness on breathing mechanisms for long-duration missions.]*

In the FGB (Funktsionalnyi-Grusovoi Blok), the CDR and FE-1 started a new round of the periodic preventive maintenance of RS (Russian Segment) ventilation systems. Peggy cleaned the detachable VT7 fan screens 1, 2 & 3 of the three SOTR (Thermal Control System) gas-liquid heat exchangers (GZhT4) while Yuri cleaned the grille of the TsV1 ventilator.

Peggy Whitson conducted another session with the InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions) experiment in the MSG (Microgravity Science Glovebox), conducting runs #34 (vial 002) to investigate a higher frequency (2.0 Hz) instead of yesterday's low frequency (0.66 Hz) which

resulted in weak fluid/particle structures. *[InSPACE obtains basic data on MR (magnetorheological) fluids, i.e., a new class of "smart materials" that can be used to improve or develop new brake systems, seat suspensions robotics, clutches, airplane landing gear, and vibration damper systems. The colloidal (dispersed) particles are contained in CAs (Coil Assemblies) in the MSG that subject them to electric fields at certain strength and frequencies. The desired strong dipolar interaction between the small colloidal particles can be achieved in micro-G simply with an external magnetic field being turned on and off. On the ground, the flow properties (rheology) of many materials, especially those making up consumer products like detergents, fabric softeners, toothpaste and paints, are similarly controlled, though not by magnetic fields but by adding a polymer. It now appears, for example, that new formulations of fabric softeners may perform better in space than on earth.]*

It was Malenchenko's turn today for the mandatory 30-min. medical CBT (Computer-based Training) contingency drill, with video & text material, to refresh his CMO proficiency/rating. Peggy and Leo completed theirs on 2/21. *[To maintain proficiency in using HMS (health maintenance systems) hardware, today's training focused on Part 2 of the regular exercise, viz., a review of Nasal Airway, Suction Device, ILMA (Intubating Laryngeal Mask Airway) with endotracheal tube, and Cricothyrotomy (incision to re-enable breathing air inflow).]*

In the Soyuz 15S spacecraft, docked at the FGB nadir port, Malenchenko turned on the gas analyzer, a periodic 48-hr. checkup activity.

The FE-1 completed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Yuri also performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

In addition, working from the Russian voluntary "time permitting" task list, the Russian flight engineer --

- Conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder) *[This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 16];* and

- Performed the daily monitoring, picture-taking and downloading on the BIO-5 Rasteniya-2 ("Plants-2") experiment. Today's task was extended to include recharging the water tank of the greenhouse. *[Rasteniya-2, researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. During the duration of the BIO-5 experiment, students of the Moscow City Palace for Youth Creativity of the Meshchansky inter-regional center #15 in Moscow) and the Prince of Oldenburg Lyceum in St. Petersburg will be cultivating plants in parallel on the ground and conducting comparative observation of plant growth and development under gravity and zero-gravity conditions. They are receiving the photo images taken by Yuri.]*

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1, FE-2).

Peggy Whitson then transferred the crew's exercise data file to the MEC (Medical Equipment Computer) laptop for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

As most every day after his arrival, when not busy with urgent Columbus commissioning work, Leo had 60 minutes for himself for general orientation (station familiarization & acclimatization), as is standard daily rule for the first two weeks after starting station residency.

At ~9:37am, FE-2 Eyharts powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply) and at 9:42am conducted a ham radio exchange with students at College Reydellet, Saint-Denis, Ile de La Réunion. *[Saint-Denis is the administrative capital of the French overseas department of Réunion Island, in the Indian Ocean. The city counts 130,000 inhabitants. Jules Reydellet College collaborated in the making of SPUTNIK 40 (RS17), and students contacted Viktor Afanasyev on MIR from TsUP-Moscow in September 1999. The College welcomed Victor Poliakov and Pavel Vinogradov who threw a spaceship model from MIR, and also cosmonauts Jean-Loup Chrétien, Jean-Pierre Haigneré and Claudie Haigneré. The exchange was conducted in French.]*

RPC Trip: Yesterday, RPC 03 (Remote Power Controller 03) in RPCM (RPC

Module) LA2B_G tripped due to an overcurrent, as a subsequent data dump showed. The RPC powers the MTL RFCA (Moderate Temperature Loop Rack Flow Control Assembly) in Node-1, used to provide more MTL flow to the US Airlock depress pump during EVAs. Formulation of a plan for troubleshooting and possibly R&R (Removal & Replacement) is underway.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:

<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site);

<http://earthobservatory.nasa.gov/>

<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 7:49am EST [= epoch]):

Mean altitude -- 337.5 km

Apogee height -- 342.8 km

Perigee height -- 332.3 km

Period -- 91.28 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007797

Solar Beta Angle -- -59.6 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 58 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53075

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*):

02/28/08 -- ISS Reboost w/IWIS, SDMS

03/07/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana) (~11:23pm EST); docking 04/03

03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS

03/12/08 -- ATV CAM (Collision Avoidance Maneuver) demo

03/13/08 -- STS-123/Endeavour/1J/A docking

03/18/08 -- ATV1 parking orbit (loiter)

03/25/08 -- STS-123/Endeavour/1J/A undocking

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking)

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch

04/10/08 -- Soyuz TMA-12/16S docking (DC1)

04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)
 05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
 05/14/08 -- Progress M-64/29P launch
 05/16/08 -- Progress M-64/29P docking (DC1)
 05/25/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS
 05/27/08 -- STS-124/Discovery/1J docking
 06/05/08 -- STS-124/Discovery/1J undocking
 08/07/08 -- ATV1 undocking
 08/12/08 -- Progress M-65/30P launch
 08/14/08 -- Progress M-65/30P docking (SM aft port)
 08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
 09/09/08 -- Progress M-64/29P undocking (from DC1)
 09/10/08 -- Progress M-66/31P launch
 09/12/08 -- Progress M-66/31P docking (DC1)
 10/01/08 -- **NASA 50 Years**
 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
 10/12/08 -- Soyuz TMA-13/17S launch
 10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
 10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
 10/18/08 -- STS-126/Discovery/ULF2 docking
 10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
 11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
 11/20/08 -- **ISS 10 Years**
 11/26/08 -- Progress M-67/32P launch
 11/28/08 -- Progress M-67/32P docking (SM aft port)
 12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
 12/06/08 -- STS-119/Discovery/15A docking
 12/15/08 -- STS-119/Discovery/15A undocking
 1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
 05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
 3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
 4QTR CY09 -- STS-130/19A - MPLM
 1QTR CY10 -- STS-131/ULF4
 2QTR CY10 -- STS-132/20A – Node-3 + Cupola
 3QTR CY10 -- STS-133/ULF5.

ISS On-Orbit Status 02/24/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday -- off-duty day for CDR Whitson, FE-1 Malenchenko & FE-2 Eyharts. Ahead: Week 19 of Increment 16.*

For today's Voluntary Science program, Peggy Whitson continued her work with the InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions) experiment in the MSG (Microgravity Science Glovebox), conducting runs #31, #32 and #33 to investigate low frequency behavior (0.66 Hz) at the highest particle concentration MR (magnetorheological) fluid, exchanging video tapes after each run, then removing the vial assembly and finally powering the MSG down. *[InSPACE obtains basic data on MR fluids, i.e., a new class of "smart materials" that can be used to improve or develop new brake systems, seat suspensions robotics, clutches, airplane landing gear, and vibration damper systems. The colloidal (dispersed) particles are contained in CAs (Coil Assemblies) in the MSG that subject them to electric fields at certain strength and frequencies. The desired strong dipolar interaction between the small colloidal particles can be achieved in micro-G simply with an external magnetic field being turned on and off. On the ground, the flow properties (rheology) of many materials, especially those making up consumer products like detergents, fabric softeners, toothpaste and paints, are similarly controlled, though not by magnetic fields but by adding a polymer. It now appears, for example, that new formulations of fabric softeners may perform better in space than on earth.]*

During the InSPACE runs, Peggy took time for the periodic deployment of two passive FMK (Formaldehyde Monitoring Kit) sampling assemblies in the Lab (below CEVIS) and SM (Service Module, most forward handrail) for two days, to catch any atmospheric formaldehyde (H₂CO, methanal) on a collector substrate for subsequent analysis on the ground. *[Formaldehyde is an intermediate in the oxidation (combustion) of methane and other carbon compounds, e.g., forest fires,*

in automobile exhaust, and in tobacco smoke. Small amounts of formaldehyde are produced as a metabolic byproduct in most organisms, including humans.]

FE-1 Malenchenko completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables plus the weekly collection of the toilet flush counter (SPK-U) and water supply (SVO) readings for calldown to TsUP/Moscow.

Yuri also gathered weekly data on total operating time and "On" durations of the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem for reporting to TsUP.

In the US Lab, FE-2 Eyharts set up the hardware associated with urine and blood collections for NASA's NUTRITION/Repository experiment. *[To gain more time for Leo's planned work on the COL FSL (Columbus Orbital Laboratory/Fluid Science Laboratory) facility, his start with NUTRITION may be scheduled as early as tomorrow morning. The NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

Working from the Russian voluntary "time permitting" task list, Yuri Malenchenko today --

- Completed his seventh run of the Russian DZZ-2 "Diatomeya" ocean observations program, using the Japanese HDV (High Definition) video camera for nocturnal observations of the ocean to detect and record bio-luminescent glow of high-production water areas *[Uplinked target zones in the Pacific Ocean were the Eastern coast of New Zealand, above the Eastern Pacific Upwelling, and in the Indian Ocean the geographical area above the West Indian underwater ridge and the Great Australian Bight)];*
- Performed a session of the Russian GFI-8 "Uragan" (hurricane) earth-imaging program, using the Nikon D2X digital camera with 800 mm focal length lens *[Uplinked targets for today were pollution in the Caspian Sea, a general view of the Aral Sea, and the Pyrenees mountains (from DC1 window)],* and
- Conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder) *[This is a daily monitoring/temp checking, carried on*

the Russian voluntary task list for the duration of Expedition 16].

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR) and VELO bike with bungee cord load trainer (FE-1).

Eyharts and Whitson had their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop), Leo at ~11:15am, Peggy at ~12:50pm EST.

CDRA Troubleshooting Update: After Whitson's work, with the ground, on CDRA (Carbon Dioxide Removal Assembly) troubleshooting over the past two days, CDRA was activated yesterday and is functional. However, the system still exhibits the same signature of an elevated differential pressure (dP) over the Precooler during Half-Cycle 1, although the troubleshooting cleared several suspected causes. CDRA was deactivated again today by ground commanding (~7:00am-12:00pm), and analysis continues.

RSE1 Laptop Upgrade Update: On 2/22, Yuri Malenchenko's attempt to upgrade the Russian laptop RSE1 with a new software application for ATV (Automated Transfer Vehicle) docking simulations, from a DVD on the RSS1 laptop, was aborted after the procedure failed, probably due to incompatibility of the old RSS1 software with the new load. After restoring RSS1 functionality with a spare hard drive, TsUP-Moscow was considering repeating the ATV OBT (Onboard Training) software load on 2/27 (Wednesday).

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site);
<http://earthobservatory.nasa.gov/>
<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 7:32am EST [= epoch]):

Mean altitude -- 337.6 km

Apogee height -- 342.8 km

Perigee height -- 332.4 km

Period -- 91.29 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007761

Solar Beta Angle -- -61.1 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 60 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53059

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*):

02/28/08 -- ISS Reboost w/IWIS, SDMS

03/07/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana)
(~11:23pm EST); docking 04/03

03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS

03/12/08 -- ATV CAM (Collision Avoidance Maneuver) demo

03/13/08 -- STS-123/Endeavour/1J/A docking

03/18/08 -- ATV1 parking orbit (loiter)

03/25/08 -- STS-123/Endeavour/1J/A undocking

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking)

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch

04/10/08 -- Soyuz TMA-12/16S docking (DC1)

04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)

04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/25/08 -- STS-124/Discovery/1J launch -- JEM PM "Kibo", racks, RMS

05/27/08 -- STS-124/Discovery/1J docking

06/05/08 -- STS-124/Discovery/1J undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/16/08 -- STS-126/Discovery/ULF2 launch -- MPLM Leonardo, LMC

10/18/08 -- STS-126/Discovery/ULF2 docking

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
4QTR CY09 -- STS-130/19A - MPLM
1QTR CY10 – STS-131/ULF4
2QTR CY10 -- STS-132/20A – Node-3 + Cupola
3QTR CY10 – STS-133/ULF5.

ISS On-Orbit Status 02/23/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday -- off-duty day for CDR Whitson, FE-1 Malenchenko & FE-2 Eyharts except for housekeeping and voluntary work.*

The crew performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the CDR's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

CDR Whitson prepared the MELFI (Minus Eighty Degree Laboratory Freezer for the ISS) for the next DCB (Double Cold Bag) sample stow activity, first swapping box modules in Dewar 3 trays A & B, then inserting 16 -32deg ICEPAC belts in Dewar 3 *[The MELFI dewar is currently powered off, i.e., at ambient temperature, so Peggy did not have to hurry through the normal 60 sec time "window" after its opening.]*

The CDR reconfigured the auto-rebooted PCS (Portable Computer System) laptops in COL (Columbus Orbital Laboratory), Lab and SM for use after the new R5 software patch uplink by the ground. Later in the day, she powered down the currently not needed Cupola and Airlock PCS laptops.

Peggy also finished up her assistance to ground specialists in troubleshooting the CDRA (Carbon Dioxide Removal Assembly) which had exhibited an unexpected differential pressure (dP) offset between half cycle 1 and half cycle 2 operations. *[The troubleshooting, begun yesterday, involves inspecting and cleaning CDRA locations that could contribute to the dP anomaly at five locations that are accessible from the front of the rack and one area that requires removal of the*

TCCS (Trace Contaminant Control System) and use of the ULD (Ultrasonic Leak Detector). Yesterday Whitson experienced difficulties with the onboard fiber scope tool required for inspecting the AD/DES #2 (Absorbent/Desorbent Bed #2), resulting in deferral of about one hour of troubleshooting to today. Ground controllers plan to activate CDRA after dP troubleshooting is complete.]

The FE-1 completed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM.

Also, working from the Russian voluntary "time permitting" task list, Yuri Malenchenko --

- Completed another radiation data monitoring & logging session for flow & dose power data with the Matryoshka-R radiation payload and its LULIN-5 electronics box *[accumulated readings were recorded on a log sheet for subsequent downlink to TsUP/Moscow via the BSR-TM payload data channel]*,
- Conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder) *[this is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 16]*,
- Performed a session of the Russian "Uragan" (hurricane) earth-imaging program, using the Nikon D2X digital camera with 800 mm focal length lens *[targets uplinked for today were the Western slopes of Carpathian mountains, Aral Sea and a dust storm (if present), the Kerch Strait area, the Main Caucasus mountain range (Elbrus volcano, Kazbek volcano), oil slicks in the Caspian Sea, the Pyrenees mountains(series of snapshots along the ridge)]*, and
- Completed another KPT-3 session to make observations and take aerial KPT-3 photography of environmental conditions for Russia's Environmental Safety Agency (ECON) using the Nikon D2X digital camera with SIGMA 300-800mm telephoto lens.

Two new jobs added to Peggy Whitson's voluntary "job jar" task list concern preparations for 1J/A EVAs, viz., (1) configuring some foam brushes and the tile sample bag, and (2) EMU resizing for 1J/A (also hard-scheduled next Wednesday).

At ~5:55am EST, Peggy & Leo held the (now) regular weekly audio tagup with ESA's Col-CC (Columbus Control Center) in Oberpfaffenhofen near Munich/Germany. *[S/G-2 (Space-to-Ground 2) phone patch via SSC-10 (Station Support Computer 10)].*

At ~7:40am, Yuri Malenchenko had his weekly PFC (Private Family Conference) via

S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop).

At ~9:15am, the crew held its regular weekly planning conference (WPC) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP/Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

MSS Software Transition Update: Last night, ground controllers successfully completed uplink and checkout of the Robotics MSS (Mobile Service System) R5 software to the Prime C&C MDM (Command & Control Multiplexer/Demultiplexer computer). *[This software update is required to incorporate Dextre/SPDM (Special Purpose Dexterous Manipulator) functionality into the MSS. In addition, there were a few updates to the SSRMS (Space Station Remote Manipulator System) and MBS (Mobile Base System) behavior as well as new SPDM PCS displays. The crew's next Robotics operations will occur on the new MSS R5 software. In prep for that, the ground will uplink a brief summary of system behavior changes for the DOUG (Dynamic Onboard Ubiquitous Graphics) software review for those ops.]*

Columbus Update: Columbus systems continue to operate nominally.

Weekly Science Update (Expedition Sixteen -- Week 18)

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): Radiation measurements continue to be performed in the PIRS module. Memory card exchange has been successfully performed on 2/15.

ANITA: Completed.

BCAT-3 (Binary Colloidal Alloy Test 3): The ground is presently working to schedule an activity to get the orientation of the stowed sample module rotated. This is to reduce the possibility of a bubble migrating through some of the samples when they are being stowed and equilibrating for six months. The stowage procedure is being updated to reflect this desire for future operations.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): In progress.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Third session successfully performed on 2/14.

EuTEF (European Technology Exposure Facility): EuTEF has been successfully installed on COL External Platform during EVA-3 on 2/15 (FD9). During Week#18, 9 out of 9 instruments have been progressively checked out from ground with success. Two instruments (PLEGPAY and EXPOSE-E) have already been fully commissioned. At EuTEF platform level, troubleshooting is underway on some software issues with the DHPU MMU (Data Handling & Power Unit Mass Memory Unit), so that scripts can be loaded to operate the EuTEF platform in an automated way. The full commissioning of the remaining instruments will continue during Week #19 and the science program will begin during Week #20.

GEOFLOW: Hardware launched on 1E. The FSL (Fluid Science Laboratory) facility commissioning continues for a couple of days by Leo Eyharts, and it is currently planned to start the GEOFLOW science program during Week #20.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): In progress.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): Completed 30 runs since the start of InSPACE-2. Three runs were completed on 2/19 which were performed nominally. These runs explored the low frequency response of the fluid. A progression to much larger structures with increasing field strength was observed. The final structures at the end of the last run exhibited large field distortion effects when it pulsed.

Integrated Immune: Peggy's and Leo's participation in the STS-122 (1E) Integrated Immune session is appreciated!

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Troubleshooting of the centrifuge/incubator was performed successfully on 2/15 and 2/16. The test demonstrated that the temperature can be set between +37degC and +6degC, and the KUBIK-

FM3 is fully functional. Telemetry has been downlinked and is under analysis by the KUBIK Payload Developer (PD).

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: MULTIGEN-1 samples have been downloaded on STS-122 (1E) and will now be analyzed on the ground..

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION/REPOSITORY: In progress..

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): The ground appreciates Peggy's completion of the download/initialization activity off the task list. Her remaining scheduled activities include monthly downloads, two more weeks of sleep logging, and doffing the Actiwatch. Also appreciated is the additional sleep logging. "Peggy, you continue to go above and beyond and the PI greatly appreciates it."

SOLAR (Solar Monitoring Observatory): SOLAR has been successfully installed on COL External Platform during EVA-3 on 2/15 (FD9). Some software glitches have been repeatedly encountered with the Sun Pointing Device platform, and are currently under investigation. Some anomalies have also been encountered with a sub-system of the SOVIM instrument, which had to be power cycled. The SOLAR instruments are currently outgassing (nominal activity), before the science program is started.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): In progress.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: In progress.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels):
WAICO#1 hardware launched on 1E. WAICO#1 items (ATCS with chemicals, Cultivation Box Bowls with Agar) transferred to MELFI on 2/10 (FD4). Two transfer activities of 2 x 4 WAICO-#1 Seeds containers to MELFI have been performed on 2/11 to start Arabidopsis seeds vernalization phase. The BIOLAB commissioning is nearing completion. The transfer of cold stowed items from MELFI to BIOLAB was completed yesterday (2/22), and WAICO#1 experiment is currently planned to start on 02/26.

CEO (Crew Earth Observation): Ongoing.

CEO photo targets uplinked for today were **Dhaka, Bangladesh** (*the population of greater Dhaka, the Bangladeshi capital, is 11 million, making it the 11th largest city on Earth. Images of the margins of the city are requested. The city can be hard to identify: the crew was to start looking right as ISS passed over the very wide Brahmaputra River on the India-Bangladesh border. Then they were to look on a branch river nearer track than the Brahmaputra*), **Ganges River Delta** (*fast change of river course location and island shape typify this major world delta. Requested was a mapping swath of overlapping images aimed right of track. An extreme example of fast change was the sudden appearance offshore of New Moore Island [3.5 km long] in 1970. The island appeared immediately after the storm surge and floods generated by Cyclone Bhola in November 1970. This cyclone, although only a category 3 storm, was the most destructive on record. It caused the movement of vast amounts of sediment. The island continues to grow*), and **East Haruj Megafans, Libya** (*ISS passed over the center of this remote Saharan target. A mapping swath taken near nadir was requested. The almost featureless desert landforms of these “desert flats” have been recently recognized as vast spreads of river sediment [megafans]. The sediment has been transported hundreds of km from the Tibesti Mts. far to the south. Now-dry river courses can be traced from the mountains. These rivers undoubtedly flowed during wet climate phases in the past.*)

CEO photography can be viewed and studied at the websites:

<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);

<http://earthobservatory.nasa.gov/>

<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 8:30am EST [= epoch]):

Mean altitude -- 337.7 km

Apogee height -- 343.0 km

Perigee height -- 332.3 km

Period -- 91.29 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007958

Solar Beta Angle -- -61.4 deg (magnitude peaking)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 66 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53044

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*):

02/28/08 -- ISS Reboost w/IWIS, SDMS

03/07/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana)

(~11:23pm EST); docking 04/03

03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS

03/12/08 -- ATV CAM (Collision Avoidance Maneuver) demo

03/13/08 -- STS-123/Endeavour/1J/A docking

03/18/08 -- ATV1 parking orbit (loiter)

03/25/08 -- STS-123/Endeavour/1J/A undocking

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking)

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch

04/10/08 -- Soyuz TMA-12/16S docking (DC1)

04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)

04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/25/08 -- STS-124/Discovery/1J launch -- JEM PM "Kibo", racks, RMS

05/27/08 -- STS-124/Discovery/1J docking

06/05/08 -- STS-124/Discovery/1J undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
4QTR CY09 -- STS-130/19A - MPLM
1QTR CY10 – STS-131/ULF4
2QTR CY10 -- STS-132/20A – Node-3 + Cupola
3QTR CY10 – STS-133/ULF5.

Note: The daily ISS On-Orbit Status reports can also be found at

ISS On-Orbit Status 02/22/08

All ISS systems continue to function nominally, except those noted previously or below.

Upon wakeup, FE-1 Yuri Malenchenko terminated his tenth MBI-12 SONOKARD experiment session, started last night, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

Before breakfast, CDR Whitson, FE-1 Malenchenko and FE-2 Eyharts started the day with the periodic session of the Russian biomedical routine assessments PZEh-MO-7/Calf Volume Measurement and PZEh-MO-8/Body Mass Measurement (fourth for CDR & FE-1, first for FE-2), using the IM mass measurement device which Yuri Malenchenko afterwards broke down for stowage. *[Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference pints, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures. For determining body mass in zero-G, where things are weightless but not massless, the Russian IM "scales" measure the inertial forces that arise during the oscillatory motion of a mass driven by two helical metering springs with known spring constants. By measuring the time period of each oscillation of the unknown mass (the crewmember) and comparing it to the period of a known mass, the crewmember's mass is calculated by the computer and displayed.]*

Malenchenko serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out" cycle to vacuum on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated at ~4:15pm EST. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. Filter bed 1 was regenerated yesterday.]*

The FE-1 also started charging the SONY HRV-Z1J camcorder battery and ~2.5 hrs later terminated the process without dismantling the setup.

For today and Sunday (2/24), Peggy Whitson's work schedule includes shooting some "Life inboard the ISS" footage with the camcorder for use on Russian television. *[For today's filming, TsUP-Moscow's suggestion was to film Yuri Malenchenko while working with the Matryoshka radiation detectors and the filling of the Elektron EDV container with US condensate water (see below). Other scenes of interest to TV viewers would include crewmembers washing their faces, brushing their teeth, exercising, cooking meals, conducting science research and servicing life support systems. The downlinking of the recorded footage is scheduled next week (2/26 & 2/27).]*

CDR Whitson supported FE-2 Eyharts' activities with the ELITE-S2 (Elaboratore Immagini Televisive - Space 2) payload by moving the CEVIS (Cycle Ergometer with Vibration Isolation) out of the field of view of the cameras crucial to of the experiment, which she then set up for capturing Leo's Eyharts' movement protocol. After powering up the IMU (Interface Management Unit) and calibrating the work area for the cameras, the FE-2 had ~1.5 hrs to perform the test operations while Whitson took documentary photographs and later stowed the test camera. *[The Italian (ASI) experiment ELITE-S2 is a human motion analysis facility for technological characterization and potential application for multifactorial movement analysis, to study the connection between brain, visualization and motion in micro-G. By recording and analyzing the three-dimensional motion of astronauts, this study should help engineers apply ergonomics into future spacecraft designs and determine the effects of weightlessness on breathing mechanisms for long-duration missions. For each of three planned protocols, a set of body landmarks are identified and reflective markers are applied on the subject who then performs prescheduled movements with the index finger tips then returns to the initial position (for example, the subject has to reach and brush, without exerting forces). The video cameras trace the trajectories of the body parts of the astronaut catching the light reflected by the markers, thus recording the kinetic and trajectory data of the movement.]*

Yuri Malenchenko set up new Bubble dosimeters for recording radiation traces as

an additional component of the RS (Russian Segment) radiation payload suite “Matryoshka-R” (RBO-3-2), initializing and deploying the detectors. *[A total of seven Bubble dosimeter detectors (A01-A08, A05 not used) were initialized in the Bubble dosimeter reader in the Service Module (SM) and positioned at their exposure locations, three near the “Phantom” unit on the DC1 panel and four in the SM starboard crew cabin on both sides of the MOSFET (metal oxide semiconductor field-effect transistor) dosimeter detector unit. The setup was photo-documented with the NIKON D2X camera and also reported to TsUP via log sheet on the BSR-TM payload channel. The complex Matryoshka payload suite is designed for sophisticated radiation studies. Note: Matryoshka is the name for the traditional Russian set of nested dolls.]*

The FE-1 spent ~1.5 hrs on the TVIS treadmill for the periodic Russian PZE-MO-3 test for physical fitness evaluation, his second time, using the TVIS in unmotorized (manual control) mode and wearing the Kardiokassette KK-2000 belt with three chest electrodes. *[The fitness test, controlled from the RSE-Med laptop, yields ECG (electrocardiogram) readings to the KK-2000 data storage device, later downlinked via the BSR-TM payload telemetry channel. Before the run, the KK-2000 was synchronized with the computer date/time readings. For the ECG, the crewmembers worked out on the treadmill, first walking 3 min. up to 3.5 km/h, then running at a medium pace of 6.5 km/h, followed by the maximum pace not exceeding 10 km/h, then walking again at gradually decreasing pace.]*

In the COL (Columbus Orbital Laboratory), Leo Eyharts worked on the BLB (Biolab), first deinstalling and removing all hardware items required earlier for BLB and BLB-Incubator commissioning, then installing a new video tape and the hardware for the subsequent operation of the WAICO (Waving and Coiling of Arabidopsis Roots at Different g-levels) experiment, including 1 ATCS (Automatic Temperature Controlled Stowage) unit and 16 seed containers stored in the MELFI (Minus Eighty Degree Laboratory Freezer for the International Space Station) on 2/10. *[WAICO, contributed by Leibniz Universität in Hannover, Germany, is a small greenhouse for studying the interaction of circumnutation (the successive bowing or bending in different directions of the growing tip of the stems and roots) and gravitropism (a tendency to grow toward or away from gravity) in microgravity and 1-g of Arabidopsis thaliana (commonly known as thale cress).]*

In the US Lab, Whitson performed troubleshooting on the CDRA (Carbon Dioxide Removal Assembly), after connecting the regular ITCS LTL (Internal Thermal Control System/Low Temperature Loop) coolant jumper at the LAB1D6 rack for the ground-commanded activation of CDRA later (12:10p-2:00pm). *[For the troubleshooting, Peggy first used a fiber optics tool to inspect the AD/DES #2 (Absorbent/Desorbent Bed #2), then removed the TCCS (Trace Contaminant*

Control Subassembly) and used the ULD (Ultrasonic Leak Detector) to sample and inspect Ad/DES #2.]

FE-1 Malenchenko upgraded the Russian laptop RSE1 with a software application from a DVD and the RSS1 laptop that enables it to support a planned ATV (Automated Transfer Vehicle) docking simulation for an upcoming docking OBT (On-Board Training).

Using the SKDS CMS (Pressure Control & Atmosphere Monitoring System/Countermeasure System), Yuri took the periodic readings of potentially harmful contaminants in the SM. The hardware was then returned to initial stowage. *[The CMS uses preprogrammed microchips to measure Formaldehyde (H_2CO , methanal), Carbon Monoxide (CO) and Ammonia (NH_3), taking one measurement per microchip.]*

Peggy gathered measurements for the periodic (weekly) atmospheric status check for ppO₂ (Partial Pressure Oxygen) and ppCO₂ (pp Carbon Dioxide), using the hand-held CSA-CP (Compound Specific Analyzer-Combustion Products), CSA-O₂ (CSA -Oxygen sensor) and CDMK (CO₂ Monitoring Kit). Batteries were to be replaced if necessary. *[Purpose of the 15-min activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements. CSA-CP sensors (and readings) employed in the SM were #1051 (20.7%) & #1044/prime (20.9%); in Node-1 #1058 (19.6%); and in Node-2 #1045 (20.6%). O₂ sensor checks used #1052 (21.5%), #1041 (21.6%). CDMK CO₂ level in Lab was 0.43 and in SM ~0.42%.]*

Malenchenko completed the periodic (about twice a month) replenishing of the Elektron's water supply for electrolysis, filling the KOV thermal loops' EDV container with purified water from CWC (Contingency Water Container, #1043) collected by the US CCAA (Common Cabin Air Assembly). *[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron micropump shutdown.]*

The FE-1 completed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM.

Also, working from the Russian voluntary "time permitting" task list, Malenchenko -

- Performed the periodic downloading of accumulated log files from the Russian BSMM (Payload Matching Unit/computer) to the US OCA for downlink,

- Completed the daily IMS maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur),
- Conducted the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder) *[This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 16]*, and
- Performed the daily monitoring, picture-taking and downloading on the BIO-5 Rasteniya-2 ("Plants-2") experiment. *[Rasteniya-2, researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP)].*

For Peggy Whitson and Leo Eyharts, a new item added to the discretionary US “job jar” task list is to recover the functionality of the SSC-2 (Station Support Computer 2) laptop. *[Steps include removing & stowing its current CPSD (Crew Personal Support Disk) hard drive #1148, replacing it with a second hard drive (#1185), reconnecting the A31p client to the Ethernet cable and reloading the hard drive from a backup DVD, then re-registering the client on the OpsLAN (Operations Local Area Network).]*

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1/MO-3, FE-2), RED resistive exercise device (CDR) and VELO bike with bungee cord load trainer (FE-1).

Peggy then transferred the crew’s exercise data file to the MEC (Medical Equipment Computer) laptop for downlinking, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~3:25am EST, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~8:55am, Peggy, Yuri and Leo conducted their standard bi-weekly teleconference with the JSC Astronaut Office (Steve Lindsey), via S-band S/G-2 audio & phone patch.

At ~3:55pm, the crew will have their tenth weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. *[S/G-2 (Space-to-Ground 2) phone patch via SSC-10 (Station Support Computer 10)].*

MSS Software Transition: MCC-Houston has started the multi-hour transition of onboard computers to the new CDH (Command & Data Handling) software version R5 for the Robotics MSS (Mobile Service System) and SSRMS (Space Station Remote Manipulator System). [The procedure began at ~7:00am on the Prime C&C MDM (Command & Control Multiplexer/Demultiplexer computer), after first deleting the old MSS R3 software. After an initial checkout, ground specialists will tomorrow load a patch (PPL/Prepositioned Load) to all PCS (Portable Computer System) laptops to add the Robotics displays that go with R5, then repeat the file uplinks to the Backup & Standby C&C MDMs as well as the MSD (Mass Storage Device), followed by the remaining patches to the other PCS laptops.]

COL Update: Columbus systems continue to operate nominally.

WDS Update: An updated Water Delivery System "cue card" was uplinked for the crew's reference. [The new card (16-0018U) lists 36 CWCs (~1392.5 L total) for the four types of water identified on board: technical water (812.9 L, for Elektron, flushing, hygiene), potable water (559.6 L), condensate water (20 L), waste/EMU dump and other (0 L). Of the 36 containers, nine CWCs with technical water (388.9 L) cannot be used until cleared for Wautersia bacteria, and 10 CWCs with potable water (427 L), transferred from Atlantis, are not cleared for use pending analysis of samples returning on 1E.]

CEO photo targets uplinked for today were **Northern Temperate Lakes, Wisconsin** (looking right or east of ISS track for lakes in this LTER [Long Term Ecological Research] site. The North Temperate Lakes Research program aims to understand the ecology of lakes in relation to relevant atmospheric, geochemical, landscape and human processes. The overarching research question is "How do biophysical setting, climate, and changing land use and cover interact to shape lake characteristics and dynamics over time [past, present, future]?" Documenting land use around the lake as well as lake levels and colors), and **West Hawk Impact Crater** (looking right or east of ISS orbital track for this Canadian lake formed by an impact crater. West Hawk Lake was formed approximately 351 million years ago. It is 2.4 kilometers in diameter. West Hawk Lake is also the deepest lake in Manitoba [115m].)

CEO photography can be viewed and studied at the websites:
<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site);
<http://earthobservatory.nasa.gov/>
<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 8:08am EST [= epoch]):

Mean altitude -- 337.7 km

Apogee height -- 343.0 km

Perigee height -- 332.4 km

Period -- 91.29 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007872

Solar Beta Angle -- -60.6 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.77

Revolutions since FGB/Zarya launch (Nov. 98) -- 53028

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*):

02/28/08 -- ISS Reboost w/IWIS, SDMS

03/07/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana)
(~11:23pm EST); docking 04/03

03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS

03/12/08 -- ATV CAM (Collision Avoidance Maneuver) demo

03/13/08 -- STS-123/Endeavour/1J/A docking

03/18/08 -- ATV1 parking orbit (loiter)

03/25/08 -- STS-123/Endeavour/1J/A undocking

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking)

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch

04/10/08 -- Soyuz TMA-12/16S docking (DC1)

04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)

04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/25/08 -- STS-124/Discovery/1J launch -- JEM PM "Kibo", racks, RMS

05/27/08 -- STS-124/Discovery/1J docking

06/05/08 -- STS-124/Discovery/1J undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
4QTR CY09 -- STS-130/19A - MPLM
1QTR CY10 – STS-131/ULF4
2QTR CY10 -- STS-132/20A – Node-3 + Cupola
3QTR CY10 – STS-133/ULF5.

ISS On-Orbit Status 02/21/08

All ISS systems continue to function nominally, except those noted previously or below.

FE-1 Malenchenko performed the periodic servicing of the Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The regen process will be terminated before sleeptime, at ~2:15pm EST. Regeneration of bed #2 follows tomorrow. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods.]*

CDR Whitson and FE-2 Eyharts completed the mandatory 30-min. medical CBT (Computer-based Training) contingency drill, with video & text material, to refresh their CMO (Crew Medical Officer) proficiency/rating. *[To maintain proficiency in using HMS (health maintenance systems) hardware, today's training focused on Part 2 of the regular exercise, viz., a review of Nasal Airway, Suction Device, ILMA (Intubating Laryngeal Mask Airway) with endotracheal tube, and Cricothyrotomy (incision to re-enable breathing air inflow).]*

FE-1 Malenchenko worked in the Soyuz TMA-11/15S vehicle, docked at the FGB nadir port, dismantling the KURS-A rendezvous and approach radar system of its SUDN motion control & navigation system and removing it from the Orbit Module (to be jettisoned prior to reentry), a 3.5-hour job including logging it in the IMS (Inventory Management System). These valuable components will be returned to Earth on the Shuttle for reuse. *[KURS, not required for Soyuz reentry or prox ops (relocation), has two components: KURS-A is the active half of the Russian space program's proven S-band radar system for automated flight, which measures relative motion parameters between Soyuz(or Progress) and the ISS during rendezvous operations, to enable the autopilot's calculation of corrective impulses. The system's passive transponder counterpart (KURS-P) is on the Service Module (SM), with one antenna each at the tip of the two solar array wings.]*

Leo continued preparing the ELITE-S2 (Elaboratore Immagini Televisive - Space 2) hardware for operation, connecting camera cables to its IMU (Interface Management Unit) and routing them in the Lab, then activating the ELC (EXPRESS Laptop Computer) and installing the ELITE-S2 Remote Desktop Client software from CD. *[The Italian (ASI) experiment ELITE-S2 is a human motion analysis facility for technological characterization and potential application for multifactorial movement analysis, to study the connection between brain, visualization and motion in micro-G. By recording and analyzing the three-dimensional motion of astronauts, this study should help engineers apply ergonomics into future spacecraft designs and determine the effects of weightlessness on breathing mechanisms for long-duration missions.]*

Peggy Whitson performed clean-up operations on the EMCS (European Modular Cultivation System) facility, exchanging a number of EMCS modules in preparation for the upcoming CW/RW (Cell Wall/Resist Wall) experiment. *[The EMCS rack contains a rotating centrifuge that can support a wide range of small plant and animal experiments under partial gravity conditions.]*

The CDR also conducted the periodic check of active U.S. payloads, viz., cleaning the ANITA (Analyzing Interferometer for Ambient Air) inlet plus inspecting and filter cleaning of the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. *[The CGBA incubator is controlled from the ground, with automatic video downlinked to Earth. ANITA continues to collect data every six seconds and downlinks the data daily to the ground team. ANITA monitors low levels of potential gaseous contaminants in the ISS cabin atmosphere with a capability of simultaneously monitoring 32 gaseous contaminants. The experiment is testing the accuracy and reliability of this technology as a potential next-generation atmosphere trace-gas monitoring system for ISS and future spacecraft. This is a collaborative investigation with ESA.]*

Continuing his COL (Columbus Orbital Laboratory) commissioning work, Leo Eyharts set up hardware in the FSL (Fluid Science Laboratory), specifically the upper section of the CEM (Central Experiment Module), including removing launch fixation bolts and installing some ORUs (Orbital Replacement Units),

In Node-2, Whitson installed and configured an SSC (Station Support Computer) A31p laptop as SSCR (Station-to-Shuttle Communications Router), loading it with the necessary image software (V.4.0) and connecting it to the ISL UIP (Integrated Station LAN Utility Interface Panel). *[The SSCR will enable wireless connectivity between the Shuttle and Station LANs (Local Area Networks) during a flight, which will allow the Shuttle to shut down its own Ku-band to help save fuel cell cryo. During the 1J/A mission, the laptop will be powered up again, and the ground will verify that everything works OK with the Shuttle network.]*

The CDR also continued troubleshooting & cable connectivity checkout of the PS28 (Powerstrip 28) junction box with Part 2 of the uplinked procedures.

Later, Peggy conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. *[Updated "cue cards" based on the crew's water calldowns are sent up every other week. The current cue card (#16-0018T), to be updated with today's data, lists 36 CWCs (~1295.1 L total) for the four types of water identified on board: technical water (695.3 L, for Elektron, flushing, hygiene), potable water (559.5 L), condensate water (40.2 L), waste/EMU dump and other (0 L). Of the 36 containers, nine CWCs with technical water (251.1 L) cannot be used until cleared for Wautersia bacteria, and 10 CWCs with potable water (427 L), transferred from Atlantis, are not cleared for use pending analysis of samples returning on 1E.]*

Regular servicing & maintenance tasks completed by Yuri Malenchenko today included –

- Linking up with TsUP-Moscow stowage specialists at ~3:05am EST via S-band to conduct the weekly IMS (Inventory Management System) tagup, discussing stowage issues and equipment locations,
- The periodic checkout/verification of IP-1 airflow sensors in the various RS (Russian segment) hatch openings (8) in the SM, FGB and DC1 (Docking Compartment),
- The monthly maintenance on the Russian IK0501 GA (gas analyzer) of the SOGS Pressure Control & Atmospheric Monitoring System, adjusting for O₂ readings *[IK0501 is an automated system for measuring CO₂, O₂, and H₂O in the air as well as the flow rate of the gas being analyzed],*
- The daily monitoring, picture-taking and downloading on the BIO-5 Rasteniya-2 ("Plants-2") experiment. *[Rasteniya-2, researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP)], and*
- Completing the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM.

Also, working from the Russian voluntary "time permitting" task list, Yuri was to -

- Perform the periodic downloading of accumulated log files from the Russian BSMM (Payload Matching Unit/computer) to the US OCA for downlink,
- Complete the daily IMS maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur), and

- Conduct the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). *[This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 16.]*

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1, FE-2).

Peggy then transferred the crew's exercise data file to the MEC laptop for downlinking, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Shortly before sleep time, Malenchenko will set up the Russian MBI-12 SONOKARD (Sonocard) payload and started his tenth experiment session, using a sports shirt from the SONOKARD kit with a special device in the pocket for testing a new method for acquiring physiological data without using direct contact on the skin. Measurements are recorded on a data card for return to Earth. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

At ~3:25am EDT, Leo Eyharts powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply), to conduct, at 3:30am, a ham radio exchange with students at Robespierre School in Rueil-Malmaison, France. Questions to Leo were uplinked by ARISS (Amateur Radio on ISS) beforehand. *["When do you know when it is time to sleep?"; "What do you like to eat on earth, that you could not have in the ISS?"; "Is it frightening to go to space?"; "How long could the Space Station remain in space?"; "What do you do if you get sick?"; "Are there any meteors passing nearby the ISS?"; "How could you take a shower in zero-gravity?"; "Is the Earth pollution visible from the space?"; "What did you put in your suitcase before leaving to the space?"; "Do you plan to live one day on another planet?"]*

VolSci Program Update: For the Voluntary Science program on 2/24 (Sunday), Peggy Whitson has opted for another session with the InSPACE-2 experiment.

VOA Shutdown: Yesterday the US VOA (Volatile Organics Analyzer) shut down after successfully running through a test and shortly after the standard Sample Acquire command was sent by the ground. Specialists are analyzing a VOA data dump before any further troubleshooting will be performed.

CEO photo targets uplinked for today were **Brent Impact Crater** (*weather was predicted to be partly cloudy in this area, but hopefully it was clear enough for the crew to see this crater. Brent impact crater is 3.8 kilometers in diameter and is one of the older craters, dated at approximately 396 million years. As with many craters in Canada, this one is highlighted by the lakes that fill in part of the crater*), and **Charlevoix Impact Crater** (*as with Brent crater, the area around Charlevoix is also predicted to be partly cloudy. Roughly half of this impact crater is visible along the left bank (western side) of the St. Lawrence River. Charlevoix is 54 kilometers in diameter and 342 million years old*).

CEO photography can be viewed and studied at the websites:

<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site);

<http://earthobservatory.nasa.gov/>

<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 6:27am EST [= epoch]):

Mean altitude -- 337.7 km

Apogee height -- 342.8 km

Perigee height -- 332.6 km

Period -- 91.29 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007653

Solar Beta Angle -- -58.9 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 100 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53011

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*):

02/28/08 -- ISS Reboost w/IWIS, SDMS

03/07/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana) (~11:23pm EST); docking 04/03

03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS

03/12/08 -- ATV CAM (Collision Avoidance Maneuver) demo

03/13/08 -- STS-123/Endeavour/1J/A docking

03/18/08 -- ATV1 parking orbit (loiter)

03/25/08 -- STS-123/Endeavour/1J/A undocking
03/29/08 -- ATV1 Demo Day 1
03/31/08 -- ATV1 Demo Day 2
04/03/08 -- ATV1 Demo Day 3 (docking)
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
05/25/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS
05/27/08 -- STS-124/Discovery/1J docking
06/05/08 -- STS-124/Discovery/1J undocking
08/07/08(NET) -- ATV-1 undocking (from SM aft port)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
04/15/09 -- **Constellation's Ares I-X Launch**
04/23/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/??/09 -- STS-128/Discovery/17A - MPLM, last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
08/??/09 -- STS-129/Endeavour/ULF3 - ELC1, ELC2
10/??/09 -- STS-130/Discovery/19A - MPLM
04/??/10 -- STS-132/Discovery/20A – Node-3 + Cupola.

ISS On-Orbit Status 02/20/08

All ISS systems continue to function nominally, except those noted previously or below.

STS-122/Atlantis returned to Earth this morning after 12d 18h 22min in space, touching down at KSC on the first landing opportunity at 9:07am EST, after 202 orbits & 5.3 million miles. During the perfectly executed ISS 1E mission, its seven-member crew conducted three EVAs, delivered and installed the European Columbus laboratory, brought up new Expedition 16 crewmember Léopold Eyharts and returned his predecessor Dan Tani who spent 121 days in space (116 on board the station). It was the 121st flight of a Space Shuttle, the 24th Shuttle mission to visit the station and the 29th for Atlantis. *Welcome back, Atlantis! Next up: STS-123/Endeavour/1J/A on March 11 with the Kibo laboratory module – Japan/JAXA's BIG day.*

Wake/sleep cycle for the crew remains at 1:00am-4:30pm EST.

FE-2 Eyharts began his day with a 15-min familiarization session of the ELITE-S2 payload, reviewing upcoming activation and checkout procedures. Later (~1:10pm EST), Leo conducted a teleconference with ground personnel, including Gianluca Neri, the experiment's PD (Payload Developer). *[The Italian (ASI) experiment ELITE-S2 (Elaboratore Immagini Televisive - Space 2) is a human motion analysis facility for technological characterization and potential application for multifactorial movement analysis, to study the connection between brain, visualization and motion in micro-G. By recording and analyzing the three-dimensional motion of astronauts, this study should help engineers apply ergonomics into future spacecraft designs and determine the effects of weightlessness on breathing mechanisms for long-duration missions.]*

The FE-2 also continued commissioning of the COL (Columbus Orbital Laboratory), finishing up readying the BLB (Biolab) facility. *[Leo's activities included BioGlovebox containment and sterilization testing, BioGlovebox health check as*

well as configuring the BGB LSM (Life Support Module) by setting the GN₂ (gaseous nitrogen) valve on the Biolab Rack UIP (Utility Interface Panel) to “N₂ Supply” and opening Life Support Gas B.]

Working in the “Quest” Airlock on more post-EVA cleanup tasks, CDR Whitson set up and started the periodic scrubbing process on the EMU (Extravehicular Mobility Unit) cooling water loops, by initiating ionic and particulate matter filtration (using a 3-micron filter) on suits #3006 & #3018, then starting (and later terminating) cooling loop iodination (biocide maintenance). Afterwards, the cooling loops were reconfigured and the EMU water processing kit disassembled and stowed.

[Purpose of the scrubbing, including iodination of the LCVGs (Liquid Cooling & Ventilation Garments) for biocidal maintenance, is the elimination of any biomass and particulate matter that may have accumulated in the loops.]

FE-1 Malenchenko worked on the Russian BSPN Payload Server, upgrading the RSS1 laptop computer with new a software version from a file uplinked by TsUP-Moscow overnight.

In support of IP (International Partners) video requirements, Peggy Whitson used the Lab RWS (Robotic Workstation) for troubleshooting the faulty RS (Russian Segment) video setup for downlinking analog video signals via US Ku-band and digital “streaming video” packets via the MPEG-2 (Moving Pictures Expert Group 2) encoder, U.S. OpsLAN and Ku-band. *[To look for the fault in the video setup, Peggy was to go by a process of elimination, connecting/disconnecting cables, swapping laptop shells and hard drives, etc.]*

The FE-1 did more ATV (Automated Transfer Vehicle)-related work by running tests of the connection of the KL-154 “Klest” television equipment with the ATV television control console (BRTK-PU).

The CDR performed a routine inspection of the MELFI (Minus Eighty Degree Laboratory Freezer for the International Space Station). *[Purpose: to verify Dewar 3 configuration (tray & box module), remove any condensation found, and inspect the dewar’s box module lids.]*

FE-2 Eyharts filled out the regular FFQ (Food Frequency Questionnaire), his first, on the MEC (Medical Equipment Computer). *[By means of these FFQs, NASA/ESA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins.]*

Afterwards, Eyharts set up and conducted the periodic (monthly) O-OHA (On-Orbit Hearing Assessment) test, a 30-min NASA EHS (Environmental Health Systems) examination to assess the efficacy of acoustic countermeasures, using a special MEC laptop application. It was Leo's first onboard O-OHA session. *[The O-OHA audiography test involves minimum audibility measurements for each ear over a wide range of frequencies (0.25-10 kHz) and sound pressure levels, with the crewmembers using individual-specific Prophonics earphones, Bose ANC headsets and the SLM (sound level meter). To conduct the testing, the experimenter is supported by special EarQ software on the MEC, featuring an up/down-arrow-operated slider for each test frequency that the crewmember moves to the lowest sound pressure level at which the tone can still be heard. The baseline test is required not later than about Flight Day 14 for each new Expedition and is then generally performed once per month. Note: There have been temporary hearing deficits documented on some U.S. and Russian crewmembers, all of which recovered to pre-mission levels.]*

Whitson & Eyharts each completed a run with the MedOps WinSCAT (Spaceflight Cognitive Assessment Tool) experiment by logging in on the MEC and performing the psychological evaluation exercise on the laptop-based WinSCAT experiment. It was Peggy's fourth and Leo's first session. *[WinSCAT is a time-constrained questionnaire test of cognitive abilities, routinely performed by astronauts aboard the ISS every 30 days before or after the PHS (periodic health status) test or on special CDR's, crewmembers or flight surgeons request.]*

The CDR had 75 min reserved for unpacking and stowing 1E-delivered cargo, supported by an uplinked Unpack List.

Peggy also conducted the periodic (every two weeks) 10-min inspection of the RED (Resistive Exercise Device) canister cords and accessory straps as well as the canister bolts for re-tightening if required.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR) and VELO bike with bungee cord load trainer (FE-1).

Peggy then transferred the crew's exercise data file to the MEC laptop for downlinking, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Continuing the current round of RS ventilation system maintenance, the FE-2 worked in the FGB module cleaning the ventilation screens of interior panels 201,

301 and 401.

FE-1 Yuri Malenchenko completed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM).

[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

Working off his discretionary “time permitting” task list, the FE-1 also was to –

- Perform the daily 20-min IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur),
- Conduct the daily monitoring, picture-taking and downloading on the newly set up BIO-5 Rasteniya-2 (“Plants-2”) experiment *[Rasteniya-2, researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. During the duration of the BIO-5 experiment, students of the Moscow City Palace for Youth Creativity of the Meshchansky inter-regional center #15 in Moscow) and the Prince of Oldenburg Lyceum in St. Petersburg will be cultivating plants in parallel on the ground and conducting comparative observation of plant growth and development under gravity and zero-gravity conditions. They are receiving the photo images taken by Yuri],*
- Do the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder) *[this is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 16],*
- Perform the periodic downloading of accumulated log files from the Russian BSMM (Payload Matching Unit/computer) to the “Wiener” power laptop, then transfer its log files to US OCA for downlink, and
- Gather and prepare equipment required for a SOTR (Thermal Control System, US: TCS) test to measure KOB1 (Loop #1) hydraulic parameters *[during recent RS SOTR operation, the coolant pressure in KOB1 dropped, possibly because of entrapped air or a minor leak in the accumulator bellows. A test to measure the free air volume in KOB1 and to conduct a leak check on the system is scheduled for tomorrow (2/21).]*

A new task added to the US “job jar” task list is for Peggy to start prepack preparations for the next Shuttle visit, STS-123-1J/A next month.

No CEO photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:

<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site);

<http://earthobservatory.nasa.gov/>

ISS On-Orbit Status 02/19/08

All ISS systems continue to function nominally, except those noted previously or below. *Crew rest day.*

Wake/sleep cycle for the crew was adjusted to 1:00am-4:30pm EST.

For today's Voluntary Science program, CDR Whitson continued her work with the InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions) experiment in the MSG (Microgravity Science Glovebox), conducting runs #28, #29 and #30, investigating low frequency behavior of the lowest concentration magnetorheological (MR) fluid, exchanging video tapes after each run, then switching to the highest concentration (vial #4) and finally powering the MSG down. *[The activity included an EPO (Education Payload Operation) Demo for grades 9-12. InSPACE obtains basic data on MR fluids, i.e., a new class of "smart materials" that can be used to improve or develop new brake systems, seat suspensions robotics, clutches, airplane landing gear, and vibration damper systems. The colloidal (dispersed) particles are contained in CAs (Coil Assemblies) in the MSG that subject them to electric fields at certain strength and frequencies. The desired strong dipolar interaction between the small colloidal particles can be achieved in micro-G simply with an external magnetic field being turned on and off. On the ground, the flow properties (rheology) of many materials, especially those making up consumer products like detergents, fabric softeners, toothpaste and paints, are similarly controlled, though not by magnetic fields but by adding a polymer. It now appears, for example, that new formulations of fabric softeners may perform better in space than on earth.]*

FE-2 Leo Eyharts broke out and set up the PFE-OUM (Periodic Fitness Evaluation-Oxygen Uptake Measurement) equipment on the HRF-2 (Human Research Facility 2) rack, including the HRF PFM/PAM (Pulmonary Function Module/Photoacoustic Analyzer Module), Mixing Bag System and GDS (Gas Delivery System). Data collection on Leo as subject, with Peggy as operator, is scheduled tomorrow. *[The PFE-OUM experiment, using the CEVIS ergometer for workout, demonstrates the*

capability of crewmembers to perform periodic fitness evaluations with continuous oxygen consumption measurements within 14 days after arrival on ISS, and once monthly during routine PFEs. Once the capability of the pulmonary function system (PFS) to perform PFEs is verified, crewmembers will be able to integrate their monthly PFE with oxygen consumption measurements to fulfill the requirement for cardiovascular fitness evaluations during long-duration space flight.]

FE-1 Yuri Malenchenko completed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM).

[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

Working off his discretionary “time permitting” task list, the FE-1 performed the periodic downloading of accumulated log files from the Russian BSMM (Payload Matching Unit/computer) to the “Wiener” power laptop, then transferred two log files to US OCA for downlink.

Also on Yuri’s task list for today was the regular check of the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature checkup on its ART (automatic temperature recorder). *[This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 16.]*

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1, FE-2). The CEVIS is set up for tomorrow’s PFE-OUM session by Leo.

Peggy then transferred the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~3:30am EST, the crew participated in a TV downlink of greetings for replay to the participants of the 12th World Russian People’s Council taking place in the State Kremlin Palace in Moscow from 2/20 to 2/22. *[An assembly of children and young people, the Congress is devoted to the theme “Future Generations – Russia’s National Treasure”. For the first time in the history of the World Russian People’s Council since 1993, the majority of the forum participants will be young people from all corners of Russia. President V.V. Putin and Alexy II, Patriarch of Moscow and All of Russia, are expected to address the Council with their welcome greetings.]*

Over 5000 people will participate in the Congress, to be greeted by the ISS crew: "...Our society needs you to be bold, dynamic, thinking, searching! You will be implementing ideas of Tsiolkovsky, Korolev, and other space pioneers. We also congratulate students of the Bauman Moscow State University who won the Innovation Project 2007 competition in the Youths and Space category. Today, our space home is orbiting the Earth, and tomorrow these words from a song will become a reality: "Fly around the Earth and go to Mars!" Mars is awaiting you!"]

MT Translation: Later today (4:20pm-6:20pm) the Mobile Transporter cart will be translated on its rails by ground commanding from WS7 (Worksite 7) to WS4 to provide added MMOD (Micrometeoroid/Orbital Debris) protection of the TUS (Trailing Umbilical System), as before Flight 1E. During the move, Russian thrusters will be inhibited (3:49pm-6:25pm) due to loads constraints.

WDS Update: An updated Water Delivery System "cue card" was uplinked for the crew's reference. The new card (16-0018T) lists 36 CWCs (Contingency Water Containers; ~1295.1 L total) for the four types of water identified on board: technical water (695.3 L, for Elektron, flushing, hygiene), potable water (559.5 L), condensate water (40.2 L), waste/EMU dump and other (0 L). Of the 36 containers, nine CWCs with technical water (251.1 L) cannot be used until cleared for *Wautersia* bacteria, and 10 CWCs with potable water (427 L), transferred from Atlantis, are not cleared for use pending analysis of samples returning on 1E.

Weekend Voluntary Science: Two optional activities for the voluntary "Saturday Science" program for next weekend (2/23-24) were suggested to Peggy for her choice. Selection is required by tonight. *[The two choices are: (1) InSPACE-2 – two experiment runs on 2/23 and three runs on 2/24; (2) EPO – Careers Demo (Identify all the different steps crewmembers have taken to get to where they are today. Identify all the different NASA careers that work together to prepare an astronaut for spaceflight. Objective: to motivate students to strive for a career in science, technology, engineering, and mathematics and to someday work for NASA.)]*

No CEO photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site);

ISS Orbit (as of this morning, 8:39am EST [= epoch]):

Mean altitude -- 337.8 km

Apogee height -- 343.0 km

Perigee height -- 332.6 km

Period -- 91.29 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007759

Solar Beta Angle -- -53.2 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 380 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 52981

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*):

02/20/08 -- STS-122/Atlantis/1E landing at KSC (nominal) ~9:06am ET

02/28/08 -- ISS Reboost w/IWIS, SDMS

03/07/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana)
(~11:23pm EST); docking 04/03

03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS

03/12/08 -- ATV CAM (Collision Avoidance Maneuver) demo

03/13/08 -- STS-123/Endeavour/1J/A docking

03/18/08 -- ATV1 parking orbit (loiter)

03/25/08 -- STS-123/Endeavour/1J/A undocking

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking)

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch

04/10/08 -- Soyuz TMA-12/16S docking (DC1)

04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)

04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

04/24/08 -- STS-124/Discovery/1J launch -- JEM PM "Kibo", racks, RMS

04/26/08 -- STS-124/Discovery/1J docking

05/04/08 -- STS-124/Discovery/1J undocking

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

08/07/08(NET) -- ATV-1 undocking (from SM aft port)

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
04/15/09 -- **Constellation's Ares I-X Launch**
04/23/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/??/09 -- STS-128/Discovery/17A - MPLM, last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
08/??/09 -- STS-129/Endeavour/ULF3 - ELC1, ELC2
10/??/09 -- STS-130/Discovery/19A - MPLM
04/??/10 -- STS-132/Discovery/20A – Node-3 + Cupola.

ISS On-Orbit Status 02/18/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 18 of Increment 16, with a new FE-2, Léopold (Leo) Eyharts who has replaced Dan Tani. US Holiday (President's Day).*

STS-122/Atlantis and ISS are flying in separate orbits again (Flight Day 12 for STS-122/1E)

After final preparations on both sides of the hatches (closed yesterday on ISS side at 1:03pm EST), Atlantis this morning undocked smoothly at 4:27am from PMA-2 (Pressurized Mating Adapter 2), after a total docked time of 11d 13h 42m. *[For undocking, the station was turned from -XVV through ~180 deg to +XVV ZLV (+x-axis in velocity vector, z-axis in local vertical) at ~3:30am, put briefly on free drift for the undocking, and then maneuvered to 1E Stage attitude of +XVV TEA attitude at 5:06am.]*
See picture from Atlantis flight deck, below.

KSC landing is nominally expected on 2/20 (Wednesday) at ~9:06m EST. *[If the landing occurs as planned, STS-122 mission duration will be 12d 18h 21m. Dan Tani's total time in space will be 121 days, with 116 days on board ISS.]*

Aboard the station, the crew is enjoying a light-duty day. Wakeup for CDR Peggy Whitson, FE-1 Yuri Malenchenko and FE-2 Leo Eyharts was at ~12:45am. Sleep time tonight: 3:15pm EST.

With the U.S. CDRA (Carbon Dioxide Removal Assembly) deactivated by the ground overnight (~9:00pm-2:00am) and its cooling no longer required, Whitson demated and took down the ITCS LTL (Internal Thermal Control System/Low Temperature Loop) jumper at the CDRA-supporting LAB1D6 rack.

Both Eyharts and Whitson used the DCS760 digital cameras and PD-100 camcorder to document the undocking, backing away and separation of the Atlantis. Peggy later conducted the playback for transmitting the footage to the ground.

FE-1 Malenchenko made sure that the Lab science window was shuttered for protection against jet plumes during the undocking.

Before and during the undocking, the FE-1 stood by at a laptop with a stopwatch to monitor the proper performance of automatic undocking software for the PMA-2 departure under Russian thruster control. *[The procedure provides for the crewmember to take over the automatic operational attitude control sequence manually if the software does not resume control after the period of free drift a few minutes after physical separation.]*

After the undocking, PCS (Portable Computer System) laptops were not shut down as usual because of a planned uploading (on 2/22-23) of a patch to each PCS for a new MSS (Mobile Service System) software version (R5).

Assisted by Yuri, Peggy Whitson later depressurized the PMA-2 to prevent humidity condensation and pressure fluctuations. Leak checking by Peggy followed for the standard one hour. Afterwards, the necessary equipment was torn down.

The FE-1 did the reconfiguration of the Russian telephone/telegraph subsystem (STTS) to its post-undocking settings, from its primary string back to nominal mode on the backup string. This also severed the VHS (UHF) channel to the receding Shuttle Orbiter and restored the RSA-2 S/G (Space-to-Ground) comm configuration on Panel 3. *[The "Voskhod-M" STTS enables telephone communications between the SM, FGB, DC1 Docking Compartment and U.S. segment (USOS), and also with users on the ground over VHF channels selected by an operator at an SM comm panel, via STTS antennas on the SM's outside. There are six comm panels in the SM with pushbuttons for accessing any of three audio channels, plus an intercom channel. Other modes of the STTS include telegraphy (teletype), EVA voice, emergency alarms, Packet/Email, and TORU docking support.]*

In the US Airlock (A/L), the CDR terminated the bake-out regeneration of the last batch of METOX (Metal Oxide) canisters. *[As per ground request, she also inspected the oven's air inlet screen to assist in an airflow analysis.]*

Later, Peggy started the downloading of IWIS (Internal Wireless Instrumentation System) structural dynamics data recorded during the reboost and the undock activities. When completed, the CDR dismantled and stowed the IWIS hardware.

Structural dynamics data from the external SDMS (Structural Dynamic Measurement System) on the S0 truss were dumped by ground command at ~2:30pm.

Yuri Malenchenko terminated the current extended performance testing of the Russian KRIOGEM-03 refrigerator. *[Steps included removing the AX-03 icepack for return to its container and deactivating the freezer, leaving its door ajar temporarily for airing out, before wiping the camera with a dry napkin and closing the refrigerator's door.]*

The FE-1 had more time reserved for transferring cargo & payload equipment from Progress M-63/28P to the ISS, going by an uplinked list of locations and objectives. *[For example: Gear for the Korean experiment to be conducted by the next visiting cosmonaut*

(VC-14) was stowed in the DC1 Docking Compartment since the experiment will be performed there.]

At ~12:40pm, Dr. Whitson participated in a 20min. crew teleconference with the Principal Investigator (PI) of the InSPACE (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions) to discuss Peggy's Voluntary Science activity tomorrow and results found to date. *[InSPACE, conducted last in June 2006 by Jeff Williams on Increment 13 and now again on Increment 16, obtains basic data on magnetorheological (MR) fluids, i.e., a new class of "smart materials" that can be used to improve or develop new brake systems, seat suspensions robotics, clutches, airplane landing gear, and vibration damper systems. The dispersed particles are contained in CAs (Coil Assemblies) in the MSG that subject them to electric fields of certain strength and frequencies. New visual data from InSPACE-2 of MR fluid structures in a pulsed magnetic field show columns of particles exhibiting an unexpected oscillation when viewed from the side (perpendicular to the applied magnetic field), reminiscent of the instabilities of a fluid jet. This behavior has never been observed in earthbound experiments with MR fluids. Additional experiments in the MSG helped to determine how this phenomenon varies when the operator changed the strength of the field, the concentration of the sample, and the pulse frequency.]*

Working off her voluntary "job jar" task list, Peggy also was to download/initialize her SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) Actiwatch which will stop taking data on 2/20 if not initialized. *[To monitor the crewmember's sleep/wake patterns and light exposure, Peggy wears a special Actiwatch device which measures the light levels encountered by her as well as her patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the "job jar" task list.]*

Also on the CDR's task list was the set-up of an additional SSC (Station Support Computer) in COL as per Peggy's request. *[For lack of sufficient wireless/RF bandwidth, ground recommendation is for her to use an additional drag-thru LAN cable across the hatch from Node-2.]*

To allow use of a camcorder in Node-2, Peggy removed the J01 cap at the Node's VDC video camcorder port (N2 S3) and stowed it away.

FE-2 Eyharts continued COL (Columbus Orbital Laboratory) commissioning activities on the BLB (Biolab), including opening its gas supply line, checking out OHD (Overheat Detection) functionality, testing its laptop and conducting a sterilization functionality test on the BLBGlovebox.

Leo also worked on the MEC (Medical Equipment Computer) to personalize its software load for storing his own physical exercise data.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer

(CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Malenchenko then transferred the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~12:12pm, Leo had a PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop).

No CEO photo targets uplinked for today.

ISS On-Orbit Status 02/17/08

All ISS systems continue to function nominally, except those noted previously or below.

Sunday --- Mission 1E Flight Day 11 (FD11). Dan Tani's 118th day in space (116 aboard ISS). Ahead: Week 18 of Increment 16.

Wake/sleep cycle shifted further back to prepare for 2/18 undocking: 1:45am – 4:15pm EST (incl. Eyharts), Shuttle crew: 1:45am – 4:45pm (incl. Tani).

CDR Peggy Whitson performed her final INTEGRATED IMMUNE blood collection, assisted by MS1 Leland Melvin, right before hatch closure. FE-2 Dan Tani will continue his saliva collections, both liquid and dry, and blood collections aboard the Atlantis all the way home. FE-2-16 Leo Eyharts transferred his and Peggy's saliva return pouches and blood sleeves as well as Dan's saliva collection kit to the Shuttle for return. *[Background: IMMUNE assessment, integrated with the Russian IMMUNO, is a 24-hr. test of human immune system changes, with the objective to investigate immune neuro-endocrine reactions in the space environment by studying samples of saliva, blood and urine using collection kits and the biomedical (MBI) protection kit, to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects. The saliva is collected in two forms, dry and liquid. The dry samples are collected at intervals during the collection day using a specialized book that contains filter paper. The liquid saliva collections require that the crewmember soak a piece of cotton inside their mouth and place it in a salivette bag; there are four of the liquid collections during docked operations. The on-orbit blood samples are collected right before undocking and returned on the Shuttle so that analysis can occur with 48 hours of the sampling. This allows assays that quantify the function of different types white blood cells and other active components of the immune system. For cold storage, samples are secured in the MELFI (Minus-Eighty Laboratory Freezer for ISS). Also included are entries in a fluid/medications intact log, and a stress-test questionnaire to be filled out by the subject at begin and end. Urine is collected during a 24-hour period, conventionally divided into two twelve-hour phases: morning-evening and evening-morning.]*

More crewtime was applied to COL (Columbus Orbital Laboratory) rack configuration, activation & operation, led by CDR Peggy Whitson and MS3 Hans Schlegel.

Whitson terminated the fine leak check of the COL/Node-2 vestibule (which showed successful hermeticity), then ingressed the new module (~3:55 am) for performing the required COL IATCS (Internal Active Thermal Control System) coolant fluid sampling. *[After installation and purging (degassing) the sampling adaptor and FSS (Fluid System Servicer) hose of entrapped air, further steps included configuring the adapter, adjusting the metering valve, collecting the return sample, and tearing down and removing the degassing & sampling equipment.]*

Hans Schlegel meanwhile continued activation of the EDR (European Drawer Rack) and BLB (BIOLAB). *[On EDR, Schlegel activated the laptop, connected & test-activated (later deactivated) the PCDF EU (Protein Crystallization Diagnostic Facility Electronic Unit). On BLB, he set up the laptop, installed stowage items (SI, power & video cables, 4 BGB front filters, plus removal of Kapton tape from rear filters) & commissioning items (CI, EU mounting plate, spotlight) for the BLBGlovebox, then verified functionality of the power switch on front.]*

Later, Schlegel took documentary 3D photography of the COL interior using a NIKON camera equipped with two lenses for stereoscopic imagery.

Afterwards, Peggy worked on installing the K-BAR (Knee-Brace Assembly Replacement) capture mechanisms on COL racks A1 and F2 (which gave Tani and Eyharts some trouble) for relocating of the MSG (Microgravity Science Glovebox) and EXPRESS Rack 3 (ER3) racks.

COL activation & commissioning also included the EPM (European Physiology Module) and the FSL (Fluid Science Laboratory), the latter's to be completed by Leo Eyharts.

FE-1 Malenchenko took the periodic sensor readings of the Russian "Pille-MKS" (MKS = ISS) radiation dosimetry experiment which has ten sensors placed at various locations in the Russian segment (port cabin window, starboard cabin window, ASU toilet facility, control panel, etc.). Nine of the ten dosimeters are read manually.

Concluding post-EVA clean-up ops, FE-2 Dan Tani terminated the overnight regeneration of METOX (Metal Oxide) canisters in the Airlock (A/L) oven and initiated the process on the next batch.

CDR Whitson gathered and stowed the EVA tools used during the 1E spacewalks, finishing up what Rex Walheim couldn't quite complete yesterday.

Winding up the three-day checkout of the KUBIK-3 thermally controlled incubator in the Soyuz 15S Orbital Compartment, Yuri copied the accumulated time/temperature data for subsequent downlinking via the BSR-TM payload telemetry channel, then deactivated the thermostat system and closed out ops.

Dan Tani had ~4 hrs for changing out and replacing the failed SSPCM (Solid State Power

Control Module) in the HRF1 (Human Research Facility Rack 1) in the US Lab, to be checked out later by CDR Whitson. *[However, afterwards the rack is exhibiting some anomalous conditions which constrain its re-activation.]*

Malenchenko performed maintenance and functionality checks on the Russian VELO cycle ergometer (VB-3), focusing on its pedals, crank arm and internal springs, involving disassembly and reassembly of the exercise device.

Peggy and Dan reviewed DCB (Double Cold Bag) procedure familiarization material, then packed return samples and transferred the DCB to the Shuttle.

CDR Whitson, CDR Frick and PLT Poindexter concluded the O₂ (oxygen) transfer from Atlantis to the ISS HPGTs (High-Pressure Gas Tanks) on the exterior of the A/L after ~15 hours of operation, then tore down the transfer and pump-over equipment. Total amount O₂ transferred: 85-90 lbs. *[This transfer used the remaining operational cycles allowed under Flight Rule for the diaphragm pump of the ORCA (Oxygen Recharge Compressor Assembly) which had been modified by waiver from 280,000 to 373,000 cycles. A replacement ORCA will be delivered to KSC in December this year.]*

The FE-1 had 2h 15m reserved for transferring cargo & payload equipment from Progress M-63/28P to the ISS, going by an uplinked list of locations and objectives. *[For example: The equipment for the Korean experiment to be conducted by the next visiting cosmonaut (VC-14) was to be stowed in the DC1 Docking Compartment since the experiment will be performed there.]*

Yuri completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables plus the weekly collection of the toilet flush counter (SPK-U) and water supply (SVO) readings for calldown to TsUP/Moscow.

Malenchenko also gathered weekly data on total operating time & "On" durations of the Russian POTOК-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem for reporting to TsUP.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2/Leo), TVIS treadmill (CDR, FE-2/Leo), RED resistive exercise device (CDR) and VELO bike with bungee cord load trainer (FE-1).

Malenchenko later transferred the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~7:10am, Yuri had a PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9

laptop).

The traditional **Crew Farewell** ceremony took place at 12:20pm EST, followed by air duct removal and hatch closure at ~1:03pm, handled on the ISS side by Peggy Whitson and Yuri Malenchenko. *[Afterwards, Frick and Poindexter switched attitude control authority of the mated stack from ISS CMG TA (Control Moment Gyroscope Thruster Assist) mode to Orbiter control.]*

Atlantis will undock from ISS tomorrow morning at 4:27am after a total docked time of 11d 13h 42m. After a one-orbit flyaround for photo imaging at 400-600 ft, final separation burn of the Shuttle will be performed at 6:10pm. Landing is set for Wednesday, 2/20, nominally at KSC at 9:06am EST. Total mission for STS-122/1E will then have been 12d 18h 21m. Dan Tani's total time in space will be 121 days, with 116 days on board ISS.

Transfers Update: Total water transferred from Atlantis: ~1386 lbs. Total nitrogen (N₂) transferred: ~37 lbs. Total oxygen (O₂) transferred: ~90 lbs.

Progress 27P Deorbit: Two days ago, on 2/15, Progress M-62/27P performed its deorbit burn and reentered the atmosphere for burn-up and splash down in the Pacific. *[Progress 27P undocked from the ISS DC1 on 2/4 at 5:32am EST but remained in orbit in free flight until 2/15, continuing to phase out in front of the ISS (about 40 km per orbit) in order to support Russian Earth observation experiments.]*

Good-Bye Sally Davis: This was Flight Director Sally Davis' final shift ("Cassini Flight") after more than 400 shifts on the ISS flight control team (FCT). Thank you, Sally – and stick around!

After Shuttle departure, the ISS crew will –

- Deactivate the IWIS (Internal Wireless Instrumentation System) equipment,
- Reconfigure the Airlock CCAA (Common Cabin Air Assembly) flexible air duct to its nominal stage setup,
- Disconnect the UOP DCP (utility outlet panel/display & control panel) bypass power cable for the VTR at the Lab RWS (Robotics Work Station),
- Restore the onboard communications network to its nominal configuration, and
- Depressurize the PMA-2 to prevent humidity condensation and pressure fluctuations, followed by leak checking for the standard one hour. Afterwards, the necessary equipment will be torn down.

No CEO photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:

<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site);

<http://earthobservatory.nasa.gov/>

<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

Significant Events Ahead *(all dates Eastern Standard, some changes possible.):*

- 02/18 (FD 12) -- Undock from ISS (~4:27am ET); perform final OBSS berthing;
- 02/19 (FD 13) -- Stow cabin; checkout Shuttle flight control systems;
- 02/20 (FD 14) -- . Prepare for and perform deorbit burn; land at KSC (nominal)
~9:06am ET

02/28/08 -- ISS Reboost w/IWIS, SDMS

03/07/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana) (~11:23pm EST); docking 04/03

03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS

03/12/08 -- ATV CAM (Collision Avoidance Maneuver) demo

03/13/08 -- STS-123/Endeavour/1J/A docking

03/18/08 -- ATV1 parking orbit (loiter)

03/25/08 -- STS-123/Endeavour/1J/A undocking

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking)

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch

04/10/08 -- Soyuz TMA-12/16S docking (DC1)

04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)

04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

04/24/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS

04/26/08 -- STS-124/Discovery/1J docking

05/04/08 -- STS-124/Discovery/1J undocking

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

08/07/08(NET) -- ATV-1 undocking (from SM aft port)

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC

10/18/08 -- STS-126/Discovery/ULF2 docking

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-67/32P launch

11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
04/15/09 -- **Constellation's Ares I-X Launch**
05/??/09 -- **Six-person crew on ISS** (following Soyuz 18S-2 docking)
04/??/10 -- STS-132/Discovery/20A – Node-3 + Cupola.

ISS On-Orbit Status 02/16/08

All ISS systems continue to function nominally, except those noted previously or below.

Mission 1E Flight Day 10 (FD10). Saturday – half-day off for the combined ISS & Shuttle crew except for housekeeping and voluntary work.

Wake/sleep cycle shifted back again to prepare for 2/18 undocking: 3:15am – 5:15pm EST, Shuttle crew: 3:15am – 5:45pm.

More crewtime was applied to COL (Columbus Orbital Laboratory) rack configuration, activation & operation, led by CDR Peggy Whitson and FE-2-16 Leo Eyharts. *[In particular, Whitson focused on readying the EDR (European Drawer Rack), gathering equipment, outfitting the rack, installing PCDF EU (Protein Crystallization Diagnostic Facility Electronic Unit) coolant water and data connections, setting up the laptop, verifying its software load & activating it, checking out the EDR RFI (Rack Fire Indicator), and checking out the functionalities of the rack's various subsystems.]*

CDR Whitson also performed Part 1 of troubleshooting & cable connectivity checkout of the PS28 (Powerstrip 28) junction box.

Afterwards Peggy relocated MSG (Microgravity Science Glovebox) payload hardware to the newly installed COL ZSR (Zero-G Stowage Rack).

MS3 Schlegel meanwhile worked on BIOLAB (BLB), installing stowage items required for BLB and BLB BioGlovebox commissioning. *[BLB activation steps included installation of analysis instruments, viz., D&C (Distribution & Cleaning) cassettes for the microscope and the spectrophotometer, lamp assembly for the spectrophotometer, VTR (Video Tape Recorder) damping system, the VTR itself and its test tape, the BGB laptop (power & video cables), four BGB front filters plus removal of protective Kapton tape from BGB rear filters, EC (Experiment Container) mounting plate, and the BGB spotlight. Activities concluded with a BGB BioGlovebox containment test and sterilization functionality test.]*

CDR Whitson, CDR Frick and PLT Poindexter reconfigured the O₂ (oxygen) transfer system and initiated O₂ pump-over from the Orbiter to the HPGTs (High-Pressure Gas Tanks) on the exterior of the U.S. Airlock (A/L). Total amount O₂ available for transfer: ~90

lbs. *[This transfer used the remaining operational cycles allowed under Flight Rule for the diaphragm pump of the ORCA (Oxygen Recharge Compressor Assembly) which had been modified by waiver from 280,000 to 373,000 cycles. A replacement ORCA will be delivered to KSC in December this year.]*

Using the RSK1 laptop, FE-2 Malenchenko continued his test program with the new KPT-2 BAR-RM payload equipment begun on 2/13, today taking measurements with the AU-1 ultrasound analyzer at various locations in the RO (large diameter) section of the Service Module (SM) and later downlinking the data via BSR-TM channel. The data are being used for experimenting with ISS leak detection based on environmental data anomalies (temperature, humidity, and ultrasound emissions) at possible leak locations. *[BAR-RM is designed to develop a procedure for detection of air leakage from ISS modules based on environmental data anomalies (temperature, humidity, ultrasound emissions). The payload uses a remote infrared thermometer (Kelvin-Video), a thermohygrometer (Iva-6A), a heat-loss anemometer/thermometer (TTM-2), an ultrasound analyzer (AU-01), and a leak detector (UT2-03) to determine physical background signs of loss of ISS pressure integrity which could be indicative of leaks in the working compartments of the station. Measurements are taken in specific zones (13 in SM PkhO and 4 in DC1), both with lights & fans turned on and off.]*

FE-2 Dan Tani worked in the A/L cleaning up after yesterday's EVA-3 by Walheim and Love, deconfiguring one of the two DCS-760 cameras (without flash) and stowing it, terminating regeneration of the first set of METOX (Metal Oxide) canisters initiated by Peggy yesterday and then starting the process on the second set (#15 & #16).

CDR Whitson meanwhile conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. *[Updated "cue cards" based on the crew's water calldowns are sent up every other week (currently #16-0018R).]*

After setting up the KUBIK-3 thermally controlled incubator in the Soyuz 15S Orbital Compartment yesterday and switching it later from +37 degC +6 degC for running overnight, Malenchenko today checked its performance at that value and later reset it to +38 degC for continued monitoring (which included removal of the resulting moisture later today).

Dan Tani removed the VOA (Volatile Organics Analyzer) from the Lab CHeCS rack and had ~2.5 hrs set aside for changing out and replacing its OMI (On-orbit Maintenance Items) with new spares.

FE-1 Malenchenko set up the pumping equipment and initiated (later closed out) the periodic transfer of urine from four EDV-U containers in the SM to the Rodnik BV2 tank of Progress M-63/28P (emptied of potable water on 2/14).

Frick and Poindexter continued filling containers with fuel-cell generated water in the Orbiter for transfer to the ISS. After today, total water transfers amount to 11 CWCs and 8

PWRs (Payload Water Reservoirs).

The two FE-2s, Tani & Eyharts, had another hour to continue their handover activities which prepare Leo for taking over from Dan after Shuttle undock.

Servicing and maintenance tasks completed by Yuri Malenchenko today included –

- The periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS (Russian segment) hatch openings (8) in the SM, FGB and DC1 (Docking Compartment),
- Completing the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, plus from his discretionary “time permitting” task list --
- The daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur),
- The daily monitoring, picture-taking and downloading on the newly set up BIO-5 Rasteniya-2 ("Plants-2") experiment. *[Rasteniya-2, researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. During the duration of the BIO-5 experiment, students of the Moscow City Palace for Youth Creativity of the Meshchansky inter-regional center #15 in Moscow) and the Prince of Oldenburg Lyceum in St. Petersburg will be cultivating plants in parallel on the ground and conducting comparative observation of plant growth and development under gravity and zero-gravity conditions. They are receiving the photo images taken by Yuri.],* and
- The regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). *[This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 16.]*

A new item on the US voluntary “job jar” task list for Peggy today was to conduct a count and audit of the contents of CD (Compact Disk) Vol. 3 container.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Malenchenko later transferred the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

This morning at ~8:40am EST, the combined flight crew of 10 persons participated in a 40-min PAO TV interview/exchange from COL with a large number of media clients at NASA centers (JSC, KSC), ESA's EAC (European Astronaut Centre) in Cologne, Germany, and CNES HQ in Paris, France, for ESA. The event went exceedingly well, with every crewmember except Yuri called on to participate.

Reboost Update: This morning's reboost of the mated stack by the Orbiter was executed nominally, resulting in a burn duration 36 min 0 sec, delta-V of ~1.3 m/s and mean altitude increase ~2.3 km/1.2 n.mi. Purpose of the reboost (the first executed by Atlantis since 2002) was to establish the correct phasing conditions for Soyuz 15S landing, Soyuz 16S launch and the next Shuttle mission, STS-123/1JA.

EVA-3 Update: Evaluation of yesterday's spacewalk showed that it ran 30 min longer than planned and achieved all objectives plus some of the get-aheads, except for 1J/A and SARJ task items.

Voluntary Science Program: For the voluntary science program on 2/19 (Tuesday), Peggy Whitson has opted for another session with the InSPACE-2 experiment.

Weekly Science Update (Expedition Sixteen -- Week 17)

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): Radiation measurements continue to be performed in the PIRS module..

ANITA: Completed.

BCAT-3 (Binary Colloidal Alloy Test 3): "BCAT-3 has now been stowed with the intention to take it out again in about six months for the long duration sample equilibrium photos. Before BCAT-3 was stored, we were able to get some new photos of Sample 5 using the Dan Tani setup and lighting (which works really well!). With this setup, we were able to see some structure in Sample 5, which was a pleasant surprise and very exciting for the BCAT-3 Principal Investigators (PIs). Additionally, the photos that Peggy took of Dan performing the BCAT-3 experiment are "way cool" and will be really nice to have when we are sharing the BCAT-3 results with the world.

It has been a joy to work with everyone on BCAT-3 and we're looking forward to similar opportunities with BCAT-4 (which goes up on 1JA) and with BCAT-5, which is in the works. These future experiments involve many science investigators from both NASA and CSA, which speaks volumes about how well BCAT-3 was performed by the astronauts and the ground-based support teams."

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): "Dan, thanks for completing the repeat CCISS session. The session went very well, and we are very impressed with your completion of two Holter checkouts during your mission!"

CFE (Capillary Flow Experiment): Reserve.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): In progress.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): In progress.

EuTEF (European Technology Exposure Facility): Planned. EuTEF has been successfully installed on COL External Platform during EVA-3 on 2/15 (FD9). Currently receiving telemetry on ground.

GEOFLOW: Planned.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Blood and urine samples of first session are stored in MELFI.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress..

Integrated Immune: "Peggy, you are half way through with your mid increment Integrated Immune collections. Dan, you are half way through with your last Integrated Immune session. Leo, you are half way through with your early increment Integrated Immune session."

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: MULTIGEN-1 samples will be downloaded on STS-122 (1E).

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION/REPOSITORY: In progress..

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): “Peggy, for Sleep, your Actiwatch will stop taking data on February 20, so the team is planning to add an activity to your task list soon. As always, all your extra logging is greatly appreciated! Also, thanks for your help with CCISS this past week. Dan, we hope you enjoyed Sleeping during your mission! You will be taking off your Actiwatch on the Shuttle so we can get it on the ground and download it. The PI looks forward to all your final data!”

SOLAR (Solar Monitoring Observatory): Planned. SOLAR has been successfully installed on COL External Platform during EVA-3 on 2/15 (FD9). Currently receiving telemetry on ground.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): In progress.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: In progress.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): WAICO#1 hardware launched on 1E. WAICO#1 items (ATCS with chemicals, Cultivation Box Bowls with Agar) transferred to MELFI on 2/10 (FD4). Two activities for transfer of 2 x 4 WAICO#1 seed containers to MELFI were performed on 2/11 to start seed vernalization.

CEO (Crew Earth Observation): “With the extension of STS122, and since most of us in CEO will be working late Monday night and early Tuesday morning supporting Shuttle image analysis, we will not resume CEO ops on Tuesday, 2/19 as earlier planned. We will resume CEO operations on Wednesday, Feb. 20.”

No CEO photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:

<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);

<http://earthobservatory.nasa.gov/>

<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*):

- 02/17 (FD 11) -- Cargo transfers; rendezvous tools checkout; O₂ transfer teardown; close hatches in preparation for undocking;
- 02/18 (FD 12) -- Undock from ISS (~4:26am ET); perform final OBSS berthing;
- 02/19 (FD 13) -- Stow cabin; checkout Shuttle flight control systems;
- 02/20 (FD 14) -- . Prepare for and perform deorbit burn; land at KSC (nominal) ~9:06am ET

02/28/08 -- ISS Reboost w/IWIS, SDMS

03/07/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana) (~11:23pm EST); docking 04/03

03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS

03/12/08 -- ATV CAM (Collision Avoidance Maneuver) demo

03/13/08 -- STS-123/Endeavour/1J/A docking

03/18/08 -- ATV1 parking orbit (loiter)

03/25/08 -- STS-123/Endeavour/1J/A undocking

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking)

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch

04/10/08 -- Soyuz TMA-12/16S docking (DC1)

04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)

04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

04/24/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS

04/26/08 -- STS-124/Discovery/1J docking

05/04/08 -- STS-124/Discovery/1J undocking

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

08/07/08(NET) -- ATV-1 undocking (from SM aft port)

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC

10/18/08 -- STS-126/Discovery/ULF2 docking

ISS On-Orbit Status 02/15/08

All ISS systems continue to function nominally, except those noted previously or below.
Mission 1E Flight Day 9 (FD9).

ISS crew goes to sleep one hour earlier than yesterday: 3:45am – 6:15pm, Shuttle crew half an hour later. 3:45am – 6:45pm.

Mission 1E's EVA-3 was completed successfully by Rex Walheim & Stan Love in 7h 25m, accomplishing all its objectives and get-aheads.
[During the spacewalk, Walheim (EV1) & Love (EV3) transferred the European SOLAR (Solar Monitoring Observatory) and the EuTEF (European Technology Exposure Facility) to the COL EPF (Columbus Orbital Laboratory External Payload Facility), retrieved the failed CMG (Control Moment Gyro) for stowage in the Shuttle PLB for return, installed COL worksite interface fixtures and handrails, inspected a suspected sharp-edged MMOD impact site on an Airlock (A/L) handrail (#508), and inspected, photographed and took samples from the failed starboard SARJ (Solar Alpha Rotary Joint) race ring and covers not yet inspected before. Official start time of the spacewalk was 8:07am EST, about 28 min ahead of timeline, and it ended at 3:32pm. Total EVA duration (PET = Phase Elapsed Time) was 7h 25min. It was the 104th spacewalk for ISS assembly & maintenance and the 76th from the station (28 from Shuttle, 54 from Quest, 22 from Pirs) totaling 465h 21min, and the 8th for Expedition 16 (totaling 57h 29min). After today's EVA, a total of 129 spacewalkers (97 NASA astronauts, 21 Russians, and 11 astronauts representing Japan-1, Canada-4, France-1, Germany-2 and Sweden-3) have logged a total of 653h 43min outside the station on building, outfitting and servicing. It was also the 126th spacewalk involving U.S. astronauts.]

CDR Peggy Whitson and FE-2-16 Leo Eyharts finished their IMMUNO (Integrated Immune Assessment) experiment, begun on 2/9, with dry saliva collections, first thing after wake-up and then four more times during the day. All samples were stored at ambient temperature. *[Background: IMMUNO (Integrated Immune Assessment) is a 24-hr. test of human immune system changes, with the objective to investigate immune neuro-endocrine reactions in the space environment by studying samples of saliva, blood and urine using collection kits and the biomedical (MBI) protection kit, to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The*

strategy uses both long and short duration crewmembers as study subjects. The saliva is collected in two forms, dry and liquid. The dry samples are collected at intervals during the collection day using a specialized book that contains filter paper. The liquid saliva collections require that the crewmember soak a piece of cotton inside their mouth and place it in a salivette bag; there are four of the liquid collections during docked operations. The on-orbit blood samples are collected right before undocking and returned on the Shuttle so that analysis can occur with 48 hours of the sampling. This allows assays that quantify the function of different types white blood cells and other active components of the immune system. For cold storage, samples are secured in the MELFI (Minus-Eighty Laboratory Freezer for ISS). Also included are entries in a fluid/medications intact log, and a stress-test questionnaire to be filled out by the subject at begin and end. Urine is collected during a 24-hour period, conventionally divided into two twelve-hour phases: morning-evening and evening-morning.]

As part of ongoing COL commissioning, mostly by MS3 Hans Schlegel, CDR Whitson took time to verify that both C&W/MAL (Caution & Warning/Master Alarm Light) panels in the new module are functional.

With the larger part of her work schedule dedicated to the new FSL (Fluid Science Laboratory), Peggy Whitson first reviewed installation procedures, then set up FSL in its rack in the COL module and configured it for operation, including mating to UIP (Utility Interface Panel, or "Z-panel"), removing front launch fixations, setting up VMU (Video Management Unit), and removing a front gap protection fixture. *[Background: FSL is a multi-user facility, designed by ESA (European Space Agency) and built by Thales Alenia Space in Turin, Italy, for conducting fluid physics research in microgravity conditions. It can be operated in fully- or in semi-automatic mode and can be controlled on-board by ISS crewmembers, or from the ground in telescience mode. FSL experiments will give insight into the physics of fluids in space, including aqueous foams, emulsions, convection, and fluid motions. Understanding how fluids behave in micro-G will lead to the development of new fluid delivery systems in future spacecraft. Under micro-G, fluids are subject to significantly reduced gravity-driven convection, sedimentation and stratification and fluid static pressure, allowing the study of fluid dynamic effects normally masked by gravity, including diffusion-controlled heat and mass transfer. The absence of gravity-driven convection eliminates the negative effects of density gradients (inhomogeneous mass distribution) that arise in processes involving heat treatment, phase transitions, diffusive transport or chemical reaction. Convection in terrestrial processes is a strong perturbing factor, the effects of which are seldom predictable with great accuracy and which dominate heat and mass transfer in fluids. Experiments are integrated into an FSL EC (Experiment Container). With a typical mass of 30-35 kg, and standard dimensions of 400x270x280 mm³, the EC provides ample space to accommodate the fluid cell assembly, including any necessary process stimuli and dedicated electronics.]*

Afterwards, Peggy moved to the EDR (European Drawer Rack) to mate its umbilical connections to the COL UIP. *[Background: EDR is a single six-post ISPR (International Standard Payload Rack) with 7 Experiment Modules (EMs), each with its own power & cooling, plus a VMU (Video Management Unit) which will send streaming video, images*

and high rate science data to Earth via the COL's high rate data link. It will also have the capability to store 72 GB of video temporarily. It assumes that the payloads onboard will be largely autonomous to minimize data transfer requirements. Cooling and power will be provided along with a way to transmit data back to earth. Data will be sent via the Video Management Unit (VMU) and the Rack Interface Controller (RIC) to the Columbus sending module and then to earth. There will be an air cooling system for each drawer, as well as access to water cooling, vacuum, venting and nitrogen, if necessary. The EMs come in two types: standard ISS locker and standard 8 PU ISIS drawer.]

Next item on Whitson's "inspection tour" inside COL was to check out the EDR's fire warning system, by testing and verifying the functionality of the Rack Fire Indicators (RFIs).

FE-1 Yuri Malenchenko worked through a long list of standard maintenance/service tasks on Russian Segment (RS) systems, completing –

- The current extended performance check of the KRIOGEM-03M refrigerator system, powered up on 2/12 to -22 degC, for once-daily monitoring of its displayed temperature for the next five days (through 2/17), in anticipation of upcoming experiment activities,
- The daily monitoring, picture-taking & downloading on the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth & development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse,
- Taking the periodic readings of potentially harmful contaminants in the Service Module (SM) using the SKDS CMS (Pressure Control & Atmosphere Monitoring System/Countermeasure System) which uses preprogrammed microchips to measure Formaldehyde (H_2CO , methanal), Carbon Monoxide (CO) and Ammonia (NH_3),
- The periodic (generally monthly) service of the ESA/RSC-Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS), removing its PCMCIA memory card (#942) from the AST spectrometer and replacing it with a new card (#943),
- The periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS hatch openings (8) in the SM, FGB and DC1 (Docking Compartment),
- Inspecting the Russian de-ionized water container (KOV EDV), used for supplying water to the Elektron oxygen (O_2) generator for electrolysis, for bubbles and possible need for filling up with U.S. condensate from a CWC (Contingency Water Container, #1070),
- Setting up the KUBIK-3 thermally controlled incubator in the Soyuz TM- Orbital Compartment for monitoring it at a set temperature of +37 degC , then switching it to +6 degC for running overnight,
- Completing the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, and
- Performing the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Yuri Malenchenko also performed his first session of the ETD (Eye Tracking Device) experiment, which studies the coordination of eye and head movements in zero-G, i.e. the adaptation of the human vestibular (balance) system, and takes place in the DC-1's central sphere. *[After its initial calibration with the calibrating unit, the experiment investigates horizontal eye and head movement coordination, measures Listing's plane, and determines the orientation of the vestibulo-ocular coordinate system, using five target marks on a visual target board on the EV-2 hatch on the horizontal plane. For the experiment, Yuri first had to check the setup of the left and right video cameras, then establish his most comfortable and stable body position relative to the visual target (60 cm for the first part of the experiment, 100 to 150 cm in parts two & three). Each step requires another prior calibration run, using visual target cues or the calibration unit.]*

CDR Frick and PLT Poindexter continued filling CWCs (Contingency Water Containers) in Atlantis and moving them to the ISS, today transferring the 10th CWC.

FE-2 Dan Tani had an hour reserved for unpacking STS-122/1E cargo, supported by an uplinked Unpack List and the IMS.

The FE-2 also configured and programmed the IWIS (Internal Wireless Instrumentation System), verifying proper functionality of its RSUs (Remote Sensor Units) spread throughout the station and NCU (Network Control Unit), to measure structural dynamics disturbances (accelerations/vibrations) during tomorrow's scheduled reboost of the mated stack by the Shuttle. IWIS will be left in place to record dynamics data also during the Shuttle undocking on 2/18.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Malenchenko later transferred the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

During today's spacewalk by Rex & Stan, PLT Alan Poindexter again provided IVA support, while MS1 Melvin, FE-2 Tani & FE-2-16 Eyharts operated the SSRMS (Space Station Remote Manipulator System) for the hardware transfers (SOLAR, CMG, EuTEF).

After the spacewalkers' ingress at 3:32pm, post-EVA activities by CDR Steve Frick, CDR Peggy Whitson, Love and Walheim in the A/L consisted of recharging the EMU/spacesuits with water from PWR (Payload Water Reservoir), then reconnecting the LTAs (Lower Torso Assemblies) to the EMUs and capping the UIA (Umbilical Interface Assembly), initiating and monitoring the regeneration of the METOX (Metal Oxide) CO₂ filter canisters, initiating the discharge/recharge process on the EMU batteries in the BSA (Battery Stowage Assembly), and reconfiguring EVA tools.

At ~4:30am EST, Hans Schlegel & Leo Eyharts conducted a brief private phone call/exchange with attendees at an ESA Council Meeting.

Transfers: As of today, 10 filled CWCs (Contingency Water Containers, contents ~45 L each) and 4 PWRs (Payload Water Reservoirs) were transferred from the Shuttle to ISS. Nitrogen transfer was completed, with 27 lbs N₂ transferred to the station. Even with the additional mission extension by one day, ~70 lbs of oxygen (O₂) will be available for transfer on FD10.

Reboost: Tomorrow morning's reboost of the mated stack by the Orbiter is scheduled for 7:17am, to establish the correct phasing conditions for Soyuz 15S landing, Soyuz 16S launch and the next Shuttle mission, STS-123/1JA. Nominal delta-V ~1.3 m/s, burn duration 36 min 0 sec. Expected altitude increase ~2.3 km/1.2 nmi.

Weekend Voluntary Science: For the voluntary "Saturday Science" program on 2/16-17, Peggy and Dan were offered for their choice: (1) a session with the InSPACE-2 experiment; (2) an EPO (Education Payload Operation)-Demo of Science Research aboard ISS, and (3) SWAB (Surface, Water and Air Biocharacterization) collections of air & surface samples. Crew selection is required ASAP.

No CEO photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:

<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site);

<http://earthobservatory.nasa.gov/>

<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*):

- 02/16 (FD 10) -- Cargo transfers; COL activities & Commissioning; Reboost;
- 02/17 (FD 11) -- Cargo transfers; close hatches in preparation for undocking;
- 02/18 (FD 12) -- Undock from ISS (~4:26am ET); perform final OBSS berthing;
- 02/19 (FD 13) -- Stow cabin; checkout Shuttle flight control systems;
- 02/20 (FD 14) -- . Prepare for and perform deorbit burn; land at KSC (nominal) ~9:06am ET

02/28/08 -- ISS Reboost

03/07/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana) (~11:23pm EST); docking 04/03

03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS

03/12/08 -- ATV CAM (Collision Avoidance Maneuver) demo

03/13/08 -- STS-123/Endeavour/1J/A docking

03/18/08 -- ATV1 parking orbit (loiter)

03/25/08 -- STS-123/Endeavour/1J/A undocking
 03/29/08 -- ATV1 Demo Day 1
 03/31/08 -- ATV1 Demo Day 2
 04/03/08 -- ATV1 Demo Day 3 (docking)
 04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
 04/08/08 -- Soyuz TMA-12/16S launch
 04/10/08 -- Soyuz TMA-12/16S docking (DC1)
 04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
 04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
 04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS
 04/26/08 -- STS-124/Discovery/1J docking
 05/04/08 -- STS-124/Discovery/1J undocking
 05/14/08 -- Progress M-64/29P launch
 05/16/08 -- Progress M-64/29P docking (DC1)
 08/07/08(NET) -- ATV-1 undocking (from SM aft port)
 08/12/08 -- Progress M-65/30P launch
 08/14/08 -- Progress M-65/30P docking (SM aft port)
 08/28/08 – STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
 09/09/08 -- Progress M-64/29P undocking (from DC1)
 09/10/08 -- Progress M-66/31P launch
 09/12/08 -- Progress M-66/31P docking (DC1)
 10/01/08 -- **NASA 50 Years**
 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
 10/12/08 -- Soyuz TMA-13/17S launch
 10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
 10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
 10/18/08 -- STS-126/Discovery/ULF2 docking
 10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
 11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
 11/20/08 -- **ISS 10 Years**
 11/26/08 -- Progress M-67/32P launch
 11/28/08 -- Progress M-67/32P docking (SM aft port)
 12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
 12/06/08 -- STS-119/Discovery/15A docking
 12/15/08 -- STS-119/Discovery/15A undocking
 04/15/09 -- **Constellation’s Ares I-X Launch**
 05/??/09 -- **Six-person crew on ISS** (following Soyuz 18S-2 docking)
 04/??/10 -- STS-132/Discovery/20A – Node-3 + Cupola.

ISS On-Orbit Status 02/14/08

All ISS systems continue to function nominally, except those noted previously or below.
Mission 1E Flight Day 8 (FD8).

Crew sleep cycle shifted one hour earlier: 3:45am – 7:15pm for both crews.

Last night, Mission 1E was extended by one day (13+0+2), with landing now on Wednesday 2/20 at ~9:03am EST (if at KSC).

Columbus final activation has been completed.

After yesterday's command queue lockup between the COL CCS (Columbus Orbital Laboratory Command & Control System) and the COL MMC (Mission Management Computer), final activation of COL data management systems was accomplished late last night by transitioning/swapping the primary & backup C&C MDM (Multiplexer/Demultiplexer) computers. *[The MMC is the intermodule interface computer required between the US C&DH (Command & Data Handling) system and the COL DMC (Data Management Computer) which handles equipment monitoring]*

With IMV (Intermodular Ventilation) and smoke detector function established, the crew continued COL outfitting and activation, including:

- Activation of the PWS (Portable Workstation) computer,
- Installation & activation of PCS (Portable Computer System) laptops,
- Relocation of the Biolab (BLB) from its launch location to its ISPR (International Standard Payload Rack) plus installing its DC converter, and
- Installation of VCA (Video Camera Assembly) 1 & 2.

Other outfitting activities completed by last night ahead of timeline included -

- Unlocking the anti-vibration mounts for the WPA (Water Pump Assembly) and CWSA (Condensate Water Separator Assembly),
- Relocating the EDR (European Drawer Rack) from its launch position to its operational location,
- Removing anti-vibration bolts on the CFA (Cabin Fan Assembly),
- Installing a ZSR (Zero-G Stowage Rack) in COL, and
- Rotating the COL D1 Rack to gain access to payload stowage locations and

recording a video of the activities for subsequent downlink to COL-CC (Columbus Orbital Laboratory Control Center) in Oberpfaffenhofen).

[Biolab (Biological Experiment Laboratory in Columbus) is a biological and physiological facility for studying the effects of microgravity on microorganisms, cells, tissue cultures, small plants and small invertebrates. EDR is a multi-discipline facility that provides an opportunity for compact experiments of low mass, supporting a variety of small payloads. Each payload will have access to power, data communications, cooling among other accommodations.]

Today, CDR Whitson completed COL vestibule outfitting by installing the nitrogen (N₂) supply jumper/hose between Node-2 and COL, followed by purge of the N₂ system to remove any contamination from the lines.

To prepare for providing COL power to the externally mounted MISSE (Materials ISS Experiment) payload coming up on Mission 1J/A, Leo Eyharts swapped a 20 amp fuse with a 3 amp fuse in the COL PPSB (Payload Power Switch Box).

Before breakfast, for the last time FE-2 Dan Tani completed his daily access of the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop for downlink. *[To monitor the crewmember's sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

For today's recording and ground-commanded downlinking of onboard video, Peggy Whitson inserted and swapped tapes in the two VCRs (Video Cassette Recorders), 1&2.

Whitson had ~1hr set aside for troubleshooting the failed video connection for the ORB-1 video channel from the Shuttle to ISS via the ISS CVIU-10 (Common Video Interface Unit #10) in Node-2. *[For the IFM (In-flight Maintenance), the CDR accessed the base of Harmony's S4 rack and used pin kit jumpers to cross-wire CVIU-10 video transmit/receive cables for continuity testing. If this test was unsuccessful, Peggy was to extend the testing to other parts of the cabling.]*

Later, Peggy performed a pre-EVA video check by routing a Shuttle view to a Lab RWS (Robotic Workstation) monitor and checking picture quality.

FE-1 Malenchenko hooked up the necessary "plumbing" and compressor for transferring potable water from the BV2 tank of Progress M-63/28P to the SM Rodnik BV2 water tank. *[The water transfer, monitored by Yuri several times during the day, at first was by self-flow (under its own tank pressure), then using the compressor pump via a GZhS gas/liquid separator, to remove air bubbles in the water. Filling of the empty Progress BV1 & BV2*

tanks with urine will be scheduled later.]

Starting a new round of RS ventilation system maintenance, the FE-1 worked in the Service Module (SM), replacing the four dust collector filters (PF1-4) and cleaning "Group A" fan grilles.

For tomorrow's EVA-3 by MS2/EV1 Walheim and MS4/EV3 Love, final preparations by Tani, Rex & Stan today included -

- Reconfiguring two DCS 760 digital still cameras for the spacewalk, leaving them connected to station power for now to conserve batteries, one with 28mm lens and a new EVA Action Finder unit, the other with 35mm lens and an EVA flash,
- Setting up three batteries in the A/L BSA (Airlock Battery Stowage Assembly) for charging during the prebreathe period and to be installed in the photo equipment prior to egress,
- Starting EMU battery charge,
- Powering down onboard amateur (ham) radio equipment (Kenwood in SM, Ericsson in FGB) to prevent RF (radio frequency) interference with the EMU (Extravehicular Mobility Unit)/spacesuits,
- Preparing the A/L EL (Equipment Lock) for the Campout & spacewalk,
- Closing out METOX regeneration in the A/L bake-out oven, and
- Reviewing EVA-3 procedures particulars.

Peggy also prepared a special EVA swatch tool for a late-added touch inspection of an A/L handrail (#506) with a possibly sharp edged MMOD impact spot. *[The touch tests, supported by close-up photography, will use four swatch samples stroked firmly over the area of interest, once in each of four directions – RTV (Room Temperature Vulcanizing) material and Vectran on the swatch tool plus RTV and Vectran on a surplus overglove (on hand).]*

Whitson, Tani, Malenchenko and the two spacewalkers underwent the standard PMC (Private Medical Conference) via S- & Ku-band audio/video.

Dan Tani closed the Lab science window shutters as protection during today's Atlantis thruster firings that set up attitude for the periodic water dump and also to protect the window during for tomorrow's EVA.

The FE-1 continued the extended leak checking of the spare BZh Liquid Unit (#056) for the Elektron O₂ generator by checking the unit's pressure and charging it once again with pressurized N₂ from the BPA-M Nitrogen Purge Unit (#23) to 1 atm (1 kg/cm²). The last test pressurization was on 1/09. *[During Elektron operation, the inert gas locked up in the BZh has the purpose to prevent dangerous O₂/H₂ mixing. A leaking BZh cannot be used.]*

Yuri also conducted the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS hatch openings (8) in the SM, FGB and DC1 (Docking Compartment).

In preparation for upcoming experiment activities, Malenchenko continued the current extended performance check of the Russian KRIOGEM-03M refrigerator system, powered up on 2/12 to -22 degC with an AX ice pack from storage installed, for once-daily monitoring of its displayed temperature for the next five days (through 2/17).

Yuri also completed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Later, the FE-1 handled the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

At ~9:55am EST, the crew conducted a 20-min interactive TV "voice call" event with attendees at an ESA VIP gathering at the German Federal Ministry of Economics & Technology in Berlin, headed by Angela Merkel, the Chancellor of the Federal Republic of Germany, Jean-Jacques Dordain, ESA Director General, and Thomas Reiter as Moderator. The linkup and exchange, focused on the commissioning of the European Columbus laboratory and the resulting increasing salutary "internationalization" of the ISS, were very successful.

At ~11:10am, the ISS crew also engaged in three live TV/PD-100 camcorder media interviews of about 6.5 min duration each, with NBC News (Tom Costello), WOI-TV (Elizabeth Erwin), and WBBM Radio (Steve Grzanich).

FE-2 Tani and FE-2-16 Eyharts had over 2.5 hrs scheduled to continue their handover activities as ISS 2nd flight engineers.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Malenchenko later transferred the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Rex Walheim (EV1) & Stan Love (EV3) will begin their "campout" (*nachalo desaturatsiy* = desaturation start) in the A/L with hatch closure and depressurization of the Crewlock (CL) from 14.7 to 10.2 psi at ~6:00pm (i.e., an hour earlier than yesterday), followed by mask prebreathe at ~6:00-7:15pm. Sleep time for the ISS crew begins at 7:15pm.

Following the usual hygiene break/with mask prebreathe for Rex & Stan at ~4:20-5:30am

tomorrow morning after spending the night on 10.2 psi, the A/L hatch will be closed again for EVA preps in 10.2 psi, followed by EMU purge and prebreathe in the EMUs. Afterwards, with CL depressurization and EV1/EV3 egress, EVA-3 nominally begins at ~8:35am EST. Alan Poindexter will support the spacewalk as IV (Intravehicular) crewmember, keeping tabs with the detailed activity steps and crib sheet, and Melvin, Tani & Eyharts will work the SSRMS (Space Station Remote Manipulator System) for the hardware transfers (SOLAR, CMG, EuTEF) . *[Objectives of the spacewalk are to transfer SOLAR (Solar Monitoring Observatory) and the EuTEF (European Technology Exposure Facility) to the COL EPF (External Payload Facility), and to retrieve the failed CMG (Control Moment Gyro) for stowage in the Shuttle PLB for return. Get-ahead tasks for EVA-3 include more inspection of the failed SARJ (Solar Alpha Rotary Joint) with close-up photography, inspection of a suspected damage divot or debris (with its removal with a wipe) and photography of the remaining 5 single covers that have not yet been inspected, with 4 of them to be sampled with a sticky tape.]*

Transfers: As of this morning, 7 filled CWCs (Contingency Water Containers, contents ~45 L each) and 4 PWRs (Payload Water Reservoirs) were transferred from the Shuttle to ISS. Nitrogen transfer was completed, with 27 lbs N₂ transferred to the station. Even with the additional mission extension by one day, 60 lbs of oxygen (O₂) will be available for transfer on FD10.

No CEO photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:

ISS On-Orbit Status 02/13/08

All ISS systems continue to function nominally, except those noted previously or below.
Mission 1E Flight Day 7 (FD7).

Crew sleep cycle remains at 4:45am EST – 8:15pm for both crews.

Mission 1E's EVA-2 was completed successfully by Rex Walheim & Hans Schlegel in 6h 45m, accomplishing all its objectives and get-aheads.
[During the spacewalk, Walheim (EV1) & Schlegel (EV2) removed the new NTA (Nitrogen Tank Assembly) from the Shuttle PLB (Payload Bay), "flew" it to the CETA (Crew & Equipment Translation Aid) cart for transfer to the P1 truss, installed it in place of the failed NTA, which they returned via CETA for stowage in the PLB, and performed Get-Aheads, viz.: Clean up Lab MMOD (Micrometeoroid/Orbital Debris Shield) & install Columbus Trunnion Covers.] Official start time of the spacewalk was 9:27am EST, about 8 min ahead of the timeline, and it ended at 4:12pm. Total EVA duration (PET = Phase Elapsed Time) was 6h 45min. It was the 103rd spacewalk for ISS assembly & maintenance and the 75th from the station (28 from Shuttle, 53 from Quest, 22 from Pirs) totaling 457h 56min, and the 7th for Expedition 16 (totaling 50h 04min). After today's EVA, a total of 127 spacewalkers (95 NASA astronauts, 21 Russians, and 11 astronauts representing Japan-1, Canada-4, France-1, Germany-2 and Sweden-3) have logged a total of 646h 18min outside the station on building, outfitting and servicing. It was also the 125th spacewalk involving U.S. astronauts.]

Final COL (Columbus Orbital Laboratory) activation procedures were put on hold for today due to an onboard computer issue between a C&C MDM (Command & Control Multiplexer/Demultiplexer) computer and the MMC (Mission Management Computer). *[Clearing the command queue in the CCS (Command & Control System) memory, blocked by a bit that erroneously indicates the queue to be empty, is requiring MCC-Houston to create, test, uplink and execute a special command sequence "from scratch".]*

To establish ventilation allowing crew activities inside COL, COL-CC (Columbus Control Center) in Oberpfaffenhofen attempted a workaround by uplinking commands via VTC (Vital Telemetry Telecommand Computer) to cycle COL IMV (Intermodular Ventilation) valves and turn on the IRFA (IMV Return Fan Assembly), establishing module ventilation. The attempt was not satisfactory. At this time, there is no IMV, and smoke detection,

dependent on ventilation, is currently prime crew responsibility.

COL activation operations, on hold due to the CCS command issue, will deal mostly with moving European payload systems from their launch locations and setting them up at their operational rack positions. The work ahead by FE-2 Dan Tani & FE-2-16 Leo Eyharts is to include among else –

- Installing K-BAR capture mechanisms in COL and relocating a ZSR (Zero-G Stowage Rack) and its pivot fittings from position A2 to O3 (or F3 to O4) in COL,
- Rotating COL Rack D1 forward (away from the cell wall),
- Installing RPDA (Remote Power Distribution Assembly) items and a front panel on the Biolab (BLB),
- Relocating the BLB to its ISPR (International Standard Payload Rack) location & installing its DC converter,
- Tilting the D1 rack back and securing it,
- Relocating the EDR (European Drawer Rack) to its final ISPR position,
- Activating the PWS (Portable Workstation) in COL, and
- Setting up PCS (Portable Computer System).

[Biolab (Biological Experiment Laboratory in Columbus) is a biological and physiological facility for studying the effects of microgravity on microorganisms, cells, tissue cultures, small plants and small invertebrates. EDR is a multi-discipline facility that provides an opportunity for compact experiments of low mass, supporting a variety of small payloads. Each payload will have access to power, data communications, cooling among other accommodations.]

Before breakfast, FE-2 Dan Tani completed his daily access of the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop for downlink. *[To monitor the crewmember's sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

As part of pre-EVA activities, Dan Tani closed the protective Lab science window shutters, while Yuri Malenchenko powered down the ham radio equipment in SM (Service Module) and FGB at ~6:30am EST to prevent RF interference with the EMUs during the spacewalk.

The FE-2 performed the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling CWC (Contingency Water Container) #1062 with the collected water slated for processing. No samples required this time. *[Estimated offload time before termination (leaving ~6 kg in the tank): ~25 min.]*

Malenchenko used the standard pump/hose gear to collect a water sample of ~200 mL from the SM BV1 Rodnik storage tank for return to Earth.

Afterwards, the FE-1 activated the Russian KTSP2 (Central Post Computer 2) RS2 laptop with its new display software, installed yesterday, for backup, before working on the KTSP1 RS3 laptop to repeat the software upgrade from a flash drive, then making a backup copy.

Yuri also conducted the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS (Russian segment) hatch openings (8) in the SM, FGB and DC1 (Docking Compartment).

Later, Malenchenko transferred the ATV (Automated Transfer Vehicle) control panel (PU) to its operational location and installed it.

The FE-1 continued his work with the Russian KPT-2 science payload BAR-RM, Kelvin, Ira and TTM, begun yesterday, today running tests and taking the first measurements (temperatures, relative humidity, dew point temperatures), using the RSK1 laptop (which he reconfigured afterwards). The data are being used for experimenting with ISS leak detection based on environmental data anomalies (temperature, humidity, and ultrasound emissions) at leak locations. After the data gathering, downlinking was via BSR-TM channel. *[BAR-RM is designed to develop a procedure for detection of air leakage from ISS modules based on environmental data anomalies (temperature, humidity, ultrasound emissions). The payload uses a remote infrared thermometer (Kelvin-Video), a thermohygrometer (Iva-6A), a heat-loss anemometer/thermometer (TTM-2), an ultrasound analyzer (AU-01), and a leak detector (UT2-03) to determine physical background signs of loss of ISS pressure integrity which could be indicative of leaks in the working compartments of the station. Measurements are taken in specific zones (13 in SM PkhO and 4 in DC1), both with lights & fans turned on and off.]*

During today's spacewalk by Rex & Hans, PLT Alan Poindexter provided IVA support, while MS1 Leland Melvin and MS4/EV3 Stan Love worked the SSRMS (Space Station Remote Manipulator System) to assist with the NTA R&R (Removal & Replacement).

After the spacewalkers' ingress at 4:12pm, post-EVA activities by CDR Steve Frick, CDR Peggy Whitson, Schlegel and Walheim in the Joint Airlock (A/L) consisted of recharging the EMU/spacesuits with water from PWR (Payload Water Reservoir), then reconnecting the LTAs (Lower Torso Assemblies) to the EMUs and capping the UIA (Umbilical Interface Assembly), initiating and monitoring the regeneration of the METOX (Metal Oxide) CO₂ filter canisters, initiating the discharge/recharge process on the EMU batteries in the BSA (Battery Stowage Assembly), and reconfiguring EVA tools.

In preparation for upcoming experiment activities, FE-1 Yuri Malenchenko continued the current extended performance check of the Russian KRIOGEM-03M refrigerator system, powered up yesterday to -22 degC with an AX ice pack from storage installed, for once-daily monitoring of its displayed temperature for the next five days (through 2/17).

Yuri also completed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO*

solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

Working off his discretionary “time permitting” task list, the FE-1 handled the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Other voluntary items on Yuri’s “job jar” list for today were -

- The daily monitoring, picture-taking and downloading on the newly set up BIO-5 Rasteniya-2 ("Plants-2") experiment. *[Rasteniya-2, researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. During the duration of the BIO-5 experiment, students of the Moscow City Palace for Youth Creativity of the Meshchansky inter-regional center #15 in Moscow) and the Prince of Oldenburg Lyceum in St. Petersburg will be cultivating plants in parallel on the ground and conducting comparative observation of plant growth and development under gravity and zero-gravity conditions. They are receiving the photo images taken by Yuri.],* and
- The regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). *[This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 16.]*

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Malenchenko later transferred the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

ETCS Shutdown: Loop A of the ISS ETCS (External Thermal Control System) suffered an inadvertent shutdown yesterday afternoon after the begin of COL MTL IFHX (Moderate Temperature Loop Interface Heat Exchanger) integration into the ETCS Loop A. The shutdown occurred when the loop’s flow control valve was unable to compensate for a warm (~65 degC) slug of ammonia passing through the system from the first IFHX that was discovered to have been left powered on (to provide extra margin against freezing). After recovery of the ETCS loop per procedure, the heater was deactivated and both COL IFHXs were integrated without further incident.

No CEO photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:

<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site);

<http://earthobservatory.nasa.gov/>

<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*):

- 02/14 (FD 08) -- Continue COL Module outfitting; crew off-duty period;
- 02/15 (FD 09) -- EVA-3 to transfer the SOLAR (Solar Monitoring Observatory) and the EuTEF (European Technology Exposure Facility) to the COL Module external payload facility, and to retrieve a failed CMG (Control Moment Gyro) and stow for return;
- 02/16 (FD 10) -- Cargo transfers; close hatches in preparation for undocking; reboost (TBD)
- 02/17 (FD 11) -- Undock from ISS (~7:05am ET); perform final OBSS berthing;
- 02/18 (FD 12) -- Stow cabin; checkout Shuttle flight control systems;
- 02/19 (FD 13) -- Prepare for and perform deorbit burn; land at KSC (Nominal Landing) ~10:17am ET.

03/07/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana) (~11:23pm EST); docking early April

03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS

03/12/08 -- ATV CAM (Collision Avoidance Maneuver) demo

03/13/08 -- STS-123/Endeavour/1J/A docking

03/18/08 -- ATV1 parking orbit (loiter)

03/25/08 -- STS-123/Endeavour/1J/A undocking

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking)

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch

04/10/08 -- Soyuz TMA-12/16S docking (DC1)

04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)

04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

04/24/08 -- STS-124/Discovery/1J launch -- JEM PM "Kibo", racks, RMS

04/26/08 -- STS-124/Discovery/1J docking

05/04/08 -- STS-124/Discovery/1J undocking

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

08/07/08(NET) -- ATV-1 undocking (from SM aft port)

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
09/18/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
09/20/08 -- STS-126/Discovery/ULF2 docking
10/01/08 -- STS-126/Discovery/ULF2 undocking.
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment
11/08/08 -- STS-119/Discovery/15A docking
11/17/08 -- STS-119/Discovery/15A undocking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
04/15/09 -- **Constellation's Ares I-X Launch**
05/??/09 -- **Six-person crew on ISS** (following Soyuz 18S-2 docking)
04/??/10 -- STS-132/Discovery/20A – Node-3 + Cupola.

ISS On-Orbit Status 02/12/08

All ISS systems continue to function nominally, except those noted previously or below.
Mission 1E Flight Day 6 (FD6).

Congratulations, ESA! At ~9:15am EST, the European Columbus laboratory was opened and entered by crewmembers for the first time. *[Columbus is permanently attached at the starboard port of Node-2.]*

Crew sleep cycle remains at 4:45am – 8:15pm for both crews.

Before breakfast, FE-2 Dan Tani completed his daily access of the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop for downlink. *[To monitor the crewmember's sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

CDR Peggy Whitson and FE-2-16 Leo Eyharts continued their IMMUNO (Integrated Immune Assessment) experiment, begun on 2/9, with liquid saliva collections, first thing after wake-up and prior to breakfast, drinking and teeth-brushing. All samples were stored at ambient temperature. Dan Tani's IMMUNO liquid saliva collection starts tomorrow morning. *[IMMUNO (Integrated Immune Assessment) is a 24-hr. test of human immune system changes, with the objective to investigate immune neuro-endocrine reactions in the space environment by studying samples of saliva, blood and urine using collection kits and the biomedical (MBI) protection kit, to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects. The saliva is collected in two forms, dry and liquid. The dry samples are collected at intervals during the collection day using a specialized book that contains filter paper. The liquid saliva collections require that the crewmember soak a piece of cotton inside their mouth and place it in a salivette bag; there are four of the liquid collections during docked operations. The on-orbit blood samples are collected right before undocking and returned on the Shuttle so that analysis can occur with 48 hours of the sampling. This allows assays that quantify the function of*

different types white blood cells and other active components of the immune system. For cold storage, samples are secured in the MELFI (Minus-Eighty Laboratory Freezer for ISS). Also included are entries in a fluid/medications intact log, and a stress-test questionnaire to be filled out by the subject at begin and end. Urine is collected during a 24-hour period, conventionally divided into two twelve-hour phases: morning-evening and evening-morning.]

In preparation for upcoming experiment activities, FE-1 Yuri Malenchenko activated the Russian KRIOGEM-03M refrigerator system for an extended performance check, powering it up to -22 degC with an AX ice pack from storage installed, then monitoring its displayed temperature for the next five days (through 2/17) once a day before sleeptime.

Afterwards, Yuri made preparations for a software upgrade of the CPC1 (Central Post Computer) RS2 laptop by loading newly OCA-uplinked software (for updated displays) onto a USB flash drive. Installation of the file contents from the flash drive in RS2 is scheduled tomorrow.

The FE-1 also collected condensate water (KAV) upstream of the FGS (Gas-Liquid Mixture Filter) of the SRV-K2M (Condensate Water Recovery System) in empty drink bags for return to Earth.

Whitson and Tani meanwhile finished the Node-2 O₂ (oxygen) system leak check, then terminated the leak check of the Harmony-to-Columbus vestibule.

In preparation for Columbus hatch opening and ingress, Peggy and Dan worked jointly to –

- Remove the center CBM (Common Berthing Mechanism) disk cover and thermal cover after opening the Node-2 hatch,
- Install electrical grounding straps,
- Disconnect Node-2/Columbus ITCS QD (Internal Thermal Control System Quick Disconnect),
- Install Columbus power jumpers and
- Remove all CPA (Control Panel Assembly) power jumpers (J1, J2, J3, J4).

After hatch opening and first crew ingress in Columbus at ~9:15am, Peggy, Dan and Leo continued outfitting Columbus. Among else, they –

- Installed hardwired instrumentation jumpers and connect 1553 data cables,
- Removed forward, aft, overhead & deck Node-2 CPA panels,
- Installed IMV (Intermodular Ventilation) airducts,
- Installed condensate water hose,
- Removed the aft NPRV (Negative Pressure Relief Valve) valve, replacing it with an IMV valve,
- Installed fiber optics cable, SDS (Sample Delivery System) and IMV return line,
- Transferred two PFEs (portable fire extinguishers) and two PBAs (portable breathing apparatus) to Columbus,
- Installed Partition Support Posts, and
- Installed the Ethernet cable and IVA (Intravehicular Activity) antenna assembly.

The FE-1 meanwhile conducted the periodic checkout/verification of IP-1 airflow sensors in the various RS (Russian segment) hatch openings (8) in the SM (Service Module), FGB and DC1 (Docking Compartment).

Upon Columbus (COL) hatch opening, Malenchenko took samples using the Russian IPD Draeger tubes and AK-1M samplers, testing for CO (Carbon Monoxide) in the SM & COL and for Formaldehyde (H₂CO, methanal) in COL. At the same time, Eyharts collected samples with the U.S. CSA-CP (Compound Specific Analyzer- Combustion Products) and GSC (Grab Sample Container). The FE-1 prepacked the air samples for return on the Shuttle.

FE-2 Tani deployed the new EMER-1 SODF (Station Operations Data File) emergency procedures book for Columbus.

Malenchenko set up the Russian KPT-2 science payload BAR-RM, Kelvin, Ira and TTM, to be used for experimenting with ISS leak detection based on environmental data anomalies (temperature, humidity, and ultrasound emissions) at leak locations. Data gathering will take place in the next two days using the RSE-1 laptop, with downlinking via BSR-TM channel. *[BAR-RM is designed to develop a procedure for detection of air leakage from ISS modules based on environmental data anomalies (temperature, humidity, ultrasound emissions). The payload uses a remote infrared thermometer (Kelvin-Video), a thermohygrometer (Iva-6A), a heat-loss anemometer/thermometer (TTM-2), an ultrasound analyzer (AU-01), and a leak detector (UT2-03) to determine physical background signs of loss of ISS pressure integrity which could be indicative of leaks in the working compartments of the station. Measurements are taken in specific zones (13 in SM PkhO and 4 in DC1), both with lights & fans turned on and off.]*

Yuri Ivanovich also completed the 2.5-hr Part 2 of his first onboard "Profilaktika" (MBI-8, "Countermeasures") series of preventive health maintenance fitness testing, including ECG (Electrocardiogram), blood test and subjective rating. *[Today's fitness test was performed on the TVIS treadmill in unmotorized (idle) mode, with free choice of speeds within the range permitted. The test investigates the action mechanism and efficiency of various countermeasures (currently VELO and TVIS) aimed at preventing locomotor system disorders in weightlessness. The test differs from the normal TVIS session by the use of the TEEM-100 gas analyzer (via a mask equipped with a pneumotachometer sensor), measurement of blood lactate level and subjective evaluation of physical exertion levels during the test. The lactate blood samples were taken twice at the end of the session, using the ACCUSPORT analyzer and REFLOTRON-4 accessories. Results were entered on a log sheet. TEEM and ECG (electrocardiograph) data were transferred to the RSE-Med laptop, also on a tape cassette (Cardiocassette-2000), and prepared for later downlink via Regul-Packet comm. Results were also called down via S-band to specialists standing by at TsUP-Moscow.]*

Dan Tani reconfigured the DCS-760 EVA cameras and initiated charging of their batteries.

Malenchenko completed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Working off his discretionary "time permitting" task list, Yuri conducted the daily monitoring, picture-taking and downloading on the newly set up BIO-5 Rasteniya-2 ("Plants-2") experiment. *[Rasteniya-2, researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. During the duration of the BIO-5 experiment, students of the Moscow City Palace for Youth Creativity of the Meshchansky inter-regional center #15 in Moscow) and the Prince of Oldenburg Lyceum in St. Petersburg will be cultivating plants in parallel on the ground and conducting comparative observation of plant growth and development under gravity and zero-gravity conditions. They are receiving the photo images taken by Yuri.]*

Also suggested on Yuri's Russian voluntary "job jar" list for today was the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). *[This is a daily monitoring/temp checking, carried on the Russian voluntary task list for the duration of Expedition 16.]*

Leo Eyharts updated the TVIS exercise protocol for his future use of the device as new FE-2.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS (CDR, FE-1), and RED resistive exercise device (CDR, FE-2).

Afterwards, Yuri copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Rex Walheim (EV1) & Hans Schlegel (EV2) will begin their "campout" (*nachalo desaturatsiy* = desaturation start) in the Airlock (A/L) with hatch closure and depressurization of the Crewlock (CL) from 14.7 to 10.2 psi at ~7:00pm, followed by mask prebreathe at ~7:00-8:15pm. Sleep time for the ISS crew begins at 8:45pm.

Following the usual hygiene break/with mask prebreathe for Rex & Hans at ~5:20-6:30am tomorrow morning after spending the night on 10.2 psi, the A/L hatch will be closed again for EVA preps in 10.2 psi, followed by EMU purge and prebreathe in the EMUs.

Afterwards, with CL depressurization and EV1/EV2 egress, EVA-2 nominally begins at ~9:35am EST. Frick & Whitson will support the spacewalk as IV (Intravehicular) crewmembers, keeping tabs with the detailed activity steps and crib sheet. *[Objectives of the spacewalk are to (1) Remove new NTA (Nitrogen Tank Assembly) from Shuttle PLB (Payload Bay), (2) Transfer ("fly") the NTA to the CETA (Crew & Equipment Translation Aid) cart for transfer to the P1 truss, (3) Replace old NTA with new NTA, (4) Return old NTA for stowage in PLB, (4) Perform Get-Aheads, viz.: Install Lab MMOD (Micrometeoroid/Orbital Debris Shield) & Columbus Trunnion Covers.]*

No CEO photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:

<http://earthobservatory.nasa.gov/>

<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*):

- 02/13 (FD 07) -- Perform more COL Module outfitting; EVA-2 to remove failed NTA from P1 truss and to install a new NTA plus Get-Aheads;
- 02/14 (FD 08) -- Continue COL Module outfitting; crew off-duty period;
- 02/15 (FD 09) -- EVA-3 to transfer the SOLAR (Solar Monitoring Observatory) and the EuTEF (European Technology Exposure Facility) to the COL Module external payload facility, and to retrieve a failed CMG (Control Moment Gyro) and stow for return;
- 02/16 (FD 10) -- Cargo transfers; close hatches in preparation for undocking;
- 02/17 (FD 11) -- Undock from ISS (~7:05am ET); perform final OBSS berthing;
- 02/18 (FD 12) -- Stow cabin; checkout Shuttle flight control systems;
- 02/19 (FD 13) -- Prepare for and perform deorbit burn; land at KSC (Nominal Landing) ~10:15am ET.

03/07/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana) (~11:23pm EST); docking early April

03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch

04/10/08 -- Soyuz TMA-12/16S docking (DC1)

04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)

04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

04/24/08 -- STS-124/Discovery/1J launch -- JEM PM "Kibo", racks, RMS

04/26/08 -- STS-124/Discovery/1J docking

05/04/08 -- STS-124/Discovery/1J undocking

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

08/07/08(NET) -- ATV-1 undocking (from SM aft port)

08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
09/18/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
09/20/08 -- STS-126/Discovery/ULF2 docking
10/01/08 -- STS-126/Discovery/ULF2 undocking.
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment
11/08/08 -- STS-119/Discovery/15A docking
11/17/08 -- STS-119/Discovery/15A undocking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
04/15/09 -- **Constellation's Ares I-X Launch**
05/??/09 -- **Six-person crew on ISS** (following Soyuz 18S-2 docking)
04/??/10 -- STS-132/Discovery/20A – Node-3 + Cupola.

ISS On-Orbit Status 02/11/08

All ISS systems continue to function nominally, except those noted previously or below.
Mission 1E Flight Day 5 (FD5). Underway: Week 17 of Increment 16.

Mission 1E's EVA-1 was completed successfully by Stanley Love & Rex Walheim in 7hr 58min, accomplishing all its objectives.

[During the spacewalk, Walheim (EV1) & Love (EV2) prepared Columbus for unberthing and installation, hooking up electric cables, removing protective covers from the module's docking mechanism and equipping Columbus with the PDGF (Power & Data Grapple Fixture) required for grappling. They also started preparing the NTA (Nitrogen Tank Assembly) for removal, preparatory to replacement with a new NTA on EVA-2 (disconnecting electric cables and two ammonia flex hoses was deferred to Wednesday, but Walheim unfastened two of the four bolts holding down the NTA). Official start time of the spacewalk was 9:13am EST, about 25 minutes ahead of the timeline, and it ended at 5:11pm. Total EVA duration (PET = Phase Elapsed Time) was 7h 58min. It was the 102nd spacewalk for ISS assembly & maintenance and the 74th from the station (28 from Shuttle, 52 from Quest, 22 from Pirs) totaling 451h 11min, and the 6th for Expedition 16 (totaling 43h 19min.) After today's EVA, a total of 125 spacewalkers (94 NASA astronauts, 21 Russians, and ten astronauts representing Japan-1, Canada-4, France-1, Germany-1 and Sweden-3) have logged a total of 639h 33min outside the station on building, outfitting and servicing. It was also the 124th spacewalk by U.S. astronauts.]

In addition, **ESA's Columbus Module was successfully installed on the Node-2 "Harmony" starboard dock at ~4:44pm.** *[FE-2 Dan Tani, MS1 Leland Melvin and MS-5 Leo Eyharts operated the SSRMS (Space Station Remote Manipulator System) to grapple, unberth, transfer and reberth Columbus at the Node-2 Stbd CBM (Common Berthing Mechanism) with the SSRMS in "limp" mode. All motorized bolts have engaged to firmly hold the science laboratory at its place, and leak checks are now being performed on the vestibule between Columbus and the Node-2 port. Ingress in Columbus is scheduled for tomorrow at ~ 2:55pm EST.]*

After wakeup at ~4:45am EST, ending the 8.5-hr sleep period before the spacewalk, the Airlock Crewlock (A/L CL) hatch was cracked at ~5:20am EST for a hygiene break/with mask prebreathe for Walheim and Love, after spending the night on 10.2 psi campout.

Around 6:30am, the hatch was closed again by IVs (Intravehicular Crewmembers) for EVA preparations in 10.2 psi, followed by EMU purge & prebreathe. Afterwards, IVs supported the CL depressurization and EV1/EV2 egress (EMUs switched to batteries at 9:13am).

Before breakfast, FE-2 Dan Tani completed his daily access of the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop for downlink. *[To monitor the crewmember's sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

Prior to EVA start, FE-1 Malenchenko verified powerdown of onboard ham radio equipment (Kenwood in SM & Ericsson in FGB) to prevent RF interference with the EMUs, as well as proper closure of the protective Lab window shutters.

At the Node-2 starboard hatch, FE-2 Tani powered up the CBCS (Centerline Berthing Camera System) which he had installed and checked out on 11/28/08 in preparation for today's Columbus berthing.

After last week's installation of the new EMI (Electromagnetic Interference) filter in the Elektron O₂ (oxygen) generator system, Malenchenko worked with the ground on activating of the Elektron at 32 amps, first pressurizing the BZh Liquid Unit with N₂ (nitrogen) via laptop and later monitoring the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating. *[During nominal operations a gas analyzer is utilized to detect hydrogen (H₂) in the O₂ line (which could cause overheating) but is not included in the control algorithm until 10 minutes after Elektron startup. The new EMI filter, recently (2/9) installed on the Elektron's current stabilizer (FPP ST-64), prevents RFI (radio frequency interference) with the ATV/Automated Transfer Vehicle).]*

The FE-1 conducted the fourth recharging of the Motorola Iridium-9505A satellite phone brought up on Soyuz 15S, a monthly routine job. *[After retrieving it from its location in the TMA-11/15S descent module (BO) at ~6:55am EST, Yuri initiated the recharging of its lithium-ion battery, monitoring the process every 10-15 minutes as it took place. Upon completion at ~8:15am, the phone was returned inside its SSSP Iridium kit and stowed it back in the BO's operational data files (ODF) container. The satphone accompanies returning ISS crews on Soyuz reentry & landing for contingency communications with SAR (Search-and-Rescue) personnel after touchdown (e.g., after an "undershoot" ballistic reentry). The Russian-developed procedure for the monthly recharging has been approved jointly by safety officials. During the procedure, the phone is left in its fire-protective fluoroplastic bag with open flap. The Iridium 9505A satphone uses the Iridium constellation of low-Earth orbit satellites to relay the landed Soyuz capsule's GPS (Global Positioning System) coordinates to helicopter-borne recovery crews. The older Iridium-*

9505 phones were first put onboard Soyuz in August 2003. The newer 9505A phone, currently in use, delivers 30 hours of standby time and three hours of talk, up from 20 and two hours, respectively, on the older units.]

In the Service Module (SM), Malenchenko installed the water sampler and performed part of the periodic water sampling for return to Earth, using empty drinking bags to collect condensate (KAV) samples upstream of the Water Purification Column Unit (SRV-K2M BKO).

Yuri also set up the hardware and conducted the first part of the onboard "Profilaktika" (MBI-8, "Countermeasures") preventive health maintenance fitness test, on the VELO bicycle ergometer. Part 2, on the TVIS treadmill, is scheduled tomorrow. *[Test procedure for MBI-8, which requires workouts on the VELO and TVIS, is identical to the Russian MO-5 assessment, but in addition to the nominal procedure it uses the TEEM-100M gas analyzer with breathing mask, a blood lactate test with the ACCUSPORT analyzer and REFLOTRON-4 accessories, and a subjective evaluation of physical exertion levels during the test (using the Borg Perceived Exertion Scale, viz., 10 steps from very light over hard and very hard to maximum). Results are entered on a log sheet. TEEM and ECG (electrocardiograph) data are transferred to the RSE-Med laptop, also on a tape cassette (Cardiocassette-2000), and prepared for later downlink via Regul-Packet comm. Results are also called down to specialists standing by at TsUP. Data from the previous session (1/3) were also to be transferred.]*

Two more CWC (Contingency Water Container) bags were filled in the Atlantis with water from the Shuttle's fuel cells by CDR Frick & PLT Poindexter and transferred to ISS.

Malenchenko worked on the RBO-3-1 Matryoshka-M radiation equipment in the DC1 Docking Compartment and removed 16 radiation dosimeters from the "Phantom" unit, packing 13 of the containers for return on the Shuttle and leaving three (##8, 13, 18) for continued support of the Bubble-Dosimeter experiment.

Also in the DC1, Yuri readied three smoke detectors (IDZ-2, "Electroinductive Detector 2"), to replace the current units, scheduled for tomorrow.

CDR Whitson supported the ESA experiment WAICO (Waving and Coiling of Arabidopsis Roots at Different g-levels) by inserting four (of eight) Shuttle-delivered SED seed containers in the MELFI (Minus-Eighty Laboratory Freezer for ISS), Dewar 4, Tray C/4. *[WAICO, contributed by Leibniz Universität in Hannover, Germany, will study the interaction of circumnutation (the successive bowing or bending in different directions of the growing tip of the stems and roots) and gravitropism (a tendency to grow toward or away from gravity) in microgravity and 1-g of Arabidopsis thaliana (commonly known as thale cress). MELFI exhibited an as-yet unexplained warm-up yesterday but its current temperature remains well within WAICO range, with WAICO samples being protected on both high and low side.]*

Whitson also continued preparations of the Node-2 starboard hatch transfer section

("vestibule") for Columbus docking by installing the VAJ (Vacuum Access Jumper) equipment for vestibule pressurization. After Columbus berthing, the equipment will be used for the standard one-hour leak checking.

In the Joint Airlock (A/L), Dan Tani, Rex Walheim and Stan Love performed post-EVA activities, including charging the EMU/spacesuits with water from PWR (Payload Water Reservoir) and CWC (Contingency Water Container) #1059, then reconnecting the LTAs (Lower Torso Assemblies) to the EMUs and capping the UIA (Umbilical Interface Assembly).

They also initiated and monitored regeneration of the two METOX canisters used for the Campout in the A/L bakeout oven and set up EMU batteries in the BSA (Battery Stowage Assembly) for recharge.

After Columbus berthing, Peggy Whitson will uninstall and remove the CBCS (Centerline Berthing Camera System) in Node-2 for stowage.

Dan Tani meanwhile will download the DCS-760 imagery resulting from the EVA.

The FE-1 continued cargo transfer and stowage activities from Progress M-63/28P to the ISS, while Frick and Poindexter accomplished more cargo transfers between Atlantis and ISS.

Malenchenko completed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Working off his discretionary "time permitting" task list, Yuri conducted the daily monitoring, picture-taking and downloading on the newly set up BIO-5 Rasteniya-2 ("Plants-2") experiment. *[Rasteniya-2, researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. During the duration of the BIO-5 experiment, students of the Moscow City Palace for Youth Creativity of the Meshchansky inter-regional center #15 in Moscow) and the Prince of Oldenburg Lyceum in St. Petersburg will be cultivating plants in parallel on the ground and conducting comparative observation of plant growth and development under gravity and zero-gravity conditions. They are receiving the photo images taken by Yuri.]*

Also suggested on Yuri's Russian voluntary "job jar" list for today was the regular checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). *[This is a daily monitoring/temp checking, carried on*

the Russian voluntary task list for the duration of Expedition 16.]

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-2), RED resistive exercise device (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

No CEO photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:

<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site);

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*):

- 02/12 (FD 06) -- More FI (Focused Inspection) if required; prepare for and perform COL Module ingress;
- 02/13 (FD 07) -- Perform COL Module outfitting; EVA-2 to remove failed NTA from P1 truss and to install a new NTA;
- 02/14 (FD 08) -- Continue COL Module outfitting; crew off-duty period;
- 02/15 (FD 09) -- EVA-3 to transfer the SOLAR (Solar Monitoring Observatory) and the EuTEF (European Technology Exposure Facility) to the COL Module external payload facility, and to retrieve a failed CMG (Control Moment Gyro) and stow for return;
- 02/16 (FD 10) -- Cargo transfers; close hatches in preparation for undocking;
- 02/17 (FD 11) -- Undock from ISS; perform final OBSS berthing;
- 02/18 (FD 12) -- Stow cabin; checkout Shuttle flight control systems;
- 02/19 (FD 13) -- Prepare for and perform deorbit burn; land at KSC (Nominal Landing) ~9:59am EST.

03/07/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana) (~11:23pm EST); docking early April

03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch

04/10/08 -- Soyuz TMA-12/16S docking (DC1)

04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)

04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

04/24/08 -- STS-124/Discovery/1J launch -- JEM PM "Kibo", racks, RMS

04/26/08 -- STS-124/Discovery/1J docking

05/04/08 -- STS-124/Discovery/1J undocking

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

08/07/08(NET) -- ATV-1 undocking (from SM aft port)

08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
09/18/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
09/20/08 -- STS-126/Discovery/ULF2 docking
10/01/08 -- STS-126/Discovery/ULF2 undocking.
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment
11/08/08 -- STS-119/Discovery/15A docking
11/17/08 -- STS-119/Discovery/15A undocking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
04/15/09 -- **Constellation's Ares I-X Launch**
05/??/09 -- **Six-person crew on ISS** (following Soyuz 18S-2 docking)
04/??/10 -- STS-132/Discovery/20A – Node-3 + Cupola.

ISS On-Orbit Status 02/10/08

All ISS systems continue to function nominally, except those noted previously or below.
Sunday --- Mission 1E Flight Day 4 (FD4). Ahead: Week 17 of Increment 16.

Mission 1E replanning by MCC-Houston, driven by the one-day delay of the first spacewalk, was completed last night, as follows:

- Approved mission extension by one day (i.e., 12+0+2 instead of 11+0+2), resulting in 2/19 (Tuesday) as return date for Atlantis;
- Limiting resource being oxygen (O₂), under further discussion is the option to either extend by one more docked day or transfer the unexpended O₂ to the ISS (current O₂ margins are estimated to be 11+1+2 plus an additional 20-25 hours. These are still being refined given the insertion of the new FD4);
- All FD 4 activities moved to FD 5. EVA-1 will be conducted by Stanley Love and Rex Walheim tomorrow, with Campout of the two tonight;
- Today (FD 4) was replanned and includes 1.5 hrs of focused inspection (FI) of the starboard OMS (Orbital Maneuvering System) pod blanket that has a corner slightly peeled back (**see images below**) [*the FI, starting at ~ 2:15 pm EST, is planned for 90 min, with additional FI time available on FD 06 if needed*];
- Transfer status: 22% of transfer complete, 6 hours of transfer scheduled for FD 4, expect 35/40 lbs N₂ transfer today, 3 CWCs filled.

Wakeup time for the ISS crew remains at 4:45am EST, with sleep time tonight 8:45pm. Same times for the Shuttle crew.

After wakeup and before breakfast, FE-2 Dan Tani completed his daily access of the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop for downlink. [*To monitor the crewmember's sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days,*

as part of the crew's discretionary "job jar" task list.]

In Node-2, CDR Whitson performed a leak check on the O₂ supply line set up yesterday to allow flow of Shuttle O₂ to the ISS PBAs (Portable Breathing Apparatus) in support of pre-EVA mask prebreathe for denitrogenation.

The crew, particularly CDR Frick, PLT Poindexter, MS2 Walheim and MS4 Love, conducted an in-depth review of procedures for the EVA-1 spacewalk, with egress scheduled to start tomorrow morning at ~9:40am EST.

CDR Whitson, with Frick and Poindexter, initiated N₂ (nitrogen) transfer from the Orbiter to the ISS HPGTs (High-Pressure Gas Tanks) on the exterior of the U.S. Airlock (A/L). *[A total of ~40 lbs of N₂ was to be transferred to the ISS (until stopped by the HPGT counter pressure).]*

FE-1 Malenchenko transferred and replaced new Russian ODF (Operations Data Files) documents and updates from Progress 28P. *[The new material was inserted in five Procedures Books (SOZh Life Support System, SOGS Atmosphere Revitalization System, VKS Auxiliary Computer System, PTO VnuKD FGB IVA IFM (In-flight Maintenance) Part 1, and RPR TKG #363 Progress M-63 Cargo Transfer Ops.)]*

Similarly, CDR Peggy Whitson transferred a CD (Compact Disk) storage box with new data files for the 1E stage from Atlantis to the ISS.

Malenchenko completed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Yuri also handled the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

More CWC (Contingency Water Container) bags were filled in the Atlantis with water from the Shuttle's fuel cells by Frick & Poindexter for transfer to ISS.

Yuri Malenchenko performed a successful leak check on his Russian Sokol spacesuit.

More 1E cargo transfers from the Shuttle to ISS were handled by Poindexter, Frick and Whitson.

FE-2 Dan Tani, slated for return on the Atlantis on 2/19, and MS5 Léopold (Leo) Eyharts, who is to replace him as ISS FE-2, had 3h 15m scheduled for standard joint handover

activities, to be continued through the docked period ahead.

Tani downlinked the data from his two CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS) Actiwatchs and body-worn Holter recorder.

EV1 Walheim & EV2 Love worked on their EMUs (Extravehicular Mobility Units), adjusting sizes and swapping components as required (MS3 Hans Schlegel being scheduled for spacewalk next week). Preparations for tomorrow's spacewalk included refilling the in-EMU DIDBs (Disposable In-suit Drink Bags). *[The DIDBs were filled yesterday with non-iodinated drinking water, good for 24 hr & intended for today. The postponement of EVA-1 to FD5 required a refill with fresh non-iodinated potable water.]*

Schlegel meanwhile checked out the REBA (Rechargeable EVA Battery Assembly)-powered EVA hardware in the Airlock (A/L), as Rex and Stan prepared the A/L Equipment Lock for their campout. See today's **picture of Hans below**. *[Reminder: The U.S. A/L has two hatch-separated compartments: the Crew Lock (CL) and the Equipment Lock (EL).]*

In Node-2, Peggy prepared PCS (Portable Computer System) 120 Vdc UOP (Utility Outlet Panel) power for the spacewalk and verified correct A31p laptop function.

Whitson also started the outfitting of the Node-2 port vestibule for tomorrow's berthing of Columbus (COL). The vestibule outfitting will be continued over the next several days after the COL berthing.

Schlegel, Love & Tani each have a PFC (Private Family Conferences) on their schedule, via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop), Stan at ~1:50pm, Hans at ~5:30pm, Dan at ~6:15pm.

At ~2:15pm EST, Shuttle crewmembers Leland Melvin (MS1), Frick, Poindexter and Love began the 2.5-hr. focused inspection of the starboard OMS pod with the detached corner of one of the TPS (Thermal Protection System) blankets. The resulting imagery will be downlinked later tonight for inspection by ground specialists. *[The forward corner of the blanket (~6 in x ~6 in) is peeled back and sticking up approximately 2 inches. There is no RTV visible and there is no structural rib underneath. Additionally, there is a loose portion of the blanket in the middle raised to an unknown height.]*

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Yuri transferred the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working off his discretionary "time permitting" task list, Malenchenko conducted the daily

monitoring, picture-taking and downloading on the newly set up BIO-5 Rasteniya-2 ("Plants-2") experiment. *[Rasteniya-2, researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. During the duration of the BIO-5 experiment, students of the Moscow City Palace for Youth Creativity of the Meshchansky inter-regional center #15 in Moscow) and the Prince of Oldenburg Lyceum in St. Petersburg will be cultivating plants in parallel on the ground and conducting comparative observation of plant growth and development under gravity and zero-gravity conditions. They are receiving the photo images taken by Yuri.]*

Rex (EV1) and Stan (EV2) will begin their "campout" (*nachalo desaturatsiy* = desaturation start) in the A/L with hatch closure and depressurization of the CL from 14.7 to 10.2 psi at ~7:00pm, followed by mask prebreathe at ~7:00-8:15pm. Sleep time for the ISS crew begins at 8:45pm. *[For the Campout, METOX (Metal Oxide) canisters #0017 & #0019) have been installed in the A/L for CO₂ control.]*

Following the usual hygiene break/with mask prebreathe for Walheim & Love at ~5:20-6:30am tomorrow morning after spending the night on 10.2 psi, the A/L hatch will be closed again for EVA preps in 10.2 psi, followed by EMU purge and prebreathe in the EMUs. Afterwards, with CL depressurization and EV1/EV2 egress, EVA-1 nominally begins at ~9:40am EST. Frick & Poindexter will support the spacewalk as IV (Intravehicular) crewmembers, keeping tabs with the detailed activity steps and crib sheet.

Unberthing and transfer of the COL Module to its Node-2 CBM (Common Berthing Mechanism) by Dan Tani, Leo Eyharts and Leland Melvin will begin tomorrow at ~2:10pm.

No CEO photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:

<http://earthobservatory.nasa.gov/>

<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*):

- 02/11 (FD 05) -- EVA-1 to install PDGF (Power & Data Grapple Fixture) on Columbus (COL) Module, to unberth and install COL on starboard side of Node-2, and to prepare the P1 Truss NTA (Nitrogen Tank Assembly) for repair and replacement;
- 02/12 (FD 06) -- More FI (Focused Inspection) if required; prepare for and perform COL Module ingress;
- 02/13 (FD 07) -- Perform COL Module outfitting; EVA-2 to remove failed NTA from

P1 truss and to install a new NTA;

- 02/14 (FD 08) -- Continue COL Module outfitting; crew off-duty period;
- 02/15 (FD 09) -- EVA-3 to transfer the SOLAR (Solar Monitoring Observatory) and the EuTEF (European Technology Exposure Facility) to the COL Module external payload facility, and to retrieve a failed CMG (Control Moment Gyro) and stow for return;
- 02/16 (FD 10) -- Cargo transfers; close hatches in preparation for undocking;
- 02/17 (FD 11) -- Undock from ISS; perform final OBSS berthing;
- 02/18 (FD 12) -- Stow cabin; checkout Shuttle flight control systems;
- 02/19 (FD 13) -- Prepare for and perform deorbit burn; land at KSC (Nominal Landing) ~9:59am EST.

03/07/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana); docking early April

03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch

04/10/08 -- Soyuz TMA-12/16S docking (DC1)

04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)

04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

04/24/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS

04/26/08 -- STS-124/Discovery/1J docking

05/04/08 -- STS-124/Discovery/1J undocking

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

08/07/08(NET) -- ATV-1 undocking (from SM aft port)

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)

09/18/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC

09/20/08 -- STS-126/Discovery/ULF2 docking

10/01/08 -- STS-126/Discovery/ULF2 undocking.

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)

11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment

11/08/08 -- STS-119/Discovery/15A docking

11/17/08 -- STS-119/Discovery/15A undocking

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-67/32P launch

11/28/08 -- Progress M-67/32P docking (SM aft port)

04/15/09 -- **Constellation's Ares I-X Launch**

05/??/09 -- **Six-person crew on ISS** (following Soyuz 18S-2 docking)

04/??/10 -- STS-132/Discovery/20A – Node-3 + Cupola.

ISS On-Orbit Status 02/09/08

All ISS systems continue to function nominally, except those noted previously or below.
Saturday – Docking Day. *Happy Birthday, Peggy Whitson!*

STS-122/Atlantis docked smoothly at the PMA-2 (Pressurized Mating Adapter-2) port at 12:17pm EST, eight minutes ahead of time, after successfully completing the RPM (R-Bar Pitch Maneuver) at 11:32am. The station now hosts ten occupants again as Mission 1E is underway. *[The combined crew is comprised of ISS CDR Peggy Whitson, FE-1 Yuri Malenchenko, FE-2 Dan Tani, STS CDR Steve Frick, PLT Alan Poindexter, MS1 Leland Melvin, MS2 Rex Walheim, MS3 Hans Schlegel, MS4 Stanley Love, and MS5 Léopold Eyharts who replaces Dan Tani as FE-2, while the latter returns on the Atlantis as MS-5.]*

Hook closure to rigidize the Shuttle-ISS linkup was at 12:43pm. After the docking, the station was reoriented as planned to minimize the risk of micrometeoroid/debris impacts upon the Shuttle (-x-axis in velocity vector, +z-axis in local vertical).

Hatches were open at 1:40pm, and the new crew was welcomed aboard the ISS and given the mandatory 25-min. safety briefing. Later, EVA/EMU equipment was transferred from the Shuttle to the ISS Airlock (A/L) as the SRMS (Shuttle Remote Manipulator System) handed over the grappled OBSS (Orbiter Boom Sensor System) to the ISS SSRMS (Space Station RMS) which then was “parked” overnight, whereas the SRMS maneuvered to Columbus Module (COL) viewing position.

In a last-moment timeline modification, EVA-1, originally scheduled for tomorrow and preceded by the regular Campout tonight, was postponed by one day and will now be conducted on Monday, 2/11, by Rex Walheim and Stan Love, who replaces Hans Schlegel. Ground teams are currently replanning FD4 (Flight Day 4) according to the mission priorities, and the Shuttle has initiated measures to protect cryo prop margin so that additional docked days can be added to the mission.

Due to the EVA-1 delay, the crew was able to complete several get-aheads from tomorrow’s plan, including: the Node-2/PMA-2 axial VBA (Vestibule Barrier Assembly) installation and Leo Eyharts’ IELK (Individual Equipment Liner Kit) installation in Soyuz 15S. Eyharts’ Sokol suit checkout is still scheduled for tomorrow. Dan Tani’s IELK was

uninstalled and was temporary stowed for return on a future flight.

Wakeup time for the ISS crew had shifted once more this morning, to 4:45am EST, for a long day (sleep time tonight: 8:45pm).

Preparatory to the Shuttle arrival, FE-2 Tani closed the Lab science window shutter as protection against thruster plumes. *[The window shutter must remain closed when Shuttle is within 3000 ft/915m of the ISS. It may be opened for no more than 15 minutes for photo documentation if the Shuttle is in Freedrift.]*

After wakeup and before breakfast, FE-2 Dan Tani completed his daily access of the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop for downlink. *[To monitor the crewmember's sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

For her second session with the ESA/Russian biomed experiment "IMMUNO", Peggy Whitson set up the IMMUNO urine collection hardware and took air samples with the IPD-NH₃ Draeger tubes sampler, testing for ammonia (NH₃) in the SM, then started the experiment. *[IMMUNO (Integrated Immune Assessment) is a 24-hr. test of human immune system changes, with the objective to investigate immune neuro-endocrine reactions in the space environment by studying samples of saliva, blood and urine using collection kits and the biomedical (MBI) protection kit, to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects. The saliva is collected in two forms, dry and liquid. The dry samples are collected at intervals during the collection day using a specialized book that contains filter paper. The liquid saliva collections require that the crewmember soak a piece of cotton inside their mouth and place it in a salivette bag; there are four of the liquid collections during docked operations. The on-orbit blood samples are collected right before undocking and returned on the Shuttle so that analysis can occur with 48 hours of the sampling. This allows assays that quantify the function of different types white blood cells and other active components of the immune system. Samples are secured in the MELFI (Minus-Eighty Laboratory Freezer for ISS). Also included are entries in a fluid/medications intact log, and a stress-test questionnaire to be filled out by the subject at begin and end. Urine is collected during a 24-hour period, conventionally divided into two twelve-hour phases: morning-evening and evening-morning.]*

Before the docking, CDR Whitson worked on the Node-2 O₂ (oxygen) supply line, purging it with N₂ (nitrogen) and configuring it to allow Shuttle to supply O₂ to the ISS PBAs (Portable Breathing Apparatus) in support of pre-EVA mask prebreathe for denitrogenation.

Also before the actual docking, FE-1 Malenchenko performed final STTS communications configuration checks for the docking. After the docking, Yuri switched USOS/RS (US Segment/Russian Segment) comm systems to their mated-flight mode.

Shortly before the docking, the crew configured the Russian MCS (Motion Control System) for the automatic "PMA-2 Arrival" mode, an operational sequence used to monitor Orbiter arrival at the PMA-2. *[At "Capture Confirmed", ISS attitude was immediately set to "free drift" to allow dampening out relative motions of ISS and Discovery (with the ODS dampers/shock absorbers), then maneuvered to "Mated TEA" (Torque Equilibrium Attitude) to account for the new overall configuration with Discovery docked.]*

Docking took place at 12:17pm. After leak checks of the ODS (Orbiter Docking System) vestibule for about an hour, hatches were opened at 1:40pm, with the traditional ship's bell ringing. Hand shakes and hugs between the crews came 15 minutes later.

Before and during ISS/STS hatch opening, Yuri Malenchenko performed the standard collection of air samples with the Russian AK-1M sampler in the SM, FGB, Lab, and then also in the Orbiter.

Prior to the start of docked mission activities, CDR Whitson took care of the transfer of joint mission books from the Shuttle over to ISS. *[The new books, contained in a Ziploc bag and CTB (Crew Transfer Bag), include the SODF (Station Operations Data Files) procedures for the docked mission and emergency situations.]*

The FE-1 took air samples for the periodic (currently daily) atmospheric status check for ppO₂ (Partial Pressure Oxygen), using the hand-held CSA-O₂ (Compound Specific Analyzer-Oxygen) sensors that were readjusted on 1/22. Batteries were to be replaced if necessary. *[CSA-O₂s #1041 & #1052 were to be activated (if not already on) for taking readings in the Lab. Afterwards, both units were to be turned off and returned to their stowage. Purpose of the ~25-min activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements, prior to US EVA-14 scheduled for next Wednesday. Daily CSA- O₂ readings will be compared to the MCA to ensure the hardware is operating to a known calibrated device. Two CSA- O₂s are required to support the Airlock campout for the upcoming 1E EVA-1.]*

CDR Whitson and Shuttle PLT Poindexter filled CWCs (Contingency Water Containers) and transferred them to the ISS.

Whitson and Poindexter also configured the BPSMU (Battery Powered Speaker Microphone Unit) by installing the ISS- and Shuttle-side string of cables with a dragthrough QD (quick disconnect).

The FE-1 worked on the Elektron O₂ generator system, installing a new Progress-delivered electronic interference filter, designed to prevent RFI (radio-frequency interference) with

the ATV/Automated Transfer Vehicle. *[On 12/21/07, when Yuri assisted the ground in activation the Elektron in the standard 32 amp mode, the system came on in 11 amps mode. A recently (11/27) installed electronic interference filter (FPP) felt hot to Yuri's touch, who, on ground advice, turned off the Elektron, removed the filter and reconnected the cables. The electrolysis machine was successfully reactivated in 32 amp mode and was then operating nominally at 24 amps.]*

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Yuri transferred the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working from his discretionary "time permitting" task list, the FE-1 also performed the periodic collection & deletion of readings on the MOSFET (metal oxide semiconductor field-effect transistor) radiation sensor reader/display of the RBO-3-2 Matryoshka-R anthropomorphic (human torso) "phantoms" located inside the station for sophisticated radiation studies, collecting radiation measurements every 15 minutes around the clock.

At ~7:05am, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

Weekly Science Update (Expedition Sixteen -- Week 16)

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): Radiation measurements continue to be performed in the PIRS module..

ANITA: Completed.

BCAT-3 (Binary Colloidal Alloy Test 3): Dan Tani ran Sample 5 for BCAT-3 using a custom set up of his own design. "We got some really good data with this and we're seeing structure in Sample 5, which we didn't know was possible. Very nice. Thank you. The BCAT-3 samples have now been stowed and we are looking forward to getting the DVDs of the data. And thanks for the pictures of the BCAT-3 set up showing Dan working with it. This really helps us when we share with the world why we're excited about this work". BCAT-4 will be coming up on 1JA.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): "Dan, currently you are scheduled to repeat the last CCISS session the day after 1E's launch, on Feb 8,9,10. We look forward to seeing the CCISS data. Thanks for participating!"

CFE (Capillary Flow Experiment): Reserve.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): In progress.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): In progress.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Blood and urine samples of first session for Malenchenko are stored in MELFI.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): Peggy completed three runs starting the extra, extra science; runs 25, 26 and 27 for those keeping score at home. "While the runs may seem old hat as Peggy can almost perform them from the bike, they are providing new and useful data each time. The PI is anxious to receive the flight tapes to begin detailed analysis, and looking forward to the crew conference. InSPACE-2 remains grateful to Peggy for sharing her time with us".

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): "Thanks for operating LOCAD on Sunday, 2/3. Again, you chose some great sites and provided a quick general survey of endotoxin in the airlock. As expected, it was mostly free of endotoxin, apart from the hatch handle, which perhaps receives frequent handling. The results are a first step toward developing methods to monitor and restrict biological contamination associated with surface EVA during exploration missions. Thanks for all your hard work with LOCAD!"

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: MULTIGEN-1 samples will be downloaded on STS-122 (1E).

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION/REPOSITORY: “Peggy, thanks for your continued attention to detail in completing the FD120 Nutr/Rep session. The information conveyed via crew notes proves to be very helpful for planning purposes. Only one session remains (FD180). Dan, thank you for your continued attention to detail in completing your FD120 Repository session. We appreciate your participation!”.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): “Peggy, you continue to be an excellent SLEEP subject and the PI appreciates all your extra logging. Dan, thanks for any SLEEP Logging.”

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): In progress.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: In progress.

CEO (Crew Earth Observation): Ongoing.

No **CEO** photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:

<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);

<http://earthobservatory.nasa.gov/>

<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*):

03/07/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana); docking early April

03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch

04/10/08 -- Soyuz TMA-12/16S docking (DC1)

04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS
04/26/08 -- STS-124/Discovery/1J docking
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
08/07/08(NET) -- ATV-1 undocking (from SM aft port)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
09/18/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
09/20/08 -- STS-126/Discovery/ULF2 docking
10/01/08 -- STS-126/Discovery/ULF2 undocking.
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment
11/08/08 -- STS-119/Discovery/15A docking
11/17/08 -- STS-119/Discovery/15A undocking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
04/15/09 -- **Constellation’s Ares I-X Launch**
05/??/09 -- **Six-person crew on ISS** (following Soyuz 18S-2 docking)
04/??/10 -- STS-132/Discovery/20A – Node-3 + Cupola.

ISS On-Orbit Status 02/08/08

All ISS systems continue to function nominally, except those noted previously or below. *Dan Tani's 109th day in space.*

The crew's work/sleep cycle was shifted once more in preparation for Atlantis 1E arrival, to **5:00am-8:15pm**.

STS-122/Atlantis continues its catch-up flight for tomorrow's FD3 ISS docking at ~12:25pm EDT, to begin ISS Stage 1E. (Catch-up rate ~480 nmi. per revolution of ~92 min.). *[Hatch opening: expected at ~1:35pm, followed by: Safety Briefing, OBSS (Orbiter Boom Sensor System) handoff from SSRMS (Space Station Remote Manipulator System) to SRMS (Shuttle RMS) at ~4:30pm, Soyuz seat liner transfer (for the Tani/Anderson exchange), and preparations for the first spacewalk, EVA-1, by EV1 Walheim & EV2 Schlegel, on 2/10, preceded by their overnight Campout tomorrow night in the Airlock (A/L) for denitrogenation/pre-breathe. Objectives of the nominal 11-day mission: Delivering & installing the Columbus module, delivering new ISS-16 crewmember Léopold Eyharts & bringing Dan Tani back home, and conducting a total of three EVAs. Landing will nominally take place at KSC on FD10 (2/18) at ~9:59am EST.]*

After wakeup and before breakfast, FE-2 Dan Tani completed his daily access of the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop for downlink. *[To monitor the crewmember's sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

The FE-2 worked on recharging a total of 8 batteries for two DCS digital still

cameras in two batches of four simultaneously for the two DCS-760 digital cameras, to be used for the Orbiter RPM (R-bar Pitch Maneuver) photo shoot tomorrow. *[Rbar = along the radius vector of the ISS, downward. During the RPM at ~600 ft from the station, the ISS crew will have only ~90 seconds for taking high-resolution digital photographs, using the 400mm & 800mm telephoto lenses, of all tile areas and door seals on the Atlantis from SM windows 6 & 8, to be downlinked for launch debris assessment. Thus, time available for the shooting will be very limited, requiring great coordination between the two headset-equipped photographers and the Shuttle.]*

Also for the upcoming high-pressure RPM P/TV (Photo/Video) activity, Tani worked throughout the day on formatting the necessary P/TV storage devices. *[Formatted, in a Kodak DCS 760 camera on station power, were five 1GB EVA Flash Cards plus three PCMCIA 1GB Microdrives, each one taking ~20 minutes. Afterwards, the reformatted cards and microdrives were transferred to the SM (Service Module) for the DCS 760 camera configuration to get ready for the RPM documentation.]*

Working in the newly arrived 28P cargo ship (TKG), Yuri Malenchenko installed the LKT local temperature sensor commutator (TA251MB) of the BITS2-12 onboard telemetry measurement system, along with its ROM unit (read-only memory, TA765B), a 1-hr. job. The LKT was subsequently switched on by the ground to complete the basic configuration. Yuri then completed the electronic integration of 28P into the ISS by installing the standard US-21 matching unit, another 1-hr. task. Afterwards, the Progress thrusters were testfired to insure their functionality in providing attitude control for ISS. These tests were successful and 28P is now incorporated into the steering logic for the ISS. *[The US-21 matching unit connects the SM with the Progress motion control and DPO thrusters systems, so that they can be commanded by the SM computer system (BVS). After bolting the box down, Yuri hooked up its the telemetry (TM) connector to the BITS2-12 onboard TM system on Go from TsUP, after Moscow had inhibited data output to the VD-SU control system mode, powered off the BITS and deactivated the SKV-1 air conditioner. These systems were subsequently turned back on. The dynamic thruster test of the installation was successful.]*

FE-2 Tani completed his third (and last) on-orbit session with the CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS) experiment, with Peggy Whitson acting as operator, by setting up and donning the Holter Monitor, donning the CBPD (Continuous Blood Pressure Device), performing the Baro Study, doffing the CBPD, and starting the 24-hr passive heart rate data collection. Data are recorded on a PCMCIA memory card, with the HRF (Human Research Facility) rack laptop for control. Data download and equipment stowage is scheduled tomorrow after the 24-hr period. *[CCISS studies the effects of long-duration spaceflight on crewmembers' heart functions and their blood vessels that*

supply the brain (=“cerebrovascular”). Learning more about the changes in cardiovascular & cerebrovascular systems in zero-G could lead to specific countermeasures that might better protect future space travelers. For the Baro study of CCIS, heart rate and blood pressure are being recorded for resting and timed breathing for 5 min, with no caffeine or food (water is acceptable) allowed two hours before the start of the Baro Study and no exercise prior to the Baro Study.]

Malenchenko had about 30 minutes set aside for maintenance/servicing of the toilet facility (ASU), changing out replaceable ASU parts with new components, e.g. a receptacle (MP) and a filter insert (F-V). All old parts were discarded as trash.

The FE-1 also prepared equipment for the upcoming installation of a new electronic interference filter in the Elektron O₂ generator system, designed to prevent RFI (radio-frequency interference) with the ATV/Automated Transfer Vehicle. *[On 12/21/07, when Yuri assisted the ground in activation the Elektron in the standard 32 amp mode, the system came on in 11 amps mode. A recently (11/27) installed electronic interference filter (FPP) felt hot to Yuri's touch, who, on ground advice, turned off the Elektron, removed the filter and reconnected the cables. The electrolysis machine was successfully reactivated in 32 amp mode and was then operating nominally at 24 amps.]*

FE-2 Tani set up the latest software version of the DOUG (Dynamic Onboard Ubiquitous Graphics) application, intended for the upcoming Columbus transfer and 10A spacewalks.. *[DOUG is a special application running on the MSS (Mobile Service System) RWS laptops that provides a graphical birdseye-view image of the external station configuration and the SSRMS arm, showing its real-time location and configuration on a laptop during its operation.]*

Also in support of 1E, CDR Peggy Whitson –

- Installed the ISS-side string of the BPSMU (Battery Powered Speaker Microphone Unit) *[after Shuttle docking, cables connected to the Shuttle-half of the dragthrough QD (quick disconnect) will be installed by the Shuttle crew],*
- Performed the pressurization process on the PMA-2 (Pressurized Mating Adapter #2), followed by leak checking and additional preparations of the PMA for the Shuttle's arrival *[the pressurization equipment was left connected for the post-docking leak checks],*
- Powered on the Cupola RWS (Robotic Work Station) and Airlock (A/L) A31p laptops in preparation for their support of the 1E docked mission, and.
- Configured & connected the bypass cables of the VDS VTR (Video Distribution System/Video Tape Recorder) for passing video to and from the station on the Lab's starboard side and allowing the station to receive video

from the Orbiter on the Lab's port side.

FE-1 Malenchenko meanwhile powered down the VOA (Volatile Organics Analyzer).

The regular installation of the IWIS (Internal Wireless Instrumentation System) hardware for measuring and recording structural dynamics during docking was completed by Whitson.

In the Lab, the CDR connected the regular ITCS LTL (Internal Thermal Control System/Low Temperature Loop) coolant jumper at the LAB1D6 rack in support of ground-commanded activation of the U.S. CDRA (Carbon Dioxide Removal Assembly). *[A PPL (Pre-Positioned Load) was uplinked earlier today to mask a faulty temperature sensor ("A") that was causing the CDRA to deactivate earlier in the week. The CDRA was then reactivated and went into operate nominally.]*

Peggy also conducted the periodic coolant sample collection from the Node-2 ITCS (Internal Thermal Control System) MTL & LTL (Medium & Low Temperature Loops), as well as from the PhosRA (Phosphate Removal Assembly).

Regular surface sampling was conducted by Peggy for the SWAB (Characterization of Microorganisms & Allergens in Spacecraft) experiment.

Afterwards, Whitson performed the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling CWC (Contingency Water Container) #1062 with the collected water slated for processing, and putting aside two water samples in bags (1 sample bag, 1 purge bag) for return to Earth. *[Estimated offload time before termination (leaving ~6 kg in the tank): ~40 min.]*

In Node 2, the FE-2 installed a J01 camcorder cap on the S3 viewport (camcorder port 1).

Tani finished disassembly and packing of the BCAT-3 (Binary Colloidal Alloy Test-3) science payload which had run by itself in Node-2 since 12/13/07 (briefly interrupted for EVA-13 and EVA-14 photo support). *[The experiments was supported by Dan with periodic status checks, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. The SSC (Station Support Computer) was taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour.]*

With the Elektron-VM O₂ (oxygen) generator currently off, a cabin air refresh was performed by the FE-1 from Progress 27P storage (SrPK) as required.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Yuri then transferred the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working off his discretionary "time permitting" task list, Yuri conducted the daily monitoring, picture-taking and downloading on the newly set up BIO-5 Rasteniya-2 ("Plants-2") experiment. *[Rasteniya-2, researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. During the duration of the BI O-5 experiment, students of the Moscow City Palace for Youth Creativity of the Meshchansky inter-regional center #15 in Moscow) and the Prince of Oldenburg Lyceum in St. Petersburg will be cultivating plants in parallel on the ground and conducting comparative observation of plant growth and development under gravity and zero-gravity conditions. They are receiving the photo images taken by Yuri.]*

At ~7:05am, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~7:35am EST, Peggy Whitson and Dan Tani supported two PAO TV interviews of 6 minutes each, one with CBS News, the other with MSNBC News.

AT ~9:20am, Yuri Malenchenko supported an interview with a correspondent of Rossiysky Kosmos Magazine, Moscow. *["Could you summarize what you have been able to accomplish to date and what your plans are for the future?"; "What did the new cargo vehicle bring to the station?"; "What are the main objectives of the joint ISS/STS-122 flight?"]*

At ~2:05pm, the crew had their ninth weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. *[S/G-2 (Space-to-Ground 2) phone patch via SSC-10 (Station Support Computer 10)].*

At ~7:00pm, Rex Walheim (EV1) and Hans Schlegel (EV2) will begin their

“campout” in the A/L with hatch closure and depressurization of the CL (Crewlock) from 14.7 to 10.2 psi, followed by mask prebreathe. Sleep time for the ISS crew begins at 8:15pm. *[For the Campout, fresh METOX (Metal Oxide) canisters are installed in the A/L for CO₂ control.]*

Significant Events Ahead *(all dates Eastern Standard, some changes possible.):*

- 02/09/08 – STS-122/Atlantis/1E docking (~12:25pm EST)
- 02/10 (FD 04) -- EVA-1 to install PDGF (Power & Data Grapple Fixture) on Columbus module, to unberth and install Columbus module on starboard side of Node-2, and to prepare the P1 Truss NTA (Nitrogen Tank Assembly) for repair and replacement;
- 02/11 (FD 05) -- Focused Inspection (if required); prepare for and perform Columbus module ingress;
- 02/12 (FD 06) -- Perform Columbus module outfitting; EVA-2 to remove failed NTA from P1 truss and to install a new NTA;
- 02/13 (FD 07) -- Continue Columbus module outfitting; crew off-duty period;
- 02/14 (FD 08) -- EVA-3 to transfer the SOLAR (Solar Monitoring Observatory) and the EuTEF (European Technology Exposure Facility) to the Columbus module external payload facility, and to retrieve a failed CMG (Control Moment Gyro) and stow for return;
- 02/15 (FD 09) -- Cargo transfers; close hatches in preparation for undocking;
- 02/16 (FD 10) -- Undock from ISS; perform final OBSS berthing;
- 02/17 (FD 11) -- Stow cabin; checkout Shuttle flight control systems;
- 02/18 (FD 12) -- Prepare for and perform deorbit burn; land at KSC (Nominal Landing) ~9:59am EST.

03/07/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana); docking early April

03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch

04/10/08 -- Soyuz TMA-12/16S docking (DC1)

04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)

04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS

04/26/08 -- STS-124/Discovery/1J docking

05/04/08 -- STS-124/Discovery/1J undocking

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

08/07/08(NET) -- ATV-1 undocking (from SM aft port)

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
09/18/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
09/20/08 -- STS-126/Discovery/ULF2 docking
10/01/08 -- STS-126/Discovery/ULF2 undocking.
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment
11/08/08 -- STS-119/Discovery/15A docking
11/17/08 -- STS-119/Discovery/15A undocking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
04/15/09 -- **Constellation's Ares I-X Launch**
05/??/09 -- **Six-person crew on ISS** (following Soyuz 18S-2 docking)
04/??/10 -- STS-132/Discovery/20A – Node-3 + Cupola.

ISS On-Orbit Status 02/07/08

All ISS systems continue to function nominally, except those noted previously or below.

The crew's work/sleep cycle was shifted preparatory to Atlantis 1E arrival to **3:30am-8:30pm**.

Yest kasaniye! Progress M-63 (28P), approaching from below the station, docked flawlessly at the DC1 Docking Compartment nadir port at 9:38am EST, followed by docking probe retraction and hook closure ("sborka") after motion damp-out, while the ISS was in LVLH (local vertical/local horizontal) attitude. All Progress systems operated nominally from Automated Rendezvous start. *[Launched on 2/5 (8:02am EST), the 28P resupply drone delivered about 2.5 tons of cargo for the ISS crews, including propellants for the Russian thrusters, fresh water, oxygen, food, spare parts, repair gear, life support and science experiment hardware.]*

STS-122/Atlantis lifted off flawlessly right on time at 2:45pm EST on Mission ISS-1E with all systems performing nominally. The Orbiter will dock to the ISS on 2/9 (Saturday) at approximately 12:24pm EST and is currently catching up with the ISS, carrying the seven-member crew of Commander Stephen Frick, Pilot Alan Poindexter and Mission Specialists Hans Schlegel, Leland Melvin, Léopold Eyharts, Stanley Love and Rex Walheim. STS-120 is the 121st space shuttle flight, the 29th flight for the Atlantis, and the 24th flight to the station. Its primary payload is the European Columbus module. **We are off to another great mission!**

After wakeup and before breakfast, FE-2 Dan Tani completed his daily access of the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop for downlink. *[To monitor the crewmember's sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his*

patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]

Also upon wake-up, CDR Whitson started Part 2 (of 5) of the periodic acoustic measurement protocol by recording post-sleep data of the crew-worn acoustic dosimeters, later deploying the dosimeters statically in the Service Module (SM) (Panel 404 near SM air conditioner, SM Central Post, & Vozdukh) for the duration of the day. *[Acoustic data must be taken twice per Increment, each time for the duration of the 16-hour crew workday.]*

At ~5:55am, the FE-2 again activated the VDS MPC (Video Distribution System/ Multi-Purpose Converter) with its four downlinks to allow the ground to conduct HDTV (high-definition TV) playback and downlink operations. Later (~2:10pm), the MPC was powered off again. *[The end-to-end test of the system, conducted by the crew and ground specialists on 1/17 to verify the MPC HDTV (Multi-Purpose Converter/High-Definition TV) capability all the way to the NASA TV satellite, was very successful, yielding an overall end-to-end audio latency (delay) for the MPC System of 3.2 seconds. This is the delay from the crewmember to JSC/MCC-H to NASA Headquarters and out to the NASA TV satellite in high definition (including, but are not limited to, CNNHD, ABC, NBC, CBS, and Discovery HD Theater), i.e. the sum total of the audio delay the interviewer and interviewee will "feel" during an interactive event. This Japan/JAXA originated system will be utilized soon for downlink messages and in-flight interviews based on client capability.]*

The crew monitored the 28P docking and recorded it with the HD (High Definition) video camera and then downlinked the video to the ground for viewing.

Earlier today, FE-1 Malenchenko and CDR Whitson had completed final preparations for Progress arrival, including turning off amateur (ham) radio equipment in the ISS to prevent any interference with Progress/KURS radio traffic, and activation of the SSC6 (Station Support Computer 6) A31p laptop in the FGB for handling the video transmission from the Russian segment (RS) via the Ku-band assets in the USOS. *[The A31p used for the routing from the SM is located in the FGB since available cables are not long enough to extend to the Node. The video signal is fed from there via coaxial cable to the SSC Operations LAN (local area network) and from there into the Ku-band system for subsequent conversion from the Russian SECAM format to the American NTSC format on the ground. The newly set up VSW (Video Streaming Workstation) failed to convert and/or downlink analog video of the docking to MCC-Houston and thence to TsUP-Moscow. A second video stream, a digital MPEG (Moving Pictures Expert Group 2) transmission originating in the RS by the Russian/ESA encoder, passed without problem via the ISS JSL (Joint Station LAN) through Ku-band to both MCCs.]*

Malenchenko and Whitson then monitored the docking process from the TORU (teleoperated approach & docking system) station in the SM, in "hot standby" mode, and took photography of the Progress approach and linkup. *[Yesterday, it was reported here that one of the two VHF receivers of the TORU system has failed aboard the Service Module (SM). This was in error since the failed VHF receiver is on the Progress, not on the SM.]*

After the docking, the crew shut off TORU and began reconfiguring the STTS telephone/telegraph subsystem to normal ops. *[The "Voskhod-M" STTS enables telephone communications between the SM, FGB, DC1 and U.S. segment (USOS), and also with users on the ground over VHF channels selected by an operator at an SM comm panel, via STTS antennas on the SM's outside. There are six comm panels in the SM with pushbuttons for accessing any of three audio channels, plus an intercom channel. Other modes of the STTS include telegraphy (teletype), EVA voice, emergency alarms, Packet/Email, and TORU docking support.]*

The FE-1 then conducted the standard one-hour leak checks of the docking vestibule and fuel/oxidizer transfer line interface between Progress and DC1. During leak checking and initial clamp installation, Russian thrusters were inhibited (as they were during docking).

The new Progress provided the ISS cabin with a 12.2 mmHg air repress. This repress sets the initial ISS pressure profile for the 1E mission.

After opening the two hatches, Yuri and Peggy first installed the QD (quick disconnect) screw clamps (BZV) of the docking & internal transfer mechanism (SSVP) to rigidize the coupling, and the FE-1 removed the PkhO/DC1 (SU) hatch cover, reinstalled the IP-1 airflow sensor and assembled the ventilation/heating air duct. The crew obtained a photo of a mark left on the passive mechanism receiving cone by the active docking mechanism probe and downlinked the data.

Next, Malenchenko performed the standard air sampling inside the Progress with the Russian AK-1M air sampler, then deactivated the cargo ship.

Peggy and Yuri then began Progress unloading and cargo transfer to the ISS, accompanied by IMS (Inventory Management System) logging.

Tani performed his daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13/07 (briefly interrupted for EVA-13 and EVA-14 photo support). Later, Dan was instructed by POC (Payload Operations Center) to disassemble and stow the BCAT-3 payload. *[The status check, conducted on the last image taken by the DCS 760 digital still camera which*

is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour.]

On the RED resistive exerciser, Dan Tani completed the periodic cable replacement with spare cables that arrived today on 28P. The replacement was followed by a calibration procedure that is required to allow the ASCRs (Astronaut Strength, Conditioning, & Rehabilitation Specialists) to update crew exercise protocols as necessary and track RED hardware status.

In the FGB, Malenchenko replaced the OSP-4 fire extinguisher with a new spare.

The CDR conducted the weekly 10-min. CWC audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. *[Updated "cue cards" based on the crew's water calldowns are sent up every other week (currently #16-0018Q).]*

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exercise device (CDR), and VELO bike with bungee cord load trainer (FE-1).

Whitson then transferred the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Significant Events Ahead *(all dates Eastern Standard, some changes possible.):*

03/07/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana)
03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS
04/26/08 -- STS-124/Discovery/1J docking
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
08/07/08(NET) -- ATV-1 undocking (from SM aft port)
08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
09/18/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
09/20/08 -- STS-126/Discovery/ULF2 docking
10/01/08 -- STS-126/Discovery/ULF2 undocking.
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment
11/08/08 -- STS-119/Discovery/15A docking
11/17/08 -- STS-119/Discovery/15A undocking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
04/15/09 -- **Constellation's Ares I-X Launch**
05/??/09 -- **Six-person crew on ISS** (following Soyuz 18S-2 docking)
04/??/10 -- STS-132/Discovery/20A – Node-3 + Cupola.

ISS On-Orbit Status 02/06/08

All ISS systems continue to function nominally, except those noted previously or below.

Progress M-63/28P is continuing its 3-day flight to the ISS for docking tomorrow morning (2/7) at ~9:38am EST at the DC1 nadir port.

After wakeup and before breakfast, FE-2 Dan Tani completed his daily access of the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop for downlink. *[To monitor the crewmember's sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

Before breakfast, CDR Whitson began Part 1 (of 5) of the periodic acoustic measurement protocol by deploying crew-worn acoustic dosimeters, to be carried for 24 hours (with a microphone on the shirt collar). (Last time done: 12/26). *[Tonight, after about 15 hours of measurements, dosimeter data will be downloaded and the hardware power-cycled for another data take starting tonight after 8.5-hr. sleep. At that point, the crew will deploy the dosimeters statically in the station for the duration of the day, record measurements tomorrow noon and stow the instruments. Acoustic data must be taken twice per Increment, each time for the duration of the 16-hour crew workday.]*

Before breakfast and exercise, FE-1 Malenchenko completed his second session with the periodic Russian MedOps test "Hematokrit" (MO-10), measuring red cell count of the blood. *[The blood samples were drawn from a finger with a perforator lancet, then centrifuged in two microcapillary tubes in the M-1100 kit's minicentrifuge, and its hematocrit value was read off the tubes with a magnifying*

glass. It is a well-known phenomenon of space flight that red blood cell count (normal range: 30-45%) tends to go down over time. After the exam, the data were saved in the IFEP software (In-Flight Examination Program) on the MEC (Medical Equipment Computer), and Oleg Kotov stowed the equipment.]

Also upon wakeup, Malenchenko terminated his ninth MBI-12 SONOKARD experiment session, started last night, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

All three crewmembers participated in the periodic training exercise for emergency response to fire on-board the ISS. Today the emergency simulation was a burning odor in Node-1. A conference between the crew and ground specialists was held after the simulation to assess the training exercise.

CDR Whitson and FE-1 Yuri Malenchenko conducted a TV downlink test via Ku-band. The purpose of this test was to convert the Russian video signal into an NTSC (National Television Standards Committee) video signal for downlink via Ku-Band, as well as MPEG-2 (Motion Picture Expert Group 2) streaming video via OpsLAN (Operations Local Area Network). This procedure can be used during Soyuz, Progress, and Automated Transfer Vehicle (ATV) dockings or Russian-based Extravehicular Activities (EVAs). The test was nominal.

Whitson and FE-2 Dan Tani worked in the U.S. Airlock (A/L), successfully completing numerous EVA hardware configuration activities. *[Peggy and Dan reconfigured EMU 3018 for use by Stan Love during Flight 1E and configured EMUs 3006 and 3008 for Flight 1J/A. Tani also gathered US EVA tools, reprogrammed PGTs (Pistol Grip Tools), and checked out two SAFER (Simplified Aid for EVA Rescue) units. These activities were all in support of Flight 1E. In addition to EMU resizing, the CDR initiated an EMU battery discharge cycle to completely discharge EMU battery 2041. Completely discharging this battery will maximize its effectiveness in supporting EVAs during Flight 1J/A.]*

Using the vacuum cleaner and other tools, the FE-2 performed the periodic 80-min US segment (USOS) hatch seal inspection (Node-1 forward, aft & starboard, Lab aft & forward, Node-2 aft, and Joint Airlock) in support of ACS (Atmospheric Control

System) maintenance (last time done: 11/17).

Continuing his support of the NUTRITION experiment, Dan Tani collected urine samples for the Repository payload. *[Repository utilizes a storage bank to maintain biological specimens over extended periods of time and under well-controlled conditions. Samples from ISS crewmembers, which include blood and urine, are collected, processed, and archived during the preflight, inflight, and postflight phases of ISS missions. These biosamples will serve as a resource for future spaceflight-related medical research.]*

CDR Whitson completed T+2 in-flight microbiology analysis of water samples she collected in MCDs (Microbial Capture Devices) on 2/4. *[The water samples were taken from the SM SRV-K (Service Module/Condensate Water Processor) Hot and Warm water taps. Some of the samples taken on 2/4 will return on Flight 1E for ground analysis.]*

Last night, when TsUP-Moscow performed a TORU system test on the SM, it failed, showing zero output voltage on the primary VHF receiver. During the next ground pass (Daily Orbit 4), when the output voltage was still 0 on the primary VHF receiver, Moscow switched to the backup VHF receiver, on which it was nominal.

The TORU system test was nominal on the backup VHF receiver. *[TORU is still available for docking, but now zero-fault tolerant. Per Flight Rules D2-8 para. D, D2-10 para. B.2 docking is still possible since the Kurs system is available. Since TORU is a backup to KURS and is only used if the crew needs to perform manual docking, Progress 28P is still GO for docking tomorrow morning at ~9:38am EST.]*

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Whitson then transferred the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Significant Events Ahead *(all dates Eastern Standard, some changes possible.):*

02/07/08 -- Progress M-63/28P docking (9:38am) at DC1 nadir port

02/07/08 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite. ~2:40pm EST

02/09/08 -- Progress M-

02/22/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana)

03/06/08 -- ATV-1 Demo Day 1

03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS
 03/12/08 -- ATV-1 Demo Day 2
 03/15/08 -- ATV-1 Demo Day 3 & Docking (SM aft port)
 04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
 04/08/08 -- Soyuz TMA-12/16S launch
 04/10/08 -- Soyuz TMA-12/16S docking (DC1)
 04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
 04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
 04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS
 04/26/08 -- STS-124/Discovery/1J docking
 05/04/08 -- STS-124/Discovery/1J undocking
 05/14/08 -- Progress M-64/29P launch
 05/16/08 -- Progress M-64/29P docking (DC1)
 08/07/08(NET) -- ATV-1 undocking (from SM aft port)
 08/12/08 -- Progress M-65/30P launch
 08/14/08 -- Progress M-65/30P docking (SM aft port)
 09/09/08 -- Progress M-64/29P undocking (from DC1)

ISS On-Orbit Status 02/05/08

All ISS systems continue to function nominally, except those noted previously or below.

With the usual dependability, **Progress M-63/28P launched nominally this morning at Baikonur** at 8:02am EST. Ascent was nominal, all appendages (antennae and solar arrays) deployed nominally and the vehicle reached orbital insertion at 8:12am. 28P is scheduled to dock to the ISS on 2/7 (Thursday) at 9:38am. *Congrats, Baikonur!*

After wakeup and before breakfast, FE-2 Dan Tani completed his daily access of the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop for downlink. *[To monitor the crewmember's sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

Before breakfast & first exercise, Whitson, Malenchenko and Tani completed a full session with the Russian crew health monitoring program's medical assessment MO-9/Biochemical Urinalysis. Afterwards, the FE-1 closed out and stowed the Urolux hardware. *[MO-9 is conducted every 30 days (and also before and after EVAs) and is one of five nominal Russian medical tests adopted by NASA for U.S. crewmembers for IMG PHS (Integrated Medical Group/Periodic Health Status) evaluation as part of the "PHS/Without Blood Labs" exam. The analysis uses the sophisticated in-vitro diagnostic apparatus Urolux developed originally for the Mir program. Afterwards, the data are entered in the MEC (Medical Equipment Computer)'s special IFEP software (In-Flight Examination Program).]*

The FE-1 serviced the Russian BMP (Harmful Impurities Removal System), starting

the "bake-out" cycle to vacuum on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process was terminated at ~2:15pm EST. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. Filter bed 1 was regenerated yesterday.]*

Having passed the "Day 120" mark in his flight, FE-2 Tani began his first session with the NASA/JSC experiment NUTRITION w/Repository, for which he had to forego exercising and food intake for eight hours. Today's protocol consisted of two blood draws (for Serum & Heparin). Later, the FE-2 set up the equipment for the 24-hour urine collections which start with the first void early tomorrow morning and continue through Thursday morning. *[Acting as operator, Peggy Whitson as CDR performed phlebotomy on Dan Tani, i.e., drawing blood samples (from an arm vein) which was first allowed to coagulate in the Repository, then spun in the HRF RC (Human Research Facility/Refrigerated Centrifuge) and finally placed in MELFI (Minus-Eighty Laboratory Freezer for ISS). The RC was later powered off after a temperature reset to limit wear on the compressor, and cleaned. Background: NUTRITION is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight; this includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes. The Clinical Nutritional Assessment profile currently required on all U.S. Astronauts collects blood and urine samples preflight and postflight. NUTRITION expands this protocol by also capturing inflight samples and an additional postflight sample. Furthermore, additional measurements are included for samples from all sessions, including additional markers of bone metabolism, vitamin status, and hormone and oxidative stressor tests. The results will be used to better understand the impact of countermeasures (exercise and pharmaceuticals) on nutritional status and nutrient requirements. The Clinical Nutritional Assessment profile (MR016L), first started on two Mir crewmembers and then on all ISS US crews, nominally consists of two pre-flight and one post-flight analysis of nutritional status, as well as an in-flight assessment of dietary intake using the FFQ (Food Frequency Questionnaire). The current NUTRITION project expands MR016L testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

The crewmembers participated in an emergency descent OBT (onboard training) exercise. The training includes review of procedures, crew responsibilities, Soyuz activation, hatch closure, leak checks, suit donning, undocking preparation, orbital descent module leak checks, descent timeline simulation and landing operations.

At ~9:10am, Peggy and Yuri had a 15-min teleconference with ground specialists to discuss the images downlinked from their recent (1/31) Shuttle RPM (R-bar Pitch

Maneuver) skill training. *[The skill training prepares the crew for the bottom side mapping of the Orbiter at the arrival of STS-122/1E. During the RPM at ~600 ft from the station, the ISS crew will have only ~90 seconds for taking high-resolution digital photographs of all tile areas and door seals on the Orbiter, to be downlinked for launch debris assessment. Thus, time available for the shooting will be very limited, requiring great coordination between the two headset-equipped photographers and the Shuttle.]*

Tani performed his daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13/07 (briefly interrupted for EVA-13 & EVA-14 photo support). *[The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour.]*

The FE-1 conducted the periodic (monthly) functional closure test of the Russian Vozdukh CO₂ removal system's spare emergency vacuum valves (AVK), in the spare parts kit. *[The AVKs are critical because they close the Vozdukh's vacuum access lines in the event of a malfunction in the regular vacuum valves (BVK) or a depressurization in the Vozdukh valve panel (BOA). Access to vacuum is required to vent CO₂ during the regeneration of the absorbent cartridges (PP). During nominal operation, the AVK valves remain open.]*

In preparation for payloads coming up on Progress 28P, Yuri Malenchenko assembled and set up the Russian TBU (Universal Biotechnological Thermostat) cooler in the Service Module (SM).

Later, the FE-1 unstowed and installed the equipment for the periodic Russian PZE-MO-10 "Hematokrit" testing that is scheduled tomorrow for him. *[MO-10 measures the hematocrit (red blood cell mass) value of the blood (it is a well-known phenomenon of space flight that red blood cell mass {normal range: 30-45%} tends to go down over time).]*

The FE-1 completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Working off his discretionary "time permitting" task list, the FE-1 also performed the daily 20-min. IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow,

Baikonur).

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Whitson then transferred the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Significant Events Ahead *(all dates Eastern Standard, some changes possible.):*

02/07/08 -- Progress M-63/28P docking (9:38am) at DC1 nadir port
02/07/08 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite. ~2:40pm EST
02/09/08 -- Progress M-
02/22/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana)
03/06/08 -- ATV-1 Demo Day 1
03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS
03/12/08 -- ATV-1 Demo Day 2
03/15/08 -- ATV-1 Demo Day 3 & Docking (SM aft port)
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS
04/26/08 -- STS-124/Discovery/1J docking
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
08/07/08(NET) -- ATV-1 undocking (from SM aft port)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
09/18/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
09/20/08 -- STS-126/Discovery/ULF2 docking
10/01/08 -- STS-126/Discovery/ULF2 undocking.
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment
11/08/08 -- STS-119/Discovery/15A docking
11/17/08 -- STS-119/Discovery/15A undocking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
04/15/09 -- **Constellation's Ares I-X Launch**
05/??/09 -- **Six-person crew on ISS** (following Soyuz 18S-2 docking)
04/??/10 -- STS-132/Discovery/20A – Node-3 + Cupola.

ISS On-Orbit Status 02/04/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 16 of Increment 16.*

This morning, Progress M-62/27P successfully undocked from the ISS DC1 at 5:32am EST. 26P will remain in orbit in free flight until 2/15, continuing to phase out in front of the ISS (about 40 km per orbit) in order to support Russian Earth observation experiments. *[The separation appeared smooth, with no anomalous behavior reported by the crew. TsUP-Moscow confirmed a 15 second first separation burn complete at approximately 5:35:07am EST. The ISS returned to US Momentum Management (MM) at approximately 6:46am EST.]*

FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the sessions file on the HRF-1 laptop for downlink. *[To monitor the crewmembers' sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

FE-1 Malenchenko performed the periodic service of the Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The regen process will be terminated before sleeptime, at ~3:05pm EST. Regeneration of bed #2 follows tomorrow. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods.]*

At ~3:20am, the FE-2 again activated the VDS MPC (Video Distribution System/ Multi-Purpose Converter) with its four downlinks to allow the ground to conduct HDTV (high-definition TV) playback and downlink operations. Later (~2:10pm), the MPC was powered off again. *[The end-to-end test of the system, conducted by the crew and ground specialists on 1/17 to verify the MPC HDTV (Multi-Purpose Converter/High-Definition TV) capability all the way to the NASA TV satellite, was*

very successful, yielding an overall end-to-end audio latency (delay) for the MPC System of 3.2 seconds. This is the delay from the crewmember to JSC/MCC-H to NASA Headquarters and out to the NASA TV satellite in high definition (including, but are not limited to, CNNHD, ABC, NBC, CBS, and Discovery HD Theater), i.e. the sum total of the audio delay the interviewer and interviewee will "feel" during an interactive event. This Japan/JAXA originated system will be utilized soon for downlink messages and in-flight interviews based on client capability.]

FE-1 Malenchenko set up the "Chibis" garment , an extensive cardiovascular test of human pericardium (heart muscle) activity as well as of primary parameters of central and regional blood circulation at rest and under the effect of lower body negative pressure (LBNP, Russian: ODNT). Yuri and Peggy Whitson then conducted MBI-5 LBNP sessions. *[The LBNP applies a lower than ambient pressure to the body from the hips down to simulate 1g loads normally experienced on Earth. This acts as an orthostatic stressor and can be used to study deconditioning of the human cardiovascular system in space. The Chibis provides gravity-simulating stress to the body's cardiovascular/circulatory system for evaluation of Yuri's & Peggy's orthostatic tolerance (e.g., the Gauer-Henry reflex) after 7 weeks in zero-G. The MBI-5 protocol again consisted of first imbibing 150-200 milliliters of water or juice, followed by a sequence of progressive regimes of reduced ("negative") pressure, set at -25, -30, -35 and -40 mmHg for five minutes each, while shifting from foot to foot at 10-12 steps per minute. The body's circulatory system interprets the pressure differential between upper and lower body as a gravity-like force pulling the blood and body fluids "down". MBI-5 data output include blood pressure readings with the Tenzoplus Sphygmomanometer, today without telemetry data monitoring but reporting of heart rate and blood pressure to TsUP-Moscow.]*

The CDR readied the PZE MO-9 equipment for another Russian "Urolux" biochemical urine testing, scheduled tomorrow for all three crewmembers. *[MO-9 is conducted regularly every 30 days (and also before and after EVAs) and is one of five nominal Russian medical tests adopted by NASA for US crewmembers for IMG (Integrated Medical Group) PHS evaluation as part of the "PFE w/o Blood Labs" exam. The analysis uses the sophisticated in-vitro diagnostic apparatus Urolux developed originally for the Mir program. The data are then entered in the Medical Equipment Computer (MEC)'s special IFEP (In-Flight Examination Program) software.]*

After the 27P undocking, FE-1 Yuri Malenchenko manually closed the PEV (Pressure Equalization Valve; Russian: KVD) between the DC1 and its docking port vestibule.

FE-1 Yuri Malenchenko successfully replaced the Russian Navigation Computer

Module (NVM-1). *[During recent ASN-M testing, the NVM-2 experienced erratic behavior when commanded as the prime controller and switching unexpectedly to the backup controller NVM-2. The NVM is the hardware responsible for receiving state vector signals, processing raw measurements, and providing position, velocity, and time information. ESA (European Space Agency), NASA, and RSC-E (Rocket Space Corporation - Energia (RSC-E) jointly agreed that three healthy NVM-1 (one onboard spare) are required for ATV1 rendezvous. ATV1 is no go for docking until NVM-2 is replaced and confirmed as operational. The new unit was activated and will be monitored by ground specialists for approximately 48 hours. A new NVM will also be delivered on 28P.]*

After Peggy Whitson prepared the auditory test equipment, she, Malenchenko & FE-2 Tani took the periodic (monthly) O-OHA (On-Orbit Hearing Assessment) test, a 30-min. NASA environmental health systems examination to assess the efficacy of acoustic countermeasures, using a special MEC (Medical Equipment Computer) laptop application. It was the third session for the three crewmembers. *[The O-OHA audiography test involves minimum audibility measurements for each ear over a wide range of frequencies (0.25-10 kHz) and sound pressure levels, with the crewmembers using individual-specific Prophonics earphones, Bose ANC headsets and the SLM (sound level meter). To conduct the testing, the experimenter is supported by special EarQ software on the MEC, featuring an up/down-arrow-operated slider for each test frequency that the crewmember moves to the lowest sound pressure level at which the tone can still be heard. The baseline test is required not later than about Flight Day 14 for each new Expedition and is then generally performed once per month. Note: There have been temporary hearing deficits documented on some U.S. and Russian crewmembers, all of which recovered to pre-mission levels.]*

CDR Whitson obtained sound level measurements in specific locations throughout ISS. The measurements included: 13 locations in the US Lab including inside the Temporary Sleep Station (TeSS), 6 locations in Node 2, and three in the SM Kayuta sleep stations. The crew also noted any non-nominal hardware or configuration that was excessive causing noise. The data will be downlinked for analysis.

Tani and Whitson changed the 4AA batteries in the SB-28 flash. *[Then, they homogenized and manually photographed BCAT-3 samples 1-6 with 5 being the last sample to homogenize then photograph--this will then have the setup ready for the next activity which is a long-term sample 5 run.]*

The FE-1 completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables plus the weekly collection of the toilet flush counter (SPK-U) and water supply (SVO) readings for calldown to TsUP/Moscow.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS

cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Whitson then transferred the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Significant Events Ahead *(all dates Eastern Standard, some changes possible.):*

02/05/08 -- Progress M-63/28P launch (8:02am)
02/07/08 -- Progress M-63/28P docking (9:38am) at DC1 nadir port
02/07/08 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite. ~2:40pm EST
02/09/08 -- Progress M-
02/22/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana)
03/06/08 -- ATV-1 Demo Day 1

ISS On-Orbit Status 02/03/08

All ISS systems continue to function nominally, except those noted previously or below.
Sunday -- off-duty day for CDR Whitson, FE-1 Malenchenko and FE-2 Tani except for housekeeping and voluntary work. Ahead: Week 16 of Increment 16.

FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop for downlink. *[To monitor the crewmembers' sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

Upon wakeup, CDR Whitson performed another urine collection for the NASA/JSC experiment NUTRITION w/Repository, collecting a final urine sample for storage in the MELFI (Minus-Eighty Laboratory Freezer for ISS), after which the experiment was turned off. The next urine collection closed out with the first void of today. Peggy's next Nutrition/Repository activity is the FD180 session. *[The current NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

For today's VolSci (Voluntary Weekend Science) program, CDR Whitson continued her work with the MSG (Microgravity Science Glovebox) and the InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions) experiment,

FE-2 Dan Tani's VolSci program for today consisted of another session (the fourth) of the LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System)/Phase 2 operations, sampling four of the sites that were identified in the CHeCS SSK (Crew Health Care Systems/Surface Sampler Kit) procedure also scheduled for today. *[The goal is to*

compare LOCAD results with the SSK colony growth results. LOCAD uses small, thumb-sized "microfluidic" cartridges that are read by the experiment reader. The cartridges contain dried extract of horseshoe crab blood cells and colorless dye. In the presence of the bacteria, the dried extract reacts strongly to turn the dye a green color. Therefore, the more green dye, the more microorganisms there are in the original sample. The handheld device tests this new analysis technology by sampling for the presence of gram negative bacteria in the sample in about 15 minutes, showing the results on a display screen.

Background: Lab-on-a-Chip technology has an ever-expanding range of applications in the biotech industry. Chips are available (or in development) which can also detect yeast, mold, and gram positive bacteria, identify environmental contaminants, and perform quick health diagnostics in medical clinics. The technology has been used to swab the MERs (Mars Exploration Rovers) for planetary protection. With expanded testing on ISS, began by Sunita Williams in March/April this year, this compact technology has broad potential applications in space exploration--from monitoring environmental conditions to monitoring crew health. The current study should prepare for long-duration exploration by demonstrating a system that enables the crew to perform biochemical analysis in space without having to return samples to Earth.]

After Houston Flight Controllers started deactivating the CDRA (Carbon Dioxide Removal Assembly) early this morning and cooling was no longer required, the FE-2 disconnected the ITCS LTL QD (Internal Thermal Control System/Low Temperature Loop/Quick Disconnect) jumper to the CDRA rack (LAB1D6).

The FE-1 completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables plus the weekly collection of the toilet flush counter (SPK-U) and water supply (SVO) readings for calldown to TsUP/Moscow.

Malenchenko also gathered weekly data on total operating time & "On" durations of the Russian POTOК-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem for reporting to TsUP.

Whitson and Tani had their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop), Peggy at ~10:00am EST, Dan at ~11:25am.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Working off his "time permitting" discretionary task list, Yuri conducted his sixth run of the Russian DZZ-2 "Diatomeya" ocean observations program, using the NIKON-F5 still camera with 80-200 mm Nikkor zoom lens and the SONY PD-150O camcorder to record color contrasts on water surface and irregular cloud cover pattern in the World Ocean target areas. *[Uplinked target zones in the Atlantic Ocean were offshore areas of*

Argentina, the Gulf of Guinea and the coastal area of Northwest Africa, the Amazon river runoff area and the Madeira Islands water region.]

Also from his discretionary “time permitting” task list, Malenchenko used the updated Symantec AntiVirus program to run a check on the RSS2 laptop and download data logs.

On Dan Tani’s “job jar” task list for today was to fill out an uplinked questionnaire on the post-EVA condition of the EMU overgloves.

No **CEO** photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:

<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);

<http://earthobservatory.nasa.gov/>

<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*):

02/04/08 -- Progress M-62/27P undocking (5:32am; stays in orbit till 2/15)
02/05/08 -- Progress M-63/28P launch (8:02am)
02/07/08 -- Progress M-63/28P docking (9:38am)
02/07/08 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite. ~2:40pm EST
02/09/08 -- Progress M-
02/22/08 -- ATV-1 “Jules Verne” launch/Ariane V (Kourou, French Guyana)
03/06/08 -- ATV-1 Demo Day 1
03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS
03/12/08 -- ATV-1 Demo Day 2
03/15/08 -- ATV-1 Demo Day 3 & Docking (SM aft port)
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS
04/26/08 -- STS-124/Discovery/1J docking
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
08/07/08(NET) -- ATV-1 undocking (from SM aft port)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
09/18/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC

09/20/08 -- STS-126/Discovery/ULF2 docking
10/01/08 -- STS-126/Discovery/ULF2 undocking.
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment
11/08/08 -- STS-119/Discovery/15A docking
11/17/08 -- STS-119/Discovery/15A undocking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
04/15/09 -- **Constellation's Ares I-X Launch**
05/??/09 -- **Six-person crew on ISS** (following Soyuz 18S-2 docking)
04/??/10 -- STS-132/Discovery/20A – Node-3 + Cupola.

ISS On-Orbit Status 02/02/08

All ISS systems continue to function nominally, except those noted previously or below.

Saturday -- off-duty day for CDR Whitson, FE-1 Malenchenko and FE-2 Tani except for housekeeping and voluntary work. >>>Yesterday, NASA observed the annual Day of Remembrance honoring those members of the NASA Family who lost their lives while furthering the cause of exploration and discovery. This memorial event honors the families and crews of Columbia STS-107, Challenger STS 51-L, and Apollo 1, as well as all the astronauts who have sacrificed their lives for this nation. <<<

FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop for downlink. *[To monitor the crewmembers' sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

Upon wakeup, CDR Whitson performed the last sampling of her Day 120 session with the NASA/JSC experiment NUTRITION w/Repository, collecting a final urine sample for storage in the MELFI (Minus-Eighty Laboratory Freezer for ISS). The sampling kit was then stowed away. *[The current NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

The crew performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the CDR's sleep station with a standard cleaning solution; also, fan screens and grilles are*

cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]

Yuri and Peggy completed preparations for Progress M-62/27P undocking on Monday, 2/4 (5:27am) on its own free-flyer mission (till 2/15). *[The FE-1 and CDR finished trash loading and reported completion to the ground for the final Go from TsUP/Moscow, followed by cargo ship activation, tearing down the ventilation air duct, removing the threaded BZV QD (quick disconnect) screw clamps screw clamps of the SSVP docking & internal transfer system, and closing hatches between 27P and the transfer tunnel (PrK) to the DC1 after taking video of the mating surfaces/seals. They then conducted the one-hour vestibule leak check and downlinked the video imagery of the SM/Progress hatch interface. Russian MCS/thrusters were temporarily inhibited during the clamp removal due to loads constraints.]*

In the Airlock (A/L), Dan Tani terminated charging on the EMU (Extravehicular Mobility Unit) batteries in the BCA (Battery Charger Assembly) and the regeneration of the METOX (Metal Oxide) CO2 absorption canisters used during the EVA-14.

Yuri completed today's routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

At ~8:40am EST, the crew held its regular weekly planning conference (WPC) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP/Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Dan then transferred the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working off his discretionary "time permitting" task list, Malenchenko used the updated Symantec AntiVirus program to run a check on the RSS2 laptop and download data logs.

A second job item on the FE-1's voluntary list for today was another KPT-3 session to make observations and take aerial KPT-3 photography of environmental conditions for Russia's Environmental Safety Agency (ECON) using the Nikon D2X digital camera with SIGMA 300-800mm telephoto lens.

Weekly Science Update (Expedition Sixteen -- Week 15)

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): Last memory card replacement activity has been successfully performed on 1/28. Radiation measurements continue to be performed in the PIRS module..

ANITA: Completed.

BCAT-3 (Binary Colloidal Alloy Test 3): All the photos that have been taken (up through Tuesday) since astronaut Dan Tani adjusted the camera for BCAT (last weekend) have looked great. The charger for the camera was removed on 1/ 29 to be used for an EVA (which put BCAT photography on hold) and the charger was returned on 1/ 31; it is anticipated that the camera for BCAT-3 will be reinitialized and started next Monday, 2/4.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Dan, currently you are scheduled to repeat the last CCISS session on 2/4 and 2/5. This session is a repeat due to the Shuttle launch slip moving your last session out of the PI requirements.”

CFE (Capillary Flow Experiment): Reserve.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): In progress.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): In progress.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): First session of the experiment for ISS FE-1 Yuri Malenchenko has been successfully completed from 1/24 to 1/26. Pictures of the blood smear plates have been downlinked and positively assessed by science team. Blood and urine samples have been stored in MELFI.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): “Thanks for operating LOCAD on 1/26. You achieved the main goal for that session: a positive spike EU/ml value for the negative control. This was valuable data, as it provides a more definitive indication that the swabbing kits on orbit have remained sterile and free of endotoxin. Your feedback and perseverance through the air bubbles/dispensing issues were especially appreciated, and I fully agreed with your evaluation. It is readily apparent that water is evaporating from the water cartridges over time (due to an incomplete seal), which makes the starting volume uncertain. Bubbles introduced during mixing are further interfering with accurate dispensing. We are working to fix these issues in the short term by flying up new swabbing kits on 1J/A; and in the long term by redesigning the water cartridge with a more complete seal, and redesigning the swab/dispensing tip to reduce bubble formation during mixing. We hope these changes will lead to greater certainty as regards starting/dispensing volumes and more accurate, quantitative analysis.”

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 “Pirs”.

MULTIGEN-1: MULTIGEN-1 samples will be downloaded on STS-122 (1E).

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION/REPOSITORY: In progress.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): “Peggy, thanks for any continued logging in the Sleep Log software! Dan, our only remaining activities are Sleep logging and doffing your Actiwatch on the Shuttle with the other 1E crewmembers. We are working to add the Sleep logging to the timeline for your convenience.”

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): In progress.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: In progress.

CEO (Crew Earth Observation): Through 1/31 the ground has received a total of 12,994 frames of ISS/CEO imagery for review and cataloging. "We are evaluating your recent images of our requested target cities of Canberra and Sydney, Australia. We also believe that you have just acquired our first images in years of two islands in the northern part of the South Sandwich Islands archipelago (another target request). We've received confirmation of your acquisition of imagery of mega iceberg A53a from Glaciologist and Lead Scientist, Tom Scambos, at NOAA's National Snow and Ice Data Center. The iceberg is nearing the south side of South Georgia Island now and he says: "This is an iceberg worth watching, because, being water-saturated, it may well show a sudden, crumbling, disintegration, spreading fine blue micro-icebergs over the ocean surface." Thanks for your diligence and vigilance in locating and photographing these features under difficult viewing conditions. This weekend an excellent example of your Luquillo Mountains, Puerto Rico, a Long Term Ecological Research Site, will be posted on NASA/GSFC's Earth Observatory website."

CEO photo targets uplinked for today was the **Kerguelen Islands Icecap, S Indian Ocean** *(at 50S, these islands support a permanent icefield which is of great interest as "one of the most sensitive icecap glaciers on earth." SRTM (Shuttle Radar Topography Mission data) data created a benchmark measurement of ice volume of the major Kerguelen icecap. Your remotely sensed images show ice margin change (which has a known relationship to ice volume change). Look right (Fig. 1) on the west end of the main island.*

CEO photography can be viewed and studied at the websites:

<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site);

<http://earthobservatory.nasa.gov/>

<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

Significant Events Ahead *(all dates Eastern Standard, some changes possible.):*

02/04/08 -- Progress M-62/27P undocking (5:27am; stays in orbit till 2/15)

02/05/08 -- Progress M-63/28P launch (8:03am)

02/07/08 -- Progress M-63/28P docking (9:33am)

ISS On-Orbit Status 02/01/08

All ISS systems continue to function nominally, except those noted previously or below. ***Happy Birthday, Dan!***

FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop for downlink. *[To monitor the crewmembers' sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

Before breakfast, CDR Whitson completed her 120-Day NUTRITION/w Repository session (blood collection only). Whitson also set up NUTRITION w/Repository hardware for the 24-hour urine sample collections that will begin tomorrow morning and end Sunday morning.

Also before breakfast, CDR Whitson, FE-1 Malenchenko and FE-2 Tani started the day with the periodic session of the Russian biomedical routine assessments PZEh-MO-7/Calf Volume Measurement and PZEh-MO-8/Body Mass Measurement (third for CDR & FE-1, second for FE-2), using the IM mass measurement device which Yuri Malenchenko afterwards broke down for stowage. *[Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference pints, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures. For determining body mass in zero-G, where things are weightless but not massless, the Russian IM "scales" measure the inertial forces that arise during the oscillatory motion of a mass driven by two helical metering springs with known spring constants. By measuring the time period of each oscillation of the unknown mass (the crewmember) and comparing it to the period of a known mass, the crewmember's mass is calculated by the computer and displayed.]*

FE-2 Dan Tani assisted ground controllers in MCC-Houston by successfully walking the SSRMS (Space Station Remote Manipulator System) from the MBS (Mobile Base System) to the Node-2 PDGF (Power & Data Grapple Fixture). *[The SSRMS is now in the 1E start position. Robotics ground controllers also translated the MT from WS4 (Worksite 4) to the WS7 for Flight 1E. The MT translation was successful, but only one of two IMCA (Integrated Motor/Controller Assembly) "ready for latch" microswitches on the primary string showed ready for latching at WS7. Ground controllers switched to the redundant string and both microswitches on that string showed ready for latching, then switched back to the primary string and both microswitches showed ready for latching at that time. The MT was successfully latched at WS7 and keep alive power was restored to the MBS. The MT will be translated back to WS4 after Flight 1E.]*

FE-1 Yuri Malenchenko and CDR Whitson installed the StM Docking Mechanism between Progress M-62/27P and the DC1 nadir port. *[The StM is the "classic" probe-and-cone type, consisting of an active docking assembly (ASA) with a probe (SSH), which fits into the cone (SK) on the passive docking assembly (PSA) for initial soft dock and subsequent retraction to hard dock. The ASA is mounted on the Progress' cargo module (GrO), while the PSA sits on the docking ports of the SM, FGB and DC1. 26P is being prepared for potential remote-commanded undocking in case of a docking contingency during the relocation of 14S, carrying the three crewmembers, from the FGB nadir port to the SM aft port.]*

Malenchenko and Whitson also conducted another TORU OBT (Tele-operator Control System On-Board Training) session in preparation for the docking of 28P on *[The TORU training session consisted of procedure and docking data reviews, a tagup with ground instructors, and onboard simulator training. 27P will undock from ISS on 2/4 (5:27am EST). 28P will dock to ISS on 2/7 (9:38am EST).]*

Tani completed various EVA equipment preparation and reconfiguration tasks today, including EMU (Extravehicular Mobility Unit) water refills and cooling loop scrubs, cooling loop configurations, and METOX (Metal Oxide) regeneration operations. *[EVA Postscript: It was reported that during the Airlock (A/L) hatch closing at the end of EVA-14, a tether was caught in the hatch requiring the hatch to be re-opened to remove the tether before re-closing. Ground specialists speculated that the tether might have damaged the hatch seal due to this event. Further review has determined the part of the tether caught in the hatch was Nomex cloth which would not have damaged the A/L hatch seal. Additionally, positive indication of seal integrity was provided by the leak check during A/L repressurization. No further analysis is planned at this time.]*

TsUP-Moscow conducted a successful retest of the Medium Gain-2 (WAS2) antenna as part of the PCE (Proximity Communication Equipment) checkout required for ATV-1 (Automated Transfer Vehicle 1) rendezvous and docking. *[The retest required an attitude*

control handover from USOS (US Segment) momentum management control to RS (Russian Segment) thruster control (~11:50am EST) and back (~2:35pm). The attitude for the test was LVLH (Local Vertical/Local Horizontal) 0, 0, 0. TsUP specialists indicated the WAS2 antenna passed today's test.]

Peggy worked with the DCS-760 still cameras, taking blank and white images to “clean” and calibrate the CCDs (Charge-Coupled Devices). The test photos were stored on a 1GB Microdrive PCMCIA and downlinked to MCC-Houston for determining which cameras will be used for the actual RPM activities before STS-122/1E docking.

Yuri completed today's routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Working off his discretionary “time permitting” task list, the FE-1 also performed the daily 20-min. IMS maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

At ~3:35am EST, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~9:20am, the station residents convened for their weekly teleconference with ISS Program Management at JSC/Houston via S-band/audio.

At ~2:40pm, the crew was scheduled for their eighth weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. *[S/G-2 (Space-to-Ground 2) phone patch via SSC-10 (Station Support Computer 10)].*

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Peggy then transferred the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Significant Events Ahead *(all dates Eastern Standard, some changes possible.):*
02/04/08 -- Progress M-62/27P undocking (5:27am; stays in orbit till 2/15)

02/05/08 -- Progress M-63/28P launch (8:03am)
 02/07/08 -- Progress M-63/28P docking (9:33am)
 02/07/08 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite. ~2:40pm EST
 02/09/08 -- Progress M-
 02/22/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana)
 03/06/08 -- ATV-1 Demo Day 1
 03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS

ISS On-Orbit Status 01/31/08

All ISS systems continue to function nominally, except those noted previously or below. *Light duty day today for the crew following yesterday's successful EVA.*
>>>>Today 50 years ago, the U.S. launched its first Earth satellite, Explorer 1, on a Redstone/Jupiter rocket built by the Wernher von Braun team for the Army Ballistic Missile Agency (ABMA). The satellite, developed by JPL and equipped with radiation sensors by Dr. James Van Allen, discovered the Van Allen Radiation Belts of Earth.<<<<

FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop for downlink. *[To monitor the crewmembers' sleep/wake patterns and light exposure, Dan wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

After yesterday's successful EVA-14 spacewalk, CDR Whitson performed clean-up work in the Airlock (A/L), starting the discharge cycle on the 16V EMU batteries (~5-7 hrs), and later initiating their recharge.

To prepare for next week's (2/4) undocking of Progress M-62/27P, FE-1 Malenchenko dismantled and removed electronic equipment from the cargo ship, to be recycled. Removed were the US-21 matching unit, the cargo ship's LKT local temperature sensor commutator (TA251MB) of the BITS2-12 and its PZU-1M ROM (read-only memory) unit. *[When a Progress is undocked and jettisoned, the valuable electronics are retained, to be recycled on a future vehicle.]*

In the Service Module (SM), Malenchenko turned off the JAXA-3DPC (Japan Aerospace Exploration Agency-3D Photon Crystals) crystal growth experiment, running since 1/22. *[The purpose of this investigation is to grow photonic crystals*

in microgravity using particles in electrolytic solutions that will be fixed using ultraviolet light in a process referred to as photocuring, after self-organization and ordering of colloid nanoparticles in an electrolyte solution with subsequent fixation in an elastic gel matrix.]

In the Lab, Whitson connected the regular ITCS LTL (Internal Thermal Control System/Low Temperature Loop) coolant jumper at the LAB1D6 rack in support of ground-commanded activation of the U.S. CDRA (Carbon Dioxide Removal Assembly).

Yuri conducted the daily monitoring, picture-taking and downloading on the newly set up BIO-5 Rasteniya-2 ("Plants-2") experiment. *[Rasteniya-2, researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. During the duration of the BIO-5 experiment, students of the Moscow City Palace for Youth Creativity of the Meshchansky inter-regional center #15 in Moscow) and the Prince of Oldenburg Lyceum in St. Petersburg will be cultivating plants in parallel on the ground and conducting comparative observation of plant growth and development under gravity and zero-gravity conditions. They are receiving the photo images taken by Yuri.]*

The FE-2 reconfigured the DCS-760 digital camera used during the EVA for its return to monitoring the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13/07 (briefly interrupted for EVA-13 and EVA-14 photo support). *[The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour.]*

After reviewing the video tape of their last (11/29/07) training session for the Shuttle RPM (R-bar Pitch Maneuver) picture-taking, Whitson and Malenchenko conducted another standard 30-min RPM imaging skill training, Peggy's fifth, Yuri's sixth, using DCS-760 digital still cameras in the SM to take photos of an Orbiter cut-out for practice, using the 400mm & 800mm telephoto lenses. *[The skill training prepares crewmembers for the bottomside mapping of the Orbiter at the arrival of STS-122/1E next week (2/9). During the RPM at ~600 ft from the station, the ISS crew will have only ~90 seconds for taking high-resolution digital photographs of all tile areas and door seals on the Atlantis from SM windows 6 & 8, to be downlinked for launch debris assessment. Thus, time available for the shooting will be very limited,*

requiring great coordination between the two headset-equipped photographers and the Shuttle.]

To provide access to the TORU panel for the subsequent refresher test, the FE-1 relocated the ATV (Automated Transfer Vehicle) control panel in the SM. *[TORU lets an SM-based crewmember perform the approach and docking of automated Progress vehicles in case of KURS failure.]*

Yuri and Peggy then conducted a 40-min. refresher teleconference on the upcoming (2/7) Progress 28P docking using the TORU manual backup control system in a vehicle-to-vehicle test.

The CDR ran the periodic check of active U.S. payloads, i.e., cleaning the ANITA (Analyzing Interferometer for Ambient Air) inlet plus inspecting and filter cleaning of the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. *[The CGBA incubator is controlled from the ground, with automatic video downlinked to Earth. ANITA continues to collect data every six seconds and downlinks the data daily to the ground team. ANITA monitors low levels of potential gaseous contaminants in the ISS cabin atmosphere with a capability of simultaneously monitoring 32 gaseous contaminants. The experiment is testing the accuracy and reliability of this technology as a potential next-generation atmosphere trace-gas monitoring system for ISS and future spacecraft. This is a cooperative investigation with ESA.]*

Whitson also powered down the A31p laptop in the A/L, required during the Campout.

As part of post-EVA cleanup activities, FE-1 Yuri Malenchenko recorded the “Pille” radiation readings from the EMU-worn (plus one background) “Pille-MKS” dosimeters in a log table for subsequent downlink to the ground.

Other cleanup activities performed by Peggy and Dan during the day were –

- Disconnecting the UOP DCP (Utility Outlet Panel/Display & Control Panel) bypass power cables at the Lab RWS (Robotics Work Stations), used during the EVA for SSRMS (Space Station Remote Manipulator System) video coverage,
- Powering down the no-longer-needed A31p PCS (Portable Computer System) laptop in the Airlock (A/L), and
- Initiating and monitoring regeneration of the used EMU METOX (Metal Oxide) canisters in the A/L bakeout oven.

Malenchenko switched the SM ham radio station to Repeater Mode. *[Repeater mode allows radio amateurs to conduct ham radio sessions using ISS radio station*

during their pass. For example, amateur operator from Moscow can have a voice session with an operator in Paris. Voice radio contacts are typically conducted in auto mode without crew's involvement; however, the crew has a capability to participate in the exchange. This mode is distinguished by the fact that uplink should be set in one VHF frequency (i. e. 144-146 MHz), and downlink in another (430-440 MHz), and vice versa.]

Dan Tani worked on prepacking return items for STS-122/1E.

The CDR conducted the weekly 10-min. CWC audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. *[Updated "cue cards" based on the crew's water calldowns are sent up every other week (currently #16-00180).]*

In the Lab, CDR Whitson set up the NUTRITION/Repository hardware for upcoming urine and blood collections.

Yuri completed today's routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Working off his discretionary "time permitting" task list, the FE-1 also performed the daily 20-min. IMS maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Peggy took air samples for the periodic (weekly) atmospheric status check for ppO₂ (Partial Pressure Oxygen) and ppCO₂ (pp Carbon Dioxide), using the hand-held CSA-CP (Compound Specific Analyzer-Combustion Products), CSA-O₂ (CSA - Oxygen sensor) and CDMK (CO₂ Monitoring Kit). Batteries were to be replaced if necessary. *[Purpose of the 15-min activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements.]*

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Tani then transferred the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM data of the workouts on

RED, followed by their erasure on the HRM storage medium (done six times a week).

Significant Events Ahead *(all dates Eastern Standard, some changes possible.):*

01/31/08 -- **Explorer-1 50 Years (1st U.S. Satellite on Redstone rocket)** [see <http://usspace50.com> & <http://www.us50thspace.com>]

ISS On-Orbit Status 01/30/08

All ISS systems continue to function nominally, except those noted previously or below.

Stage EVA-14 by CDR Peggy Whitson & FE-2 Dan Tani was completed successfully in 7hr 10min, accomplishing its objectives.

During the spacewalk, Whitson (EV1) & Tani (EV2), supported by FE-1 Yuri Malenchenko as intravehicular (IV) crewmember, removed the failed Stbd (right-side) BMRRM (Bearing Motor Roll Ring Module) and replaced it with a new spare, followed by more investigation and photo documentation of the Stbd SARJ (Solar Alpha Rotary Joint). *[The S4-1A BMRRM removal & replacement task was completed successfully. There was an S-band communication problem toward the beginning of the EVA that was cleared with a BSP (Baseband Signal Processor) power cycle. The communication dropout happened before the crew got into critical operations and was recovered in time to have very little effect on the overall EVA timeline. After the new BMRRM was installed all the power channels were reconfigured and the BGA was rotated and checked out successfully. Afterwards, the BGA was in autotrack and performing nominally. The removed BMRRM was brought back inside and will be stowed for return on the next available Shuttle flight. Per plan, there was time for the EVA crew to remove and inspect under several starboard SARJ covers. Eight of the remaining thirteen covers were inspected, leaving five more to be inspected on a later EVA. Photos taken during this activity are being downlinked for review by the SARJ troubleshooting team.]*

[Official start time of the spacewalk was 4:56am EST, 34 minutes ahead of the timeline, ending at 12:06pm. Total EVA duration (PET = Phase Elapsed Time) was 7h 10min. It was the 101st spacewalk for ISS assembly & maintenance and the 73rd from the station (28 from Shuttle, 51 from Quest, 22 from Pirs) totaling 443h 13min, and the 5th for Expedition 16 (totaling 35h 21min. During the spacewalk, her

sixth, Peggy Whitson set a new record of aggregated EVA time by a woman of 39h 46min when she exceeded her previous mark of 32h 36m. After today's EVA, a total of 123 spacewalkers (92 NASA astronauts, 21 Russians, and ten astronauts representing Japan-1, Canada-4, France-1, Germany-1 and Sweden-3) have logged a total of 631h 35min outside the station on building, outfitting and servicing. It was also the 123rd spacewalk by U.S. astronauts.]

Whitson and Tani began their overnight Campout prebreathe and lockout in the A/L at ~2:50pm EST. With METOX (Metal Oxide) canisters for CO₂ removal in the A/L, the two spacewalkers will perform start PBA mask prebreathe for denitrogenation, while readying their equipment, then depress the A/L to 10.2 psi for the campout.

Prior to the spacewalk, FE-1 Malenchenko verified closure of the protective Lab window shutter.

Malenchenko also completed the pre-egress reconfiguration of the Russian STTS (onboard telephone/telegraph subsystem) to its EVA settings. After the crew's return, Yuri reconfigured the STTS for nominal ops. *[The "Voskhod-M" STTS enables telephone communications between the SM (Service Module), FGB, DC1 Docking Compartment and U.S. segment (USOS), and also with users on the ground over VHF channels selected by an operator at an SM comm panel, via STTS antennas on the SM's outside. There are six comm panels in the SM with pushbuttons for accessing any of three audio channels, plus an intercom channel. Other modes of the STTS include telegraphy (teletype), EVA voice, emergency alarms, Packet/Email, and TORU docking support.]*

During the spacewalk, Yuri provided IV support, prepared the DCS 760 camera setup for post-ingress photographing of the EVA gloves and subsequently assisted the spacewalkers in ingressing, CL (Crew Lock) repressurization and post-EVA activities.

The FE-1 also performed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module). *[Regular daily SOZh maintenance consists among else of replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

After returning on board from outside, Whitson and Tani doffed the EMUs, after taking photographs of the gloves and overgloves while still pressurized. As part of post-EVA tasks, the spacewalkers also reported on size fit of their EMUs and components.

Later today, CDR Whitson will downlink the EVA imagery to the ground and

reconfigure the DCS 760 for regular use (e.g., removing its thermal blanket).

Afterwards, Peggy and Dan were also scheduled for their regular post-EVA PMCs (Private Medical Conferences) with the ground.

No CEO (Crew Earth Observation) targets uplinked for today.

CEO photography can be viewed and studied at the websites:

<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site);

<http://earthobservatory.nasa.gov/>

<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 8:38am EST [= epoch]):

Mean altitude -- 336.9 km

Apogee height -- 340.7 km

Perigee height -- 333.2 km

Period -- 91.28 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0005597

Solar Beta Angle -- 27.6 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.78

Mean altitude loss in the last 24 hours -- 213 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 52665

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*):

ISS On-Orbit Status 01/29/08

All ISS systems continue to function nominally, except those noted previously or below.

FE-1 Malenchenko set up the pumping equipment and initiated (later closed out) the periodic transfer of urine from five EDV-U containers in the SM (Service Module) to the Rodnik BV2 tank of Progress M-62/27P.

With the Elektron-VM O₂ (oxygen) generator currently off, a one-hour cabin air refresh was to be performed by the FE-1 from Progress 27P storage (SrPK) if required.

CDR Whitson conducted the periodic (every two weeks) 10-min inspection of the RED (Resistive Exercise Device) canister cords and accessory straps as well as the canister bolts for re-tightening if required.

Malenchenko completed today's routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Working off his "time permitting" discretionary job list, Yuri performed the daily 20-min. IMS maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

At ~8:45am EST, the crew conducted a teleconference with the Shuttle crew of STS-122/1E, scheduled for launch on 2/7.

At ~9:40am, Peggy, Dan and Yuri tagged up with EVA specialists at MCC-H to discuss final arrangements for tomorrow's EVA-14 spacewalk.

Spending time in the Airlock (A/L) for final preparations for EVA-14, Peggy Whitson and Dan Tani –

- Configured the DCS-760 digital camera and flash attachment to be taken outside,
- Recharged three batteries for the EVA EMU-prebreathe period, to be installed in the EVA photo flash unit and EVA camera just prior to the spacewalk (when off station power),
- Prepared the A/L EL (Airlock Equipment Lock) for the Campout & spacewalk,
- Tagged up with ground specialists at ~9:40am EST for reviewing EVA particulars, and
- Underwent the standard pre-EVA PMC (Private Medical Conference) via S- & Ku-band audio/video.

Yuri prepared three Russian “Pille-MKS” radiation dosimeters, recorded their dosages and equipped each of the two EMUs (Extravehicular Mobility Unit) with a radiation sensor (A0309/CDR & A0310/FE-2). *[A third sensor, A0308, was placed in the SM on the PULT reader for background readings.]*

The CDR powered down the ham radio equipment in SM (Service Module) and FGB at ~12:30pm to prevent RF interference with the EMUs during the spacewalk. Peggy also closed the protective Lab science window shutters.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Whitson then transferred the crew’s exercise data file to the MEC for downlink, as well as the daily wristband HRM data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~2:50pm EST, Whitson and Tani began their overnight Campout prebreathe and lockout in the A/L. With METOX (Metal Oxide) canisters for CO₂ removal in the A/L, the two spacewalkers performed PBA (Portable Breathing Apparatus) mask prebreathe for denitrogenation, while readying their equipment, then depressed the A/L to 10.2 psi for the campout.

After the 8.5-hr sleep period before the spacewalk, the A/L CL (Crewlock) hatch will be cracked at ~1:00am EST for a hygiene break/with mask prebreathe for Whitson and Tani, after spending the night on 10.2 psi. Around 2:10am, the hatch will be

closed again by IV Yuri Malenchenko for EVA preparations in 10.2 psi, followed by EMU purge & prebreath. Afterwards, Yuri will support CL depressurization and EV1 & EV2 will egress (~5:20-5:30am).

CEO photo targets uplinked for today were **IPY – Aurora Borealis; Heard Island, S. Indian Ocean** (*clear weather windows continue to be present in the region of Heard Island at the time of the ISS orbit pass. Looking to the right of track as ISS approached Antarctica. Mapping photography of the island was requested to capture snow and ice extent. The island of Kerguelen may also be visible to the northwest of Heard Island*), and **Patagonian Glaciers, S. America** (*this orbit track provided a traverse across the central portion of the Patagonian ranges. Overlapping, nadir mapping frames of glaciers on the western side of the mountains were requested*).

CEO photography can be viewed and studied at the websites:
<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
<http://earthobservatory.nasa.gov/>
<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 8:17am EST [= epoch]):

Mean altitude -- 337.1 km

Apogee height -- 340.9 km

Perigee height -- 333.4 km

Period -- 91.28 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0005612

Solar Beta Angle -- 29.6 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.78

Mean altitude loss in the last 24 hours -- 202 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 52649

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*):

01/30/08 -- EVA-14 (BMRRM R&R, ~6 hrs)

01/31/08 -- **Explorer-1 50 Years (1st U.S. Satellite on Redstone rocket)** [see <http://usspace50.com> & <http://www.us50thspace.com>]

02/04/08 -- Progress M-62/27P undocking (5:30am) & reentry

02/05/08 -- Progress M-63/28P launch (8:03am)

02/07/08 -- Progress M-63/28P docking (9:38am)

02/07/08 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite. ~2:40pm EST

02/18/08 -- STS-122/Atlantis/1E landing (KSC: ~8:55am)
 02/22/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana)
 03/06/08 -- ATV-1 Demo Day 1
 03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS
 03/12/08 -- ATV-1 Demo Day 2
 03/15/08 -- ATV-1 Demo Day 3 & Docking (SM aft port)
 04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
 04/08/08 -- Soyuz TMA-12/16S launch
 04/10/08 -- Soyuz TMA-12/16S docking (DC1)
 04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
 04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
 04/24/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS
 04/26/08 -- STS-124/Discovery/1J docking
 05/04/08 -- STS-124/Discovery/1J undocking
 05/14/08 -- Progress M-64/29P launch
 05/16/08 -- Progress M-64/29P docking (DC1)
 08/07/08(NET) -- ATV-1 undocking (from SM aft port)
 08/12/08 -- Progress M-65/30P launch
 08/14/08 -- Progress M-65/30P docking (SM aft port)
 09/09/08 -- Progress M-64/29P undocking (from DC1)
 09/10/08 -- Progress M-66/31P launch
 09/12/08 -- Progress M-66/31P docking (DC1)
 09/18/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
 09/20/08 -- STS-126/Discovery/ULF2 docking
 10/01/08 -- STS-126/Discovery/ULF2 undocking.
 10/01/08 -- **NASA 50 Years**
 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
 10/12/08 -- Soyuz TMA-13/17S launch
 10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
 10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
 11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
 11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment
 11/08/08 -- STS-119/Discovery/15A docking
 11/17/08 -- STS-119/Discovery/15A undocking
 11/20/08 -- **ISS 10 Years**
 11/26/08 -- Progress M-67/32P launch
 11/28/08 -- Progress M-67/32P docking (SM aft port)
 04/15/09 -- **Constellation's Ares I-X Launch**
 05/??/09 -- **Six-person crew on ISS** (following Soyuz 18S-2 docking)
 04/??/10 -- STS-132/Discovery/20A – Node-3 + Cupola.

ISS On-Orbit Status 01/28/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 15 of Increment 16.*

FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night on his Actiwatch, for logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop for downlink.

The FE-2 also performed standard switch-over maintenance on the starboard & portside Lab CCAA (Common Cabin Air Assembly) air conditioners, closing the ITCS LTL (Internal Thermal Control System/Low Temperature Loop) flow to the first (LAB1S6) and initiating it on the second (LAB1P6) unit. This is a periodic service task.

After the successful completion of the Stbd SARJ (Solar Alpha Rotary Joint) video inspection via MCC-H control, Dan Tani maneuvered the SSRMS (Space Station Remote Manipulator System) for the subsequent return of the MT (Mobile Transporter).

At ~5:05am EST (until ~7:50am), Russian thrusters were disabled while the MT (Mobile Transporter) traveled on its rail track from WS-2 (Worksite 2) back to WS-4.

CDR Whitson performed the periodic filter cleaning on the MSG AAA (Microgravity Science Glovebox/Avionics Air Assembly) which involved rotating the MSG Facility rack forward/down by ~50 deg, removing a rear panel, inspecting & cleaning the AAA filter and later reversing these steps.

Afterwards, the CDR retrieved InSPACE-2 payload components from temporary stowage, replaced them into their original locations inside the MSG WV (Work Volume) and removed a protective tape from the CA (Coil Assembly) on the

InSPACE Avionics Assembly. Peggy also cleaned the lens of the InSPACE-2 camera #2.

TsUP-Moscow performed several ground-commanded tests on RS (Russian Segment) systems:

- PCE (Proximity Communications Equipment, MBRL) transmitter 1,2 (PRD1,2) tests involving ISS attitude change (during PCE testing, Peggy kept the protective Lab science window shutters closed);
- SM ODU (Service Module Integrated Propulsion System) BG2 tank refill from Progress 27P; and
- KLEST-154 TV camera test.

FE-1 Malenchenko meanwhile performed the periodic (generally monthly) service of the ESA/RSC-Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS), removing the PCMCIA memory card #938 from the AST spectrometer's slot and replacing it with #942 to continue operations, then testing #938 on the RSK1 laptop for data quantity and total size of files, before stowing it for later return to Earth.

With the Elektron-VM O₂ (oxygen) generator currently off, a one-hour cabin air refresh was to be performed by the FE-1 from Progress 27P storage (SrPK) as required.

Dan Tani worked in the U.S. Airlock on gathering and configuring EVA tools for the 1/30 EVA-14. Later, the three crewmembers reviewed the latest EVA timeline and procedures list before tagging up with ground specialists at ~12:35pm to discuss issues and details.

Dan also changed the VDS VTR (Video Distribution System/Video Tape Recorder) tape for continued ground playback of recorded HDTV footage.

After Houston Flight Controllers started deactivating the CDRA (Carbon Dioxide Removal Assembly) after yesterday's SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellites) experiments and cooling was no longer required, the CDR disconnected the ITCS LTL QD (Internal Thermal Control System/Low Temperature Loop/Quick Disconnect) jumper to the CDRA rack (LAB1D6).

The FE-2 took air samples for the periodic (currently daily) atmospheric status check for ppO₂ (Partial Pressure Oxygen) and ppCO₂ (pp Carbon Dioxide), using the hand-held CSA-CP (Compound Specific Analyzer-Combustion Products), CSA-O₂ (CSA -Oxygen sensor) and CDMK (CO₂ Monitoring Kit). Batteries were to be

replaced if necessary. *[Purpose of the 15-min activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements.]*

Later, Tani disassembled and removed the equipment used earlier for transmission & downlinking of analog (as opposed to digital) video signals from the RS via the MPEG-2 (Moving Pictures Expert Group 2) encoder and Ku-band in “streaming video” packets over the U.S. OpsLAN and Ku-band.

The FE-1 completed today’s routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

The crewmembers performed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Peggy copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working off his discretionary “time permitting” task list for today, Malenchenko completed the daily monitoring, picture-taking and downloading on the newly set up BIO-5 Rasteniya-2 (“Plants-2”) experiment. *[Rasteniya-2, researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. During the duration of the BIO-5 experiment, students of the Moscow City Palace for Youth Creativity of the Meshchansky inter-regional center #15 in Moscow) and the Prince of Oldenburg Lyceum in St. Petersburg will be cultivating plants in parallel on the ground and conducting comparative observation of plant growth and development under gravity and zero-gravity conditions. They are receiving the photo images taken by Yuri.]*

No CEO (Crew Earth Observation) targets uplinked for today.

CEO photography can be viewed and studied at the websites:

ISS On-Orbit Status 01/27/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday -- off-duty day for CDR Whitson, FE-1 Malenchenko and FE-2 Tani except for housekeeping and voluntary work. Ahead: Week 15 of Increment 16.*

FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night on his Actiwatch, for logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop for downlink.

The crew performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the CDR's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

Whitson and Tani supported the second part of the Stbd SARJ (Solar Alpha Rotary Joint) inspection via ground control, by maneuvering the SSRMS (Space Station Remote Manipulator System) to the position for surveying the Datum A surface. *[During each inspection, the SARJ was rotated using 12 degree directed positioning moves every 5 minutes (requires 8 orbits for a full 360 degree inspection). Meanwhile, ground analysis of the root cause of the roller surface failure continues. Power analyses for upcoming missions are scheduled to be completed over the next month. SARJ cleaning and lubrication techniques are being evaluated. A grease gun will be added to 1E manifest. ULF-2 manifest will likely have 12 TBAs (Trundle Bearing Assemblies) and 1 DLA (Drive Lock Assembly). Increment 18 and ULF-2 crew will receive training on outboard mode R&R and SARJ cleaning*

operations.]

For the duration of the SSRMS inspection, Peggy kept the protective Lab science window shutters closed (~1:30pm-3:08am tomorrow morning).

With the Elektron-VM O₂ (oxygen) generator currently off, a 5-min cabin air refresh was to be performed by the FE-1 from Progress 27P storage (SrPK) as required.

Tani performed his daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13/07 (briefly interrupted for EVA-13 photo support). *[The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour.]*

The FE-1 completed today's routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

In the U.S. Airlock, the CDR terminated EMU (Extravehicular Mobility Unit) battery charging in preparation for next week's EVA-14 (1/30).

Later, at ~12:05pm EST, Whitson and Tani conducted a 45-min tagup with ground specialists to discuss their EVA-14 next week (1/30).

Peggy took air samples for the periodic (currently daily) atmospheric status check for ppO₂ (Partial Pressure Oxygen) and ppCO₂ (pp Carbon Dioxide), using the hand-held CSA-CP (Compound Specific Analyzer-Combustion Products), CSA-O₂ (CSA -Oxygen sensor) and CDMK (CO₂ Monitoring Kit). Batteries were to be replaced if necessary. *[Purpose of the 15-min activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements.]*

After assisting CDRA (Carbon Dioxide Removal Assembly) activation yesterday in support of today's session with the SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellites) payload, which he had selected for his VolSci (Voluntary Weekend Science) program, Dan Tani had ~2.5 hrs for conducting another session with the payload. *[Today's session concentrated on the ability of a single crewperson to deploy two satellites. Due to the different air flows introduced with the addition of Node-2, the former operational environment*

has changed, making multi-satellite deployments more challenging. The SPHERES experiment is a test bed for the development and testing of formation flying and other multi-spacecraft control algorithms. SPHERES, done first by Exp-13 FE-1 Jeff Williams, serves to mature autonomous satellite formation flight, rendezvous and docking algorithms in a long duration, microgravity environment. Dan set up the Work Area, dimmed GLAs (General Luminaire Assemblies), programmed & deployed two gas-propelled satellites (orange, red, blue), with five beacons, and used two PD-100 camcorders for video capture, changing the VTR tape as required. Per applicable Flight Rule, SPHERES operations have no CO₂ (Carbon Dioxide) output constraints if the CDRA (CO₂ Removal Assembly) is operating in dual-bed or single-bed mode. Should CDRA not work properly, ECLSS (Environmental Control & Life Support System) engineers will assess the ppCO₂ flight rule requirement. The experiment run was time-critical since Ku-band is required for real-time video downlink.]

Yuri Malenchenko had ~30 min to provide “turn-on/turn-off” support to TsUP-Moscow for the ongoing testing (Test 1) of the ATV PCE (Automated Transfer Vehicle/Proximity Communications Equipment; Russian: MBRL).

With the Elektron-VM O₂ (oxygen) generator currently off, a 5-min cabin air refresh was to be performed by the FE-1 from Progress 27P storage (SrPK) as required.

The crewmembers performed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

The crewmembers had their weekly PFCs (Private Family Conferences) via S-band/ audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop), Yuri at ~6:00am, Peggy at ~12:50pm, and Dan at ~2:19pm.

Malenchenko had three new items on his discretionary “time permitting” task list for today –

- the daily monitoring, picture-taking and downloading on the newly set up BIO-5 Rasteniya-2 ("Plants-2") experiment. *[Rasteniya-2, researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/*

video recording. During the duration of the BI O-5 experiment, students of the Moscow City Palace for Youth Creativity of the Meshchansky inter-regional center #15 in Moscow) and the Prince of Oldenburg Lyceum in St. Petersburg will be cultivating plants in parallel on the ground and conducting comparative observation of plant growth and development under gravity and zero-gravity conditions. They are receiving the photo images taken by Yuri.];

- his sixth run of the Russian DZZ-2 "Diatomeya" ocean observations program, using the NIKON-F5 still camera with 80-200 mm Nikkor zoom lens and the SONY PD-150P camcorder to observe bioproductive processes in Southern Atlantic and Indian Oceans in summer at the Southern Hemisphere. *[Uplinked target zones in the Atlantic Ocean were coastal area of Brazil -- Agulhas subsea depression (RSA area), and the Falkland-Patagonia commercial-production area - Gulf of Guinea (Cameroon), in the Atlantic & Indian Oceans the La Plata estuary (Argentina) – Mascarene Ridge subsea area.];* and
- completed another radiation data monitoring & logging session for flow & dose power data with the Matryoshka-R radiation payload and its LULIN-5 electronics box. *[Accumulated readings were recorded on a log sheet for subsequent downlink to TsUP/Moscow via the BSR-TM payload data channel.]*

No CEO (Crew Earth Observation) targets uplinked for today.

CEO photography can be viewed and studied at the websites:

ISS On-Orbit Status 01/26/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday -- off-duty day for CDR Whitson, FE-1 Malenchenko and FE-2 Tani except for housekeeping and voluntary work.*

FE-1 Malenchenko finished Part 2 of his first stress test plus saliva and blood sampling of the ESA/Russian biomed experiment "IMMUNO" (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS), today completing remaining urine sample collections. Specimens were then stowed in a special urine containment bag (blood samples were secured yesterday in the MELFI {Minus Eighty Degree Celsius Laboratory Freezer for ISS} in cold packs). *[IMMUNO is a 24-hr. test of human immune system changes, with the objective to investigate immune neuro-endocrine reactions in the space environment by studying samples of saliva, blood and urine using collection kits and the biomedical (MBI) protection kit. Also included are entries in a fluid/medications intact log, and a stress-test questionnaire to be filled out by the subject at begin and end of the first day.]*

Today CDR Whitson installed the IWIS hardware in preparation for tomorrow's DTF. This will enable a total of 6 Remote Sensor Units (RSU) to collect data for the DTF on Saturday. Remote sensors were installed in the Airlock and Node 2. IWIS is a Station Development Test Objective (SDTO) that records structural measurements to validate math models used in loads analysis. The data will be used to reduce conservatism and might allow relaxation of operational constraints on activities such as crew exercise, vehicle dockings and reboosts that impart structural loads to ISS. The data will also provide more accurate fatigue calculations that could result in an extension of the ISS life.

In support of the end-to-end testing of the ATV PCE (Automated Transfer Vehicle/ Proximity Communications Equipment; Russian: MBRL), in the Service Module (SM) Malenchenko installed the ATV control panel (PU), the ATV hand controller, the "PCE Z0000" box, made the necessary BKS cable connections and also hooked up the BUAP (Antenna Switching Control Box) telemetry connectors to the BITS2-

12 onboard telemetry measurement system. The installation work was supported by ground specialist tagup via S-band.

With the Elektron-VM O₂ (oxygen) generator currently off, a 5-min cabin air refresh was to be performed by the FE-1 from Progress 27P storage (SrPK) as required.

Starting at ~8:37am EST, TsUP-Moscow conducted five SM thruster tests, each about one second in duration. For the test period, Peggy Whitson had closed the protective Lab science window shutters. The testing concluded at ~8:50am. *[Structural dynamics data were taken during the thruster testing by the IWIS (Internal Wireless Instrumentation System), with a total of 6 RSUs (Remote Sensor Units) collecting vibrational data. IWIS is an SDTO (Station Development Test Objective) that records structural measurements to validate math models used in loads analysis. The data will be used to reduce conservatism and might allow relaxation of operational constraints on activities such as crew exercise, vehicle dockings and reboosts that impart structural loads to ISS. The data will also provide more accurate fatigue calculations that could result in an extension of the ISS life.]*

In the Airlock, the CDR initiated EMU (Extravehicular Mobility Unit) battery charging in preparation for next week's EVA-14 (1/30).

Malenchenko meanwhile worked on the Russian SRVK-2M condensate water processor, removing its BKO multifiltration/purification unit, which has reached its service life limit, and replacing it with a new unit. The old BKO was stowed for deorbiting in Progress 27. *[The BKO, which contains five purification columns to remove dissolved mineral and organic impurities from the condensate, has a service lifetime of at least 450 liters throughput. The purified (deionized) water is used in the Elektron for electrolysis or, after treatment in the BKV water conditioning unit with salts for taste and silver ions for preservation, as potable water in the KPV container.]*

For her Voluntary Weekend Science (VolSci) program today, CDR Whitson conducted another session of the LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System)/Phase 2 operations, sampling three sites (which showed highest endotoxin levels during the December '07 sampling sessions). Plus two repeats of Negative Control (samples of clean water). *[The goal is to compare LOCAD results with the SSK colony growth results. LOCAD uses small, thumb-sized "microfluidic" cartridges that are read by the experiment reader. The cartridges contain dried extract of horseshoe crab blood cells and colorless dye. In the presence of the bacteria, the dried extract reacts strongly to turn the dye a green color. Therefore, the more green dye, the more microorganisms there are in the original sample. The handheld device tests this*

new analysis technology by sampling for the presence of gram negative bacteria in the sample in about 15 minutes, showing the results on a display screen.

Background: Lab-on-a-Chip technology has an ever-expanding range of applications in the biotech industry. Chips are available (or in development) which can also detect yeast, mold, and gram positive bacteria, identify environmental contaminants, and perform quick health diagnostics in medical clinics. The technology has been used to swab the MERs (Mars Exploration Rovers) for planetary protection. With expanded testing on ISS, began by Sunita Williams in March/April this year, this compact technology has broad potential applications in space exploration--from monitoring environmental conditions to monitoring crew health. The current study should prepare for long-duration exploration by demonstrating a system that enables the crew to perform biochemical analysis in space without having to return samples to Earth.]

The FE-2 connected the ITCS LTL QD (Internal Thermal Control System/Low Temperature Loop/Quick Disconnect) jumper to the CDRA rack (LAB1D6) in support of the activation of the CDRA (Carbon Dioxide Removal Assembly) by MCC-Houston, which requires cooling.

Peggy took air samples for the periodic (currently daily) atmospheric status check for ppO₂ (Partial Pressure Oxygen) and ppCO₂ (pp Carbon Dioxide), using the hand-held CSA-CP (Compound Specific Analyzer-Combustion Products), CSA-O₂ (CSA -Oxygen sensor) and CDMK (CO₂ Monitoring Kit). Batteries were to be replaced if necessary. *[Purpose of the 15-min activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements.]*

Dan Tani performed his daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13/07 (briefly interrupted for EVA-13 photo support). *[The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour.]*

Dan also completed today's routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

The crewmembers performed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED (CDR, FE-2) and VELO bike with bungee cord

load trainer (FE-1).

Afterwards, Peggy copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~9:00am EST, the crewmembers held their regular weekly planning conference (WPC) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP/Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

Robotics & SARJ Preview: Continuing the Stbd SARJ (Solar Alpha Rotary Joint) inspection via ground control, today (1/26) the SSRMS (Space Station Remote Manipulator System) was used to inspect the race ring's outer canted surface. Tomorrow, Sunday, the survey will focus on the Datum A surface. During each inspection, the SARJ is rotated using 12 degree directed positioning moves every 5 minutes (requires 8 orbits for a full 360 degree inspection). Meanwhile, ground analysis of the root cause continues. Power analyses for upcoming missions are scheduled to be completed over the next month. SARJ cleaning and lubrication techniques are being evaluated. A grease gun will be added to 1E manifest. ULF-2 manifest will likely have 12 TBAs (Trundle Bearing Assemblies) and 1 DLA (Drive Lock Assembly). Increment 18 and ULF-2 crew will receive training on outboard mode R&R and SARJ cleaning operations.

Weekly Science Update (Expedition Sixteen -- Week 14)

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): Radiation measurements continue to be performed in the PIRS module. Next memory card replacement activity is currently planned on 1/28.

ANITA: Completed.

BCAT-3 (Binary Colloidal Alloy Test 3): "BCAT-3 Investigator, Peter Lu at Harvard, put together a short movie from the photos taken by astronaut Daniel Tani using EarthKAM to capture the time evolution of sample 3. This captured some great science and showed that the new set-up (improvised by Dan) is working very nicely. Even more excitement occurred when sample 4 began running. Sample 4 is the sample closest to the critical point (on the other side of the critical point) in the phase diagram. It should have a surface tension that is about an order of magnitude less than the previous sample and it was not expected to show structure. BUT, we are seeing something with the new setup, and it is allowing us to see very

low contrast images. These new patterns are not yet understood (are they critical fluctuations, bimodal decomposition, something else??). For a short period after sample 4 had been running for about a week and a half some of the images were not good (the camera may have been bumped), but fortunately, the daily camera check and Dan Tani caught this problem. We suspect that he corrected it and we are about to have a look at the new images that have just been downloaded (our camera guru, Jay Owens, will apprise us of the present situation and let everyone know). Because of the new science being seen with sample 4, we have delayed switching to sample 5 until February 4. Three cheers for having astronauts that have the skills and interest to adjust the camera and lighting to capture these difficult to see structures and the interest to check to see that the hardware is working (and right it when it's not)."

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): "Dan, currently you are scheduled to repeat the last CCISS session on 2/4 and 2/5. The session will need to be repeated due to the Shuttle launch slip moving your last session out of the PI requirements."

CFE (Capillary Flow Experiment): Reserve.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): In progress.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaborate Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): In progress.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): First session of the experiment for FE-1 Yuri Malenchenko has started on 1/24. Activities continued on 1/25 and 1/26.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: MULTIGEN-1 samples will be downloaded on STS-122 (1E).

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION/REPOSITORY: In progress.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): "Peggy, thanks for downloading and initializing the Actiwatches. We verified the data and will be sending it to the PI. Dan, with your last download activity being completed your only remaining activities are 11 days of Sleep logging and doffing your Actiwatch on the Shuttle with other crewmembers. We are working to add the Sleep logging to the timeline for your convenience."

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): In progress.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: "Dan, the additional Ultrasound troubleshooting this week will be evaluated for a thorough examination of our HRF Rack 1 B1 drawer location. Last Friday's session helped give us a better understanding of the anomaly. We

appreciate your patience and interest in assisting in the identification of the anomaly.”

CEO (Crew Earth Observation): Through 1/23 the ground has received a total of 12,027 frames of ISS/CEO imagery for review and cataloging. “We are pleased to report that your excellent imagery of three of our CEO targets meets or exceeds our current requirements and we can remove them from our standing target list: Luquillo Forest, Puerto Rico; Lake Poopo, Bolivia; and Perth, Australia. Kudos to the crew! Regarding IPY related targets, although we have found none of your atmospheric limb views with polar mesospheric clouds, we have identified your first Aurora imagery acquired over eastern Canada, and, what appears to be three frames of the mega iceberg A53a near South Georgia Island in South Atlantic Ocean. Other fine target area acquisitions under review include those for the South Tibesti Megafans in North Africa and the Patagonian Glaciers. Many of your images of cities at night are absolutely awesome! Your excellent, detailed view of the Port of Suez, Egypt will be published on NASA/GSFC’s Earth Observatory website this weekend. You continue to provide us with a wealth of great astronaut photography of the Earth.”

CEO photo targets uplinked for today were **Lake Eyre, Australia** (*weather was predicted to be mostly clear over Lake Eyre. Looking right of track for the lake basin. Context views of the region using the short lens were requested*), **Patagonian Glaciers, S. America** (*clear weather conditions continue over the northern Patagonian mountains. Overlapping, nadir mapping frames taken along track of summit glaciers and icefields were requested*), and **S. Georgia/S. Sandwich, S. Atlantic Ocean** (*gaps in cloud cover were expected over S. Georgia Island during this overpass. Mapping photography of snow and ice on eastern/southeastern portion of the island was requested*).

CEO photography can be viewed and studied at the websites:
<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
<http://earthobservatory.nasa.gov/>
<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 7:29am EST [= epoch]):
Mean altitude -- 337.6 km
Apogee height -- 341.2 km
Perigee height -- 333.9 km
Period -- 91.28 min.
Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0005386

Solar Beta Angle -- 32.7 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 65 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 52601

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*):

01/30/08 -- EVA-14 (BMRRM R&R, ~6 hrs)

01/31/08 -- **Explorer-1 50 Years (1st U.S. Satellite on Redstone rocket)** [see <http://usspace50.com> & <http://www.us50thspace.com>]

02/04/08 -- Progress M-62/27P undocking (5:27am) & reentry

02/05/08 -- Progress M-63/28P launch (8:03am)

02/07/08 -- Progress M-63/28P docking (9:33am)

02/07/08 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite. ~2:40pm EST

02/09/08 -- Progress M-

02/22/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana)

03/06/08 -- ATV-1 Demo Day 1

03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS

03/12/08 -- ATV-1 Demo Day 2

03/15/08 -- ATV-1 Demo Day 3 & Docking (SM aft port)

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch

04/10/08 -- Soyuz TMA-12/16S docking (DC1)

04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)

04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

04/24/08 -- STS-124/Discovery/1J launch -- JEM PM "Kibo", racks, RMS

04/26/08 -- STS-124/Discovery/1J docking

05/04/08 -- STS-124/Discovery/1J undocking

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

08/07/08(NET) -- ATV-1 undocking (from SM aft port)

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)

09/18/08 -- STS-126/Discovery/ULF2 launch -- MPLM Leonardo, LMC

09/20/08 -- STS-126/Discovery/ULF2 docking

10/01/08 -- STS-126/Discovery/ULF2 undocking.

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment
11/08/08 -- STS-119/Discovery/15A docking
11/17/08 -- STS-119/Discovery/15A undocking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
04/15/09 -- **Constellation's Ares I-X Launch**
05/??/09 -- **Six-person crew on ISS** (following Soyuz 18S-2 docking)
04/??/10 -- STS-132/Discovery/20A – Node-3 + Cupola.

ISS On-Orbit Status 01/25/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Whitson & FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop for downlink. *[To monitor the crewmembers' sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

Upon wakeup, FE-1 Yuri Malenchenko terminated his eighth MBI-12 SONOKARD experiment session, started last night, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

For his first session of the ESA/Russian biomed experiment "IMMUNO", Yuri Malenchenko set up the IMMUNO urine collection hardware and took air samples with the IPD-NH₃ Draeger tubes sampler, testing for ammonia (NH₃) in the SM, then started the experiment. *[IMMUNO is a 24-hr. test of human immune system*

changes, with the objective to investigate immune neuro-endocrine reactions in the space environment by studying samples of saliva, blood and urine using collection kits and the biomedical (MBI) protection kit. Samples are secured in the MELFI (Minus-Eighty Laboratory Freezer for ISS). Also included are entries in a fluid/medications intact log, and a stress-test questionnaire to be filled out by the subject at begin and end. Urine is collected during a 24-hour period, conventionally divided into two twelve-hour phases: morning-evening and evening-morning.]

At ~3:25am EST, the FE-2 again activated the VDS MPC (Video Distribution System/Multi-Purpose Converter) with its four downlinks to allow the ground to conduct HDTV (high-definition TV) playback and downlink operations. Later (~1:30pm), the MPC was powered off again. *[The end-to-end test of the system, conducted by the crew and ground specialists on 1/17 to verify the MPC HDTV (Multi-Purpose Converter/High-Definition TV) capability all the way to the NASA TV satellite, was very successful, yielding an overall end-to-end audio latency (delay) for the MPC System of 3.2 seconds. This is the delay from the crewmember to JSC/MCC-H to NASA Headquarters and out to the NASA TV satellite in high definition (including, but are not limited to, CNNHD, ABC, NBC, CBS, and Discovery HD Theater), i.e. the sum total of the audio delay the interviewer and interviewee will "feel" during an interactive event. This Japan/JAXA originated system will be utilized soon for downlink messages and in-flight interviews based on client capability.]*

CDR Whitson and FE-2 Tani reviewed the POC DOUG (Portable Onboard Computer Dynamic Ubiquitous Graphics) software for the subsequent SSRMS activities, then conducted SSRMS operations by maneuvering the robotarm through an inchworm-like walk-off to the MT MBS (Mobile Transporter/Mobile Base System), detached it from Node-2 and re-based it (mathematically) on MBS PDGF-1 (Power & Data Grapple Fixture 1).

Afterwards, the MT was translated along its rail track to the Stbd SARJ (Solar Alpha Rotary Joint) inspection position, with Russian thrusters disabled during this period (~7:45am - 10:10am).

FE-1 Malenchenko supported TsUP-Moscow in the last of four days of ASN-M Satellite Navigation System testing, first transferring raw ASN data from the recent (1/22) ATV (Automated Transfer Vehicle) approach rehearsals from Laptop3 to PCMCIA memory card and setting it up for data downlinking to TsUP for analysis and determination how the test is proceeding, then tearing down and disassembling the ASN/laptop raw data gathering setup for subsequent stowage. *[The purpose of the week long testing is to confirm ASN-M hardware readiness for the upcoming ATV "Jules Verne" vehicle docking.]*

Continuing her preparations in the Airlock for EVA-14 next week, CDR Whitson spent some time cleaning out the small EVA trash bag.

With the Elektron-VM O₂ (oxygen) generator currently off, a 5-min cabin air refresh was to be performed by the FE-1 from Progress 27P storage (SrPK) as required.

Malenchenko had time set aside to take documentary photography of the current mounting location of the third REGUL-OS set (CA325) in the Service Module (SM) behind panel 338, to assess the feasibility of installing a new system in place of

-325 at the Regul-OS work area. *[Regul-OS is the Russian radio control and communications system (RSUS), equivalent to the U.S. S-band system. It is the nominal uplink path for all Russian commanding, and it handles two-way voice comm, digital/command/program data, as well as telemetry via RGS (Russian ground sites).]*

In preparation for tomorrow's robotics activities causing structural dynamics, CDR Whitson installed IWIS (Internal Wireless Instrumentation System) accelerometer RSUs (Remote Sensing Units) in the Airlock and Node-2. RSUs are also installed in the Lab, Node-1, FGB and SM (Sync Mode).

For upcoming experiments with the U.S. ULTRASOUND payload, the FE-2 set up and powered on the HRF1 (Human Research Facility1) rack drawers for troubleshooting the ULTRASOUND equipment (by checking light responses to inputs).

Continuing his troubleshooting of the Russian SKV2 air conditioner, the FE-1 inspected and replaced the inlet filter of the NOK-2 condensate evacuation pump. Removal & replacement of the NOK-2 pump is an additional task, currently listed on the Russian "time permitting" discretionary task list.

FE-2 Tani filled out the regular FFQ (Food Frequency Questionnaire), his 11th, on the MEC (Medical Equipment Computer). *[By means of these FFQs, U.S. astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins.]*

Dan also completed today's routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Peggy Whitson worked in the SM preparing (clearing) two panels (#226, #227) for the upcoming installation of the new ATV PCE (Automated Transfer Vehicle/ Proximity Communications Equipment; Russian: MBRL) and the BUAP antenna switching controller, along with their BKS cabling, in preparation for ATV docking at the SM aft end later this year.

The CDR took air samples for the periodic (currently daily) atmospheric status check for ppO₂ (Partial Pressure Oxygen) and ppCO₂ (pp Carbon Dioxide), using the hand-held CSA-CP (Compound Specific Analyzer-Combustion Products), CSA-O₂ (CSA -Oxygen sensor) and CDMK (CO₂ Monitoring Kit). Batteries were to be replaced if necessary. *[Purpose of the 15-min activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements.]*

Dan Tani performed his daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13/07 (briefly interrupted for EVA-13 photo support). *[The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour.]*

Yuri completed the daily 20-min. IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur), working off his voluntary task list.

Also off the "job jar" task list, the FE-1 performed the daily monitoring, picture-taking and downloading on the newly set up BIO-5 Rasteniya-2 ("Plants-2") experiment. *[Rasteniya-2, researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. During the duration of the BIO-5 experiment, students of the Moscow City Palace for Youth Creativity of the Meshchansky inter-regional center #15 in Moscow) and the Prince of Oldenburg Lyceum in St. Petersburg will be cultivating plants in parallel on the ground and conducting comparative observation of plant growth and development under gravity and zero-gravity conditions. They are receiving the photo images taken by Yuri.]*

The crewmembers performed their regular 2.5-hr physical workout program (about

half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Tani copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~3:10am, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~8:20am, the CDR and FE-2 held a crew conference with the next U.S. flight engineer replacing Dan Tani, ESA Astronaut Léopold Eyharts.

At ~12:15pm, Peggy, Yuri and Dan conducted their standard bi-weekly teleconference with the JSC Astronaut Office (Steve Lindsey), via S-band S/G-2 audio & phone patch.

CEVIS Controller Failure: Yesterday (~6:37am EST), after CDR and FE-2 successfully completed PFE-OUM, the CEVIS (Cycle Ergometer with Vibration Isolation) control panel indicated failure of the cycle's controller. The crew was instructed to deploy the CEVIS Contingency Controller (CCC), although it cannot capture Heart Rate (HR) and load data, and to stow the control panel in the CEVIS accessories kit. The crew was also directed to the appropriate CEVIS procedure. CEVIS data will be downlinked and analyzed to determine if any troubleshooting is possible. The crew will be emailed protocols to be used with the CCC.

Robotics & SARJ Preview: Tomorrow (1/26) and on 1/27, the SSRMS (Space Station Remote Manipulator System) will be maneuvered to conduct the scheduled Stbd SARJ (Solar Alpha Rotary Joint) inspection via ground control. On Saturday, SSRMS will inspect the race ring's outer canted surface, while on Sunday the survey will focus on the Datum A surface. During each inspection, the SARJ will be rotated using 12 degree directed positioning moves every 5 minutes (requires 8 orbits for a full 360 degree inspection). Meanwhile, ground analysis of the root cause continues. Power analyses for upcoming missions are scheduled to be completed over the next month. SARJ cleaning and lubrication techniques are being evaluated. A grease gun will be added to 1E manifest. ULF-2 manifest will likely have 12 TBAs (Trundle Bearing Assemblies) and 1 DLA (Drive Lock Assembly). Increment 18 and ULF-2 crew will receive training on outboard mode R&R and SARJ cleaning operations.

CEO (Crew Earth Observation) photo targets uplinked for today were **Heard Island, S. Indian Ocean** (*a clear weather window was predicted to be present in the region of Heard Island at the time of this orbit pass. Looking to the right of track as ISS approached Antarctica. Mapping photography of the island was requested to capture snow and ice extent*), **IPY – Aurora Borealis**, followed by **S. Georgia/S. Sandwich, S. Atlantic Ocean** (*some low clouds were predicted over these South Atlantic islands during this orbit pass, but the potential for useful photography was still high. Looking to the right of track for the islands. Mapping photography of snow and ice on eastern/southeastern portion of the island was requested. There may also have been sea ice visible to the S-SW of the island for photography, including a large iceberg [A53A].*), and **Patagonian Glaciers, S. America** (*ISS orbit track provided a traverse across the northern portion of the Patagonian ranges where clear weather conditions were predicted. Overlapping, nadir mapping frames of summit glaciers and icefields, taken along track, were requested*).

CEO photography can be viewed and studied at the websites:

<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);

<http://earthobservatory.nasa.gov/>

<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 8:27am EST [= epoch]):

Mean altitude -- 337.6 km

Apogee height -- 341.3 km

Perigee height -- 333.9 km

Period -- 91.29 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0005526

Solar Beta Angle -- 32.8 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 84 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 52586

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*):

01/30/08 -- EVA-14 (BMRRM R&R, ~6 hrs)

01/31/08 -- **Explorer-1 50 Years (1st U.S. Satellite on Redstone rocket)** [*see <http://usspace50.com> & <http://www.us50thspace.com>]*

02/04/08 -- Progress M-62/27P undocking (5:27am) & reentry

02/05/08 -- Progress M-63/28P launch (8:03am)

02/07/08 -- Progress M-63/28P docking (9:33am)

02/07/08 -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite. ~2:40pm

EST

02/09/08 -- Progress M-
02/22/08 -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana)
03/06/08 -- ATV-1 Demo Day 1
03/11/08 -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS
03/12/08 -- ATV-1 Demo Day 2
03/15/08 -- ATV-1 Demo Day 3 & Docking (SM aft port)

ISS On-Orbit Status 01/24/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Whitson & FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop for downlink. *[To monitor the crewmembers' sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

Dan Tani dismantled the InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions) experiment in the MSG (Microgravity Science Glovebox) and stowed the equipment, including the video gear.

CDR Whitson performed the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling a CWC (Contingency Water Container, #1054) with the collected water slated for processing. No samples were required this time. *[Estimated offload time before termination (leaving ~6 kg in the tank): ~40 min.]*

The CDR also conducted the weekly 10-min. CWC audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. *[Updated "cue cards" based on the crew's water calldowns are sent up every other week (currently #16-00180).]*

Whitson and Tani set up and activated the OUM-PFE (Oxygen Uptake Measurement - Periodic Fitness Evaluation) equipment at the HRF-2 (Human Research Facility 2) rack for another session, requiring a CEVIS cycle ergometer

workout. Both crewmembers then completed the evaluation protocol, wearing HRMs (Heart Rate Monitors), with each one in turn acting as subject and operator, obtaining measurements on each other during the workout. The CEVIS control panel required some crew intervention. *[The equipment includes the HRF PFM/ PAM (Pulmonary Function Module/Photoacoustic Analyzer Module), Mixing Bag System and GDS (Gas Delivery System). In a change to previous procedures, the calibration of the DPFM (Differential Pressure Flowmeter) was done manually for the first time. Later, Peggy and Dan updated the evaluation protocol, deactivated & stowed the gear, and powered down the OUM-PFE laptop. Purpose of OUM-PFE is to measure aerobic capacity during exercise within 14 days after arrival on ISS, and once monthly during routine PFEs. The data allows exercise physiologists & flight doctors to assess the crew's health & fitness and to provide data for modifying & updating crew-specific exercise regimes. PFE-OUM is a collaborative effort between NASA and ESA (European Space Agency).]*

FE-1 Malenchenko again had several hours for trash transfers to Progress M-62/27P for disposal (2/4), tracking movements in the IMS (Inventory Management System).

Yuri also performed the daily monitoring, picture-taking and downloading on the newly set up BIO-5 Rasteniya-2 ("Plants-2") experiment. *[Rasteniya-2, researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. During the duration of the BIO-5 experiment, students of the Moscow City Palace for Youth Creativity of the Meshchansky inter-regional center #15 in Moscow) and the Prince of Oldenburg Lyceum in St. Petersburg will be cultivating plants in parallel on the ground and conducting comparative observation of plant growth and development under gravity and zero-gravity conditions. They are receiving the photo images taken by Yuri.]*

With the Elektron-VM O₂ (oxygen) generator currently off, a 5-min cabin air refresh was to be performed by the FE-1 from Progress 27P storage (SrPK) as required.

Malenchenko conducted a search to gather the necessary equipment for the ATV (Automated Transfer Vehicle) hand controller of the PCE (Proximity Communications Equipment; Russian: MBRL) system preparatory to its installation on 1/26 for testing. *[To assess the impact of the installed Matryoshka gear on the planned installation of the PCE hand controller box, TsUP-Moscow sent up a picture of the PCE installed on the ISS in 2005.]*

CDR Whitson worked in the U.S. Airlock on preparations of the spacesuits for herself and Dan for EVA-14 on 1/30. *[After terminating battery recharge, Peggy installed REBA 1005 in EMU 3018 (Peggy's) and REBA 1011 in EMU 3006 (Dan's), PGT (Pistol Grip Tool) batteries 1008 & 1009 in the EV1 & EV2 PGTs, PGT battery 1004 in the spare PGT, HL (Helmet Light) 1015 & 1017 on EMU 3018, and HL 1019 & 1021 on EMU 3006.]*

The CDR also installed the METOX (Metal Oxide) CO₂ absorber canisters (in lieu of LiOH cans) in the suits, and checked out the EMUs and the SAFER (Simplified Aid for EVA Rescue) units

As part of his standard fitness evaluation, Malenchenko undertook the Russian MO-5 MedOps protocol of Cardiovascular Evaluation during Graded Exercises on the VELO cycle ergometer, with CDR Whitson assisting as CMO (Crew Medical Officer). *[The 50-min assessment, supported by ground specialist tagup via VHF and telemetry monitoring, uses the Gamma-1 ECG equipment with biomed harness, skin electrodes and a blood pressure and rheoplethysmograph cuff wired to the cycle ergometer's instrumentation panels. For the graded exercise, the subject works the pedals after a prescribed program at load settings of 125, 150, and 175 watts for three minutes each. Data output involves a kinetocardiogram, rheoplethysmogram, rheoencephalogram and a temporal pulsogram.]*

The FE-2 took air samples for the periodic (currently daily) atmospheric status check for ppO₂ (Partial Pressure Oxygen), using the hand-held CSA-O₂

(Compound Specific Analyzer-Oxygen) sensors that were readjusted on 1/22.

Batteries were to be replaced if necessary. *[CSA- O₂s #1041 & #1052 were to be activated (if not already on) for taking readings in the Lab. Afterwards, both units were to be turned off and returned to their stowage. Purpose of the 15-min activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements, prior to US EVA-14 scheduled for next Wednesday. Daily CSA- O₂ readings will be compared to the MCA to ensure the hardware is operating to a known calibrated device. Two CSA- O₂s are required to support the Airlock campout for the upcoming US EVA-14.]*

At the HRF1 (Human Research Facility 1) rack, Tani deactivated the MedOps cardiac defibrillator and conducted its periodic checkout, which was to be recorded on video and later dumped to the ground (Last time done: 12/4/07). *[This routine maintenance task is scheduled as soon as possible from Expedition start and every 60 days thereafter. For the checkout, the defib is connected to the 120V outlet, equipped with its battery (today #1020) and then allowed to charge, for about five*

seconds, to a preset energy level (e.g., 100 joules). After the button-triggered discharge, a console indicator signals success or failure of the test. The pacing signal is downlinked via S-band for 1 min. The HRF was powered down afterwards.]

Dan completed today's routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

The FE-1 performed the daily 20-min. IMS maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The FE-2 set up the video configuration for the upcoming weekend Robotics operations by putting in place the necessary cable hook-up of the UOP DCP (utility outlet panel/display & control panel) power bypass cable at the CUP RWS (Cupola Robotic Work Station).

The crewmembers performed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Tani copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~9:25am EST, the CDR and FE-2 supported an interactive PAO interview with Cathi Erdman of the Chicago Daily Herald.

Robotics & SARJ Preview: Tomorrow, 1/25, the SSRMS (Space Station Remote Manipulator System), currently based on Node-2, will be "walked off" inchworm-style to the MT MBS (Mobile Transporter/Mobile Base System), detached from Node-2 and re-based on MBS PDGF-1 (Power & Data Grapple Fixture 1). On 1/26-27, the SSRMS will be maneuvered to the subsequently planned Stbd SARJ (Solar Alpha Rotary Joint) inspection via ground control. On Saturday, SSRMS will inspect the race ring's outer canted surface, while on Sunday the survey will focus on the Datum A surface. During each inspection, the SARJ will be rotated using 12 degree directed positioning moves every 5 minutes (requires 8 orbits for a full 360 degree inspection). Meanwhile, ground analysis of the root cause continues. Power analyses for upcoming missions are scheduled to be completed over the next month. SARJ cleaning and lubrication techniques are being evaluated. A

grease gun will be added to 1E manifest. ULF-2 manifest will likely have 12 TBAs (Trundle Bearing Assemblies) and 1 DLA (Drive Lock Assembly). Increment 18 and ULF-2 crew will receive training on outboard mode R&R and SARJ cleaning operations.

Progress 26P Reentry: On 1/22, 26P completed its deorbit burn and destructive reentry into the Earth's atmosphere. The 83.16 m/s deorbit burn began at approximately 2:06 pm EST and lasted for 2 minutes and 24 seconds. 26P undocked from the DC1 (Docking Compartment) nadir port on 12/21/07 to make room for 27P.

CEO (Crew Earth Observation) photo targets uplinked for today were **Canberra, Australia** (*weather was predicted to be mostly clear over the capital city of Australia. The nadir pass provided an opportunity to acquire a SW to NE transect across the metropolitan area. Nadir imagery of the rural-urban fringe transition zones is of particular interest*), **Sydney, Australia** (*shortly after leaving Canberra, ISS orbit track brought the crew over the most populous city in Australia - Sydney. Similarly to the Canberra target, a nadir image transect across the metropolitan area and into the harbor was requested*), and **Lake Eyre, Australia** (*looking to the right of track for Lake Eyre, a large and mostly dry lake bed in south-central Australia. General context views using the short lens were requested to capture the entire lake area. This will augment higher resolution images of the lake that the crew acquired earlier in this Expedition*).

CEO photography can be viewed and studied at the websites:
<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site);
<http://earthobservatory.nasa.gov/>
<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 8:21am EST [= epoch]):

Mean altitude -- 337.7 km

Apogee height -- 341.4 km

Perigee height -- 334.0 km

Period -- 91.29 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.000546

Solar Beta Angle -- 31.8 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 98 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 52570

Significant Events Ahead *(all dates Eastern Standard, some changes possible.
NET = Not Earlier Than):*

ISS On-Orbit Status 01/23/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Whitson & FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop for downlink. *[To monitor the crewmembers' sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

Peggy Whitson continued her work with the InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions) experiment in the MSG (Microgravity Science Glovebox), today conducting runs #23 and #24, then powering down the payload and switching the MSG to standby. *[After activation of MSG plus InSPACE & InSPACE-2 equipment, Peggy checked on alignment & focusing of MSG video cam #2, repositioned the sample vial, changed out video recorder tapes and later deactivated InSPACE & MSG. InSPACE, conducted last in June 2006 by Jeff Williams on Increment 13, obtains basic data on magnetorheological fluids, i.e., a new class of "smart materials" that can be used to improve or develop new brake systems, seat suspensions robotics, clutches, airplane landing gear, and vibration damper systems. The dispersed particles are contained in CAs (Coil Assemblies) in the MSG that subject them to electric fields of certain strength and frequencies.]*

FE-1 Malenchenko supported TsUP-Moscow in the third of four days of ASN-M Satellite Navigation System testing. *[Today's activities by Yuri consisted in transferring raw ASN data from yesterday's ATV (Automated Transfer Vehicle) approach rehearsals from Laptop3 to PCMCIA memory card and setting it up for data downlinking to TsUP for*

analysis and determination how the test is proceeding. The purpose of the week long testing is to confirm ASN-M hardware readiness for the upcoming ATV "Jules Verne" vehicle docking.]

Dan Tani performed his daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13/07 (briefly interrupted for EVA-13 photo support). *[The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour.]*

Dan also relocated the IVCPDS/TEPC (Intravehicular Charged Particle Directional Spectrometer/Tissue Equivalent Proportional Counter), the primary radiation measurement tool in the ISS, from Node-2, where it was positioned on 12/24/07, to the Service Module (SM) on panel 410, plugging its power/data cable into the CHeCS (Crew Health Care Systems) outlet 1 on SM panel 210.

FE-1 Yuri Malenchenko underwent the periodic (generally monthly) health test with the cardiological experiment PZEH MO-1 ("Study of the Bioelectric Activity of the Heart at Rest") on the TVIS (Treadmill with Vibration Isolation System). *[During the 45-min. test, the FE-1 tagged up with ground specialists on a Russian ground site (RGS) pass via VHF and downlinked data from the Gamma-1M ECG (electrocardiograph) for about 5-6 minutes.]*

The FE-2 took air samples for the periodic (weekly) atmospheric status check for ppO₂ (Partial Pressure Oxygen), using the hand-held CSA-O₂ (Compound Specific Analyzer-Oxygen) sensors. Batteries were to be replaced if necessary. *[CSA-O₂s #1041 & #1052 were to be activated (if not already on) for taking readings in the Lab. Afterwards, both units were to be turned off and returned to their stowage. Purpose of the 15-min activity is to trend with MCA (Major Constituents Analyzer), i. e., to correlate the hand-held readings with MCA measurements.]*

After printing out newly uplinked procedures for the US EVA-14 next week (1/30), the CDR & FE-2 conducted a two-hour review of the briefing package, covering topics like egress plan, timeline ordering of tasks, translation/fairleads/tether plan, hazards, and ingress plan. Later (~9:10am EST), Peggy and Dan tagged up with ground specialists to discuss particulars. Using the crew input, final procedures are now being prepared. *[The spacewalk of ~6 hrs duration has one major objective, broken into several steps: (1) Set up BMRMM (Bearing Motor Roll Ring Module, "broom") worksite; (2) Removed failed BMRMM (~35 min); (3) Install replacement BMRMM (~35 min); (4) Clean up worksite; and (5) Inspect STBD SARJ (Solar Alpha*

Rotary Joint).]

In the U.S. Airlock, Whitson initiated charging EMU (Extravehicular Mobility Unit) batteries in the BCA (Battery Charger Assembly).

Malenchenko again had several hours for cargo transfers from Progress M-62/27P to the ISS and stowing trash on the drone spacecraft for disposal (2/4), tracking movements in the IMS (Inventory Management System).

The FE-1 completed today's routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Yuri also conducted the daily 20-min. IMS maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

With the Elektron-VM O₂ (oxygen) generator currently off, a 5-min cabin air refresh was to be performed by the CDR from Progress 27P storage (SrPK) as required.

Dr. Whitson broke out and set up the PFE-OUM (PFE-Oxygen Uptake Measurement) equipment on the HRF-2 (Human Research Facility 2) rack, including the HRF PFM/PAM (Pulmonary Function Module/Photoacoustic Analyzer Module), Mixing Bag System and GDS (Gas Delivery System). Data collection on herself and Dan, taking turns, is scheduled tomorrow. *[The Periodic Fitness Evaluation with Oxygen Uptake Measurement experiment, using the CEVIS ergometer for workout, demonstrates the capability of crewmembers to perform periodic fitness evaluations with continuous oxygen consumption measurements within 14 days after arrival on ISS, and once monthly during routine PFEs. Once the capability of the pulmonary function system (PFS) to perform PFEs is verified, crewmembers will be able to integrate their monthly PFE with oxygen consumption measurements to fulfill the requirement for cardiovascular fitness evaluations during long-duration space flight.]*

Working off his discretionary "time permitting" task list, Yuri performed the daily monitoring and picture-taking on the newly set up BIO-5 Rasteniya-2 ("Plants-2") experiment. *[Rasteniya-2, researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. During the duration of the BI O-5 experiment, students of*

the Moscow City Palace for Youth Creativity of the Meshchansky inter-regional center #15 in Moscow) and the Prince of Oldenburg Lyceum in St. Petersburg will be cultivating plants in parallel on the ground and conducting comparative observation of plant growth and development under gravity and zero-gravity conditions. They will be receiving photo images taken by Yuri.]

The crewmembers performed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (FE-1), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Tani copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~11:25am EST, the CDR and FE-2 supported an interactive PAO interview with students, teachers, administrators and guests of Anderson Elementary School in Wichita, KS, gathered at the Exploration Place in Wichita.

At ~2:05pm, Dan is scheduled for his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-10 laptop).

Robotics Preview: On 1/25, the SSRMS (Space Station Remote Manipulator System), currently based on Node-2, will be “walked off” inchworm-style to the MT MBS (Mobile Transporter/Mobile Base System), detached from Node-2 and re-based on MBS PDGF-1 (Power & Data Grapple Fixture 1). On 1/26-27, the SSRMS will be maneuvered to the subsequently planned Stbd SARJ (Solar Alpha Rotary Joint) inspection.

CEO (Crew Earth Observation) photo targets uplinked for today were **Heard Island, S. Indian Ocean** (*a clear weather window is predicted to be present in the region of Heard Island at the time of the ISS pass. Looking to the right of track as the station approached Antarctica. Mapping photography of the island was requested to capture snow and ice extent*), **S. Georgia/S. Sandwich, S. Atlantic Ocean** (*weather was predicted to be clear over these South Atlantic islands during the ISS pass. Looking to the right of track for the islands. Mapping photography of snow and ice on the islands was requested. There may also have been sea ice visible to the S-SW of the island for photography, including a large iceberg [A53A]*), and **Patagonian Glaciers, S. America** (*ISS track provided a traverse across the northern portion of the Patagonian ranges. Overlapping, nadir mapping frames of summit glaciers and icefields, taken along track, were requested*).

CEO photography can be viewed and studied at the websites:
<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site);
<http://earthobservatory.nasa.gov/>
<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 8:00am EST [= epoch]):

Mean altitude -- 337.8 km
Apogee height -- 341.4 km
Perigee height -- 334.2 km
Period -- 91.29 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0005405
Solar Beta Angle -- 30.6 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 107 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 52554

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*
NET = Not Earlier Than):

01/30/08 -- EVA-14 (BMRRM R&R)
01/31/08 -- **Explorer-1 50 Years (1st U.S. Satellite on Redstone rocket)** [*see*

ISS On-Orbit Status 01/22/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Whitson & FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop for downlink. *[To monitor the crewmembers' sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

At ~2:55am EST, the FE-2 again activated the VDS MPC (Video Distribution System/Multi-Purpose Converter) with its four downlinks to allow the ground to conduct HDTV (high-definition TV) playback and downlink operations. Later (~12:15pm), the MPC was powered off again. *[The end-to-end test of the system, conducted by the crew and ground specialists on 1/17 to verify the MPC HDTV (Multi-Purpose Converter/High-Definition TV) capability all the way to the NASA TV satellite, was very successful, yielding an overall end-to-end audio latency (delay) for the MPC System of 3.2 seconds. This is the delay from the crewmember to JSC/MCC-H to NASA Headquarters and out to the NASA TV satellite in high definition (including, but are not limited to, CNNHD, ABC, NBC, CBS, and Discovery HD Theater), i.e. the sum total of the audio delay the interviewer and interviewee will "feel" during an interactive event. This Japan/JAXA originated system will be utilized soon for downlink messages and in-flight interviews based on client capability.]*

In Node-2, the CDR terminated the overnight leak check on the N₂ (nitrogen) recharge system. An overnight leak check of the ISS oxygen recharge line verifies the

integrity of the Node-2 N₂ recharge system installation. *[Node-2 N₂ recharge system fine leak check pass criteria requires real-time analysis to confirm that the N₂ supply pressure decay remains less than 124 kpa (18 psia) over 10 hours.]*

Using the SKDS CMS (Pressure Control & Atmosphere Monitoring System/Countermeasure System), the FE-1 took the periodic readings of potentially harmful contaminants in the Service Module (SM). The hardware was then returned to initial stowage. *[The CMS uses preprogrammed microchips to measure Formaldehyde (H₂CO, methanal), Carbon Monoxide (CO) and Ammonia (NH₃), taking one measurement per microchip.]*

Dan Tani conducted the periodic checkout/verification of IP-1 airflow sensors in the various RS (Russian segment) hatch openings (8) in the SM (Service Module), FGB and DC1 (Docking Compartment).

Dan also terminated the depressurization of the PMA-2 (Pressurized Mating Adapter 2) in front of Node-2 with the depress pump set up yesterday after the successful completion of vestibule outfitting for the upcoming 1E Flight, and performed the standard ~1 hr leak check.

The CDR closed the Lab science window shutters as protection against today's planned thruster firings.

TsUP-Moscow conducted the second of four days of ASN-M Satellite Navigation System testing, with FE-1 support. *[Today's tests centered on an ISS attitude maneuver, controlled from the ground with ASN-M activated, with subsequent attitude hold, designed to rehearse for ATV (Automated Transfer Vehicle) approach. FE-1 transferred data from the -M to the Russian laptop. For the Russian thruster firings, attitude control authority was handed over to Russian MCS (Motion Control System) at ~7:55am EST, to be returned to U.S. momentum management at ~3:20pm. The data will be downlinked tomorrow and Friday so that TsUP-Moscow can perform an analysis on the data and determine how the test is proceeding. The purpose of the week long testing is to confirm the ASN-M hardware readiness for the upcoming ATV "Jules Verne" vehicle docking.]*

Yuri completed today's routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

The FE-1 also conducted the daily 20-min. IMS maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

In the SM, Yuri readied the newly installed Russian BIO-5 Rasteniya-2 ("Plants-2") experiment, planting its root module with pea seeds (6 seeds 1cm deep in each root module row), charging the water canister, loading new software and running a hardware test, then starting the experiment. *[Rasteniya-2, researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording.]*

With the Elektron-VM O₂ (oxygen) generator currently off, a 5-min cabin air refresh is to be performed by the FE-1 from Progress M-62/27P storage (SrPK) as required.

CDR Whitson continued her work with the MSG (Microgravity Science Glovebox) and the InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions) experiment, today conducting runs #21 and #22, then powered down the payload and switched the MSG to standby. At her option, she may also continue with runs scheduled for tomorrow. *[After activation of MSG plus InSPACE & InSPACE-2 equipment, Peggy checked on alignment & focusing of MSG video cams, switched the magnetic field between runs, today, for #22, pulsing the field at 20 Hz (Hertz) instead of 2 Hz as she did previously. Peggy also repositioned the sample vial (VA-004) by 90 deg, used camera 2 & recorder 2 in the vial position 2 starting with run #19, changed out video recorder tapes and later deactivated InSPACE & MSG. InSPACE, conducted last in June 2006 by Jeff Williams on Increment 13, obtains basic data on magnetorheological fluids, i.e., a new class of "smart materials" that can be used to improve or develop new brake systems, seat suspensions robotics, clutches, airplane landing gear, and vibration damper systems. The dispersed particles are contained in CAs (Coil Assemblies) in the MSG that subject them to electric fields of certain strength and frequencies.]*

In the SM, Malenchenko initiated the JAXA-3DPC (Japan Aerospace Exploration Agency-3D Photon Crystals) crystal growth experiment. *[The purpose of this investigation is to grow photonic crystals in microgravity using particles in electrolytic solutions that will be fixed using ultraviolet light in a process referred to as photocuring, after self-organization and ordering of colloid nanoparticles in an electrolyte solution with subsequent fixation in an elastic gel matrix.]*

The CDR and FE-1 completed the mandatory monthly 30-min. CBT (computer-based training with video and audio) to refresh their CMO proficiency/rating. *[To maintain proficiency in using HMS (health maintenance systems) hardware including ACLS (advanced cardiac life support) in contingency situations where*

crew life is at risk, these training sessions are performed once a month to review equipment and procedures via CBT. Besides ACLS, procedures include airway obstruction management, i.e., review of suction device, nasal airway, intubating laryngeal mask airway (ILMA) with endotracheal tube, and cricothyrotomy (incision to re-enable breathing air inflow).]

Dan Tani performed his daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13/07 (briefly interrupted for EVA-13 photo support). *[The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour.]*

The two Flight Engineers worked in the Progress M-62/27P vehicle, dismantling the Kurs-A rendezvous & approach radar system of its motion control & navigation system (SUDN) and removing it from the logistics drone, a 3-hr. job. These valuable components, stowed in the FGB, will be returned to Earth on the Shuttle for reuse. *[KURS-A is the active half of the Russian space program's proven S-band radar system for automated flight, which measures relative motion parameters between Progress (or Soyuz) and the ISS during rendezvous operations, to enable the autopilot's calculation of corrective impulses. The system's passive transponder counterpart (KURS-P) is on the Service Module (SM), with one antenna each at the tip of the two solar array wings.]*

Whitson conducted the periodic (monthly) CSA-CP (Compound Specific Analyzer-Combustion Products) maintenance/checkout, today on all four units, then picked a new prime instrument and returned the backup units & sampling pump to their original locations. *[The CSA-CP is a passive cabin atmosphere monitor that provides quick response capability during a combustion event (fire). Its collected data are stored on a logger. Peggy changed out the batteries on the units, then zero-calibrated the instruments (to eliminate drift in the combustion sensors).*

Following zero calibration, the backup units was stowed in the Node (next to the sampling pump), while the prime unit's datalogger function was turned on to collect data at the SM Central Post as a spot check. After one hour, the datalogger was deactivated, with the prime CSA-CP remaining on for continuous passive sampling.]

The CDR also was scheduled to conduct the periodic SM window inspection & photography, using a tool kit with ruler, adhesive tape, 90-deg equilateral triangle & measuring tape, the NIKON D2 X digital camera with 28-70 mm lens, a flash attachment, and sketches of the windows under scrutiny (##3,5,6,7,8) with previous detected flaws marked and flaw tables. *[Purpose of the activity is to assess the condition of the window panes for deterioration as compared to the data from*

previous increments (appearance of new cavities, scratches, discolorations, or spots reducing transparency, or an increase in the size of old flaws), plus photography.]

FE-1 Malenchenko used the Russian MO-21 “Ecosfera” air sampler & incubation equipment for another check on the station’s sanitary-hygiene status, conducting the standard 45-min. microbial analysis (T+7 days) on the air samples collected on 1/15 and incubated since then in the MO-21 equipment in Medium 2 (MON-2).
[MO-21 determines microbial contamination of the ISS atmosphere, specifically the total bacterial and fungal microflora counts and microflora composition according to morphologic criteria of microorganism colonies.]

Whitson performed the regular monthly & quarterly maintenance of the TVIS (Treadmill with Vibration Isolation & Stabilization), inspecting the condition of harnesses, belt slats, corner bracket ropes, IRBAs (Isolation Restorative Bungee Assemblies) and gyroscope wire ropes for any damage or defects, lubricating as required plus recording time & date values.

A new addition to Peggy’s voluntary “job jar” task list was to continue the current round of periodic preventive maintenance of RS (Russian Segment) ventilation systems by cleaning the detachable VT7 fan screens 1, 2 & 3 of the three SOTR (Thermal Control System) gas-liquid heat exchangers (GZhT4) in the FGB.

The crewmembers performed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Peggy copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~5:30am, Yuri Malenchenko conducted a periodic private teleconference with his physical exercise specialist at TsUP.

Robotics Preview: On 1/25, the SSRMS (Space Station Remote Manipulator System), currently based on Node-2, will be “walked off” inchworm-style to the MT MBS (Mobile Transporter/Mobile Base System), detached from Node-2 and re-based on MBS PDGF-1 (Power & Data Grapple Fixture 1). On 1/26-27, the SSRMS will be maneuvered to the subsequently planned Stbd SARJ (Solar Alpha Rotary Joint) inspection.

No CEO photo targets uplinked for today. *[Due to the Martin Luther King Jr. Federal Holiday yesterday, the next CEO observations will be conducted tomorrow (targets uplinked today).]*

CEO photography can be viewed and studied at the websites:

ISS On-Orbit Status 01/21/08

All ISS systems continue to function nominally, except those noted previously or below. *Martin Luther King Jr. Federal Holiday. Underway: Week 14 of Increment 16.*

CDR Whitson & FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop for downlink. *[To monitor the crewmembers' sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

FE-1 Malenchenko supported the begin of the scheduled end-to-end ASN-M Satellite Navigation System test, today installing Laptop3, connecting it to the MKO-1 (Multiplex Exchange Channel), then initializing it with its specialized software. *[ASN-M is required for the arrival of the European ATV (Automated Transfer Vehicle) "Jules Verne" later this year.]*

Peggy Whitson prepared PMA-2 (Pressurized Mating Adapter 2), where STS-122/1E will dock next month, for interim ingress, first pressurizing it, then opening the Node-2 forward hatch, removing the hatch thermal cover and the CBCS (Centerline Berthing Camera System) target, then installing the HHGA (Hatch Handle Guide Ring).

With PMA-2 pressurized, Whitson ingressed the adapter from Node-2, configured its outward vestibule for the docking with STS-122/1E and closed out the radial port in the Node-2/PMA-2 vestibule. Later, after egress, Tani evacuated the PMA-2 with the depress pump and stowed the VAJ (Vacuum Access Jumper) equipment.

While in Node-2, the CDR performed a purge and leak check on the N₂ (nitrogen) recharge system.

After setting up the hardware, Yuri Malenchenko conducted a run with the Russian MBI-21 PNEVMOKARD experiment, his third on-orbit session (which forbids moving or talking during data recording). The experiment is controlled from the RSE-Med A31p laptop, equipped with new software, and uses the TENZOPLUS sphygmomanometer to measure arterial blood pressure. *[PNEVMOKARD (Pneumocard) is an attempt to obtain new scientific information to refine the understanding about the mechanisms used by the cardiorespiratory system and the whole body organism to spaceflight conditions. By recording (on PCMCIA cards) the crewmember's electrocardiogram, impedance cardiogram, low-frequency phonocardiogram (seismocardiogram), pneumotachogram (using nose temperature sensors), and finger photoplethysmogram, the experiment supports integrated studies of (1) the cardiovascular system and its adaptation mechanisms in various phases of a long-duration mission, (2) the synchronization of heart activity and breathing factors, as well as the cardiorespiratory system control processes based on the variability rate of physiological parameters, and (3) the interconnection between the cardiorespiratory system during a long-duration mission and the tolerance of orthostatic & physical activities at the beginning of readaptation for predicting possible reactions of the crewmembers organism during their return to ground.]*

In preparation of the upcoming EVA-14 (1/30), the FE-1 recorded the "Pille" radiation readings from the EMU-worn (plus one background) "Pille-MKS" dosimeters in a log table for subsequent downlink to the ground.

With the Elektron-VM O₂ (oxygen) generator currently off, a 5-min cabin air refresh is to be performed by the FE-1 from Progress M-62/27P storage (SrPK) as required.

Malenchenko also outfitted the FGB with a new hatch seal drive handle which he transferred from the SSVP (Docking & Internal Transfer System) accessory kit of Soyuz TMA-11/15S to the FGB's SSVP kit. The old handle was returned from the FGB kit to the Soyuz to be used in final Soyuz SU (Descent Capsule)/BO (Orbital compartment) hatch closures and subsequent disposal in the BO.

In the Service Module (SM), Yuri installed a new atmosphere purification filter (A2).

The FE-1 also performed monthly maintenance on the Russian IK0501 GA (gas analyzer) of the SOGS Pressure Control & Atmospheric Monitoring System, deactivating the unit and replacing its CO₂ filter assembly (BF) with a new unit from FGB stowage (replaced last: 12/9). *[After ensuring good seals on the instrument's*

base and no leaks around the installed filter, Yuri reactivated the GA and stowed the spent BF for disposal. IK0501 is an automated system for measuring CO₂, O₂, and H₂O in the air as well as the flow rate of the gas being analyzed.]

Yuri completed today's routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Working off his discretionary "time permitting" task list, the FE-1 conducted the daily 20-min. IMS maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crewmembers performed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (FE-1), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Peggy copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Starting a new current round of periodic preventive maintenance of ventilation systems in the RS (Russian Segment), FE-2 Tani worked in the DC1 (Docking Compartment) to replace the PF1,2 filter cartridges and clean the V1 & V2 fan grilles and VD1 & VD2 air ducts.

The CDR ran the periodic check of active U.S. payloads, i.e., cleaning the ANITA (Analyzing Interferometer for Ambient Air) inlet plus inspecting and filter cleaning of the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload.

[The CGBA incubator is controlled from the ground, with automatic video downlinked to Earth. ANITA continues to collect data every six seconds and downlinks the data daily to the ground team. ANITA monitors low levels of potential gaseous contaminants in the ISS cabin atmosphere with a capability of simultaneously monitoring 32 gaseous contaminants. The experiment is testing the accuracy and reliability of this technology as a potential next-generation atmosphere trace-gas monitoring system for ISS and future spacecraft. This is a cooperative investigation with ESA.]

Peggy also prepared for tomorrow's scheduled SM window inspection & photography by unstowing a tool kit with ruler, adhesive tape, 90-deg equilateral

triangle & measuring tape, the NIKON D2 X digital camera with 28-70 mm lens, a flash attachment, and sketches of the windows under scrutiny (##3,5,6,7,8) with previous detected flaws marked and flaw tables. *[Purpose of the activity is to assess the condition of the window panes for deterioration as compared to the data from previous increments (appearance of new cavities, scratches, discolorations, or spots reducing transparency, or an increase in the size of old flaws), plus photography.]*

Tani performed his daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13/07 (briefly interrupted for EVA-13 photo support). *[The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour.]*

The crewmembers conducted their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Peggy Whitson copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Conjunction Update: Further tracking of the piece of orbital debris (Object #28099, an old Russian Strela ICBM body, NATO designation: SS-11 Sego) moved the closest approach out of the Notification Box into the “Green”, with a Pc (Probability of Collision) going below 10×10^{-17} (10 to the power of -17). Russian Ballistics stood down on any maneuver planned for Saturday morning (their time).

No CEO photo targets uplinked for today. *[Due to the Martin Luther King Jr. Federal Holiday tomorrow (1/21), the next CEO observations will be conducted on 1/23 (targets uplinked 1/22).]*

CEO photography can be viewed and studied at the websites:
<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
<http://earthobservatory.nasa.gov/>
<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 8:51am EST [= epoch]):

Mean altitude -- 338.0 km

Apogee height -- 341.7 km

Perigee height -- 334.4 km

Period -- 91.29 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0005428

Solar Beta Angle -- 26.5 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 115 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 52523

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*

NET = Not Earlier Than):

01/30/08 -- EVA-14 (BMRRM R&R)

01/31/08 -- **Explorer-1 50 Years (1st U.S. Satellite on Redstone rocket)** [*see <http://usspace50.com>*]

02/04/08 -- Progress M-62/27P undocking (5:30am) & reentry

02/05/08 -- Progress M-63/28P launch (8:03am)

02/07/08 -- Progress M-63/28P docking (9:33am)

02/07/08(target date) -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-

Lite.02/09/08 -- Progress M-

02/22/08(NET) -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana)

03/06/08 -- ATV-1 Demo Day 1

03/12/08 -- ATV-1 Demo Day 2

03/13/08(target date) -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS

03/15/08 -- ATV-1 Demo Day 3 & Docking (SM aft port)

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch

04/10/08 -- Soyuz TMA-12/16S docking (DC1)

04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)

04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

04/24/08 -- STS-124/Discovery/1J launch -- JEM PM "Kibo", racks, RMS

04/26/08 -- STS-124/Discovery/1J docking

05/04/08 -- STS-124/Discovery/1J undocking

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

08/07/08(NET) -- ATV-1 undocking (from SM aft port)

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
09/18/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
09/20/08 -- STS-126/Discovery/ULF2 docking
10/01/08 -- STS-126/Discovery/ULF2 undocking.
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment
11/08/08 -- STS-119/Discovery/15A docking
11/17/08 -- STS-119/Discovery/15A undocking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
04/15/09 -- **Constellation's Ares I-X Launch**
05/??/09 -- **Six-person crew on ISS** (following Soyuz 18S-2 docking)
04/??/10 -- STS-132/Discovery/20A – Node-3 + Cupola.

ISS On-Orbit Status 01/20/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday -- off-duty day for CDR Whitson, FE-1 Malenchenko and FE-2 Tani. Ahead: Week 14 of Increment 16.*

For today's VolSci (Voluntary Weekend Science) program, CDR Whitson continued her work with the MSG (Microgravity Science Glovebox) and the InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions) experiment, today conducting runs #18, #19, and #20, then powered down the payload and switched the MSG to standby. *[After activation of MSG plus InSPACE & InSPACE-2 equipment, Peggy checked on alignment & focusing of MSG video cams, switched the magnetic field between runs, today pulsing the field at 2 Hz (Hertz) instead of 20 Hz as she did previously. Peggy also repositioned the sample vial (VA-004) by 90 deg, used camera 2 & recorder 2 in the vial position 2 starting with run #19, changed out video recorder tapes and later deactivated InSPACE & MSG. InSPACE, conducted last in June 2006 by Jeff Williams on Increment 13, obtains basic data on magnetorheological fluids, i.e., a new class of "smart materials" that can be used to improve or develop new brake systems, seat suspensions robotics, clutches, airplane landing gear, and vibration damper systems. The dispersed particles are contained in CAs (Coil Assemblies) in the MSG that subject them to electric fields of certain strength and frequencies.]*

FE-2 Dan Tani completed his daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13/07 (briefly interrupted for EVA-13 photo support). *[The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour.]*

FE-1 Malenchenko conducted today's routine maintenance of the SOZh system

(Environment Control & Life Support System, ECLSS) in the Service Module (SM), including ASU toilet facilities systems/replaceables, the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP.

The crewmembers performed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

At ~9:30am EST, Yuri had his PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-10 laptop).

At ~2:22pm, Dan had his PFC.

With the Elektron-VM O₂ (oxygen) generator currently off, a 5-min cabin air refresh is to be performed by the FE-1 (off his voluntary task list) from Progress M-62/27P storage (SrPK) as required.

MPC HDTV Update: Dan Tani was lauded by the ground for his great work on 1/17 verifying the MPC HDTV (Multi-Purpose Converter/High-Definition TV) capability all the way to the NASA TV satellite. The test was very successful, yielding an overall end-to-end audio latency (delay) for the MPC System of 3.2 seconds. This is the delay from the crewmember to JSC/MCC-H to NASA Headquarters and out to the NASA TV satellite in high definition, i.e. the sum total of the audio delay the interviewer and interviewee will "feel" during an interactive event. This Japan/JAXA originated system will be utilized soon for downlink messages and in-flight interviews based on client capability.

No CEO photo targets uplinked for today. *[Due to the Martin Luther King Federal Holiday tomorrow (1/21), the next CEO observations will be conducted on 1/23 (targets uplinked 1/22).]*

CEO photography can be viewed and studied at the websites:
<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site);
<http://earthobservatory.nasa.gov/>
<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 8:37am EST [= epoch]):
Mean altitude -- 338.1 km

Apogee height -- 341.8 km
Perigee height -- 334.5 km
Period -- 91.30 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0005434
Solar Beta Angle -- 23.8 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 132 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 52507

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*

NET = Not Earlier Than):

01/30/08 -- EVA-14 (BMRRM R&R)

01/31/08 -- **Explorer-1 50 Years (1st U.S. Satellite on Redstone rocket)** [*see <http://usspace50.com>]*

02/04/08 -- Progress M-62/27P undocking (5:30am) & reentry

02/05/08 -- Progress M-63/28P launch (8:03am)

02/07/08 -- Progress M-63/28P docking (9:33am)

02/07/08(target date) -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-

Lite.02/09/08 -- Progress M-

02/22/08(NET) -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana)

03/06/08 -- ATV-1 Demo Day 1

03/12/08 -- ATV-1 Demo Day 2

03/13/08(target date) -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS

03/15/08 -- ATV-1 Demo Day 3 & Docking (SM aft port)

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch

04/10/08 -- Soyuz TMA-12/16S docking (DC1)

04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)

04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

04/24/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS

04/26/08 -- STS-124/Discovery/1J docking

05/04/08 -- STS-124/Discovery/1J undocking

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

08/07/08(NET) -- ATV-1 undocking (from SM aft port)

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)

09/18/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC

09/20/08 -- STS-126/Discovery/ULF2 docking
10/01/08 -- STS-126/Discovery/ULF2 undocking.
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment
11/08/08 -- STS-119/Discovery/15A docking
11/17/08 -- STS-119/Discovery/15A undocking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
04/15/09 -- **Constellation's Ares I-X Launch**
05/??/09 -- **Six-person crew on ISS** (following Soyuz 18S-2 docking)
04/??/10 -- STS-132/Discovery/20A – Node-3 + Cupola.

ISS On-Orbit Status 01/19/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday -- off-duty day for CDR Whitson, FE-1 Malenchenko and FE-2 Tani except for housekeeping and voluntary work.*

CDR Whitson & FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop for downlink. *[To monitor the crewmembers' sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

Peggy and Dan performed their part of the regular weekly station cleaning (Yuri having done his share yesterday). *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the CDR's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

Tani also performed his daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13/07 (briefly interrupted for EVA-13 photo support). *[The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour.]*

At ~9:05am EST, the crewmembers held their regular weekly planning conference (WPC) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP/Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

Later, Yuri completed today's routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including ASU toilet facilities systems/replaceables.

The crewmembers performed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Peggy Whitson copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Yuri again had some time for transferring cargo delivered on Progress M-62/27P to the ISS and stowing it.

Conjunction Advisory: MCC-Houston ballistics specialists are monitoring a conjunction with orbital debris (Object #28099, an old Russian Strela ICBM body, NATO designation: SS-11 Sego), with TCA (time of closest approach) tomorrow morning at ~10:36am EST. Current predictions (Update #8) show a miss distance of ~20.6 km, which falls within the Notification Box according to Flight Rule (B4-101). Russian Ballistics has been notified. Prime DAM TIG (Debris Avoidance Maneuver Time of Ignition), based on current prediction, will be tomorrow morning at 8:18am EST for a TCA of 10:36am.

Weekly Science Update (Expedition Sixteen -- Week 13)

ALTECRIS (Alteino Long Term monitoring of Cosmic Rays on the ISS): ALTEINO instrument has been rotated by the crew on 1/8 and memory card has been exchanged. Photos of the new configuration have been taken and placed on OCA for down-link. On 1/9 data has been downlinked and unexpected file size has been reported (partial recording). Analysis from the pictures showed that the grounding strap of the ALTEINO instrument got loose, leading to incorrect behavior of the instrument. After TsUP-Moscow request, the grounding cable has been fastened again and ALTEINO re-activated on 1/15.

ANITA: Completed.

BCAT-3 (Binary Colloidal Alloy Test 3): “Here is our re-cap from last Monday’s (1/14) ops to photo all samples then run sample 4. Seeing all the samples was very interesting and spurred the planned 1/24 sample 5 ops. We thank those involved in keeping EarthKAM going for BCAT!! Samples 1, 2, 3 and 6 all follow the same phase-separation sequence (as in the sample 3 movie he sent along), yet samples 4 and 5 are different and hence even more interesting. A scientific publication describing these findings is being prepared.”

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): “Dan, we are waiting to get the new launch date so we can schedule your second in-flight session to meet the R-21 to R-14 requirement. This activity will be hard scheduled when we get a firm launch date.”

CFE (Capillary Flow Experiment): Reserve.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): In progress.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaborate Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): In progress.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): “InSPACE-2 completed its nominal science this week and initiated an additional set of runs to further investigate pulsed-field structures at a lower pulse frequency. The fourth and highest concentration sample was successfully tested to conclude the nominal science. In total 17 runs have been completed. Our early observation of the video of the nominal science indicates that the chain structures aggregate laterally into a formation of thicker chains and voids, with a characteristic separation wavelength which depends on field strength and

volume fraction. The chain aggregates are columns spanning the length of the cell, as opposed to ellipsoidal structures observed on the ground. The additional science runs provided the first glimpse of ellipsoidal structures with sharp pointed ends. A very interesting pulse behavior of the structures was observed. The aggregate structures pulsed lengthwise with the magnetic field and pulsed laterally in a wavy pattern was fascinating to watch.”

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 “Pirs”.

MULTIGEN-1: MULTIGEN-1 samples will be downloaded on STS-122 (1E).

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION/REPOSITORY: ” Dan, thank you for your voluntary participation in a stand-alone Repository session. Your attention in keeping to the time constraints was much appreciated!”

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): “Peggy & Dan, we have added an Actiwatch download/initialization activity to the task list. The Actiatches will stop taking data on 1/26 if not performed before then.”

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): In progress.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

CEO (Crew Earth Observation): Through 1/15 the ground has received a total of 10,857 frames of ISS/CEO imagery for review and cataloging. "We have identified and are evaluating excellent imagery of our requests for: South Georgia Island; Gulf of Fonseca; and Perth, Australia (some of the best we've ever seen). We have also noted with delight your excellent imagery of cities at night. PAO is using one of your Dallas-Fort Worth, TX views. Your dramatic, oblique view of the Great Sand Dunes National Park and Preserve, CO will be published on NASA/GSFC's Earth Observatory website this weekend. Your view beautifully captures the context and extent of this spectacular dune field banked against the Sangre de Cristo Mountains. What a nice catch! Thanks for your fine work."

CEO photo targets uplinked for today were Patagonian Glaciers, S. America (ISS orbit track brought the crew over the central Patagonian mountains. Looking to the left of track as the station passed over the mountains for glaciers and icefields near the summit ridgelines), and Jarvis Island, equatorial Pacific (weather was predicted to be clear over Jarvis Island, which is located roughly halfway between the Hawaiian and Cook Islands. Jarvis is an uninhabited coral island, but during the 19th century it was a mining location for bird guano. The island is now a U.S. National Wildlife Refuge [for seabirds, shorebirds, and marine fauna]. Looking slightly to the left of track for the island.

CEO photography can be viewed and studied at the websites:

<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site);

<http://earthobservatory.nasa.gov/>

<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 8:15am EST [= epoch]):

Mean altitude -- 338.3 km

Apogee height -- 341.9 km

Perigee height -- 334.6 km

Period -- 91.30 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0005486

Solar Beta Angle -- 20.8 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 124 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 52491

Significant Events Ahead *(all dates Eastern Standard, some changes possible.*

NET = Not Earlier Than):

01/30/08 -- EVA-14 (BMRRM R&R)

01/31/08 -- **Explorer-1 50 Years (1st U.S. Satellite on Redstone rocket)** [*see <http://usspace50.com>]*

02/04/08 -- Progress M-62/27P undocking (5:30am) & reentry

02/05/08 -- Progress M-63/28P launch (8:03am)

02/07/08 -- Progress M-63/28P docking (9:33am)

02/07/08(target date) -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite.02/09/08 -- Progress M-

02/22/08(NET) -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana)

03/06/08 -- ATV-1 Demo Day 1

03/12/08 -- ATV-1 Demo Day 2

03/13/08(target date) -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS

03/15/08 -- ATV-1 Demo Day 3 & Docking (SM aft port)

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch

04/10/08 -- Soyuz TMA-12/16S docking (DC1)

04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)

04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

04/24/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS

04/26/08 -- STS-124/Discovery/1J docking

05/04/08 -- STS-124/Discovery/1J undocking

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

08/07/08(NET) -- ATV-1 undocking (from SM aft port)

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)

09/18/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC

09/20/08 -- STS-126/Discovery/ULF2 docking

10/01/08 -- STS-126/Discovery/ULF2 undocking.

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)

11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment

11/08/08 -- STS-119/Discovery/15A docking

11/17/08 -- STS-119/Discovery/15A undocking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
04/15/09 -- **Constellation's Ares I-X Launch**
05/??/09 -- **Six-person crew on ISS** (following Soyuz 18S-2 docking)
04/??/10 -- STS-132/Discovery/20A – Node-3 + Cupola.

ISS On-Orbit Status 01/18/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Whitson & FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop for downlink. *[To monitor the crewmembers' sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

Also before breakfast, Peggy Whitson, Yuri Malenchenko and Dan Tani performed the periodic Russian biomedical routine assessments PZEh-MO-7/Calf Volume Measurement and PZEh-MO-8/Body Mass Measurement (6th for CDR & FE-1, 5th for FE-2), using the IM mass measurement device which Malenchenko afterwards broke down for stowage. *[Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference points, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures. For determining body mass in zero-G, where things are weightless but not massless, the Russian IM "scales" measure the inertial forces that arise during the oscillatory motion of a mass driven by two helical metering springs with known spring constants. By measuring the time period of each oscillation of the unknown mass (the crewmember) and comparing it to the period of a known mass, the crewmember's mass is calculated by the computer and displayed.]*

At ~3:55am EST, the FE-2 again activated the VDS MPC (Video Distribution System/Multi-Purpose Converter) with its four downlinks to allow the ground to

conduct HDTV (high-definition TV) playback and downlink operations. Later (~1:05pm), the MPC was powered off again. *[The end-to-end test of the system, conducted by the crew and ground specialists on 1/17 from the ISS through the NASA DTV system using the MPC to determine signal latency was a full success. Final results for latency measurements should be available early next week, although the current estimate in the delay was approximately 3 seconds. This capability will allow High Definition (HD) TV transmission to NASA Headquarters which can then broadcast to network HD channels. Networks that could potentially take advantage of this opportunity include, but are not limited to, CNNHD, ABC, NBC, CBS, and Discovery HD Theater. The MPC Project is a joint SDTO between JAXA and NASA to downlink HDTV from the ISS.]*

Dan Tani performed his daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13/07 (briefly interrupted for EVA-13 photo support). *[The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour.]*

FE-1 Malenchenko conducted the regular weekly station cleaning in the Russian segment (RS). *[“Uborka”, usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the CDR’s sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises.]*

CDR Whitson removed and replaced two RPCMs (Remote Power Controller Modules) in the Lab. *[The R&R of RPCMs LA1B-H & LA1B_C was complicated by the fact that the TeSS rack in the Lab had to be removed to access the work site, as well as the fact that significant power-downs were required to safe the RPCMs for removal.]*

Thus, preparatory to the RPCM IFM (Inflight Maintenance), Whitson and Tani removed the TeSS (Temporary Sleep Station) rack to gain access behind it in the Lab endcone for the subsequent RPCM removal & replacements (R&Rs). Later, Peggy and Dan restored the TeSS to its normal position.

The CDR took off the PPRV (Positive Pressure Relief Valve) cap in the Node 2 starboard hatch; she later reinstalled it on the PPRV.

Before the R&Rs, the FE-2 also turned off the loads (equipment) powered by UOP-

6 (Utility Outlet Panel 6) in the Lab, which included the SSC-4 (Station Support Computer 4), SSC-7, and MEC (Medical Equipment Computer). After the RPCM R&Rs, UOP-6 loads were powered on again, and SSC-4 was logged in to launch the KFX (Ku Band File Transfer) application, which it supports.

Prior to the scheduled installation of the BUAP (Antenna Switching Control Box) gear of the ATV PCE (Automated Transfer Vehicle/Proximity Communications Equipment; Russian: MBRL), FE-1 Malenchenko and TsUP specialists performed a planned deactivation of the Elektron. As part of the deactivation process the Elektron was purged with N₂ (nitrogen), controlled from laptop.

Afterwards, Yuri had several hours set aside for the installation and checkout of the BUAP (which will switch between the external PCE antennas), followed by its connection to the BITS2-12 Onboard Telemetry Measurement System. The installation was tested by checking the AFU (Antenna Feeder Unit) circuit lines and connections for continuity and RF (radio frequency) performance with a "Standing Wave Coefficient" (KSV) test using an FSH3 spectrum analyzer from the GTS (Global Timing System). The FHS3 measurements were then transferred to the TP2 laptop and prepared for downlink to the ground. *[The PCE/MBRL components for ATV prox ops are the space-to-space radio "monoblock" (PCE Z0000), the BUAP, and the ATV control panel (PU). A full-scale test of the PCE with all antennas is scheduled for later this month.]*

The two flight engineers had again time reserved for cargo transfers and stowage from Progress M-62/27P.

Dan also filled out the regular FFQ (Food Frequency Questionnaire), his 10th, on the MEC. *[By means of these FFQs, U.S. astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins.]*

Peggy took air samples for the periodic (weekly) atmospheric status check for ppO₂ (Partial Pressure Oxygen) and ppCO₂ (pp Carbon Dioxide), using the hand-held CSA-CP (Compound Specific Analyzer-Combustion Products), CSA-O₂ (CSA - Oxygen sensor) and CDMK (CO₂ Monitoring Kit). Batteries were to be replaced if necessary. *[Purpose of the 15-min activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements.]*

Yuri completed today's routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including ASU toilet facilities systems/replaceables.

The crewmembers performed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Dan Tani copied the exercise data file to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working off his discretionary "time permitting" task list, the FE-1 conducted the daily 20-min. IMS maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

At ~2:15am EST, the CDR had her weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-10 laptop).

At ~3:20am, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~3:55am, Yuri linked up with TsUP stowage specialists via S-band to conduct the weekly IMS tagup, discussing stowage issues and equipment locations.

At ~12:45pm, the crew will conduct the periodic science/research conference with Science Program representatives at MCC-H. *[In terms of accomplishments, of the originally (at beginning of Increment) planned 92 hours plus 194 hours of reserve not planned/scheduled, all planned and reserve activities have been completed (except those that need to be done post-1E). Replanning is in work for additional research through 1E, including InSPACE, SPHERES, LOCAD, SWAB, SLAMM-D, NUTRITION & Repository, and newly designed EPO Demos. New activities coming up with STS-122/1E are GEOFLOW and WAICO.]*

At ~2:20pm, the crew is scheduled for their ninth weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. *[S/G-2 (Space-to-Ground 2) phone patch via SSC-10 (Station Support Computer 10)].*

CEO photo targets uplinked for today were *Antarctic Ice Pack*, *S. Atlantic Ocean* (storm systems are moving through the South Atlantic, but significant holes in the cloud deck can be expected. Icebergs may be visible through these holes. The larger ice fragments are monitored as potential hazards to ships and as part of International Polar Year research. Looking to the right of track as ISS approached Antarctica for opportunities to view the sea surface), and **Patagonian Glaciers, S. America** (ISS orbit track traversed the northern Patagonian mountains from NW to SE. Nadir overlapping frames, taken along track, of glaciers and icefields on the mountain flanks and summits were requested for time-series analysis of ice extent and morphology change).

CEO photography can be viewed and studied at the websites:

<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site);

<http://earthobservatory.nasa.gov/>

ISS On-Orbit Status 01/17/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Whitson & FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop for downlink. *[To monitor the crewmembers' sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

Preparatory to today's pump R&R (Removal & Replacement) of the EHS VOA (Environmental Health Systems/Volatile Organic Analyzer), CDR Whitson rotated the CHeCS rack down for some AAA (Avionics Air Assembly) fan/filter and smoke detector cleaning, before FE-2 Tani performed the VOA IFM (Inflight Maintenance), with filter inspection, preceded and followed by taking CSA-O₂ (Compound Specific Analyzer-Oxygen) readings in the affected rack areas. *[If the O₂ percentage was between 15.7% - 24.1%, Dan was Go to proceed. If not, the ground had steps to be taken to ventilate the area. Ground analysis has shown that the secondary seals in QDs (Quick Disconnects) in the Nitrogen/Oxygen systems do not always seal properly, which can result in an increased N₂/O₂ concentration behind panels & racks with no ventilation. The CHeCS (LAB1D4) is one of these racks.]*

FE-1 Malenchenko set up the equipment for his first session with the Russian experiment DYKHANIE ("respiration", "breathing"), tagged up with ground specialists and conducted the session, later closing down and stowing the equipment. *[Dykhane-1 gear uses two belts (PG-T/thoracic, PG-A/abdominal), a calibrator, resistor, mouthpiece, etc., to study fundamental physiological*

mechanisms of the external breathing function of crewmembers under long-duration orbital flight conditions. During the experiment, physiological measurements are taken and recorded with a pneumotachogram, a thoracic pneumogram, an abdominal pneumogram, and pressure data in the oral cavity. All experimentally derived plus salient environmental data along with personal data of the subject are recorded on PCMIA card for return to the ground at end of the Expedition. Objectives include determining the dynamics of the relationship between thoracic (pectoral) and abdominal breathing function reserves and their realization potential during spontaneous breathing, the coordinated spontaneous respiratory movements in terms of thoracic and abdominal components of volumetric, time & rate parameters of spontaneous respiratory cycle, identification of the features of humoral-reflex regulation of breathing by dynamics of ventilation sensitivity of thoracic and abdominal components to chemoreceptor stimuli, etc. Overall, the experiment is intended to provide a better understanding of the basic mechanisms of pulmonary respiration/gas exchange gravitational relations of cosmonauts.]

Using the Russian MO-21 “Ecosfera” air sampler & incubation equipment, the FE-1 monitored the station’s sanitary-hygiene status by conducting another 40-min. microbial analysis (T+2 days) on the air samples collected on 1/15 and incubated since then in the MO-21 equipment. *[MO-21 determines microbial contamination of the ISS atmosphere, specifically the total bacterial and fungal microflora counts and microflora composition according to morphologic criteria of microorganism colonies. The equipment, consisting of an air sampler set, a charger and power supply unit, provides samples to help determine microbial contamination of the ISS atmosphere, specifically the total bacterial and fungal microflora counts and microflora composition according to morphologic criteria of microorganism colonies.]*

Supported by ground specialists via tagup, Malenchenko also unloaded new equipment for the BIO-5 RASTENIYA-2 (“Plants-2”) micro-G growth payload from Progress 27P and installed the new payload in the Service Module (SM) near the LADA-12 greenhouse, then reinstalled software, refilled the water canister and checked the hardware out. *[The payload hardware includes a module (MIS/Module for the Investigation of Substrates), a MIS control unit (BU), a nitrogen purge unit (BPA) and other accessories. Rasteniya researches growth and development of plants under spaceflight conditions in the LADA-12 greenhouse.]*

At ~7:05am EST, Whitson and Tani conducted another teleconference with EVA specialists to discuss updated instructional material for the R&R of the failed BGA 1A BMRRM (Beta Gimbal Angle 1A Bearing Motor Roll Ring Module) during EVA-14 on 1/30. In preparation for the EVA, engineers are planning to conduct an illumination test on SAW (Solar Array Wing) 3A to characterize incidental illumination of a solar array during solar eclipse (Earth shadow period).

Peggy Whitson conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. *[Updated "cue cards" based on the crew's water calldowns are sent up every other week (currently #16-0018N).]*

The crew performed the mandatory 90-min OBT (onboard training) emergency egress drill for the case of rapid cabin depressurization, with Russian and US specialists standing by at both control centers for crew questions or comments. During the drill, the crewmembers proceeded through a prescribed series of timed station checkpoints, determining and verifying valve settings, instruments measurements, hatch configurations, etc. A 20-min joint drill debrief via S-band to the ground concluded the exercise, led by TsUP/Moscow. *[Background: Purpose of the drill is to practice (a) crew response procedures in the event of ISS depress, (b) communication and coordination between crew and the ground in such an emergency, and (c) communication and coordination among crew members themselves. In the RS, the crew translated along the emergency egress path to the FGB nadir port (where Soyuz 15S is currently docked), stepped through the process of preparing Progress 27P at the DC1 for undocking, etc. Soyuz and ISS communications were restored to nominal stage ops after the exercise.]*

Yuri Malenchenko conducted a search, gather and setup operation of equipment for new ATV PCE (Automated Transfer Vehicle/Proximity Communications Equipment; Russian: MBRL) tests scheduled tomorrow, requiring the BUAP antenna switching control box for the "Standing Wave Coefficient" (KSV) test using the FSH3 spectrum analyzer from the GTS (Global Timing System).

More troubleshooting on the recently (1/4) failed GTS was listed today on Malenchenko's voluntary, "time permitting" task list.

In the Soyuz 15S spacecraft, docked at the FGB nadir port, Malenchenko turned off the gas analyzer, terminating its periodic checkup activity.

Dan Tani performed his daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13/07 (briefly interrupted for EVA-13 photo support). *[The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour.]*

Malenchenko completed today's routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Working off his discretionary job list, Malenchenko also conducted the daily 20-min. IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

On the TVIS (Treadmill with Vibration Isolation & Stabilization), Dan tested the roll-stabilizing gyro’s Off command for proper function.

The crewmembers performed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2) , TVIS treadmill (FE-1), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Dan Tani copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

After Houston Flight Controllers started deactivating the CDRA (Carbon Dioxide Removal Assembly) early this morning (5:00-10:00am) and cooling was no longer required, the CDR disconnected the ITCS LTL QD (Internal Thermal Control System/Low Temperature Loop/Quick Disconnect) jumper to the CDRA rack (LAB1D6).

Using the MPC (Multi-Protocol Converter) for downlink, the crew at ~12:15pm transmitted onboard video footage via high definition (HDTV) G1 camera going through the MPC system. *[The short test allowed the ground to test this relatively new system originating live from the ISS to JSC to NASA Headquarters to the NASA TV satellite and finally to potential clients for future use.]*

CEO photo targets uplinked for today were **Somalia Coast, Africa** *(the Somalia coastline experiences significant change in vegetation patterns and sand dune morphology with climatic change [such as El Nino events]. It is important to capture the existing configuration of coastal vegetation and morphology for later change detection. Overlapping nadir frames, taken along track, were requested), and Patagonian Glaciers, S. America* *(ISS orbit track took the crew over the southern Patagonian ranges and their summit glaciers. Of particular interest are glaciers and icefields on the western mountain front, which became visible as the station approached South America from the west. Nadir mapping frames were requested.)*

CEO photography can be viewed and studied at the websites:

<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are

downloaded by the public each month from this "Gateway" site);
<http://earthobservatory.nasa.gov/>
<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 7:33am EST [= epoch]):

Mean altitude -- 338.5 km
Apogee height -- 342.1 km
Perigee height -- 334.9 km
Period -- 91.30 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0005384
Solar Beta Angle -- 13.7 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 130 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 52459

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*
NET = Not Earlier Than):

01/30/08 -- EVA-14 (BMRRM R&R)
01/31/08 -- **Explorer-1 50 Years (1st U.S. Satellite on Redstone rocket)** [*see*

ISS On-Orbit Status 01/16/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Whitson & FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop for downlink. *[To monitor the crewmembers' sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

FE-1 Malenchenko serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out" cycle to vacuum on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process was terminated at ~2:00 EST. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. Filter bed 1 was regenerated yesterday.]*

The FE-1 performed IFM (Inflight Maintenance) on the Service Module (SM)'s thermal control loops (KOB-1,2), removing the 3SPN1 pump assembly and replacing it with a new spare, followed by tests of the installation. *[This restores all four pump panels to operation, each pump panel with two operating pumps (ENAs).]*

After a spontaneous reboot of the KTSP1/CPC1 (Central Post Computer 1) in the SM, Malenchenko conducted troubleshooting and a health check on the computer.

In the Lab. CDR Whitson powered down the Lab PCS (Portable Computer System) laptops in support of the subsequent RPCM R&R (Remote Power Controller Module Removal & Replacement) and activated the Cupola Workstation laptop to maintain

a minimum PCS configuration during the R&R.

Afterwards, Peggy removed and replaced two RPCMs in the Lab,- LAB1P5 & LAB1D2.

FE-1 Malenchenko underwent his first Russian blood chemistry analysis test PZE MO-11, assisted by Dr. Whitson as CMO (Crew Medical Officer) as required. The exam was performed with the kits and accessories of the Reflotron-4 blood analyzer and supported by tagup with ground specialists. *[Earlier Reflotron versions have operated already on space station Mir. For the test, Malenchenko imbibed 250 ml of warm water or plain (unsweetened) tea, after which fresh blood was drawn from his finger with an Autoclix mini-lancet and a Reflotron pipette. Clinical data were then determined from the collected sample. Using various reagent tabs, the blood is tested with strips (KPI) for such parameters as hemoglobin, glucose, bilirubin, amylase, uric acid, triglycerides, urea, creatinin, cholesterol, etc. The tubes with blood samples were temporarily kept cool for the subsequent (post-breakfast) analysis. Reflotron-4 uses 40 W of power, supplied by the Service Module (SM)'s electrical system.]*

CDR Whitson continued her work with the MSG (Microgravity Science Glovebox) and the InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions) experiment, today conducting runs #14 and #15, exchange video tapes and finally powering the MSG down. *[After activation of MSG and InSPACE & InSPACE-2 equipment, Peggy checked on alignment & focusing of MSG video cam #1, switched the magnetic field between runs, changed out the video recorder tape, turned off InSPACE & MSG and stowed the equipment. InSPACE, conducted last in June 2006 by Jeff Williams on Increment 13, obtains basic data on magnetorheological fluids, i.e., a new class of "smart materials" that can be used to improve or develop new brake systems, seat suspensions robotics, clutches, airplane landing gear, and vibration damper systems. The dispersed particles are contained in CAs (Coil Assemblies) in the MSG that subject them to electric fields of certain strength and frequencies.]*

FE-2 Tani worked in the U.S. Airlock (A/L), performing maintenance activities on the EMU (Extravehicular Mobility Unit) systems, centered on cycling the EMU SCOF (secondary oxygen package checkout fixture) valve to verify its function, plus starting (and later terminating) to scrub the EMU spacesuit cooling loops to prevent accumulation of contamination.)

Tani brought the EMU #3008 into the A/L for unbundling or installation in the EDDA (EMU Don Doff Assembly), filled its water tank (with vent port plugs installed) from CWC (Contingency Water Container) #1059 and afterwards initiated ionic and particulate filtration of #3008 with the ion and 3-micron filter. *[Purpose of the*

scrubbing, including iodination of the LCVGs (Liquid Cooling & Ventilation Garments) for biocidal maintenance, is the elimination of any biomass (organic) and particulate matter that may have accumulated in the loops.]

FE-1 Malenchenko inspected the Russian de-ionized water container (KOV EDV), used for supplying water to the Elektron oxygen (O₂) generator for electrolysis, for bubbles and possible need for filling up with U.S. condensate from a CWC (Contingency Water Container, #1071). *[Air bubbles larger than ~10 mm in the water must be prevented from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]*

Dan Tani performed his daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13/07 (briefly interrupted for EVA-13 photo support). *[The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour.]*

Malenchenko completed today's routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Using the SKDS CMS (Pressure Control & Atmosphere Monitoring System/Countermeasure System), the FE-1 took the periodic readings of potentially harmful contaminants in the SM. The hardware was then returned to initial stowage. *[The CMS uses preprogrammed microchips to measure Formaldehyde (H₂CO, methanal), Carbon Monoxide (CO) and Ammonia (NH₃), taking one measurement per microchip.]*

CDR Whitson performed the routine task of taking two photos of the internal part of the DC1's nadir docking cone (ASP SSVP), used for the recent Progress 27P docking, a standard practice after Russian dockings. The pictures were then transferred to OCA for subsequent downlinking. These images are used to refine current understanding of docking conditions. *[The objective is to take photo imagery of the scratch or scuff mark left by the head of the docking probe on the internal surface of the drogue (docking cone) ring, now rotated out of the passageway. As other crewmembers before him, the CDR used the Nikon D1X digital still camera to take two pictures each with the hatch closed down.]*

The FE-2 ran the periodic check of active U.S. payloads, i.e., cleaning the ANITA (Analyzing Interferometer for Ambient Air) inlet plus inspecting and filter cleaning of

the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. *[The CGBA incubator is controlled from the ground, with automatic video downlinked to Earth. ANITA continues to collect data every six seconds and downlinks the data daily to the ground team. ANITA monitors low levels of potential gaseous contaminants in the ISS cabin atmosphere with a capability of simultaneously monitoring 32 gaseous contaminants. The experiment is testing the accuracy and reliability of this technology as a potential next-generation atmosphere trace-gas monitoring system for ISS and future spacecraft. This is a cooperative investigation with ESA.]*

Yuri conducted the periodic checkout/verification of IP-1 airflow sensors in the various RS hatch openings (8) in the SM, FGB and DC1.

Peggy Whitson checked out the setup of the BSMM (Multi-Channel Matching Unit) prepared by Yuri yesterday with new software, and conducted the scheduled HDD (Hard Disk Drive) test, followed by downlink of the resulting log file. *[BSMM is part of the OpsLAN (Operations Local Area Network), which also includes such items as the BSPN (Payload Server), OBC (Onboard Controller) for RokvISS, and GTS (Global Timing System).]*

After a recent failure (1/4) of the GTS (Global Timing System), Malenchenko performed troubleshooting on the system to recover it for operation.

At ~4:05pm EST, Dan Tani had his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-10 laptop),

The crewmembers performed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Peggy Whitson copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

CEO photo targets uplinked for today were **South Tibesti Megafans, Africa** (*weather was clear over the Tibesti megafans area. Looking for overlapping, discontinuous dry channels and stream beds as indicators for the megafans. Overlapping, nadir frames taken along-track were requested*), **IPY – Aurora Borealis; Heard Island, Southern Indian Ocean** (*some patchy cloud cover were present over Heard Island, but significant holes in the cloud deck should also have*

*been present for photography. Looking to the right of track for this mountainous island - of particular interest are the glaciated mountain peaks), and **Patagonian Glaciers, S. America** (weather was predicted to be clear over the Patagonian mountain ranges, providing an opportunity for imagery of summit glaciers. ISS passed over the northern end of the ranges. Imagery of the small summit glaciers on the interior [northeastern] range front was requested).*

CEO photography can be viewed and studied at the websites:

ISS On-Orbit Status 01/15/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Whitson & FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop for downlink. *[To monitor the crewmembers' sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

FE-1 Malenchenko serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The regen process will be terminated before sleeptime, at ~2:20pm EST. Regeneration of bed #2 follows tomorrow. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods.]*

At ~3:15am, the FE-2 activated the VDS MPC (Video Distribution System/Multi-Purpose Converter) with its four downlinks to allow the ground to conduct HDTV (high-definition TV) playback and downlink operations. Later (~1:05pm), the MPC was powered off again.

The FE-1 used his standard ECOSFERA equipment, set up yesterday, to perform microbial air sampling runs for the MedOps SZM-MO-21 experiment, taking samples in the DC-1 Docking Compartment, followed by the standard pre-return sanitary-epidemiological incubation status checks (MedOps SZM-MO-22), collecting samples from cabin surfaces along with specimens from crewmembers for

sanitation and disease studies. The samples will be returned to Earth on Soyuz. *[The MO-21 equipment, consisting of an air sampler set, a charger and power supply unit, provides samples to help determine microbial contamination of the ISS atmosphere, specifically the total bacterial and fungal microflora counts and microflora composition according to morphologic criteria of microorganism colonies. The MO-22 equipment, similar to MO-21, complements the investigation.]*

The FE-2 worked in the Airlock (A/L), continuing the lengthy troubleshooting procedure on the ATU-6 (Audio Terminal Unit #6) on the A/L Avionics Rack which still has not performed satisfactorily after the recent troubleshooting (1/9). *[ATU-6 was installed by Clay Anderson on 10/11/07 in place of a failed unit, and the failed ATU-6 was returned on 10A. The new ATU-6 has been experiencing periodic lockups and PBIT (passive built-in test) faults. Of the 3 ATUs in the A/L, one of which must be functional for EVAs, so long as the suited VA crew has established UHF (Ultra High Frequency) radio communication.]*

Tani also removed and replaced an RPCM (Remote Power Controller Module, AL1A4AB) in the Airlock.

With ~2h10m set aside, Dan Tani continued the outfitting on the Service Module (SM) ventilation system started by Peggy Whitson on 1/4, cleaning four fans (VPO5, VPO6, VPO8, VPO9) behind panels before replacing their US-made noise suppressors (blue) with Russian acoustic mufflers (white).

Yuri Malenchenko transferred the newly arrived Russian payload TkhN-7 SVS (Self-Propagating High-Temperature Synthesis) from Progress 27P, set it up in the SM with its camcorder and digital still camera gear and activated the experiment. *[SVS uses its own camera, "Telescience" hardware from PK-3 (Plasma Crystallization) and the onboard Klest TV system for researching self-propagating high-temperature fusion of samples in space.]*

CDR Whitson continued her work with the MSG (Microgravity Science Glovebox) and the InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions) experiment, today conducting runs #12 and #13, exchange video tapes and finally powering the MSG down. *[After activation of MSG and InSPACE & InSPACE-2 equipment, Peggy checked on alignment & focusing of MSG video cam #1, switched the magnetic field between runs, changed out the video recorder tape, turned off InSPACE & MSG and stowed the equipment. InSPACE, conducted last in June 2006 by Jeff Williams on Increment 13, obtains basic data on magnetorheological fluids, i.e., a new class of "smart materials" that can be used to improve or develop new brake systems, seat suspensions robotics, clutches, airplane landing gear, and vibration damper systems. The dispersed particles are contained in CAs (Coil Assemblies) in the MSG that subject them to*

electric fields of certain strength and frequencies.]

In the Soyuz 15S spacecraft, docked at the FGB nadir port, Malenchenko turned on the gas analyzer, a periodic checkup activity.

Yuri also loaded new software on the BSMM (Multi-Channel Matching Unit) in preparation for upcoming HDD testing. After the software installation, communications between the BSMM computer and the RS1 laptop was to be checked. *[BSMM is part of the OpsLAN (Operations Local Area Network), which also includes such items as the BSPN (Payload Server), OBC (Onboard Controller) for RokvISS, and GTS (Global Timing System).]*

Malenchenko broke out and prepared the hardware for his first Russian blood chemistry analysis test PZE MO-11 on Increment 16, scheduled tomorrow. The exam will be performed with the kits and accessories of the Reflotron-4 blood analyzer and supported by tagup with ground specialists.

Dan Tani worked on the PFA (Portable Fan Assembly), installing a ground wire. *[This item had been listed before on the discretionary "job jar" task list.]*

The crewmembers performed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Dan copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~8:20am, the Expedition 16 crew conducted the standard teleconference with the Expedition 17 crew, via S-Band for audio and KU-Band for video.

At ~10:00 am, the crew participated in an interactive PAO TV downlink with WHO Radio, Des Moines, IA (Jim Boyd).

CEO photo targets uplinked for today were **Khartoum, Sudan** *(the Sudanese capital city is located at the confluence of the White and Blue Nile Rivers just north of a prominent agricultural region. This pass is in fair weather and mid-morning light. However, the nadir pass may be helpful in overcoming the effects of dust and smoke that typically cause loss of detail. Trying for mapping of the urban margins, especially along the river banks), Addis Ababa, Ethiopia (this capital city is located near the center of the rugged Ethiopian Highlands. Using Lake Tana to the north-*

northwest and the Rift Valley lakes the south to help find this difficult target area. This region is often cloudy in the afternoon, so on this morning pass looking left of track for context views only), **Heard Island** (Heard Island is a bleak, uninhabited, and mountainous island located in the Southern Ocean; about two-thirds of the way from Madagascar to Antarctica. Its mountains are covered in glaciers and dominated by Mawson Peak, a 9,006 ft high complex volcano which forms part of the Big Ben massif. A long thin spit named "Elephant Spit" extends from the east of the island. The ISS pass was in mid-afternoon with weather satellite imagery suggesting clearing from the southwest. Looking well right of track and use the long lens for details), and **S. Georgia/S. Sandwich** (the South Georgia Island is an arching, mountainous and glaciated island that lies about 860 miles east-southeast of the Falkland Islands. The South Sandwich Islands form a separate island group and are to the southeast. Weather was expected to be mostly cloudy with occasional partial clearing, but where possible, the crew was to try for detailed views of the glaciers on the north coast of South Georgia. ISS passed it in early afternoon, and the crew was advised to look well right of track).

CEO photography can be viewed and studied at the websites:
<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site);
<http://earthobservatory.nasa.gov/>
<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 8:24am EST [= epoch]):

Mean altitude -- 338.8 km

Apogee height -- 342.5 km

Perigee height -- 335.1 km

Period -- 91.31 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0005479

Solar Beta Angle -- 5.6 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 155 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 52428

Significant Events Ahead (all dates Eastern Standard, some changes possible.
NET = Not Earlier Than):

01/31/08 -- **Explorer-1 50 Years (1st U.S. Satellite on Redstone rocket)** [see
<http://usspace50.com>]

02/04/08 -- Progress M-62/27P undocking & reentry

02/05/08 -- Progress M-63/28P launch

02/07/08 – Progress M-63/28P docking
 02/07/08(target date) -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite.

ISS On-Orbit Status 01/14/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 13 of Increment 16.*

CDR Whitson & FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop for downlink. *[To monitor the crewmembers' sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

FE-1 Malenchenko worked several hours on a major rewiring task, restringing, installing and connecting cabling for the Russian RBO-3-3 Matryoshka-R radiation monitoring suite, before closing out the outfitting job.

After the RBO installations, Malenchenko supported the ground's activation of the Elektron O₂ generator at 32 amps by monitoring the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there is no overheating. *[During nominal operations a gas analyzer is utilized to detect hydrogen (H₂) in the O₂ line (which could cause overheating) but is not included in the control algorithm until 10 minutes after Elektron startup.]*

For upcoming experiments with the U.S. Ultrasound payload, the CDR set up and powered on the HRF1 (Human Research Facility1) rack drawers, VTR (Video Tape Recorder), and Ultrasound front panel.

Closing down the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, FE-2 Tani mixed (homogenized) samples #1 through #6, then took documentary

photographs of each sample with a digital camera system, controlled by the EarthKAM software, shut down the laptop, stowed the BCAT-3 sample module and stowed the remaining equipment.

CDR Whitson continued her work with the MSG (Microgravity Science Glovebox) and the InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions) experiment, today conducting runs #10 and #11, exchange video tapes and finally powering the MSG down. *[After activation of MSG and InSPACE & InSPACE-2 equipment, Peggy checked on alignment & focusing of MSG video cam #1, switched the magnetic field between runs, changed out the video recorder tape, turned off InSPACE & MSG and stowed the equipment. InSPACE, conducted last in June 2006 by Jeff Williams on Increment 13, obtains basic data on magnetorheological fluids, i.e., a new class of "smart materials" that can be used to improve or develop new brake systems, seat suspensions robotics, clutches, airplane landing gear, and vibration damper systems. The dispersed particles are contained in CAs (Coil Assemblies) in the MSG that subject them to electric fields of certain strength and frequencies.]*

Dan Tani had 2 hrs set aside for a detailed inspection of the spare BMRMM (Bearing Motor Roll Ring Module) that he and Peggy retrieved from PMA-3 (Pressurized Mating Adapter 3) on 1/2/08, preparatory to the upcoming R&R EVA-14.

Yuri spent 1h 30m on the TVIS treadmill for the periodic Russian PZE-MO-3 test for physical fitness evaluation, his first, using the TVIS in unmotorized mode and wearing the Kardiokassette KK-2000 belt with three chest electrodes. *[The fitness test, controlled from the RSE-Med laptop, yields ECG (electrocardiogram) readings to the KK-2000 data storage device, later to be downlinked via U.S. OCA. Before the run, the KK-2000 was synchronized with the computer date/time readings. For the ECG, the crewmembers worked out on the treadmill, first walking 3 min. up to 3.5 km/h, then running at a medium pace of 6.5 km/h, followed by the maximum pace not exceeding 10 km/h, then walking again at gradually decreasing pace.]*

In preparation for a microbial air sampling session scheduled tomorrow, the FE-1 unstowed the MedOps SZM-MO-21 ECOSFERA equipment and initiated charging on the Ecosphere power pack (BP). *[The equipment, consisting of an air sampler set, a charger, power supply unit, and incubation tray for Petri dishes, determines microbial contamination of the ISS atmosphere, specifically the total bacterial and fungal microflora counts and microflora composition according to morphologic criteria of microorganism colonies.]*

Later, Yuri completed today's routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM),

including ASU toilet facilities systems/replaceables.

Malenchenko also conducted the daily 20-min. IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Continuing the current round of monthly preventive maintenance of RS (Russian Segment) ventilation systems, the FE-2 inspected and cleaned the "Group B" (B1 & B2) fan grills in the SM.

Malenchenko terminated the charging of the PD-150P DVCAM DSR videocam battery and cleaned up.

At 11:00am EST, Peggy and Dan participated in the periodic VHF-1 emergency communications check over NASA's VHF (Very High Frequency) stations, today at the Dryden (11:00-11:07am) and White Sands VHF sites (11:02-11:09am), talking with Houston/Capcom, MSFC/PAYCOM (Payload Operation & Integration Center Communicator) and Moscow/GLAVNI (TsUP Capcom) in the normal fashion via VHF radio from a handheld microphone and any of the U.S. segment ATUs (audio terminal units). *[Purpose of the test is to verify signal reception and link integrity, and to ensure minimum required link margin during emergency (no TDRS) and special events (such as a Soyuz relocation).]*

The crewmembers performed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-2, FE-1/MO-3), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Peggy copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

No CEO photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site);

ISS On-Orbit Status 01/13/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday -- off-duty day for CDR Whitson, FE-1 Malenchenko and FE-2 Tani. Ahead: Week 13 of Increment 16.*

CDR Whitson & FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop for downlink. *[To monitor the crewmembers' sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

FE-1 Malenchenko prepared for today's last day of his five-day wearing test of the spring-loaded "Penguin-3" antigravity pressure/stress suit with its load measuring system (SIN), donning the suit and its equipment, then going about his business and downloading performance measurements several times. *[Each day, Yuri has selected higher symmetrical (shoulders) & asymmetrical (chest & back) loads (~20-30 kgf), after calibrating the system with no load on the suit's internal tension straps. Load data are then collected by the SIN electronics (via analog-to-digital converters) and downloaded to a A31p laptop three times daily, followed by downlink to the ground via BSR-TM.]*

FE-2 Tani performed his daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13/07 (briefly interrupted for EVA-13 photo support). *[The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. The SSC (Station Support Computer) is taking photography of the phase separation*

occurring in the BCAT Sample 3, with the photo flash going off every half hour.]

Malenchenko completed today's routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including ASU toilet facilities systems/replaceables, the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP.

The crewmembers performed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

The CDR and FE-2 each had their weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-10 laptop), Dan at ~9:05am EST, Peggy at ~12:00pm.

Working off his discretionary "time permitting" task list, Yuri conducted another session of the Russian "Uragan" (hurricane) earth-imaging program, using the Nikon D2X digital camera with 800 mm focal length lens. *[Targets uplinked for today were Patagonia Glaciers and Icebergs in the Drake Passage.]*

A second job item on the FE-1's voluntary list for today was another KPT-3 session to make observations and take aerial KPT-3 photography of environmental conditions for Russia's Environmental Safety Agency (ECON) using the Nikon D2X digital camera with SIGMA 300-800mm telephoto lens.

Task items on Peggy's and Dan's discretionary "job jar" task list today were (1) a thorough review of uplinked draft material on the BMRRM (Bearing Motor Roll Ring Module) hardware and EVA-14 procedures for its upcoming R&R, (2) an audit of CTB (Cargo Transport Bags) and their contents, and (3) installation of a ground wire on the PFA (Portable Fan Assembly).

No CEO photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site);
<http://earthobservatory.nasa.gov/>

ISS On-Orbit Status 01/12/08

All ISS systems continue to function nominally, except those noted previously or below. Saturday -- off-duty day for CDR Whitson, FE-1 Malenchenko and FE-2 Tani except for housekeeping and voluntary work.

CDR Whitson & FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop for downlink. *[To monitor the crewmembers' sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

The crew performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the CDR's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

As part of the house cleaning, FE-1 Malenchenko performed preventive maintenance cleaning on the FS5, FS6, FS9, VPkhO, VdPrK, VPrK & TsV2 fan grilles in the SM, DC1 Docking Module and FGB (Funktsionalnyi-Grusovoi Blok).

The FE-1 also prepared for today's fourth day of his five-day wearing test of the spring-loaded "Penguin-3" antigravity pressure/stress suit with its load measuring system (SIN), donning the suit and its equipment, then going about his business

and downloading performance measurements several times. *[Each day, Yuri selects higher symmetrical (shoulders) & asymmetrical (chest & back) loads (~20-30 kgf), after calibrating the system with no load on the suit's internal tension straps. Load data are then collected by the SIN electronics (via analog-to-digital converters) and downloaded to an A31p laptop three times daily, followed by downlink to the ground via BSR-TM.]*

FE-2 Tani retrieved and stowed the two FMKs (Formaldehyde Monitoring Kits) deployed by him on 1/10 in the Lab (below CEVIS cycle) and SM (most forward handrail on panel 307).

Dan also performed his daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13/07 (briefly interrupted for EVA-13 photo support). *[The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour.]*

For today's VolSci (Voluntary Weekend Science) program, CDR Whitson continued her work with the MSG (Microgravity Science Glovebox) and the InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions) experiment, today conducting runs #7, #8, and #9, then powered down the payload and switched the MSG to standby. *[After activation of MSG and InSPACE & InSPACE-2 equipment, Peggy checked on alignment & focusing of the two MSG video cams, switched the magnetic field between runs, changed out video recorder tapes and later deactivated InSPACE & MSG. InSPACE, conducted last in June 2006 by Jeff Williams on Increment 13, obtains basic data on magnetorheological fluids, i.e., a new class of "smart materials" that can be used to improve or develop new brake systems, seat suspensions robotics, clutches, airplane landing gear, and vibration damper systems. The dispersed particles are contained in CAs (Coil Assemblies) in the MSG that subject them to electric fields of certain strength and frequencies.]*

At ~9:45am EST, the crewmembers held their regular weekly planning conference (WPC) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP/Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

Later, Yuri completed today's routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including ASU toilet facilities systems/replaceables, the weekly collection of the

toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP.

The crewmembers performed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Dan Tani copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~6:35am, Yuri Malenchenko had a PFC (Private Family Conference) via S-band/ audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-10 laptop).

Working off his discretionary “time permitting” task list, Yuri conducted another session of the Russian "Uragan" (hurricane) earth-imaging program, using the Nikon D2X digital camera with 800 mm focal length lens. *[Targets uplinked for today were Icebergs in Scotia Sea and Patagonia Glaciers.]*

A second job item on the FE-1's voluntary list for today was another KPT-3 session to make observations and take aerial KPT-3 photography of environmental conditions for Russia's Environmental Safety Agency (ECON) using the Nikon D2X digital camera with SIGMA 300-800mm telephoto lens.

The CDR and FE-2 had a number of newly added jobs on their “job jar” task list: (1) in Node-2 put two hatch latches to hard stop position; (2) take SLM (Sound Level Measurement) data in Node-2 and transfer them to laptop for downlink; and (3) conduct the regular FDS PEP (Fire Detection & Suppression/Portable Emergency Provisions) safety inspection/audit.

Reboost Update: The ISS reboost yesterday by the twin SM main engines was successfully conducted on time (7:42pm EST). Purpose of the 1m 58s long maneuver burn was to establish the correct phasing conditions for 27S launch and the STS-122/1E launch season (FD3 rendezvous). The reboost produced a delta-velocity (delta-V) of 3.1 m/s (predicted: 3.0 m/s; ~5% overburn). Mean altitude increase (delta-H): 5.4 km (2.9 nmi).

Weekly Science Update (Expedition Sixteen -- Week 12)

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): ALTEINO instrument has been rotated by the crew on 1/8 and memory card has been

exchanged. Photos of the new configuration have been taken and placed on OCA for down-link. On 1/9 data has been downlinked. Data and photos will be analyzed by the science team as soon as available..

ANITA: Completed.

BCAT-3 (Binary Colloidal Alloy Test 3): “Getting great data for sample 3, Dan's setup is the best design so far, (more stable), and we continue to learn from astronauts clever techniques.”

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): “Dan, we are waiting to get the new launch date so we can schedule your second in-flight session to meet the R-21 to R-14 requirement. This activity will be hard scheduled when we get a firm launch date.”

CFE (Capillary Flow Experiment): Reserve.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): In progress.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): In progress.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): “InSPACE-2 began operations in the Microgravity Science Glovebox (MSG) on Saturday, 1/5/ 08. This is a follow-on science payload to the successful InSPACE experiment conducted in 2003 and 2006. The first six test runs were performed. Two of four samples of different particle concentrations were tested at three different magnetic field strengths and at a frequency of 20 Hz. The preliminary images looked excellent, clearly showing the microstructure developing during the steady and pulsed magnetic fields, according to Professor Eric Furst, the Principal Investigator at the University of Delaware. The new time stamping feature

on the science video, made possible through a new video cable, provides unambiguous time correlation of the downlink video.”

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 “Pirs”.

MULTIGEN-1: MULTIGEN-1 samples will be downloaded on STS-122 (1E).

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION/REPOSITORY: ” Dan, thank you for your voluntary participation in a stand-alone Repository session. Your attention in keeping to the time constraints was much appreciated!”.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): In progress.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): In progress.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

CEO (Crew Earth Observation): Through 1/9 the ground has received a total of 9,988 frames of ISS/CEO imagery for review and cataloging. That includes over 1,600 frames in the past week alone! “The quality of your imagery remains high,

especially in composition, with many striking oblique and low-light views. Your excellent view of the coastal city of Beirut, Lebanon will be published on NASA/GSFC's Earth Observatory web page this weekend. Nice shot! Thanks also for your efforts to acquire IPY imagery of Polar Mesospheric Clouds. This is a challenging phenomenon to predict and observe."

CEO photo targets uplinked for today were **South Tibesti Megafans, Africa** (*weather was predicted to be clear over the Tibesti region. Orbit track took the ISS over the center of the target area. Looking for discontinuous overlapping dry stream channels as indicators of the megafans. Nadir mapping frames taken along-track were requested*), **Teide Volcano, Canary Islands** (*the Teide Volcano, located on the island of Tenerife is a Decade Volcano [due to its high eruption hazard potential] and the highest peak in the Atlantic Ocean. Looking to the right of track as ISS approached the Canary Islands. The triangular island of Tenerife is distinctive, and Teide is located with an elliptical caldera formed by previous eruptions. Context views of the islands and Teide Volcano were requested*), and **Polar Mesospheric Clouds — PMC, Antarctica** (*IPY--PMC radar research station active. GMTs for this and subsequent PMC opportunities were chosen for closeness to the Antarctic PMC radar research site at 73S 13W. Radar is switched on during ISS passes at the given GMTs. But the crew was to feel free to look south during any night awake pass*).

CEO photography can be viewed and studied at the websites:
<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site);
<http://earthobservatory.nasa.gov/>
<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 8:53am EST [= epoch]):

Mean altitude -- 339.2 km

Apogee height -- 343.1 km

Perigee height -- 335.2 km

Period -- 91.32 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.000588

Solar Beta Angle -- -7.8 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.79

Mean altitude gain in the last 24 hours -- 5.4 km

Revolutions since FGB/Zarya launch (Nov. 98) -- 52381

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*)

NET = Not Earlier Than):

01/31/08 -- **Explorer-1 50 Years (1st U.S. Satellite on Redstone rocket)** [see <http://usspace50.com>]

02/04/08 -- Progress M-62/27P undocking & reentry

02/05/08 -- Progress M-63/28P launch

02/07/08 -- Progress M-63/28P docking

02/07/08(target date) -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite.02/09/08 -- Progress M-63/28P docking (DC1) - (~2:45pm EST).

02/22/08(NET) -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana)

03/06/08 -- ATV-1 Demo Day 1

03/12/08 -- ATV-1 Demo Day 2

03/13/08(target date) -- STS-123/Endeavour/1J/A launch/1J/A, w/SLP-SPDM, JEM ELM-PS

03/15/08 -- ATV-1 Demo Day 3 & Docking (SM aft port)

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch

04/10/08 -- Soyuz TMA-12/16S docking (DC1)

04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)

04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

04/24/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS

04/26/08 -- STS-124/Discovery/1J docking

05/04/08 -- STS-124/Discovery/1J undocking

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

08/07/08(NET) -- ATV-1 undocking (from SM aft port)

08/12/08 -- Progress M-65/30P launch

ISS On-Orbit Status 01/11/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Whitson & FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop for downlink. *[To monitor the crewmembers' sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

At ~3:10am EST, the FE-2 activated the VDS MPC (Video Distribution System/Multi-Purpose Converter) with its four downlinks to allow the ground to conduct HDTV (high-definition TV) playback and downlink operations. Later (~11:30am), the MPC was powered off again.

At ~4:15am, Dan Tani powered down the VSW (Video Streaming Workstation), set up last month to convert and/or downlink analog video from the Russian segment (RS) to MCC-Houston and thence to TsUP-Moscow.

In the DC1 Docking Compartment, FE-1 Malenchenko terminated the discharge cycle of the third 825M3 Orlan battery pack and removed it from the charger.

Malenchenko had 2h 30m hrs reserved to experiment with the Russian KPT-2 science payload "BAR-RM", testing innovative procedures to detect air leakage from ISS modules using the RSE-1 laptop and downlinking the data via BSR-TM channel. *[BAR-RM is designed to develop a procedure for detection of air leakage from ISS modules based on environmental data anomalies (temperature, humidity,*

ultrasound emissions). The payload uses a remote infrared thermometer (Kelvin-Video), a thermohygrometer (Iva-6A), a heat-loss anemometer/thermometer (TTM-2), an ultrasound analyzer (AU-01), and a leak detector (UT2-03) to determine physical background signs of loss of ISS pressure integrity which could be indicative of leaks in the working compartments of the station. Measurements are taken in specific zones (13 in SM PkhO and 4 in DC1), both with lights & fans turned on and off.]

Whitson & Tani completed their third run with the MedOps WinSCAT (Spaceflight Cognitive Assessment Tool) experiment by logging in on the MEC (Medical Equipment Computer) and performing the psychological evaluation exercise on the laptop-based WinSCAT experiment. *[WinSCAT is a time-constrained questionnaire test of cognitive abilities, routinely performed by astronauts aboard the ISS every 30 days before or after the PHS (periodic health status) test or on special CDR's, crewmembers or flight surgeons request.]*

Yuri Malenchenko prepared for today's third day of his five-day wearing test of the spring-loaded "Penguin-3" antigravity pressure/stress suit with its load measuring system (SIN), donning the suit and its equipment, then going about his business while downloading performance measurements. *[During each of the five days, Yuri selects higher symmetrical (shoulders) & asymmetrical (chest & back) loads (~20-30 kgf), after calibrating the system with no load on the suit's internal tension straps. Performance/body motion data are then collected by the SIN electronics (via analog-to-digital converters) and downloaded to an A31p laptop three times daily, followed by downlink to the ground via BSR-TM. The load suit is intended to retain muscle tone during long-duration missions and also retain the crewmember's normal height to facilitate his/her fit in their individual Kazbek seat in the Soyuz.]*

In the Soyuz 15S, docked at the FGB nadir port, Dan, Peggy and Yuri conducted the standard fit check of the Kazbek couches, the contoured shock absorbing seats in the Descent Module. For Yuri, Kazbek measurements will be useful to test the efficacy of the Penguin-3 exercise. *[For the fit check, crew members removed their cabin suits and donned Sokol KV-2 suit and comm caps, getting into in their seats and assessing the degree of comfort and uniform body support provided by the seat liner. Using a ruler, they then measured the gap between the top of the head and the top edge of the structure facing the head crown. The results were reported to TsUP. Kazbek-UM couches are designed to withstand g-loads during launch and orbital insertion as well as during reentry and brake-rocket-assisted landing. Each seat has two positions: cocked (armed) and noncocked. In cocked position, they are raised to allow the shock absorbers to function during touchdown. The fit check assures that the crewmembers, whose bodies gain in length during longer-term stay in zero-G, will still be adequately protected by the seat liners for their touchdown in Kazakhstan, either emergency or regular return.]*

CDR Whitson continued her work with the MSG (Microgravity Science Glovebox) and the InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions) experiment, today conducting runs #4, #5, and #6 (new samples of slightly higher concentration), then exchanging the vial assembly. MSG was powered down afterwards. *[After activation of MSG and InSPACE & InSPACE-2 equipment, Peggy checked on alignment & focusing of the two MSG video cams, switched the magnetic field between runs, changed out video recorder tapes and later deactivated InSPACE & MSG. InSPACE, conducted last in June 2006 by Jeff Williams on Increment 13, obtains basic data on magnetorheological fluids, i.e., a new class of "smart materials" that can be used to improve or develop new brake systems, seat suspensions robotics, clutches, airplane landing gear, and vibration damper systems. The dispersed particles are contained in CAs (Coil Assemblies) in the MSG that subject them to electric fields of certain strength and frequencies.]*

Continuing the current round of RS ventilation system maintenance, FE-2 Tani worked in the Service Module (SM), replacing the four PF1-4 dust collectors, then in the FGB (*Funktsionalnyi-Grusovoi Blok*) where he replaced the PS1 & PS2 dust filters.

The FE-2 performed his daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13/07 (briefly interrupted for EVA-13 photo support). *[The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour.]*

Dan also filled out the regular FFQ (Food Frequency Questionnaire), his 9th, on the MEC (Medical Equipment Computer). *[By means of these FFQs, U.S. astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins.]*

The FE-1 began gathering tools, cabling and equipment for a major outfitting job for the RBO-3-3 MATRYOSHKA-R radiation monitoring payload in the RS, behind SM panels 121 & 122, scheduled for next Monday (1/14). Specialists stood by at TsUP for tagup as required.

The CDR ran the periodic check of active U.S. payloads, i.e., cleaning the ANITA (Analyzing Interferometer for Ambient Air) inlet plus inspecting and filter cleaning of the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. *[The CGBA incubator is controlled from the ground, with automatic video*

downlinked to Earth. ANITA continues to collect data every six seconds and downlinks the data daily to the ground team. ANITA monitors low levels of potential gaseous contaminants in the ISS cabin atmosphere with a capability of simultaneously monitoring 32 gaseous contaminants. The experiment is testing the accuracy and reliability of this technology as a potential next-generation atmosphere trace-gas monitoring system for ISS and future spacecraft. This is a cooperative investigation with ESA.]

After switching the ANITA equipment from local sampling mode to non-local sampling via its user interface software, Dan Tani used a hand pump and sample bag to collect a non-local ambient air sample from the FGB/Node-1 location, for subsequent analysis in the ER4 (EXPRESS Rack 4) ANITA drawer. *[Developed by ESA, ANITA is a potential next-generation trace-gas analysis system that uses a Fourier-Transform Infrared (FTIR) spectrometer to determine concentrations of up to 32 different trace gases in the cabin atmosphere (measuring absorbance vs. wavelength). ANITA provides continuous, automatic air sampling from its location in ER4, taking one local sample every 6 minutes, for medical personnel during the first ten days, later for environmental specialists. Data are stored on the ANITA laptop hard drive, with a representative data set downlinked daily by ground command.]*

Malenchenko used the AK-1M adsorber and IPD-CO Draeger tubes to conduct the periodic sampling of cabin air for subsequent analysis on the ground. *[Yuri started out by taking air samples in the SM and FGB and to check for leaked-out Freon in the SM, then switched to the IPD-CO Draeger tubes sampler to check for CO (carbon monoxide) in the SM.]*

The CDR took air samples for the periodic (weekly) atmospheric status check for ppO₂ (Partial Pressure Oxygen) and ppCO₂ (pp Carbon Dioxide), using the hand-held CSA-CP (Compound Specific Analyzer-Combustion Products), CSA-O₂ (CSA - Oxygen sensor) and CDMK (CO₂ Monitoring Kit). Batteries were to be replaced if necessary. *[Purpose of the 15-min activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements.]*

Air samples were also collected by Dan, with a U.S. GSC (Grab Sample Container) at the center of the Lab, SM and FGB.

The FE-1 inspected the Russian de-ionized water container (KOV EDV), used for supplying water to the Elektron oxygen (O₂) generator for electrolysis, for bubbles and possible need for filling up with U.S. condensate from a CWC (Contingency

Water Container, #1071). *[Air bubbles larger than ~10 mm in the water must be prevented from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]*

Tani verified closure of the protective Lab window shutter for the ISS reboost scheduled later tonight (7:42pm EST). The shutter may be reopened at ~11:50pm when all potential plume residuals have dispersed two orbits later.

Yuri completed today's routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

The crewmembers performed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (CDR, FE-2, FE-1), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Dan Tani copied the exercise data file to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~6:20am, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~6:35am EST, Yuri was scheduled to link up with TsUP stowage specialists via S-band to conduct the weekly IMS tagup, discussing stowage issues and equipment locations.

At ~11:10am, Peggy, Yuri and Dan conducted their standard bi-weekly teleconference with the JSC Astronaut Office (Steve Lindsey), via S-band S/G-2 audio & phone patch.

At ~2:50pm, the crew is scheduled for their eighth weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. *[S/G-2 (Space-to-Ground 2) phone patch via SSC-10 (Station Support Computer 10)].*

Reboost Update: For tonight's ISS reboost, the new delta-V of 3 m/s was determined to account for the changed launch dates of Progress 28P (2/5) and STS-122/1E (2/7). The maneuver by the SM main engine, at 7:42pm EST, is planned for a burn duration of 1m 58s and an altitude increase (delta-h) of 5.2 km/2.8 n.mi. Attitude control authority will be handed over to Russian MCS (Motion Control

System) at 6:00pm and returned to US MMC (Momentum Management Control) at ~8:35pm.

CEO (Crew Earth Observation) photo targets uplinked for today again were **Perth, Australia** (*ISS had a near-nadir pass over Perth, the capital and largest city of the state of Western Australia. Weather conditions were predicted to be mostly clear. Overlapping mapping frames were requested as the station traversed the urban center, located to the left of track. Such imagery is useful for monitoring land cover and land use change both within the city center and along the urban-rural fringe*), and **Polar Mesospheric Clouds — PMC, Antarctica** (*IPY--PMC radar research station active. GMTs for this and subsequent PMC opportunities were chosen for closeness to the Antarctic PMC radar research site at 73S 13W. Radar is switched on during ISS passes at the given GMTs. But the crew was to feel free to look south during any night awake pass*).

CEO photography can be viewed and studied at the websites:
<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
<http://earthobservatory.nasa.gov/>
<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 8:26am EST [= epoch]):

Mean altitude -- 333.9 km

Apogee height -- 335.8 km

Perigee height -- 332.1 km

Period -- 91.21 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0002764

Solar Beta Angle -- -12.5 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.79

Mean altitude loss in the last 24 hours -- 142 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 52365

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*

NET = Not Earlier Than):

01/11/08 -- ISS reboost; ~7:42pm, delta-V 3.0m/s; SM main engine (2 KD thrusters & ODU props)

01/31/08 -- **Explorer-1 50 Years (1st U.S. Satellite on Redstone rocket)** [*see <http://usspace50.com>*]

02/04/08 -- Progress M-62/27P undocking & reentry

02/05/08 -- Progress M-63/28P launch

02/07/08 -- Progress M-63/28P docking (DC1)
 02/07/08(NET) -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite (~2:45pm EST).
 02/22/08(NET) -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana)
 02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A, ~11:53am, w/SLP-SPDM, JEM ELM-PS
 02/16/08 -- STS-123/Endeavour/1J/A docking
 02/27/08 -- STS-123/Endeavour undocking
 02/29/08 -- STS-123/Endeavour landing
 03/06/08 -- ATV-1 Demo Day 1
 03/12/08 -- ATV-1 Demo Day 2
 03/15/08 -- ATV-1 Demo Day 3 & Docking (SM aft port)
 04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
 04/08/08 -- Soyuz TMA-12/16S launch
 04/10/08 -- Soyuz TMA-12/16S docking (DC1)
 04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
 04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
 04/24/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS
 04/26/08 -- STS-124/Discovery/1J docking
 05/04/08 -- STS-124/Discovery/1J undocking
 05/14/08 -- Progress M-64/29P launch
 05/16/08 -- Progress M-64/29P docking (DC1)
 08/07/08(NET) -- ATV-1 undocking (from SM aft port)
 08/12/08 -- Progress M-65/30P launch
 08/14/08 -- Progress M-65/30P docking (SM aft port)
 09/09/08 -- Progress M-64/29P undocking (from DC1)
 09/10/08 -- Progress M-66/31P launch
 09/12/08 -- Progress M-66/31P docking (DC1)
 09/18/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
 09/20/08 -- STS-126/Discovery/ULF2 docking
 10/01/08 -- STS-126/Discovery/ULF2 undocking.
 10/01/08 -- **NASA 50 Years**
 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
 10/12/08 -- Soyuz TMA-13/17S launch
 10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
 10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
 11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
 11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment
 11/08/08 -- STS-119/Discovery/15A docking
 11/17/08 -- STS-119/Discovery/15A undocking
 11/20/08 -- **ISS 10 Years**
 11/26/08 -- Progress M-67/32P launch
 11/28/08 -- Progress M-67/32P docking (SM aft port)

04/15/09 -- **Constellation's Ares I-X Launch**

05/??/09 -- **Six-person crew on ISS** (following Soyuz 18S-2 docking)

04/??/10 -- STS-132/Discovery/20A – Node-3 + Cupola.

Note: The daily ISS On-Orbit Status reports can also be found at

ISS On-Orbit Status 01/10/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Whitson & FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop for downlink. *[To monitor the crewmembers' sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

Upon wakeup, FE-1 Yuri Malenchenko terminated his seventh MBI-12 SONOKARD experiment session, started last night, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

FE-2 Tani completed the visual "T+2 Day" microbial (bacterial & fungal) analysis of the Week 11 potable water samples, collected on 1/8 and processed on board with the MCDs (Microbial Capture Devices). *[On 1/8, three samples (225 mL each) were taken in the Service Module (SM) -- at the potable water SRV-K hot port, SRV-K warm port & SVO-ZV tap for inflight analysis, plus two chemical post-flight samples (750 mL) for return on 1E from SRV-K warm & SVO-ZV.]*

CDR Whitson, assisted by Dan Tani, had several hours set aside for the R&R (Removal & Replacement) of the leaking EXPRESS Rack 1 (ER1) ITCS (Internal Thermal Control System) pressure relief valve but completed the job successfully in a record time of 37 min, after some preparatory work yesterday. Peggy also took documentary photographs of the rack without all the lockers and drawers installed.

[A fluid leak in ER1 was identified in late 2005, and the valve was identified as the most likely suspect. The rack's anomaly has significantly impacted the science community. A spare valve was delivered on 12A.1 and installed today. The suspect valve was not designed as an ORU (Orbital Replacement Unit), but its R&R restores full functionality to the rack. ER1, with 8 lockers and 2 drawers containing SAMS (Space Accelerations Measuring System) & MAMS (Microgravity Accelerations Measuring System), has been inactive since 1/2.]

Peggy later assisted the ground in activating the SAMS by turning on the ICU (Interim Control Unit) in ER1 (Drawer 1).

In the DC1 (Docking Module), with temporary comm link established, FE-1 Malenchenko terminated discharging the second Orlan 825M3 battery pack and started the discharge process on pack #3 (of three).

Yuri then continued his three-day life-extension maintenance on the three Russian Orlan-M spacesuits #25, #26 & #27 in DC1, today doing more spacesuit and BSS (Orlan Interface Unit) leak and valve tests, including a hermeticity check on the Orlan #26 backup bladder. Normal comm was restored after activity closeout.

The FE-1 prepared for today's second day of a new five-day wearing test of the spring-loaded "Penguin-3" antigravity pressure/stress suit with its load measuring system (SIN), donning the suit and its equipment, then going about his business and downloading performance measurements several times. *[During each of the five days, Yuri selects higher symmetrical (shoulders) & asymmetrical (chest & back) loads (~20-30 kgf), after calibrating the system with no load on the suit's internal tension straps. Performance/body motion data are then collected by the SIN electronics (via analog-to-digital converters) and downloaded to an A31p laptop three times daily, followed by downlink to the ground via BSR-TM. The load suit is intended to retain muscle tone during long missions and also retain the crewmember's normal height to facilitate his/her fit in their individual Kazbek seat in the Soyuz.]*

The CDR performed the periodic deployment of two passive FMK (formaldehyde monitoring kit) sampling assemblies in the Lab (below CEVIS) and SM (most forward handrail) for two days, to catch any atmospheric formaldehyde on a collector substrate for subsequent analysis on the ground.

The FE-2 completed his daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13/07 (briefly interrupted for EVA-13 photo support). *[The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour.]*

Peggy Whitson conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. *[Updated "cue cards" based on the crew's water calldowns are sent up every other week (currently #16-0018N).]*

Dan Tani deployed a new WAP (Wireless Access Point) unit each in Node-1 and Node-2. Afterwards, he loaded the crew PDAs (Personal Digital Assistants) with new IMS/BCR (Inventory Management System/Bar Code Reader) software and deployed the PDAs by configuring them for use with the new WAPs. *[WAP2 allows the usage of the wireless WiFi capabilities of the PDA for IMS updating, editing & synchronizing from throughout the station.]*

Whitson worked for about half an hour on the CMRS (Crew Medical Restraint System), stowed in the CHeCS (Crew Health Care Systems) rack, to perform the periodic checkout and inspection of the system for upcoming standard CMO (Crew Medical Officer) proficiency training. *[Peggy inspected the CMRS for cracks in the board and/or metal fastener exposed on top of CMRS (found on the ground units), either of which could provide a high-voltage defibrillation ground path from the patient to ISS structure. The board-like CMRS allows strapping down a patient on the board with a harness for medical attention by the CMO who is also provided with restraints around the device. The device can be secured to the ISS structure within two minutes to provide a patient restraint surface for performing emergency medical procedures, such as during ACLS (Advanced Cardiac Life Support). It can also be used to transport a patient between the station and the Orbiter middeck. It isolates the crew and equipment electrically during defibrillations and pacing electrical discharges, accommodates the patient in the supine zero-G positions, provides cervical spine stabilization and, for a three-person crew, can also restrain two CMOs during their delivery of medical care.]*

Malenchenko transferred the new Russian KPT-2 "BAR-RM" science payload from Progress 27P, set it up and prepared it for subsequent operation. After taking measurements, the FE-1 was to downlink the data via BSR-TM channel from the RSE-1 laptop and close out operations with hardware deactivation. *[BAR-RM is designed to develop a procedure for detection of air leakage from ISS modules]*

based on environmental data anomalies (temperature, humidity, ultrasound emissions). The payload uses a remote infrared thermometer (Kelvin-Video), a thermohygrometer (Iva-6A), a heat-loss anemometer/thermometer (TTM-2), an ultrasound analyzer (AU-01), and a leak detector (UT2-03) to determine physical background signs of loss of ISS pressure integrity which could be indicative of leaks in the working compartments of the station. Measurements are taken in specific zones (13 in SM PkhO and 4 in DC1), both with lights & fans turned on and off.]

Yuri also completed today's routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Working off his discretionary "time permitting" task list, the FE-1 later conducted the daily 20-min. IMS maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crewmembers performed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Dan Tani transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~9:20am EST, the CDR and FE-2 supported two interactive PAO interviews with TV stations of 10 min each, one with WHO-TV in Des Moines, IA (Brooke Bouma), the other with WMAQ-TV in Chicago, IL (Phil Rogers).

Reboost Preview: Tomorrow's ISS reboost with the SM main engine (2 KD thrusters & ODU props) is scheduled for 7:42pm EST, with magnitude of the desired delta-V currently under review (typ.: ~3 m/s) since it is mostly designed for phasing for Progress 28P rendezvous as well as STS-122/1E docking on FD3. For example: If the Shuttle launch moves into the February window (starting 2/7), rescheduling of 28P launch from 2/7 to, say, 2/5 would be required to deconflict the two launches/dockings, which in turn determines the reboost delta-V tomorrow evening. Stay tuned.

PPS P6 Reconditioning: At ~10:00am EST, reconditioning (discharge/recharge) maintenance has started on the truss P6 battery sets 2B2 (channel 2B) and 4B2 (channel 4B), simultaneously. The approximate timeframe for the reconditioning

runs from today to 1/19. After today's start of discharge, the batteries will be transitioned to recharge on 1/14. Times for the second discharge/recharge cycle will be adjusted after observing the first charge cycle.

BCC Dry Run: Early this morning, MCC-Houston conducted another BCC (Backup Control Center) dry run in test mode, with no involvement of the ISS crew or vehicle. The seven-hour exercise started at 1:00am EST. *[Purpose of this periodic exercise is to demonstrate BCC functionality under Russian assets while providing proficiency training for Moscow-HSG (Houston Support Group) personnel at the HSR (Houston Support Room) and TsUP-Moscow specialists.]*

CEO (Crew Earth Observation) photo targets uplinked for today again were **South Tibesti Megafans, Africa** (*weather was predicted to be clear over this region of ancient dry river channels. The Tibesti megafans were formed by rivers and streams that flowed during a much wetter climatic regime [approximately 8000 years ago] than currently exists in the Sahara. Nadir-viewing, overlapping frames taken along-track were requested to map the southwestern extent of the megafans; looking for a discontinuous pattern of overlapping channels*), **Tenoumer Impact Crater, Mauritania** (*the crew had a near-nadir pass over this geologically young [~21,000 years old] impact structure. Looking to the left of track for the well-defined circular crater, located to the north of a dune field*), **Polar Mesospheric Clouds — PMC, Antarctica** (*IPY--PMC radar research station active. GMTs for this and subsequent PMC opportunities were chosen for closeness to the Antarctic PMC radar research site at 73S 13W. Radar is switched on during ISS passes at the given GMTs. But the crew was to feel free to look south during any night awake pass*), and **Madrean Sky Islands, North America** (*ISS orbit track paralleled mountains in northern Mexico that are part of the "sky islands". These cool, moist, high-altitude pine-oak forested mountain summits are surrounded by desert. The ecosystems of the mountain summits are considered to be remnants of much more widespread flora and fauna present at lower latitudes during cooler and wetter climatic periods. Nadir-viewing, overlapping frames taken along-track was requested*).

CEO photography can be viewed and studied at the websites:
<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site);
<http://earthobservatory.nasa.gov/>
<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 8:11am EST [= epoch]):
Mean altitude -- 334.1 km

Apogee height -- 335.9 km
Perigee height -- 332.3 km
Period -- 91.21 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0002684
Solar Beta Angle -- -17.2 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.79
Mean altitude loss in the last 24 hours -- 160 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 52349

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*
NET = Not Earlier Than):

01/11/08 -- ISS reboost (~7:42pm, SM main engine w/two thrusters)
01/24/08(NET) -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite.
01/31/08 -- **Explorer-1 50 Years (1st U.S. Satellite on Redstone rocket)** [*see*

ISS On-Orbit Status 01/09/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Whitson & FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop for downlink. *[To monitor the crewmembers' sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

The FE-2 worked in the Airlock (A/L), starting on a lengthy (2h 25m) troubleshooting procedure on the EACP (EVA/EMU Audio Control Panel), first setting up comm from the A/L, then activating the EACP and connecting it via the "low clearance" Y-cable to ATU-4 (Audio Terminal Unit, #4) and ATU-6 on the A/L Avionics Rack. After initial testing, the EACP was turned off again. *[ATU-6 was installed by Clay Anderson on 10/11/07 in place of a failed unit, and the failed ATU-6 was returned on 10A. The new ATU-6 has been experiencing periodic lockups and PBIT (passive built-in test) faults. Engineering analysis and testing indicate that these issues may be caused by improperly mated J3 & J4 connections, a problem with the address connector, or a dirty fiber-optic connector. There are 3 ATUs in the A/L, one of which must be functional for EVAs, so long as the suited EVA crew has established UHF (Ultra High Frequency) radio communication.]*

In the DC1 Docking Module, with temporary comm link established, FE-1 Malenchenko terminated discharging the first Orlan 825M3 battery pack and started discharging pack #2 (of three).

Yuri then continued his three-day maintenance on the three Russian Orlan-M spacesuits #25, #26 & #27 in DC1, today performing spacesuit and BSS (Orlan Interface Unit) leak and valve tests, including a hermeticity check on the Orlan #25 backup bladder. The activity was supported by specialist tagup.

At ~3:20am EST, the FE-1 supported the ground's reactivation of the Elektron O₂ generator at 32 amps by monitoring the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there is no overheating. *[During nominal operations a gas analyzer is utilized to detect hydrogen (H₂) in the O₂ line (which could cause overheating) but is not included in the control algorithm until 10 minutes after Elektron startup.]*

Malenchenko also continued the extended leak checking of the spare BZh Liquid Unit (#056) for the Elektron O₂ generator by checking the unit's pressure and charging it once again with pressurized N₂ from the BPA-M Nitrogen Purge Unit (#23) to 1 atm (1 kg/cm²). The last test pressurization was on 12/13/07. *[During Elektron operation, the inert gas locked up in the BZh has the purpose to prevent dangerous O₂/H₂ mixing. A leaking BZh cannot be used.]*

CDR Whitson powered up the MSG (Microgravity Science Glovebox) and conducted another InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions) experiment run (#3), then exchanged the vial assembly. MSG was powered down afterwards. *[After MSG and InSPACE & InSPACE-2 equipment activation, Peggy checked on alignment & focusing of the two MSG video cams, switched the magnetic field between runs, changed out video recorder tapes and later deactivated InSPACE & MSG. InSPACE, conducted last in June 2006 by Jeff Williams on Increment 13, obtains basic data on magnetorheological (MR) fluids, i.e., a new class of "smart materials" that can be used to improve or develop new brake systems, seat suspensions robotics, clutches, airplane landing gear, and vibration damper systems. The dispersed MR fluid particles are contained in CAs (Coil Assemblies) inside small precision rectangular borosilicate glass vials in the MSG. The CAs subject them to pulsed electromagnetic fields of certain strength and frequencies.]*

FE-2 Tani conducted periodic coolant sampling on the Node-2 ITCS MTL (Internal Thermal Control System/Moderate Temperature Loop) by adjusting its fluid sampling adapter metering valve and then taking a fluid sample for OPA (Ortho-Phthalaldehyde) testing (with test strips). The sampling process for OPA was then repeated on the LTL (Low Temperature Loop) side of the Node-2 ITCS and subsequently also on the MTL loop of the Lab ITCS. *[OPA, an antimicrobial agent, was introduced into the Lab ITCS coolant by the AmiA (Antimicrobial*

Applicator), before the AmiA was removed again on 11/2 by Clay Anderson for Earth return.]

Yuri Malenchenko prepared for today's first day of a new five-day wearing test of the spring-loaded "Penguin-3" antigravity pressure/stress suit with its load measuring system (SIN), donning the suit and its equipment, then going about his business and downloading performance measurements several times. *[During each of the five days, Yuri selects higher symmetrical (shoulders) & asymmetrical (chest & back) loads (~20-30 kgf), after calibrating the system with no load on the suit's internal tension straps. Performance/body motion data are then collected by the SIN electronics (via analog-to-digital converters) and downloaded to an A31p laptop three times daily, followed by downlink to the ground via BSR-TM.]*

Dan Tani performed his daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13/07 (briefly interrupted for EVA-13 photo support). *[The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour.]*

Later, Tani undertook the monthly FDS PEP (Fire Detection & Suppression/Portable Emergency Provisions) safety inspection/audit. *[The IMS (Inventory Management System)-supported inspection involves verification that PFEs (portable fire extinguishers), PBAs (portable breathing apparatus), QDMAs (quick-don mask assemblies) and EHTKs (extension hose/tee kits) are free of damage to ensure their functionality, and to track shelf life/life cycles on the hardware (QDMA harness inspection was not required this time). In the USOS, there are a total of 5 PFEs and 7 PBAs, plus 7 QDMAs and 4 EHTKs.]*

For upcoming activities with the new Russian KPT-2 science payload BAR-RM (a cabin leakage detection experiment starting tomorrow), Malenchenko reinstalled the previous software (v1.2) from DVD-ROM on the RSE1 laptop (which does not have a second hard drive).

Yuri performed his routine servicing of the ESA/Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS), downlinking accumulated AST spectrometer data. *[The FE-1 checked the spectrometer's PCMCIA memory card (#938) in the AST slot and #941 and ascertained their file quantities and sizes in the RSK1 laptop. ALTCRISS uses the AST spectrometer employed by VC8 guest cosmonaut Roberto Vittori in 2005 in the DC1 for the Italian LAZIO (Low Altitude Zone/Ionization Observatory) experiment.]*

Using the SKDS CMS (Pressure Control & Atmosphere Monitoring System/Countermeasure System), the FE-1 took the periodic readings of potentially harmful contaminants in the SM. The hardware was then returned to initial stowage. *[The CMS uses preprogrammed microchips to measure Formaldehyde (H_2CO , methanal), Carbon Monoxide (CO) and Ammonia (NH_3), taking one measurement per microchip.]*

Dan serviced the prime CSA-CP (Compound Specific Analyzer-Combustion Products) unit, replacing its battery with a fresh one.

Yuri completed today's routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables, the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP.

The FE-1 also conducted the daily 20-min. IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Peggy Whitson performed a major outfitting job on the Node-1 overhead hatch (forward) to the Z1 Dome by installing an NPRV (Negative Pressure Relief Valve) to protect the hatch from "burping" during depressurizations. *[A hatch door "burps" when it temporarily flexes and unseats due to pressure differential acting in the "wrong" direction, i.e., opposite to pressing the door down on its seal. For the installation, Peggy had to remove the RED (Resistive Exercise Device) mounted on the Node "ceiling", install the NPRV, inspect the hatch seal and reinstall the RED.]*

Malenchenko worked on the RBO-3-2 radiation payload suite "Matryoshka-R", conducting the periodic collection and logging of accumulated data of seven Matryoshka-R Bubble Dosimeter detectors installed previously at various exposure locations in the RS (Russian Segment), using the special Bubble Dosimeter Reader. *[The complex Matryoshka payload suite is designed for sophisticated radiation studies. Three detectors now in use are positioned in spherical "Phantom" containers in the DC1, four in the stbd crew cabin, under the work table, and behind a panel (#327).]*

Today at sleeptime, Yuri will start another data take with the Russian MBI-12 SONOKARD (Sonocard) experiment, his seventh. *[During sleep, Yuri will wear a shirt with the special SONOKARD device in the shirt pocket. The objectives of the experiment are stated to (1) study the feasibility of obtaining the maximum of data*

through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]

The crewmembers performed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Dan copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

The FE-2 went on a narrated video "tour" of the ISS compartments with a Sony PD100 camcorder, paying special attention to radial port stowage in both Nodes for fireport evaluation, for subsequent downlink to MCC-Houston. (Last time done by Suni Williams on 5/8/07). *[The footage provides valuable situational insight in the current configuration of the station interior, including general stowage configuration and fireport observation (clearance), for the FCT (Flight Control Team) and will also be used for upcoming Expedition and Shuttle crews for pre-flight "handover" training.]*

At ~9:00am EST, the crew downlinked two PAO TV messages of greetings for later replay, one at the 50th anniversary race of the Daytona "500" in February, the other at the dedication of the new Davidson Space Exploration Center (housing the 43-year old Saturn-V-D dynamic test vehicle) and the 50th Anniversary of Explorer 1 festivities at the USSRC in Huntsville, AL.

At ~4:00pm, Dan Tani is scheduled for a PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop).

CEO (Crew Earth Observation) photo targets uplinked for today again were **Polar Mesospheric Clouds — PMC, Antarctica** (IPY--PMC radar research station active. GMTs for this and subsequent PMC opportunities were chosen for closeness to the Antarctic PMC radar research site at 73S 13W. Radar is switched on during ISS passes at the uplinked GMTs. But the crew was to feel free to look south during any night awake pass), and **Luquillo Forest, Puerto**

Rico (*ISS had a nadir pass over this Long Term Ecological Research [LTER] site located at the northeastern tip of Puerto Rico. One of the newer sites in the National Science Foundation's LTER Network, the Luquillo Forest represents a tropical ecosystem subject to major periodic environmental stresses such as hurricanes. Overlapping, high resolution frames taken along-track are requested to document current vegetation and land cover patterns).*

CEO photography can be viewed and studied at the websites:

<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site);

<http://earthobservatory.nasa.gov/>

<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 8:10am EST [= epoch]):

Mean altitude -- 334.2 km

Apogee height -- 335.9 km

Perigee height -- 332.6 km

Period -- 91.22 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0002481

Solar Beta Angle -- -22.1 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.79

Mean altitude loss in the last 24 hours -- 165 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 52333

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*

NET = Not Earlier Than):

01/11/08 -- ISS reboost (~7:42pm, ~12.5 m/s, SM main engine)

01/24/08(NET) -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite.

01/31/08 -- **Explorer-1 50 Years (1st U.S. Satellite on Redstone rocket)** [see

<http://usspace50.com>]

02/06/08 -- Progress M-62/27P undocking & reentry

02/07/08 -- Progress M-63/28P launch

02/09/08 -- Progress M-63/28P docking (DC1)

02/22/08(NET) -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana)

02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A, ~11:53am, w/SLP-SPDM, JEM ELM-PS

02/16/08 -- STS-123/Endeavour/1J/A docking

02/27/08 -- STS-123/Endeavour undocking

02/29/08 -- STS-123/Endeavour landing

03/06/08 -- ATV-1 Demo Day 1

03/12/08 -- ATV-1 Demo Day 2
 03/15/08 -- ATV-1 Demo Day 3 & Docking (SM aft port)
 04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
 04/08/08 -- Soyuz TMA-12/16S launch
 04/10/08 -- Soyuz TMA-12/16S docking (DC1)
 04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
 04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
 04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS
 04/26/08 -- STS-124/Discovery/1J docking
 05/04/08 -- STS-124/Discovery/1J undocking
 05/14/08 -- Progress M-64/29P launch
 05/16/08 -- Progress M-64/29P docking (DC1)
 08/07/08(NET) -- ATV-1 undocking (from SM aft port)
 08/12/08 -- Progress M-65/30P launch
 08/14/08 -- Progress M-65/30P docking (SM aft port)
 09/09/08 -- Progress M-64/29P undocking (from DC1)
 09/10/08 -- Progress M-66/31P launch
 09/12/08 -- Progress M-66/31P docking (DC1)
 09/18/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
 09/20/08 -- STS-126/Discovery/ULF2 docking
 10/01/08 -- STS-126/Discovery/ULF2 undocking.
 10/01/08 -- **NASA 50 Years**
 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
 10/12/08 -- Soyuz TMA-13/17S launch
 10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
 10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
 11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
 11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment
 11/08/08 -- STS-119/Discovery/15A docking
 11/17/08 -- STS-119/Discovery/15A undocking
 11/20/08 -- **ISS 10 Years**
 11/26/08 -- Progress M-67/32P launch
 11/28/08 -- Progress M-67/32P docking (SM aft port)
 04/15/09 -- **Constellation's Ares I-X Launch**
 05/??/09 -- **Six-person crew on ISS** (following Soyuz 18S-2 docking)
 04/??/10 -- STS-132/Discovery/20A – Node-3 + Cupola.

ISS On-Orbit Status 01/08/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Whitson & FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop for downlink. *[To monitor the crewmembers' sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

Working in the DC1 Docking Compartment, FE-1 Malenchenko, later joined by CDR Whitson, started a three-day maintenance activity on three Russian Orlan-M spacesuits (#25, #26, #27), first initiating discharge of 825M3 Orlan battery pack #1, then scrubbing and degassing the Orlan water loops, followed by the coolant loops in the DC1 and SM PkhO (Service Module Transfer Compartment) BSS Orlan Interface Units. *[Functional inspection & checkout of the suits and their spare parts, including bladder leak tests, are scheduled tomorrow & Thursday.]*

FE-2 Tani undertook the monthly (Week 11) potable water sampling for microbial inflight and post-flight chemical analysis, using jointly approved Russian sampling procedures with the U.S. WS&A (Water Sampler & Archiver) kit for collection. Later, Dan performed the in-flight analysis using the WMK (Water Microbiology Kit) and its MCDs (Microbial Capture Devices) for coliform detection. *[Three samples (225 mL each) were taken in the SM -- at the potable water SRV-K hot port, SRV-K warm port & SVO-ZV tap for inflight analysis, plus two chemical post-flight samples (750 mL) for return on 1E from SRV-K warm & SVO-ZV. Note: Flush water is being reclaimed by mopping it up with towels which are then hung up in the Russian*

segment (RS) for evaporation, collection and condensation in the SKV2 air conditioner, thus reducing the amount of water to be transferred from the Lab CCAA (Common Cabin Air Assembly) condensate tank to the RS for “Elektron” processing (demineralizing).]

The FE-1 serviced the SM's ASU toilet facilities systems/replaceables, performing the periodic replacement of the toilet's urine receptacle (M-P) and filter insert (F-V), plus associated hoses and a sensor, and stowing the old units for disposal.

The FE-2 performed his daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13/07 (briefly interrupted for EVA-13 photo support). *[The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour.]*

In the SM, Malenchenko conducted his second periodic repositioning of the ESA/RSC-Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS) by rotating its AST spectrometer 90 deg in its place to face in another direction, then swapping the AST's PCMCIA (Portable Computer Memory Card International Adapter) storage card #941 with #938. The activity was photo-recorded, with imagery downlinked afterwards. *[ALTCRISS uses the AST spectrometer to monitor space radiation at different points in the RS.]*

Later, Yuri completed today's routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables, the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP.

Working off his voluntary “time permitting” task list, the FE-1 also conducted the daily 20-min. IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

At ~11:55am EST, Peggy Whitson conducted a teleconference with ground specialists on her upcoming R&R (Removal & Replacement) of a suspect ITCS (Internal Thermal Control System) pressure relief valve in EXPRESS Rack 1 (ER1). *[A fluid leak in ER1 was identified in late 2005, and the valve is the most likely suspect. The rack's anomaly has significantly impacted the science community. A spare valve was delivered on 12A.1. The suspect valve was not designed as an ORU (Orbital Replacement Unit), but its R&R can restore full*

functionality to the rack. The IFM (Inflight Maintenance) is scheduled on 1/10 (Thursday) for several hours, and the valve will be inspected for leaks; if none are found, the hardware will be reinstalled. ER1, with 8 lockers and 2 drawers, containing SAMS (Space Accelerations Measuring System) & MAMS (Microgravity Accelerations Measuring System), has been inactive since 1/2.]

Dan Tani conducted the periodic (every two weeks) 15-min inspection of the RED (Resistive Exercise Device) canister cords and accessory straps as well as the canister bolts for re-tightening if required.

The crewmembers performed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Dan copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

With the Russian O₂ (oxygen) generator “Elektron” turned off since 12/28/07, the FE-1 had time set aside for another 1-hour O₂ repress of the cabin atmosphere from Progress M-62/27P storage tankage, if required. Yesterday’s repress added about 8 mmHg of O₂ into the ISS as per plan. *[The Elektron will remain powered down until 1/9/08 to conserve hardware lifetime. During this time, the station will be periodically repressurized with oxygen from Progress 27P.]*

As a new item added to her discretionary “job jar” task list, CDR Whitson is to take the Sony PD100 camcorder on another narrated video “tour” of the ISS compartments, with special attention to radial port stowage in both Nodes for fireport evaluation, for subsequent downlink to MCC-Houston. (Last time done by Suni Williams on 5/8/07). *[The footage provides valuable situational insight in the current configuration of the station interior, including general stowage configuration and fireport observation (clearance), for the FCT (Flight Control Team) and will also be used for upcoming Expedition and Shuttle crews for pre-flight “handover” training.]*

Weekend Voluntary Science: For the next voluntary “Saturday Science” program on 1/12, Peggy was offered, for her acceptance, two experiment runs with the InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions) payload in the MSG (Microgravity Science Glovebox).

CEO (Crew Earth Observation) photo targets uplinked for today again were **Polar Mesospheric Clouds — PMC, Antarctica** (*IPY--PMC radar research station active. GMTs for this and subsequent PMC opportunities were chosen for closeness to the Antarctic PMC radar research site at 73S 13W. Radar is switched on during ISS passes at the uplinked GMTs. But the crew was to feel free to look south during any night awake pass*), **Tigris-Euphrates Delta, Persian Gulf** (*looking to the right of track for the Tigris-Euphrates delta region. Like other deltas around the world, land use change in the region is affecting the existing ecosystems and hydrologic processes. Imagery of the coastline is requested to track these changes*), **Somalia Coast, Africa** (*weather was predicted to be clear over the Somalia coast for high resolution photography of existing land cover and land use. Nadir images of the coast, acquired along-track, were requested*), and **Volcano Colima, Mexico** (*a Decade Volcano, Colima is considered to be one of the most potentially hazardous due to human settlement in the region. Looking to the right of track for the volcano, distinctive because of two peaks. Near-nadir mapping of the summit and flanks of the cone is requested. This imagery is useful for identifying changes in vegetation density or slope material movement*).

CEO photography can be viewed and studied at the websites:
<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
<http://earthobservatory.nasa.gov/>
<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 9:00am EST [= epoch]):

Mean altitude -- 334.4 km

Apogee height -- 336.0 km

Perigee height -- 332.8 km

Period -- 91.22 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0002426

Solar Beta Angle -- -27.0 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.78

Mean altitude loss in the last 24 hours -- 189 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 52318

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*

NET = Not Earlier Than):

ISS On-Orbit Status 01/07/08

All ISS systems continue to function nominally, except those noted previously or below. *Russian Orthodox Christmas, a holiday also for ISS. Ahead: Week 12 of Increment 16.*

S Rodzhestvom Kristovym!

CDR Whitson & FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop for downlink. *[To monitor the crewmembers' sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

At ~5:00am EST, FE-1 Malenchenko received a 10-min VIP call via S-band from Patriarch Alexis II of the Russian Orthodox Church, speaking from TsUP/Moscow and extending best wishes to the crew on the occasion of today's Orthodox Christmas celebration. *[The Russian Orthodox Church celebrates its Christmas 13 days after Western Christmas, on January 7, in accordance with the old Julian calendar. It is a day of both solemn ritual and joyous celebration. Christmas was banned throughout Russia after the 1917 Revolution, along with other religious celebrations, and it wasn't until 75 years later, in 1992, that the holiday was again openly observed. Today, it's once again celebrated in grand fashion, with citizens participating in an all-night Mass in incense-filled Cathedrals amidst the company of the painted icons of Saints, along with a traditional family get-together and special meal on Christmas Eve.]*

Later, Yuri completed today's routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including ASU toilet facilities systems/replaceables, the weekly collection of the

toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP.

The crewmembers performed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Peggy Whitson copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

With the Russian O₂ (oxygen) generator “Elektron” turned off since 12/28/07, the FE-1 had time set aside for another 1-hour O₂ repress of the cabin atmosphere from Progress M-62/27P storage tankage, if required. Yesterday’s repress added about 8 mmHg of O₂ into the ISS as per plan. *[The Elektron will remain powered down until 1/9/08 to conserve hardware lifetime. During this time, the station will be periodically repressurized with oxygen from Progress 27P.]*

A new entry still on discretionary US “job jar” task list for Peggy and Yuri is “ghosting” an updated personal image with their preferred material on a 60GB hard disk in an A31p laptop UltraBay Adapter reserved as their CPSD (Crew Personal Support Disk), a 45-min task for each.

Also on Whitson’s voluntary task list, at her convenience, is an audit of rack locations, using the IMS (Inventory Management System). *[The audit function, introduced with the implementation of IMS software version 2.0, allows the crewmember to set up audits of bags, kits, containers and stowage locations on the laptop.]*

A third new item on the “job jar” task list is for FE-2 Tani to continue his crew departure preparations.

The two flight engineers were scheduled for PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop), Yuri at ~6:20am EST, Dan at ~11:50am.

No CEO photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are

downloaded by the public each month from this "Gateway" site);
<http://earthobservatory.nasa.gov/>
<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 8:39am EST [= epoch]):

Mean altitude -- 334.6 km
Apogee height -- 336.3 km
Perigee height -- 332.9 km
Period -- 91.22 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0002503
Solar Beta Angle -- -31.9 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.78
Mean altitude loss in the last 24 hours -- 213 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 52302

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*

NET = Not Earlier Than):

01/11/08 -- ISS reboost (~7:42pm)
01/24/08(NET) -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite.
01/31/08 -- **Explorer-1 50 Years (1st U.S. Satellite on Redstone rocket)** [see
<http://usspace50.com>]
02/06/08 -- Progress M-62/27P undocking & reentry
02/07/08 -- Progress M-63/28P launch
02/09/08 -- Progress M-63/28P docking (DC1)
02/22/08(NET) -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana)
02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A, ~11:53am, w/SLP-SPDM, JEM
ELM-PS
02/16/08 -- STS-123/Endeavour/1J/A docking
02/27/08 -- STS-123/Endeavour undocking
02/29/08 -- STS-123/Endeavour landing
03/06/08 -- ATV-1 Demo Day 1
03/12/08 -- ATV-1 Demo Day 2
03/15/08 -- ATV-1 Demo Day 3 & Docking (SM aft port)
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch
04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch -- JEM PM "Kibo", racks, RMS
04/26/08 -- STS-124/Discovery/1J docking

05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
08/07/08(NET) -- ATV-1 undocking (from SM aft port)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
09/18/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
09/20/08 -- STS-126/Discovery/ULF2 docking
10/01/08 -- STS-126/Discovery/ULF2 undocking.
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment
11/08/08 -- STS-119/Discovery/15A docking
11/17/08 -- STS-119/Discovery/15A undocking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
04/15/09 -- **Constellation's Ares I-X Launch**
05/??/09 -- **Six-person crew on ISS** (following Soyuz 18S-2 docking)
04/??/10 -- STS-132/Discovery/20A – Node-3 + Cupola.

ISS On-Orbit Status 01/06/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday -- off-duty day for CDR Whitson, FE-1 Malenchenko and FE-2 Tani (congrats, Dan, to the nice write-up about you and your mom in today's Washington Post!). Ahead: Week 12 of Increment 16. Also: **Christmas Eve** for tomorrow's Russian Orthodox Christmas.*

CDR Whitson & FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop for downlink. *[To monitor the crewmembers' sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

Upon wakeup, Dan Tani also performed the last sampling of his session with the NASA/JSC experiment NUTRITION w/Repository, collecting a final urine sample for storage in the MELFI (Minus-Eighty Laboratory Freezer for ISS), Dewar 2, Tray A/2-3. The sampling kit was then stowed away. *[The current NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R +30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

After Houston Flight Controllers started deactivating the CDRA (Carbon Dioxide Removal Assembly) early this morning (1:40-6:40am) and cooling was no longer

required, the FE-2 disconnected the ITCS LTL QD (Internal Thermal Control System/Low Temperature Loop/Quick Disconnect) jumper to the CDRA rack (LAB1D6).

With the Russian O₂ (oxygen) generator “Elektron” turned off since 12/28/07, Yuri had time set aside for another 1-hour O₂ repress of the cabin atmosphere from Progress M-62/27P storage tankage, if required. *[The Elektron will remain powered down until 1/9/08 to conserve hardware lifetime. During this time, the station will be periodically repressurized with oxygen from Progress 27P.]*

FE-2 Tani performed his daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13/07 (briefly interrupted for EVA-13 photo support). *[The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour. Special uplink to Dan this morning: “The BCAT team downloaded the new images and reports that they look fabulous. The team is very excited and looking forward to pressing ahead and making more progress in coming days.”]*

FE-1 Malenchenko meanwhile conducted the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers. Weekly SOZh reports (on Sundays) to TsUP/Moscow deal with number & dates of water and urine containers, counter readings of water consumption & urine collection, and total operating time of the POTOK air filtration system.]*

Working off his “time permitting” discretionary task list, Yuri conducted his fifth run of the Russian DZZ-2 “Diatomeya” ocean observations program, using the NIKON-F5 still camera with 80-200 mm Nikkor zoom lens and the SONY PD-1500 camcorder to record color contrasts on water surface and irregular cloud cover pattern in the World Ocean target areas. *[Uplinked target zones in the Atlantic Ocean were the Great Banks, the commercial-production area of the Western Sahara, the US coastal area of the Agulhas subsea table (RSA), the Gulf of Mexico with the Caribbean Sea and the Venezuelan coast.]*

A second job item on the FE-1’s discretionary list for today was another KPT-3 session to make observations and take aerial KPT-3 photography of environmental conditions for Russia's Environmental Safety Agency (ECON) using the Nikon D2X

digital camera with SIGMA 300-800mm telephoto lens. *[Targets today were contamination areas in the Seattle area and in the Pacific Ocean.]*

A new entry added to the discretionary US “job jar” task list for Peggy and Yuri is “ghosting” an updated personal image with their preferred material on an 60GB hard disk in an A31p laptop UltraBay Adapter reserved as their CPSP (Crew Personal Support Disk), a 45-min task for each.

Also on Whitson’s voluntary task list, at her convenience, is an audit of rack locations, using the IMS (Inventory Management System). *[The audit function, introduced with the implementation of IMS software version 2.0, allows the crewmember to set up audits of bags, kits, containers and stowage locations on the laptop.]*

Another newly added item on the “job jar” task list is for FE-02 Tani to continue his crew departure preparations.

The crewmembers performed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR , FE-1), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Tani and Whitson had their weekly PFCs (Private Family Conferences) via S-band/ audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop), Dan at ~9:20am EST, Peggy at ~10:55am.

No CEO photo targets uplinked for today.

CEO photography can be viewed and studied at the websites:
<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);
<http://earthobservatory.nasa.gov/>
<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 8:25am EST [= epoch]):

Mean altitude -- 334.8 km

Apogee height -- 336.4 km

Perigee height -- 333.2 km

Period -- 91.23 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0002355

Solar Beta Angle -- -36.8 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.78
Mean altitude loss in the last 24 hours -- 198 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 52286

Significant Events Ahead *(all dates Eastern Standard, some changes possible.*

NET = Not Earlier Than):

ISS On-Orbit Status 01/05/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Whitson & FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop for downlink. *[To monitor the crewmembers' sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

The crew performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

As part of the house cleaning, FE-1 Yuri Malenchenko performed preventive maintenance cleaning on the FS5, FS6, VPkhO, VdPrK, VPrK & TsV2 fan grilles in the DC1 Docking Module and FGB (*Funktsionalnyi-Grusovoi Blok*).

For today's VolSci (Voluntary Weekend Science) program, Dan Tani completed an all-day session with the NASA/JSC experiment NUTRITION w/Repository, starting with the 24-hour urine collections at wakeup, to continue through tomorrow morning. Peggy Whitson also collected & processed blood samples from Dan. The

samples were consecutively stored in the MELFI (Minus-Eighty Laboratory Freezer for ISS). *[The current NUTRITION/Repository project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

For her VolSci part, CDR Whitson worked with the MSG (Microgravity Science Glovebox) and the InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions) experiment. *[After activation of MSG and InSPACE & InSPACE-2 equipment, Peggy checked on alignment & focusing of the two MSG video cams, switched the magnetic field, changed out video recorder tapes and later deactivated InSPACE & MSG. InSPACE, conducted last in June 2006 by Jeff Williams on Increment 13, obtains basic data on magnetorheological fluids, i.e., a new class of "smart materials" that can be used to improve or develop new brake systems, seat suspensions robotics, clutches, airplane landing gear, and vibration damper systems. The dispersed particles are contained in CAs (Coil Assemblies) in the MSG that subject them to electric fields of certain strength and frequencies.]*

The FE-1 meanwhile performed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers. Weekly SOZh reports (on Sundays) to TsUP/Moscow deal with number & dates of water and urine containers, counter readings of water consumption & urine collection, and total operating time of the POTOK air filtration system.]*

The FE-2 performed his daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13/07 (briefly interrupted for EVA-13 photo support). *[The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour. Special uplink to Dan this morning: "The BCAT team downloaded the new images and reports that they look fabulous. The team is very excited and looking forward to pressing ahead and making more progress in coming days."]*

With the Russian O₂ (oxygen) generator "Elektron" turned off since 12/28/07, Yuri had time reserved for another 1-hour O₂ repress of the cabin atmosphere from Progress M-62/27P storage tankage, if required. Yesterday's repress added about 8 mmHg of O₂ into the ISS as per plan. *[The Elektron will remain powered down until 1/9/08 to conserve hardware lifetime. During this time, the station will be periodically repressurized with oxygen from Progress 27P.]*

The crewmembers performed their regular 2.5-hr physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Peggy copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working off his voluntary "time available" task list, Yuri took photographs of the externally installed SKK-9/SM and SKK-2/DC1 replaceable materials exposure experiments. *[SKK-9 was to be photographed through the DC1 EVA hatch window, SKK-2 from the SM window #6.]*

A second job item on the FE-1's discretionary list for today was another KPT-3 session to make observations and take aerial KPT-3 photography of environmental conditions for Russia's Environmental Safety Agency (ECON) using the Nikon D2X digital camera with SIGMA 300-800mm telephoto lens. *[Targets today were contamination areas in the Seattle area and in the Pacific Ocean.]*

At ~7:45am EST, Yuri participated in an interview by journalist Ekaterina Beloglazova, a correspondent of Rossiyskiy Kosmos Magazine, responding to questions uplinked beforehand. *["We know that because of the Shuttle launch delay your program underwent some changes. What kind of experiments, operations and observations did you perform? What are your impressions and do you have some interesting results?"; "Tell us about the new European module Columbus."; "How much is this expedition different from your past missions?"; "Tell us about your colleagues, your work, your relations, your habits. What is your daily schedule, where do you live, what do you like, how do you spend your free time, etc.?"]*

At ~9:10am EST, the crewmembers held their regular weekly planning conference (WPC) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly

by MCC-H and TsUP/Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

At ~9:40am, the FE-1 had his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop).

The crew worked out in their regular 2.5-hr. physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exerciser (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

SKV2 Update: After the recent successful SKV2 air conditioner reactivation, Malenchenko on 1/3 found condensate water behind some SM panels (405, 407, 409, etc). Cause of the overflow was determined to be a faulty “full” indicator pressure sensor inside the SBK condensate collection tank which failed to shut down the NOK2 condensate pump. After SKV2 deactivation by TsUP, Yuri replaced the tank with a new spare, reactivated the air conditioner and mopped up the water spills. *[SBK has 9 l water capacity and contains an absorptive material inside the tank. There are 6 spares remaining on board. These SBK tanks typically last 1 to 2 years.]*

Weekly Science Update (Expedition Sixteen -- Week 11)

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): FE-1 performed the exchange of memory card on 12/27. Radiation measurements continue nominally in the PIRS module. Next activities (rotation of the ALTEINO instrument, replacement of memory card and downlink) are currently scheduled on 1/8 and 1/9.

ANITA: Completed.

BCAT (Binary Colloidal Alloy Test): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): “Dan, we are waiting to get the new launch date so we can schedule your second in-flight session to meet the R-21 to R-14 requirement. This activity will be hard scheduled when we get a firm launch date.”

CFE (Capillary Flow Experiment): Reserve.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): In progress.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaborate Immagini Televisive - Space 2): ELITE IMU check-out was successful. The ground received good health & status data and could send commands to the payload. The payload reply was nominal and at the end the payload was shut down via ground command.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): In progress.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): "InSPACE-2 setup was completed on 1/4 and we were correctly configured for today's (1/5) first run. The crew provided us with different video views and close-ups of the hardware setup to help us assess the hardware on the ground."

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System):

"Thanks for operating LOCAD-PTS during 12/21-24. The LOCAD team is extremely grateful for your hard work in performing all the scheduled swabs (and more!) and excited about the results. To give you some feedback, here's a brief summary. Dan performed a valuable survey of 12 different sites on ISS during his two sessions. The sites he chose were excellent, and just what we were looking for based on the criteria sent up before the sessions. Some of these sites gave much higher endotoxin readings (e.g. OFFSU bathroom mirror 3.07 endotoxin units (EU)/ml, SM table top 0.564 EU/ml, and CEVIS handle 0.469), than we had seen previously (maximum reading of 0.445 EU/ml out of 23 swabs performed by Suni). Peggy's session helped further our operational database for comparison of LOCAD-PTS data with that of the CHeCS SSK culture methods. From the data we have so far, the sites that Peggy analyzed look clean (i.e. low EU/ml) and it will be interesting to see what SSK culture we get from those same sites. OPERATIONAL ANOMALIES: 1. Frozen display/'temp too high' reading. We had mistakenly informed Dan that he could leave the cartridge in the reader indefinitely before

returning to retrieve the data. In actual fact, it appears the inserted cartridge caused the internal temperature of the reader to rise above the optimal 37 Celsius, to 40-43 Celsius. SOLUTION: We will note in procedures to leave the cartridge in the reader no longer than 30 minutes. 2. Air bubbles in water cartridge and during mixing/dispensing. You both worked very well through procedures to minimize air bubbles and accurately dispense 4 droplets of equal volume in the LOCAD-PTS cartridge. However, we acknowledge that air bubbles are occurring - even before use- and that they complicate dispensing. The cause of air bubbles in the water cartridges may be partly due to inadequately sealed swabbing kit bags. SOLUTIONS: Swabbing kit bags scheduled for flight 1J/A have been more thoroughly heat-sealed. We believe this will reduce the rate of evaporation and bubble formation in the water cartridge. Introduction of bubbles during mixing is difficult to avoid, but we will revisit procedures to see if we can minimize bubbles still further."

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: MULTIGEN-1 samples will be downloaded on STS-122 (1E).

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION/REPOSITORY: "Peggy did a great job completing the FD60 Nutrition/Repository run. Blood operations were completed in record time".

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): "Peggy, we were able to downlink the data from your last download/initialization session and send it to the PI. She states that your data continues to look great. Thanks for the additional Sleep logging. You continue to go above and beyond the requirements and the PI greatly appreciates it. Your remaining activities off the task list include: monthly downloads, two more weeks of target sleep logging with sleep shifting, and doffing the Actiwatch." -- "Dan, we were able to downlink the data from your last download/initialization session and send it to the PI. She states that your data continues to look great. Please continue to Sleep log this week to meet the three

week requirement. We have left this activity on your task list per your suggestion. Your remaining activities off the task list include: at least one more download/initialization session (depending on shuttle launch), one more week of sleep logging, and doffing the Actiwatch on the Shuttle.”

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): In progress.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

CEO (Crew Earth Observation): Through 1/2 the ground has received a total of 8,323 frames of ISS/CEO imagery for review and cataloging. “As our staff returns from holidays and vacations we note with delight that you continued to be an active and enthusiastic Earth observer. Over three thousand frames were acquired since mid-December including frames with times corresponding to 48 of our target requests. We will begin providing feedback on this large backlog in the coming weeks. We will also look at the first 225 frames with D1X and D2Xs cameras and give you an assessment. Your colorful, landmark photo of the São Simão Reservoir in east-central Brazil represents the 300,000th image of the Earth downlinked from the ISS. Congratulations! It will be published on NASA/GSFC’s Earth Observatory website this weekend.”

CEO photo targets uplinked for today again were **Ganges River Delta, Asia** (*weather was predicted to be clear over the Ganges delta area. A nadir mapping pass along-track was requested to capture the current configuration of outlet channels and vegetation patterns*), **Irrawaddy River Delta, Burma** (*clear weather was predicted to continue over the Irrawaddy River delta. A nadir mapping pass along track was requested to track changes to the outlet channels, island morphology, and vegetation patterns*), **Polar Mesospheric Clouds — PMC, Antarctica** (*IPY--PMC radar research station active. GMTs for this and PMC opportunities uplinked have been chosen for closeness to the Antarctic PMC radar research site at 73S 13W. Radar is switched on during ISS passes at the GMTs given. But the crew was to feel free to look south during any night awake pass*), and **Gulf of Fonseca, Central America** (*ISS had a nadir pass over this Central America embayment. High resolution mapping along the coastline was requested to document land cover and land use change*).

CEO photography can be viewed and studied at the websites:
<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this “Gateway” site);

<http://earthobservatory.nasa.gov/>

<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

Significant Events Ahead *(all dates Eastern Standard, some changes possible.*

NET = Not Earlier Than):

01/24/08(NET) -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite.

01/31/08 -- **Explorer-1 50 Years (1st U.S. Satellite on Redstone rocket)** *[Check it out at <http://usspace50.com>]*

02/06/08 -- Progress M-62/27P undocking & reentry

02/07/08 -- Progress M-63/28P launch

02/09/08 -- Progress M-63/28P docking (DC1)

02/22/08(NET) -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana)

02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A, ~11:53am, w/SLP-SPDM, JEM ELM-PS

02/16/08 -- STS-123/Endeavour/1J/A docking

02/27/08 -- STS-123/Endeavour undocking

02/29/08 -- STS-123/Endeavour landing

03/06/08 -- ATV-1 Demo Day 1

03/12/08 -- ATV-1 Demo Day 2

03/15/08 -- ATV-1 Demo Day 3 & Docking (SM aft port)

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch

04/10/08 -- Soyuz TMA-12/16S docking (DC1)

04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)

04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

04/24/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS

04/26/08 -- STS-124/Discovery/1J docking

05/04/08 -- STS-124/Discovery/1J undocking

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

08/07/08(NET) -- ATV-1 undocking (from SM aft port)

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)

09/18/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC

09/20/08 -- STS-126/Discovery/ULF2 docking

10/01/08 -- STS-126/Discovery/ULF2 undocking.

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment
11/08/08 -- STS-119/Discovery/15A docking
11/17/08 -- STS-119/Discovery/15A undocking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
04/15/09 -- **Constellation's Ares I-X Launch**
05/??/09 -- **Six-person crew on ISS** (following Soyuz 18S-2 docking)
04/??/10 -- STS-132/Discovery/20A – Node-3 + Cupola.

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osp/iss_reports/index.htm

ISS On-Orbit Status 01/04/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Whitson & FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop for downlink. *[To monitor the crewmembers' sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

Also before breakfast, Peggy Whitson, Yuri Malenchenko and Dan Tani performed the periodic Russian biomedical routine assessments PZEh-MO-7/Calf Volume Measurement and PZEh-MO-8/Body Mass Measurement (5th for CDR & FE-1, 4th for FE-2), using the IM mass measurement device which Malenchenko afterwards broke down for stowage. *[Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference points, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures. For determining body mass in zero-G, where things are weightless but not massless, the Russian IM "scales" measure the inertial forces that arise during the oscillatory motion of a mass driven by two helical metering springs with known spring constants. By measuring the time period of each oscillation of the unknown mass (the crewmember) and comparing it to the period of a known mass, the crewmember's mass is calculated by the computer and displayed.]*

Dr. Whitson activated the MSG (Microgravity Science Glovebox) via its A31p laptop and later in the day completed Part 2 of hardware setup & installation for the

InSPACE (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions) experiment. *[InSPACE, conducted last in June 2006 by Jeff Williams on Increment 13, obtains basic data on magnetorheological fluids, i.e., a new class of "smart materials" that can be used to improve or develop new brake systems, seat suspensions robotics, clutches, airplane landing gear, and vibration damper systems. The dispersed particles are contained in CAs (Coil Assemblies) in the MSG that subject them to electric fields of certain strength and frequencies. For the new run, the CDR set up CA2-001, VA-001 (Vial Assembly 1), connected a fiber optics cable with its light guide tool to the CA, and inserted video tapes.]*

FE-1 Malenchenko inspected the KRIOGEM-03 refrigerator behind SM (Service Module) panel 229a and took photographs for downlink to TsUP-Moscow via BSR-TM, to check on adequacy of air vents for the unit.

FE-2 Tani had more time reserved for finishing up the CDRA (Carbon Dioxide Removal Assembly) maintenance conducted yesterday, as required. *[Yesterday's replacement work by Whitson & Tani concerned the second (#201) of the two CDRA desiccant/sorbent beds, the first bed having been replaced during Flight 12A.1 in December 2006. The expended CDRA bed #201, to be returned for refurbishment, was found to contain significant amounts of Zeolite in the air selector valve and at the outlets of both the desiccant and sorbent beds. Its replacement has a modified (updated) design that precludes the breach of Zeolite that had been causing CDRA subcomponent contamination and failure. The crew then connected the ITCS LTL (Internal Thermal Control System Low Temperature Loop) for cooling, after which CDRA was activated. Ground teams are closely monitoring the operations of the system over the next few days to verify nominal functionality. Note: During the R&R Tani reported finding a 14mm spherical fisheye camera lens in the depths of the Lab that had been missing for a long time.]*

The two flight engineers later performed outfitting in the DC1 (Docking Compartment), removing old protective guard cages from SD1-7 lighting fixtures and replacing them with new guards delivered on Progress 27P. The old guards were trashed.

In the Lab, CDR Whitson set up the NUTRITION/Repository hardware for urine and blood collections, to be conducted tomorrow by Dan Tani as part of his Voluntary Weekend Science initiative.

Afterwards, Peggy powered on the ELITE-S2 payload to allow ground verification of proper IMU (Interface Management Unit) function. Later, the CDR turned it off again (IMU can only be powered 2.2 hours per day to avoid violating an acoustic constraint). *[The Italian (ASI) experiment ELITE-S2 (Elaboratore Immagini Televisive - Space 2) is a human motion analysis facility for technological*

characterization and potential application for multifactorial movement analysis, to study the connection between brain, visualization and motion in micro-G. By recording and analyzing the three-dimensional motion of astronauts, this study should help engineers apply ergonomics into future spacecraft designs and determine the effects of weightlessness on breathing mechanisms for long-duration missions.]

Yuri Malenchenko set up new Bubble dosimeters for recording radiation traces as an additional component of the RS (Russian segment) radiation payload suite "Matryoshka-R" (RBO-3-2), initializing and deploying the detectors. *[With two new Bubble dosimeter detectors added, a total of eight were initialized in the Bubble dosimeter reader in the SM and positioned at their exposure locations, near the "Phantom" unit on the DC1 panel and in the starboard crew cabin on both sides of the MOSFET (metal oxide semiconductor field-effect transistor) dosimeter detector unit. The setup was photo-documented and also reported to TsUP via log sheet on the BSR-TM payload channel. The complex Matryoshka payload suite is designed for sophisticated radiation studies. Note: Matryoshka is the name for the traditional Russian set of nested dolls.]*

Checking up on potential spillage after his work on the SKV2 air conditioner (see below), Malenchenko had ~2 hrs scheduled for the periodic/long-term inspection of the pressure hull in the SM RO (Service Module Working Compartment), looking for any moisture, deposits, mold, corrosion and pitting behind panels 130, 134, 135, 138, 139 and underneath the TVIS treadmill. (Last time done: 11/2/07).

With about 3 hrs set aside, CDR Whitson performed outfitting on the SM ventilation system, cleaning four fans (VPO10, VPO11, VPO12, VSZP1) behind SM panels before replacing their US-made noise suppressors (blue) with Russian acoustic mufflers (white).

Dan took air samples for the periodic (weekly) atmospheric status check for ppO₂ (Partial Pressure Oxygen) and ppCO₂ (pp Carbon Dioxide), using the hand-held CSA-CP (Compound Specific Analyzer-Combustion Products), CSA-O₂ (CSA - Oxygen sensor) and CDMK (CO₂ Monitoring Kit). Batteries were to be replaced if necessary. *[Purpose of the 15-min activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements. CSA-CP sensors (and readings) employed in the SM were #1051 (22.6%) & #1044 (22.7%) & #1045 (21.8%). O₂ sensor checks used #1042 (22.2%), #1063 (22.3%), #1052 (22.1%), #1041 (22.1%). CDMK CO₂ level in Lab was 0.22% and 0.21% in the SM.]*

The FE-1 completed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Later, Yuri conducted the daily 20-min. IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The FE-2 filled out the regular FFQ (Food Frequency Questionnaire), his 9th, on the MEC (Medical Equipment Computer). *[By means of these FFQs, U.S. astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. At TsUP/Moscow, food specialists are currently preparing the Russian food “menu” for delivery by Progress M-63/28P next February. 28P will carry “bonus food” for Peggy and Yuri, plus about 15 kg of fresh food items (apples, grapefruit, oranges, lemons, garlic) in two containers.]*

Tani also performed the daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13/07 (briefly interrupted for EVA-13 photo support). *[The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour. Special uplink to Dan this morning: “The BCAT team downloaded the new images and reports that they look fabulous. The team is very excited and looking forward to pressing ahead and making more progress in coming days.”]*

With the Russian oxygen (O₂) generator “Elektron” turned off since 12/28/07, Yuri had time reserved for another 1-hour O₂ repress of the cabin atmosphere from Progress M-62/27P storage tankage, if required. *[The Elektron will remain powered down until 1/9/08 to conserve hardware lifetime. During this time, the station will be periodically repressurized with oxygen from Progress 27P.]*

Dan Tani updated the three deployed Post Node-2 Warning books, in their “EVA Hazards” section, with the current new Directed Position angles of the Port SARJ (Solar Alpha Rotary Joint) for +XVV and –XVV attitude. *[From 340 deg (+XVV) &*

20 deg (-XVV) to 320 deg & 40 deg, resp.]

The CDR and FE-2 had more Progress 27P unloading & cargo transfers, as necessary, along with IMS tracking, added on their discretionary “job jar” task list.

The crew worked out in their regular 2.5-hr. physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exerciser (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Dan copied the exercise data file to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~4:15am EST, Yuri linked up with TsUP stowage specialists via S-band to conduct the weekly IMS tagup, discussing stowage issues and equipment locations.

At ~7:20am, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~8:45am, the station residents convened for their weekly teleconference with ISS Program Management at JSC/Houston via S-band/audio.

At ~2:10pm, the crew is scheduled for their eighth weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. *[S/G-2 (Space-to-Ground 2) phone patch via SSC-10 (Station Support Computer 10)].*

SKV2 Update: After the recent troubleshooting of the Russian SKV2 air conditioner, the system continues to run nominally. With SKV1 nonfunctional since quite some time, SKV2 remains the only RS system that collects and condensates humidity from the air. The unit is slated for replacement in the May 2008 timeframe. *[In the USOS (US segment), the CCAA (Common Cabin Air Assembly) in the Lab is serving this function. Humidity level and air temperature need to be controlled carefully to prevent harmful condensation on hardware systems.]*

CEO photo targets uplinked for today again were **Lake Eyre, Australia** *(ISS orbit track got close to the northeastern shoreline of this large lake. Lake Eyre is very responsive to changes in local climate [as expressed by changes in precipitation]. Imagery of the current water levels and surrounding vegetation is requested to add to a time series for change analysis. Looking to the right of track for the Lake),*
Polar Mesospheric Clouds — PMC, Antarctica *(IPY--PMC radar research station*

*active. Uplinked GMT times for this and subsequent PMC opportunities were chosen for closeness to the Antarctic PMC radar research site at 73S 13W. Radar is switched on during the ISS passes at the given GMTs. But the crew was also to look south during any night awake pass. The usual indicators apply to this and PMC opportunities below: Looking right, well above the limb -- i.e. above the horizon, SW thru SE), and **Somalia Coast, Africa** (weather was predicted to be clear for high resolution mapping of the Somalia coast. Baseline imagery of the coastal region is useful for later comparison of expected land cover/land use change following petroleum infrastructure development. Nadir mapping with overlapping frames, taken along track, was requested).*

CEO photography can be viewed and studied at the websites:
<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site);
<http://earthobservatory.nasa.gov/>
<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 7:44am EST [= epoch]):

Mean altitude -- 335.1 km

Apogee height -- 336.6 km

Perigee height -- 333.7 km

Period -- 91.23 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0002173

Solar Beta Angle -- -46.8 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.78

Mean altitude loss in the last 24 hours -- 97 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 52254

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*

NET = Not Earlier Than):

01/24/08(NET) -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite.

01/31/08 -- **Explorer-1 50 Years (1st U.S. Satellite on Redstone rocket)** [*Check it out at <http://usspace50.com>*]

02/06/08 -- Progress M-62/27P undocking & reentry

02/07/08 -- Progress M-63/28P launch

02/09/08 -- Progress M-63/28P docking (DC1)

02/22/08(NET) -- ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana)

02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A, ~11:53am, w/SLP-SPDM, JEM ELM-PS

02/16/08 -- STS-123/Endeavour/1J/A docking

02/27/08 -- STS-123/Endeavour undocking
 02/29/08 -- STS-123/Endeavour landing
 03/06/08 -- ATV-1 Demo Day 1
 03/12/08 -- ATV-1 Demo Day 2
 03/15/08 -- ATV-1 Demo Day 3 & Docking (SM aft port)
 04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
 04/08/08 -- Soyuz TMA-12/16S launch
 04/10/08 -- Soyuz TMA-12/16S docking (DC1)
 04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
 04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
 04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS
 04/26/08 -- STS-124/Discovery/1J docking
 05/04/08 -- STS-124/Discovery/1J undocking
 05/14/08 -- Progress M-64/29P launch
 05/16/08 -- Progress M-64/29P docking (DC1)
 08/07/08(NET) -- ATV-1 undocking (from SM aft port)
 08/12/08 -- Progress M-65/30P launch
 08/14/08 -- Progress M-65/30P docking (SM aft port)
 09/09/08 -- Progress M-64/29P undocking (from DC1)
 09/10/08 -- Progress M-66/31P launch
 09/12/08 -- Progress M-66/31P docking (DC1)
 09/18/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
 09/20/08 -- STS-126/Discovery/ULF2 docking
 10/01/08 -- STS-126/Discovery/ULF2 undocking.
 10/01/08 -- **NASA 50 Years**
 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
 10/12/08 -- Soyuz TMA-13/17S launch
 10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
 10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
 11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
 11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment
 11/08/08 -- STS-119/Discovery/15A docking
 11/17/08 -- STS-119/Discovery/15A undocking
 11/20/08 -- **ISS 10 Years**
 11/26/08 -- Progress M-67/32P launch
 11/28/08 -- Progress M-67/32P docking (SM aft port)
 04/15/09 -- **Constellation's Ares I-X Launch**
 05/??/09 -- **Six-person crew on ISS** (following Soyuz 18S-2 docking)
 04/??/10 -- STS-132/Discovery/20A – Node-3 + Cupola.

Note: The daily ISS On-Orbit Status reports can also be found at

ISS On-Orbit Status 01/03/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Whitson & FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop for downlink. *[To monitor the crewmembers' sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

Dr. Whitson conducted her first clinical blood analysis of the US PHS (Periodic Health Status) with Blood Labs exam. Afterwards, all PHS hardware was stowed again. *[The PHS exam, with PCBA (Portable Clinical Blood Analyzer) analysis and clinical evaluation, is guided by special software (IFEP, in-flight examination program) on the MEC (Medical Equipment Computer). While PCBA analyzes total blood composition, the blood's hematocrit is particularly measured by the Russian MO-10 protocol.]*

FE-1 Malenchenko completed the 2.5-hr Part 2 of his second onboard "Profilaktika" (MBI-8, "Countermeasures") series of preventive health maintenance fitness testing, including ECG (Electrocardiogram), blood test and subjective rating. *[Today's fitness test was performed on the TVIS treadmill in unmotorized (idle) mode, with free choice of speeds within the range permitted. The test investigates the action mechanism and efficiency of various countermeasures (currently VELO and TVIS) aimed at preventing locomotor system disorders in weightlessness. The test differs from the normal TVIS session by the use of the TEEM-100 gas analyzer (via a mask equipped with a pneumotachometer sensor), measurement of blood lactate level and subjective evaluation of physical exertion]*

levels during the test. The lactate blood samples were taken twice at the end of the session, using the ACCUSPORT analyzer and REFLOTRON-4 accessories. Results were entered on a log sheet. TEEM and ECG (electrocardiograph) data were transferred to the RSE-Med laptop, also on a tape cassette (Cardiocassette-2000), and prepared for later downlink via Regul-Packet comm. Lactate levels were also called down via S-band to specialists standing by at TsUP-Moscow.]

Peggy Whitson conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. *[Updated “cue cards” based on the crew’s water calldowns are sent up every other week. The current cue card (16-0018M), to be updated with today’s data, lists 25 CWCs; ~1036.8 liters total) for the four types of water identified on board: technical water (735.4 l, for Elektron, flushing, hygiene), potable water (221.3 l), condensate water (52.8 l), waste/EMU dump and other (27.3 l). Two CWCs (#1004 & #1081, ~89 l) with potable water are off limits due to the Wautersia bacteria found in sample analysis, the source of which is still not understood. Impact of losing this potable CWC is negligible since there are sufficient drinking water supplies onboard. Also currently not to be used are nine CWCs with technical water (~389 l).]*

Malenchenko set up the pumping equipment and initiated (later closed out) the periodic transfer of urine from 6 EDV-U containers in the SM (Service Module) to the Rodnik BV1 tanks of Progress M-62/27P, then flushing the system with ~5 L of disinfectant solution. The emptied EDVs were then to be discarded on 27P because of their end of service life. *[Leak checks were performed successfully on 12/29-30 on the membranes (expulsion bladders) of the Progress’ Rodnik BV1 & BV2 tanks.]*

Tani performed the daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13/07 (briefly interrupted for EVA-13 photo support). *[The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour. Special uplink to Dan this morning: “The BCAT team downloaded the new images and reports that they look fabulous. The team is very excited and looking forward to pressing ahead and making more progress in coming days.”]*

With the Russian oxygen (O₂) generator “Elektron” turned off since 12/28/07, Yuri was scheduled to perform another 1-hour O₂ repress of the cabin atmosphere from Progress M-62/27P storage tankage, if required. *[The Elektron will remain*

powered down until 1/9/08 to conserve hardware lifetime. During this time, the station will be periodically repressurized with oxygen from Progress 27P.]

The two flight engineers again had several hours reserved for more Progress 27P unloading & cargo transfers, along with IMS (Inventory Management System) tracking.

Malenchenko also completed of the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Later, Yuri conducted the daily 20-min. IMS maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

CDR Whitson got ahead on the timeline yesterday for setting up the video equipment at the MSG (Microgravity Science Glovebox) for the upcoming first session with the InSPACE (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions) payload. Runs 1 & 2 are scheduled for next Saturday (1/5). *[InSPACE, conducted last in June 2006 by Jeff Williams on Increment 13, obtains basic data on magnetorheological fluids, i.e., a new class of "smart materials" that can be used to improve or develop new brake systems, seat suspensions robotics, clutches, airplane landing gear, and vibration damper systems. The dispersed particles are contained in CAs (Coil Assemblies) in the MSG that subject them to electric fields of certain strength and frequencies.]*

The crew worked out in their regular 2.5-hr. physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-2), RED resistive exerciser (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1/MBI-8).

Afterwards, Dan Tani copied the exercise data file to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~2:45am EST, Yuri Malenchenko represented the ISAS crew in downlinking (for taping and later replay) a TV message of greetings and congratulations to Alexander Fyodorovich Strekalov on the occasion of his upcoming 60th birthday. *[“... Your whole life is inseparable from Russian cosmonautics... Under your expert and dynamic leadership the Experimental Machine-Building Plant is manufacturing*

and testing our most reliable space vehicles Soyuz and Progress, and the deployment of this unique facility where we all reside, the ISS, is also in progress. We are aware that currently all your energy is directed to increase the number of space vehicles manufactured at your plant. We are anxiously looking forward to these additional launches which mean that we, the cosmonauts, will be flying to space more often...”]

At ~9:55am, the crew engaged in an interactive TV PAO exchange with students, teachers and administrators of Robert L. Ford NASA Explorer School in Lynn, MA. Questions to the crew were uplinked beforehand. [*“Peggy Whitson, how does it feel to be the first woman Commander of the ISS?”; “Dan Tani, how do you sleep in microgravity?”; “Yuri Malenchenko: Besides Earth, what else can you see from the ISS?”; “Peggy Whitson: How do you keep yourself clean?”; “Dan Tani: Have you gotten any taller while on your mission?”]*

BMRRM Retrieval Update: During yesterday’s successful retrieval of the spare Bearing Motor Roll Ring Module (BMRRM) from PMA-3 (Pressurized Mating Adapter 3) it turned out that the Node-1 nadir CPAs (Control Panel Assemblies) did not have to be removed for clearance, which allowed the crew to get ahead in the timeline. After hatch closure, PMA-3 was depressurized using the depressurization pump, reclaiming ~12 lbm of air from PMA-3 into the ISS instead of venting it overboard. The final PMA-3 leak checks that were scheduled for today, were also successfully completed yesterday. [*BMRRM R&R EVA: probably not earlier than around end of January.*]

CEO photo targets uplinked for today again were **Dundee Ice Cap, China** (*the glaciers in this target area are prominent only on the north slopes on this east-west oriented range. ISS passed over the westernmost end of the range; the crew was asked to look to the left of track for opportunities to take context imagery of the region. The regional climate is arid, and ice persists at this latitude primarily because of the 16,500 to 17,500 ft elevations of the mountain crests. These glaciers are currently under field investigation by Ohio State University where core samples have been taken for paleo-climate studies*), **Polar Mesospheric Clouds — PMC, Antarctica** (*IPY--PMC radar research station active. GMTs for this and other PMC opportunities were chosen for closeness to the Antarctic PMC radar research site at 73S 13W. Radar was to be switched on during the ISS passes at the GMTs given*), **Karakoram, Asia** (*the crew had a nadir pass over the Karakoram, westernmost of the mountains comprising the Himalayan ranges. Numerous mountain and valley glaciers are located here. Overlapping mapping frames taken along-track are requested*), **PMC, Antarctica** (*looking right and forward*), and **Mt. Kilimanjaro, Kenya** (*perhaps the most well-known volcano in Africa, Mt. Kilimanjaro is also the focus of glacial research. The ice fields at the summit of the mountain are highly responsive to changes in precipitation and serve*

as an important indicator of regional climate change. Looking to the right of track for the summit; there may have been clouds surrounding the mountain at lower elevation).

CEO photography can be viewed and studied at the websites:

<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site);

<http://earthobservatory.nasa.gov/>

<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 7:32am EST [= epoch]):

Mean altitude -- 335.2 km

Apogee height -- 336.7 km

Perigee height -- 333.7 km

Period -- 91.24 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0002206

Solar Beta Angle -- -51.7 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.78

Mean altitude loss in the last 24 hours -- 90 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 52238

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*

NET = Not Earlier Than):

TBD -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite.

01/31/08 -- **Explorer-1 50 Years (1st U.S. Satellite on Redstone rocket)**

[Check it out at <http://usspace50.com>]

02/06/08 -- Progress M-62/27P undocking & reentry

02/07/08 -- Progress M-63/28P launch

02/09/08 -- Progress M-63/28P docking (DC1)

02/22/08 -- NET: ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana)

02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A, ~11:53am, w/SLP-SPDM, JEM ELM-PS

02/16/08 -- STS-123/Endeavour/1J/A docking

02/27/08 -- STS-123/Endeavour undocking

02/29/08 -- STS-123/Endeavour landing

03/06/08 -- ATV-1 Demo Day 1

03/12/08 -- ATV-1 Demo Day 2

03/15/08 -- ATV-1 Demo Day 3 & Docking (SM aft port)

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch

04/10/08 -- Soyuz TMA-12/16S docking (DC1)
04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS
04/26/08 -- STS-124/Discovery/1J docking
05/04/08 -- STS-124/Discovery/1J undocking
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
08/07/08 -- NET: ATV-1 undocking (from SM aft port)
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
09/18/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
09/20/08 -- STS-126/Discovery/ULF2 docking
10/01/08 -- STS-126/Discovery/ULF2 undocking.
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment
11/08/08 -- STS-119/Discovery/15A docking
11/17/08 -- STS-119/Discovery/15A undocking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
04/15/09 -- **Constellation’s Ares I-X Launch**
05/??/09 -- **Six-person crew on ISS** (following Soyuz 18S-2 docking)
04/??/10 -- STS-132/Discovery/20A – Node-3 + Cupola.

Note: The daily ISS On-Orbit Status reports can also be found at

ISS On-Orbit Status 01/02/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Whitson and FE-2 Tani started out with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop for downlink. *[To monitor the crewmembers' sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

Peggy and Dan spent several hours getting "the broom out of the closet", i.e., accessing the PMA-3 (Pressurized Mating Adapter 3) at the Node-1 nadir port and retrieving the spare BMRMM (Bearing Motor Roll Ring Module) for its planned installation at the Stbd (right-side) 1A BGA (Beta Gimbal Assembly) on the S4 truss in an upcoming EVA, replacing the failed BMRRM. *The following steps were successfully executed to retrieve the spare part:*

- *Pressurize PMA-3 (normally kept at vacuum to avoid humidity condensation);*
- *Perform leak check on pressurized PMA-3;*
- *Open Node-1 nadir hatch;*
- *Remove Node-1 CBM CD (Common Berthing Module Center Disk) cover;*
- *Dismantle Port and Fwd CBM CPAs (Controller Panel Assemblies);*
- *Remove CBCS (Centerline Berthing Camera System);*
- *Retrieve BMRMM from its securing tethers*
- *Inspect Node-1 nadir hatch seal;*
- *Reverse all access steps (i.e., reinstall components and close hatch);*
- *Temporarily remove cargo stowed in A/L CL (Airlock Crewlock) that cannot go to vacuum, for using the depress pump to reclaim air from PMA-3;*

- Depressurize PMA-3;
- After CL repress, restow cargo items back into CL;
- Clean up.

FE-1 Malenchenko continued the current round of periodic preventive maintenance of RS (Russian Segment) ventilation systems, first working in the DC1 (Docking Compartment) to clean the V1 & V2 fan grilles and VD1 & VD2 air ducts, then moving to the Soyuz TMA-11/15S at the FGB nadir port to clean the screen of its BVN fan/heater assembly.

The FE-1 conducted the periodic checkout/verification of IP-1 airflow sensors in the various RS hatch openings (8) in the SM, FGB and DC1.

Yuri also completed the periodic collection of cabin air samples, i.e. by using --

- The SKDS CMS (Pressure Control & Atmosphere Monitoring System/Countermeasure System) to take readings of potentially harmful contaminants in the SM. *[The CMS, part of the GANK-4M analyses (see below), uses preprogrammed microchips to measure Formaldehyde (H₂CO, methanal), Carbon Monoxide (CO) and Ammonia (NH₃), taking one measurement per microchip. CMS is part of the GANK-4M analysis conducted today]; and*
- The GANK-4M Real-Time Harmful Contaminant Gas Analyzer system. *[GANK tests for Methane (CH₄), Ammonia (NH₃), Carbon Monoxide (CO), Formaldehyde (HCHO), Nitrogen Oxides (NO, NO₂), Hydrogen Chloride (HCl), Hydrogen Fluoride (HF), and Hydrogen Cyanide (HCN).]*

Dr. Whitson broke out and set up the equipment for tomorrow's scheduled U.S. PHS (Periodic Health Status) with Blood Labs exam, her first clinical blood analysis. *[The task today included an electronic function test and control analysis of the blood lab equipment, viz., the PCBA (Portable Clinical Blood Analyzer) which she then stowed temporarily.]*

FE-2 Tani performed the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling a CWC (Contingency Water Container, #1054) with the collected water slated for processing. No samples were required this time. *[Estimated offload time before termination (leaving ~6 kg in the tank): ~40 min.]*

Malenchenko conducted the third recharging of the Motorola Iridium-9505A satellite phone brought up on Soyuz 15S, a monthly routine job. *[After retrieving it from its location in the TMA-11/15S descent module (BO) at ~11:25pm EST, Yuri initiated*

the recharging of its lithium-ion battery, monitoring the process every 10-15 minutes as it took place. Upon completion at ~12:35pm, the phone was returned inside its SSSP Iridium kit and stowed it back in the BO's operational data files (ODF) container. The satphone accompanies returning ISS crews on Soyuz reentry & landing for contingency communications with SAR (Search-and-Rescue) personnel after touchdown (e.g., after an "undershoot" ballistic reentry). The Russian-developed procedure for the monthly recharging has been approved jointly by safety officials. During the procedure, the phone is left in its fire-protective fluoroplastic bag with open flap.]

Working on the EXPRESS Rack 5 (ER5), Whitson unplugged the MSG MLC (Microgravity Science Glovebox Laptop Computer) from its LAN (Local Area Network) Ethernet connection and reset/recabled ER5 to its nominal configuration. *[Last November, Peggy had temporarily configured the MSG MLC for LAN in support of Node-2 integration.]*

After the ground-commanded deactivation of the CDRA (Carbon Dioxide Removal Assembly) at ~7:50am-12:50pm, Dan Tani disconnected the ITCS LTL QD (Internal Thermal Control System/Low Temperature Loop/Quick Disconnect) coolant jumper to the CDRA (LAB1D6) rack. *[The deactivation is for cool-down in preparation for the major R&R (Removal & Replacement) of the expended CDRA Desiccant/Sorbent Bed #201 with a new spare, starting tomorrow. The entire IFM (Inflight Maintenance) will take two crewmembers approximately 9 hours (2h for CDRA removal from AR Rack, 5h for Bed 201 R&R, 2h for CDRA replacement in AR Rack), including removal of CDRA sock filters for inspection, cleaning and putting back in CDRA.]*

The FE-1 performed the periodic (monthly) functional closure test of the Russian Vozdukh CO₂ removal system's spare emergency vacuum valves (AVK), in the spare parts kit. *[The AVKs are critical because they close the Vozdukh's vacuum access lines in the event of a malfunction in the regular vacuum valves (BVK) or a depressurization in the Vozdukh valve panel (BOA). Access to vacuum is required to vent CO₂ during the regeneration of the absorbent cartridges (PP). During nominal operation, the AVK valves remain open.]*

Yuri conducted another session of the Russian "Uragan" (hurricane) earth-imaging program, using the Nikon D2X digital camera with 800 mm focal length lens. *[Targets uplinked for today were Poland, with the Wisla river and the city of Torun, monitoring oil contamination under low Sun conditions.]*

Malenchenko set up the hardware and conducted the first part of the onboard "Profilaktika" (MBI-8, "Countermeasures") preventive health maintenance fitness

test, on the VELO bicycle ergometer. Part 2, on the TVIS treadmill, is scheduled tomorrow. *[Test procedure for MBI-8, which requires workouts on the VELO and TVIS, is identical to the Russian MO-5 assessment, but in addition to the nominal procedure it uses the TEEM-100M gas analyzer with breathing mask, a blood lactate test with the ACCUSPORT analyzer and REFLOTRON-4 accessories, and a subjective evaluation of physical exertion levels during the test (using the Borg Perceived Exertion Scale, viz., 10 steps from very light over hard and very hard to maximum). Results are entered on a log sheet. TEEM and ECG (electrocardiograph) data are transferred to the RSE-Med laptop, also on a tape cassette (Cardiocassette-2000), and prepared for later downlink via Regul-Packet comm. Results are also called down to specialists standing by at TsUP.]*

With the Russian oxygen (O₂) generator "Elektron" turned off since 12/28/07, Yuri performed another 1-hour O₂ repress of the cabin atmosphere from Progress M-62/27P storage tankage. *[The Elektron will remain powered down until 1/9/08 to conserve hardware lifetime. During this time, the station will be periodically repressurized with oxygen from Progress 27P.]*

The CDR and FE-1 had about three hours set aside between them for more Progress 27P unloading & cargo transfers, along with IMS (Inventory Management System) tracking.

Later, Yuri conducted the daily 20-min. IMS maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Malenchenko also completed of the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Tani performed the daily status check on the BCAT-3 (Binary Colloidal Alloy Test-3) science payload, running by itself in Node-2 since 12/13/07 (briefly interrupted for EVA-13 photo support). The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. *[The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour. Special uplink to Dan this morning: "The BCAT team downloaded the new images and reports that they look fabulous. The team is very excited and looking forward to pressing ahead and making more progress in coming days."]*

In preparation of tomorrow's first session with the InSPACE (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions) payload in the MSG (Microgravity Science Glovebox), CDR Whitson was "hard" scheduled today for a 30-min. familiarization review of descriptive material for the experiment and set-up of the video equipment at the MSG. *[InSPACE, conducted last in June 2006 by Jeff Williams on Increment 13, obtains basic data on magnetorheological fluids, i.e., a new class of "smart materials" that can be used to improve or develop new brake systems, seat suspensions robotics, clutches, airplane landing gear, and vibration damper systems. The dispersed particles are contained in CAs (Coil Assemblies) in the MSG that subject them to electric fields of certain strength and frequencies.]*

The crew worked out in their regular 2.5-hr. physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-2), RED resistive exerciser (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1/MBI-8).

Afterwards, Dan Tani copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At 2:45pm EST, Peggy and Dan are scheduled to conduct the periodic VHF1 emergency communications check over NASA's VHF (Very High Frequency) stations, today at the Dryden (2:47-2:53pm) and White Sands VHF sites (2:49-2:56pm), talking with Houston/Capcom, MSFC/PAYCOM (Payload Operation & Integration Center Communicator) and Moscow/GLAVNI (TsUP Capcom) in the normal fashion via VHF radio from a handheld microphone and any of the U.S. segment ATUs (audio terminal units). *[Purpose of the test is to verify signal reception and link integrity, and to ensure minimum required link margin during emergency (no TDRS) and special events (such as a Soyuz relocation).]*

CEO photo targets uplinked for today again were **Polar Mesospheric Clouds** — (PMC - also known as noctilucent clouds) over selected ground sites (12 minutes for each). *(Southern spring is the season for relatively uncommon polar mesospheric clouds to form very high over Antarctica. PMC are being studied as part of the International Polar Year [IPY] investigation of climate change in high latitudes. PMC form in the stratosphere and higher, i.e. well above the lowest layer of the atmosphere [troposphere, or weather layer, characterized by clouds, and an orange tinge produced by brushfire smoke, smog, etc.]. The AIM satellite (Aeronomy of Ice in the Atmosphere) has recently been launched to investigate how PMC form and why they are apparently becoming thicker and brighter. ISS/CEO imagery will complement images from AIM and from the ground. The collaborating*

IPY scientist is excited to receive any images ISS may acquire. Collaborating Swedish scientists are now working at a base in Antarctica (73S 13 W) for PMC observation.)

CEO photography can be viewed and studied at the websites:

<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site);

<http://earthobservatory.nasa.gov/>

<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 8:27am EST [= epoch]):

Mean altitude -- 335.3 km

Apogee height -- 336.6 km

Perigee height -- 334.0 km

Period -- 91.24 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0001983

Solar Beta Angle -- -56.5 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.78

Mean altitude loss in the last 24 hours -- 89 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 52223

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*

NET = Not Earlier Than):

TBD -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite.

TBD -- STS-122/Atlantis/1E docking

TBD -- STS-122/Atlantis/1E undocking

01/31/08 -- **Explorer-1 50 Years (1st U.S. Satellite on Redstone rocket)**

ISS On-Orbit Status 01/01/08

All ISS systems continue to function nominally, except those noted previously or below. *Crew off-duty day (of course!).*

Peggy and Dan began the New Year with the daily reading of SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data accumulated during the night, for logging and filling in questionnaire entries in the experiment's session file on the HRF-1 laptop for downlink. *[To monitor the crewmembers' sleep/wake patterns and light exposure, Dan and Peggy wear a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

Afterwards, the FE-2 connected the regular ITCS LTL (Internal Thermal Control System/Low Temperature Loop) coolant jumper at the LAB1D6 rack in support of the ground-commanded activation of the U.S. CDRA (Carbon Dioxide Removal Assembly) at ~5:50am EST.

Tani then performed the daily status check on the BCAT-3 (Binary Colloidal Alloy

Test-3) science payload, running by itself in Node-2 since 12/13/07 (briefly interrupted for EVA-13 photo support). The status check, conducted on the last image taken by the DCS 760 digital still camera which is controlled by EarthKAM software on an A31p laptop, is to verify proper image focus and camera alignment. *[The SSC (Station Support Computer) is taking photography of the phase separation occurring in the BCAT Sample 3, with the photo flash going off every half hour. Special uplink to Dan this morning: "The BCAT team downloaded the new images and reports that they look fabulous. The team is very excited and looking forward to pressing ahead and making more progress in coming days."]*

FE-1 Malenchenko conducted the routine servicing of the SOZh system (Russian ECLSS) in the SM (Service Module). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

With the Elektron oxygen (O₂) generator turned off since 12/28/07, Yuri performed another 1-hour O₂ repress of the cabin atmosphere from Progress M-62/27P storage tankage. *[The Elektron will remain powered down until 1/9/08 to conserve hardware lifetime. During this time, the station will be periodically repressurized with oxygen from Progress 27P.]*

In preparation of an upcoming new session with the InSPACE (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions) payload in the MSG (Microgravity Science Glovebox), CDR Whitson, working off the discretionary "job jar" task list, conducted a 30-min. familiarization review of descriptive material for the experiment and set up the video equipment at the MSG. *[InSPACE, conducted last in June 2006 by Jeff Williams on Increment 13, obtains basic data on magnetorheological fluids, i.e., a new class of "smart materials" that can be used to improve or develop new brake systems, seat suspensions robotics, clutches, airplane landing gear, and vibration damper systems. The dispersed particles are contained in CAs (Coil Assemblies) in the MSG that subject them to electric fields of certain strength and frequencies.]*

The crew worked out in their regular 2.5-hr. physical exercise program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exerciser (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Dan Tani copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate

Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~2:10pm, Dan Tani will have a PFC (Private Family Conference), via S-band/ audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-10 laptop).

Weekend Voluntary Science: For the voluntary “Saturday Science” program on 1/5, Peggy and Dan were offered for their choice: (1) a session with the InSPACE-2 hardware (setup part 2 by Peggy, with Dan’s assistance, else to be hard-scheduled on 1/4); (2) InSPACE-2 experiment runs 1 & 2 (for Peggy, 2h25m); and (3) NASA Biological Specimen Repository (Rep), for Dan (with possible assistance from Peggy. Objective of the Repository protocol is to develop an in-flight archive of human biological samples for future research activities to advance development of prognostics, markers, and therapeutics.) Selection is required ASAP.

Regenerative ECLS Update: Yesterday’s work of installing & configuring the Regen ECLS (Regenerative Environmental Control & Life Support) modification kit #1 by Whitson & Tani was successfully completed. *[Primary objective of the activity was to pre-position cabling that will be installed once the CHeCS (Crew Health Care System) rack is moved to Lab position S4 at a later time. This procedure included rotating four racks (D1, D2, D4, P1), removing & remounting the LAB1PD1 Smoke Detector, and relocation of the OGS WDS (Oxygen Generation System/Water Delivery System.)]*

Russian SKV-2 Air Conditioner Update: Malenchenko’s intense efforts over the weekend to clean the SMOK condensate removal lines in the STR (Thermal Control System) for the SKV air conditioners of the “rubbery, jelly-like” substance found on 12/27/07 were successful. SKV-2 was reactivated on 12/30 (Sunday) and has been running nominally since then. *[SKV-2 troubleshooting began after SKV-2 and the SRVK condensate processing unit in the RS shut down on 12/23/07. SRVK and SKV-2 both remain operational, but were temporarily deactivated. SKV-1 has been inoperable for some time.]*

CEO photo targets uplinked for today again were **Polar Mesospheric Clouds** — (PMC - also known as noctilucent clouds) over selected ground sites (12 minutes for each). *(Southern spring is the season for relatively uncommon polar mesospheric clouds to form very high over Antarctica. PMC are being studied as part of the International Polar Year [IPY] investigation of climate change in high latitudes. PMC form in the stratosphere and higher, i.e. well above the lowest layer of the atmosphere [troposphere, or weather layer, characterized by clouds, and an orange tinge produced by brushfire smoke, smog, etc.]. The AIM satellite (Aeronomy of Ice in the Atmosphere) has recently been launched to investigate how*

PMC form and why they are apparently becoming thicker and brighter. ISS/CEO imagery will complement images from AIM and from the ground. The collaborating IPY scientist is excited to receive any images ISS may acquire. Collaborating Swedish scientists are now working at a base in Antarctica (73S 13 W) for PMC observation.)

CEO photography can be viewed and studied at the websites:
<http://eol.jsc.nasa.gov> (about 700,000 NASA digital photographs of Earth are downloaded by the public each month from this "Gateway" site);
<http://earthobservatory.nasa.gov/>
<http://earthobservatory.nasa.gov/Study/AstronautPhotography>

ISS Orbit (as of this morning, 8:19am EST [= epoch]):

Mean altitude -- 335.4 km
Apogee height -- 336.7 km
Perigee height -- 334.1 km
Period -- 91.24 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0001928
Solar Beta Angle -- -61.1 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.78
Mean altitude loss in the last 24 hours -- 80 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 52207

Significant Events Ahead (*all dates Eastern Standard, some changes possible.*

NET = Not Earlier Than):

TBD -- STS-122/Atlantis/1E launch -- Columbus Module, ICC-Lite.

TBD -- STS-122/Atlantis/1E docking

TBD -- STS-122/Atlantis/1E undocking

01/31/08 -- **Explorer-1 50 Years (1st U.S. Satellite on Redstone rocket)**

[Check it out at <http://usspace50.com>]

02/06/08 -- Progress M-62/27P undocking & reentry

02/07/08 -- Progress M-63/28P launch

02/09/08 -- Progress M-63/28P docking (DC1)

02/22/08 -- NET: ATV-1 "Jules Verne" launch/Ariane V (Kourou, French Guyana)

02/14/08 -- STS-123/Endeavour/1J/A launch/1J/A, ~11:53am, w/SLP-SPDM, JEM ELM-PS

02/16/08 -- STS-123/Endeavour/1J/A docking

02/27/08 -- STS-123/Endeavour undocking

02/29/08 -- STS-123/Endeavour landing

03/06/08 -- ATV-1 Demo Day 1

03/12/08 -- ATV-1 Demo Day 2
 03/15/08 -- ATV-1 Demo Day 3 & Docking (SM aft port)
 04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
 04/08/08 -- Soyuz TMA-12/16S launch
 04/10/08 -- Soyuz TMA-12/16S docking (DC1)
 04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port)
 04/23/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
 04/24/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS
 04/26/08 -- STS-124/Discovery/1J docking
 05/04/08 -- STS-124/Discovery/1J undocking
 05/14/08 -- Progress M-64/29P launch
 05/16/08 -- Progress M-64/29P docking (DC1)
 08/07/08 -- NET: ATV-1 undocking (from SM aft port)
 08/12/08 -- Progress M-65/30P launch
 08/14/08 -- Progress M-65/30P docking (SM aft port)
 09/09/08 -- Progress M-64/29P undocking (from DC1)
 09/10/08 -- Progress M-66/31P launch
 09/12/08 -- Progress M-66/31P docking (DC1)
 09/18/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
 09/20/08 -- STS-126/Discovery/ULF2 docking
 10/01/08 -- STS-126/Discovery/ULF2 undocking.
 10/01/08 -- **NASA 50 Years**
 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
 10/12/08 -- Soyuz TMA-13/17S launch
 10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
 10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
 11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
 11/06/08 -- STS-119/Discovery/15A launch – S6 truss segment
 11/08/08 -- STS-119/Discovery/15A docking
 11/17/08 -- STS-119/Discovery/15A undocking
 11/20/08 -- **ISS 10 Years**
 11/26/08 -- Progress M-67/32P launch
 11/28/08 -- Progress M-67/32P docking (SM aft port)
 04/15/09 -- **Constellation's Ares I-X Launch**
 05/??/09 -- **Six-person crew on ISS** (following Soyuz 18S-2 docking)
 04/??/10 -- STS-132/Discovery/20A – Node-3 + Cupola.
