ISS On-Orbit Status 12/31/08

All ISS systems continue to function nominally, except those noted previously or below. *GMT 366: Leap Year's End and...*

New Year's Eve... 16 times for the Expedition 18 crew of CDR Mike Fincke, FE-1 Yuri Lonchakov and FE-2 Sandra Magnus while counting down to 2009!

Before morning inspection and breakfast, FE-1 Lonchakov terminated his fifth experiment session for the long-term Russian sleep study MBI-12/SONOKARD, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

CDR Fincke & FE-2 Magnus continued ARED (Advanced Resistive Exercise Device) installation on "overtime", after encountering a snag yesterday with a stuck launch restraint bolt. ACO (Activation & Checkout) Part 1 has been moved to tomorrow since ground engineers need to look over the final ARED installation photos before giving a Go. *[For today's removal of the stuck launch restraint bolt in the left cylinder flywheel, ground teams overnight developed two troubleshooting plans for slipping the flywheel restraint off, one involving trimming the stuck bolt's ends (i.e., shorten it with a hacksaw), the other drilling into the bolts to destroy its protruding tips. Both options will require cleaning up any remaining protrusion with a file.]*

In the SM (Service Module), FE-1 Lonchakov performed troubleshooting on the new EXPOSE-R payload installation which showed no telemetry indication of mated

connectors in the unit's power circuitry. *[Troubleshooting, with ground support tagup, consisted of a thorough visual inspection of the electrical connectors and a test of the BKS onboard cable network by measuring electrical resistances between connector terminals.]*

The FE-2 conducted the T+2d inflight microbiology analyses for the samples collected on 12/29 from the PWD (Potable Water Dispenser) Ambient plus SVO-ZV and SRV-K Warm taps. *[Sandy reported "yellow" for Coliform (= Negative), "no purple dots" on the MCD (Microbial Capture Device) and a (nominal) incubation bag temperature of 80 degC.]*

Lonchakov set up new Bubble dosimeters for recording radiation traces as an additional component of the RS (Russian Segment) radiation payload suite "Matryoshka-R" (RBO-3-2), initializing and deploying the detectors. Proper function of the setup was later verified with the LULIN-5 electronics box. *[A total of eight Bubble dosimeter detectors (A01-A08) were initialized in the Bubble dosimeter reader in the SM and positioned at their exposure locations, three in the spherical "Phantom" unit on the DC1 panel and five in the SM (two in starboard crew cabin on both sides of the MOSFET (metal oxide semiconductor field-effect transistor) dosimeter detector unit, two under the work table, and one at panel 410). The setup was photo-documented with the NIKON D2X camera and also reported to TsUP via log sheet via OCA. The complex Matryoshka payload suite is designed for sophisticated radiation studies. Note: Matryoshka is the name for the traditional Russian set of nested dolls.]*

Yuri also performed more troubleshooting in the FGB to investigate an unexplained "smoke" indication light on the PSS Caution & Warning status panel, today checking connectors behind panel (PPS) 339 and associated instruments. *[A check behind panel 306 on 12/17 failed to clear the issue.]*

After setting up the SHERE (Shear History Extensional Rheology Experiment) payload equipment over the weekend, Mike Fincke had two experiment runs on his schedule for today, with the second run depending on the continuing work on ARED. Planned SHERE activities for today were –

- Activating the MSG (Microgravity Science Glovebox) from the A31p laptop,
- Powering on the SHERE hardware,
- Accessing the CGBA (Commercial Generic Bioprocessing Apparatus) to install the SHERE FM (Fluid Module) #32;
- Supporting the first SHERE experiment run (Test Point 29);
- Transferring the module with the fluid sample,
- Installing FM #36 for the second experiment run (Test Point 30);
- Removing the FM from the CGBA, followed by SHERE data transfer;
- Turning off the SHERE/CGBA equipment;

- Transferring the data files to the MSG laptop for subsequent downlink, and
- Powering down the MSG.

[Mike has 25 new Fluid Modules available that were delivered on STS-126, of a new-and-improved design that should be easier to deploy & close than the ones Greg Chamitoff used. Background: Rheology is the study of the deformation and flow of matter under the influence of an applied stress (“preshearing” = rotation) which might be, for example, a shear stress or extensional stress. In practice, rheology is principally concerned with extending the “classical” disciplines of elasticity and (Newtonian) fluid mechanics to materials whose mechanical behavior cannot be described with the classical theories. SHERE is designed to study the effect of preshear (rotation) on the transient evolution of the microstructure and viscoelastic tensile stresses for solutions with long chains of monodisperse dilute polymer molecules in the MSG. Collectively referred to as “Boger fluids,” these polymer solutions have become a popular choice for rheological studies of non-Newtonian fluids and are the non-Newtonian fluid used in this experiment. The SHERE hardware consists of the Rheometer, Camera Arm, Interface Box, Cabling, Keyboard, Tool Box, Fluid Modules, and Stowage Tray.]

The FE-1 performed another collection of the periodic readings of potentially harmful atmospheric contaminants in the SM, using the CMS (Countermeasure System), a component of the SKDS GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, today using preprogrammed microchips to measure for o-Xylol (1,2-Dimethylbenzol, C_8H_{10}) and Methyl-Mercaptan (Methanethiol, CH_4S).

Sandy Magnus used the vacuum cleaner/brush plus other tools to perform the periodic 3:15h USOS hatch seal inspection (Node-1 Forward, Aft & Starboard, Lab Aft & Forward, Node-2 Aft, Starboard & Port, Airlock, Columbus, Kibo JPM Zenith & Starboard, Kibo JLP Nadir) in support of ACS (Atmospheric Control System) maintenance.

With TsUP/Moscow approval, Magnus set up an IWIS RSU (Internal Wireless Instrumentation System/Remote Sensor Unit) in the SM (from power outlet A331), completing IWIS network setup for data taking during the initial ARED exercise.

Sandy also conducted the weekly 10-min. CWC (Contingency Water Container) inventory as part of on-going WRM (Water Recovery & Management) assessment of onboard water supplies. Updated “cue cards” based on the crew’s water calldowns are sent up every other week. *[The new card (18-0006H) lists 39 CWCs (~1,250.9 L total) for the four types of water identified on board: technical water (673.8 L, for Elektron electrolysis), potable water (530.4 L, incl. 174.6 L currently off-limit because of Wautersia bacteria), condensate water (0.0 L), waste/EMU dump and other (46.7 L). Wautersia bacteria are typical water-borne microorganisms that*

have been seen previously in ISS water sources. These isolates pose no threat to human health.]

As part of Progress M-01M/31P unloading, Yuri transferred the new BIO-2/BIORISK-MSV container #12 from the cargo ship and set it up for exposure in the SM in the conical section of the PkhO Transfer Compartment. *[BIORISK entails a series of experiments designed to expose samples of materials to study adaptation and changes of bacteria & fungi within the typical micro biota residing on structural materials of space-flown equipment. Early data from these experiments already point to significant effects of space flight on growth, reproduction, and biological properties of test microbes and fungi. BIORISK-KM experiments deal with “passive” materials, BIORISK-MSV with microorganisms-materials within the SM and BIORISK-MSN with microorganisms-materials outside the ISS.]*

Lonchakov started another round of the monthly preventive maintenance of RS (Russian segment) ventilation systems, today working 1:50h in the SM, cleaning airducts, ventilator fans and grilles.

Working from his discretionary “time permitting” task list, Yuri also was to conduct the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS (Russian Segment) hatchways, including the passageways PrK (SM Transfer Compartment)–PrK–RO (SM Working Compartment), PkhO (SM Transfer Compartment)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1.

Also on Lonchakov’s voluntary list was the frequent status check on the Russian BIO-5 Rasteniya-1 (“Plants-1”) experiment, verifying proper operation of the BU Control Unit and MIS-LADA Module fans (testing their air flow by hand).

[Rasteniya-1 researches growth and development of plants under spaceflight conditions in the LADA-14 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP).]

Sandy performed the daily IMS maintenance, consisting of updating/editing of its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

At ~2:55am EST, the crew held a 20-min. TV conference with Russian top management of RSC Energia, IBMP, GCTC (Gagarin Cosmonaut Training Center) and TsUP, postponed from yesterday.

At ~3:15am EST, the crew joined for a PAO TV Symbolic Activity downlink for the European Space Agency (ESA) for the New Year, presenting two unstowed placards expressing a Declaration of Human Rights in the COL (Columbus Orbital

Laboratory) where they also took a series of photos showing crewmembers with the placards in various scenes.

The station residents conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (FE-1).

VolSci Program Preview: For the weekend of 1/10 & 1/11, Mike and Sandy were offered three choices for the Voluntary Weekend Science program: (1) SHERE (Shear History Extensional Rheology Experiment) runs for Mike; (2) EPO (Education Payload Operations) Renovation Demo, for Mike & Sandy, to create an educational video demonstration discussing the recent renovations that have occurred on the ISS, for producing an educational product to enhance existing education resources for students in grades K-12; and (3) LOCAD-PTS (Lab-On-A-Chip Application Development – Portable Test System (PTS) for Mike, to perform a Phase 2 Surface Sampling Session in COL using the Glucan LAL Cartridges that will target fungus on ISS surfaces.

CEO (Crew Earth Observations) photo target uplinked for today was **Betsiboka River Delta, Madagascar** (*looking left of track for the major Betsiboka estuary, one of two on the northwest Madagascan coast. Since 1945 deforestation inland increased rapidly. Consequent soil erosion and delivery of sediment to the Betsiboka River and estuary resulted. The estuary is now more than 80% filled by delta islands. Growth of islands has been documented since the first Shuttle flights, and imagery of the present status is requested*).

CEO photography can be studied at this “Gateway” website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:25am EST [= epoch]):

Mean altitude -- 353.4 km

Apogee height -- 358.4 km

Perigee height -- 348.4 km

Period -- 91.61 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007443

Solar Beta Angle -- -3.7 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 61 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57958

Significant Events Ahead (all dates Eastern Time, some changes possible!):

01/14/09 -- ISS reboost w/SM thrusters
02/09/09 -- Progress M-01M/31P undocking & deorbit
02/10/09 -- Progress 32P launch
02/12/09 -- Progress 32P docking
02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment
02/14/09 -- STS-119/Endeavour/15A docking
02/24/09 -- STS-119/Endeavour/15A undocking
02/26/09 -- STS-119/Endeavour/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress 32P undocking & deorbit
05/12/09 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

08/06/09 -- STS-128/Discovery/17A – MPLM (P), LMC, last crew rotation
08/XX/09 -- Soyuz 5R/MRM2 (Russian Mini Research Module, MIM2) on Soyuz
09/XX/09 -- H-IIB (JAXA HTV-1)
11/12/09 -- STS-129/Atlantis/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P), LMC
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4
12/XX/11-- Proton 3R/MLM w/ERA.

[image002.gif](#)

ISS On-Orbit Status 12/30/08

All ISS systems continue to function nominally, except those noted previously or below.

Before breakfast and exercise, all crewmembers completed a 10-min session with the periodic Russian MedOps test "Hematokrit" (MO-10), which measures the red cell count of the blood, with CDR Fincke acting as CMO (Crew Medical Officer, Russian: "Examiner"). It was the first session for Fincke, Lonchakov & Magnus. *[The blood samples were drawn from a finger with a perforator lancet, then centrifuged in two microcapillary tubes in the M-1100 kit's minicentrifuge, and its hematocrit value was read off the tubes with a magnifying glass. It is a well-known phenomenon of space flight that red blood cell count (normal range: 30-45%) tends to go down over time. After the exam, the data were saved in the IFEP software (In-Flight Examination Program) on the MEC (Medical Equipment Computer), and Lonchakov stowed the equipment.]*

Mike Fincke & Sandy Magnus worked Part 2 of the two-day installation of the new ARED (Advanced Resistive Exercise Device) on the "ceiling" of Node-1. *[Individual installation steps included removing launch restraints with the "Makita" drill tool, installing both exercise rope and cable arm ropes, installing the cylinder flywheels, then the main arm, upper stop cables, liftbar, ARED display and all ARED cables. After installation completion and analysis of all documentary photographs by ground specialists, the crew will be given the Go for ACO (Activation & Checkout) which requires two more days.]*

FE-1 Lonchakov meanwhile had 90 min. reserved for configuring the GFI-11/ OBSTANOVKA (Environment) equipment in the DC1 Docking Compartment and performing the first electric field measurements with the Langmuir Probe on the external hull of the SM (Service Module). *[Field voltages (mV) were scanned cell by cell with the Fluke 105B ScopeMeter oscilloscope, and the oscillograms on the screen recorded by photographing, plus the scanning values were logged in a*

table. The performance of the ScopeMeter was checked with the Elektronika MMTs-01 MultiMeter. All photographic records were then downlinked via OCA.]

Afterwards, the FE-1 had a brief teleconference with TsUP to discuss some questions in regards to a RBO-3-3/MATRYOSHKA-M radiation kit returned to Earth on ULF2.

Magnus used the MAS (Microbial Air Sampler) kit to obtain the periodic microbiology air samples from specific sampling locations including from Kibo JPM (JEM Pressurized Module) mid-module, and the SSK (Surface Sample Kit) to collect/incubate microbiology samples from two prime surface sites for return to ground.

With the Orlan EVA-21 completed last week (12/22) and the DC1 no longer required as an airlock, the Progress M-01M/31P cargo ship currently docked to the DC1 its nadir port can be accessed again. To this end, Yuri Lonchakov –

- Performed the usual one-hour leak check on both DC1-SU & SU-31P hatches,
- Opened the hatches (with RS thrusters inhibited during the opening activities),
- Installed the quick-release screw clamps which rigidize the docking joint,
- Installed the air heater/fan unit & air duct in the passageway, and
- Deactivated the Progress (i.e., SUBA/Onboard Equipment Control System & SOTR/Thermal Control System).

At 10:35am, Sandy conducted the periodic VHF-1 emergency communications check over NASA's VHF (Very High Frequency) stations, today at the Dryden (10:42am–10:47am) and White Sands (10:43am–10:50am) stations, talking with Houston/Capcom, MSFC/PAYCOM (Payload Operation & Integration Center Communicator), Moscow/GLAVNI (TsUP Capcom), EUROCOM/Munich and JCOM/Tsukuba in the normal fashion via VHF radio from a handheld microphone and any of the USOS ATUs (Audio Terminal Units). *[Purpose of the test is to verify signal reception and link integrity, improve crew proficiency, and ensure minimum required link margin during emergency (no TDRS) and special events (such as a Soyuz relocation).]*

Yuri completed the periodic (about twice a month) replenishing of the Elektron oxygen generator's water supply for electrolysis, filling the KOV EDV container with water collected in CWC (Contingency Water Container) #1050 from the Lab CCAA (Common Cabin Air Assembly) dehumidifier. *[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]*

In the SM, the FE-1 performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

The FE-2 conducted the periodic status check on the running payloads CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) and ENose (Electronic Nose), both located in the ER-2 (EXPRESS Rack 2).

The crew had their periodic PMCs (Private Medical Conferences) via S- & Ku-band audio/video, Sandy at ~9:15am, Yuri at ~11:50am, Mike at ~2:10pm EST.

At ~4:20pm, just before sleep time, Yuri will set up the Russian MBI-12 SONOKARD (Sonocard) payload and start his fifth experiment session, using a sports shirt from the SONOKARD kit with a special device in the pocket for testing a new method for acquiring physiological data without using direct contact on the skin. Measurements are recorded on a data card for return to Earth.

[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]

The station residents conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR/2.5), TVIS treadmill (FE-1, FE-2/2.5), and VELO bike with bungee cord load trainer (FE-1).

At ~3:40am EST, the crew held a 20-min. TV conference with Russian top management of RSC Energia, IBMP, GCTC (Gagarin Cosmonaut Training Center) and TsUP.

Conjunction Update: Hourly tracking updates of the recurring Cosmos 2421 debris, with predictions quickly stabilizing (i.e., becoming more credible), showed its conjunction with ISS moving from inside the oblong Red zone to the Yellow and then to the Green tolerance box, with Pc (Probability of Collision) going to zero.

The DAM (Debris Avoidance Maneuver) was called off before getting to the Flight Rule imposed cutoff of "no later than 2 orbits" prior to the selected time of ignition (TIG, 3:22am EST, with 0.5 m/s delta-V).

Ded Moros Update: Yesterday's New Year's event at TsUP/Moscow with Ded Moros (Grandfather Frost) also featured the winner of the insignia contest for the Soyuz TMA-14 crew in April, a 12-year old girl from Moscow. The picture below shows the press conference with Roskosmos Head Perminov presenting the winning patch design (on left: NASA Representative Joel Montalbano). In the second picture, the winner is talking to the ISS crew.

CEO (Crew Earth Observations) photo target uplinked for today was **Toshka Lakes, Egypt** (*looking left for general oblique views and detailed overlapping frames of lake shorelines. The lakes appear between the line of track and the prominent line of the Nile River*).

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 7:42am EST [= epoch]):

Mean altitude -- 353.5 km

Apogee height -- 358.5 km

Perigee height -- 348.5 km

Period -- 91.61 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007423

Solar Beta Angle -- -8.2 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 51 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57942

Significant Events Ahead (all dates Eastern Time, some changes possible!):

01/14/09 -- ISS reboost w/SM thrusters

02/09/09 -- Progress M-01M/31P undocking & deorbit

02/10/09 -- Progress 32P launch

02/12/09 -- Progress 32P docking

02/12/09 -- STS-119/Endeavour/15A launch -- S6 truss segment

02/14/09 -- STS-119/Endeavour/15A docking

02/24/09 -- STS-119/Endeavour/15A undocking

02/26/09 -- STS-119/Endeavour/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress 32P undocking & deorbit

05/12/09 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

08/06/09 -- STS-128/Discovery/17A – MPLM (P), LMC, last crew rotation

08/XX/09 -- Soyuz 5R/MRM2 (Russian Mini Research Module, MIM2) on Soyuz

09/XX/09 -- H-IIB (JAXA HTV-1)

11/12/09 -- STS-129/Atlantis/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A – MPLM(P), LMC

04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1

05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4

12/XX/11-- Proton 3R/MLM w/ERA.

Note: The daily ISS On-Orbit Status reports can also be found at

http://www.hq.nasa.gov/osf/iss_reports/index.htm

A.N. Perminov presenting winning TMA-14 insignia (12/29/08)

Winner of the TMA-14 insignia contest speaking to the ISS crew

ISS On-Orbit Status 12/29/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 10 of Increment 18.*

FE-1 Lonchakov worked several hours on the SM (Service Module)'s fire warning system, removing and replacing all ten SIGNAL-VM DS-7A smoke detectors (which were expired). The SIGNAL-VM system was deactivated from the ground beforehand and later turned on again, as was the VD-SU telemetry control mode. *[The ten DS-7A units were replaced last by Yuri Malenchenko on 11/27/07 on Expedition 16.]*

As a relatively new regular activity after deactivation/reactivation of the BITS1-12 and VD-SU control mode, the FE-1 then checked the BRI Smart Switch Router computer and its new Ethernet connection to assess any impact of these activities on Ethernet comm, followed by dumping BRI log files from the RSS1 laptop for downlinking to the ground. *[BRI is part of the RS OpsLAN (Russian Segment/Operations Local Area Network), with connections to the three SSC clients, the Ethernet tie-in with the US network, and a network printer in the RS.]*

After FE-2 Magnus set up the video equipment in Node-1 for live monitoring of activities by the ground, Sandy & Mike Fincke conducted Part 1 of the 2-day job of replacing the RED (Resistive Exercise Device) with the new Advanced RED (ARED). *[First task for Mike was to remove the RED from the "ceiling" of Node-1 and stow it in the Kibo JPL (JEM Pressurized Logistics Segment), where he had made room for it on 12/26. Next steps were: Retrieving ARED components, installing the VIS (Vibration Isolation Stabilization) parts and the launch stack, checking yoke beam alignment, removing VIS launch restraints, position ARED launch stack (with Sandy's help), and checking the VIS for unobstructed operation. Part 2 will finish the installation tomorrow, followed by extensive ACO (Activation & Checkout) ops.]*

For station structural dynamics measurements of the first ARED use, Magnus

retrieved the IWIS (Internal Wireless Instrumentation System) accelerometer and interface plate from the WRS-2 (Water Recovery System 2) rack and set up the IWIS network of RSUs (Remote Sensor Units) and NCU (Network Control Unit) in the SM, FGB, Lab, Node-1 and Node-2.

With the OBSTANOVKA (Environment) equipment moved from stowage to the DC1 Docking Compartment yesterday as a discretionary task, Yuri Lonchakov today prepared the Fluke 105B scopemeter by connecting accessories and installing alkaline batteries, then worked with the instrument in oscilloscope mode for checkout and familiarization for the upcoming Langmuir Probe experiment ops, supported by ground specialist tagup. *[The GFI-11/OBSTANOVKA payload, along with the IMPULSE experiment, will use ionosphere probes and a pulsed plasma source to make scientific measurements of ionosphere parameters and plasma-wave characteristics.]*

Sandy Magnus performed the regular periodic US WRS (Water Recovery System) sampling. The planned sample run with the TOCA (Total Organic Carbon Analyzer) could not be completed due to another TOCA abort. Data and log files were downlinked for engineering analysis. *[Magnus collected samples from the PWD (Potable Water Dispenser) Hot needle outlet for subsequent inflight processing using the WMK (Water Microbiology Kit) with MCD (Microbial Capture Device) and CDB (Coliform Detection Bag). The usual water reclamation from the sample bags via an absorbing towel (to be dried by airing) and data recording after the analyses concluded the activities.]*

The FE-2 also performed the standard sensor calibration on the CSA-O₂ (Compound Specific Analyzer-Oxygen) units #1043 & #1059, delivered on 1J, using a new calibration adapter (#1001), brought up by 30P. *[Sandy reported an initial gas pressure of 1400 psi and final gas pressure of slightly less than 1400 psi. Flow rate: >10 fps. For #1059, peak reading was 25.8% O₂ and the final (post-calibration) cabin value was 22.1%; for #1043, peak: 25.2%, final cabin value: 22%.]*

On the Russian Matryoshka-R (RBO-3-2) radiation payload in the DC-1, the FE-1 deactivated the AST Spectrometer, removed its ALC-957 PCMCIA (Portable Computer Memory Card International Adapter) and checked out its contents on the RSK-1 laptop before stowing it in its kit (#7). AST remains off.

Lonchakov also unstowed and installed the equipment for the periodic Russian PZE-MO-10 "Hematokrit" testing which is scheduled for his post-sleep use tomorrow. *[MO-10 measures the hematocrit (red blood cell mass) value of the blood (it is a well-known phenomenon of space flight that red blood cell mass {normal range: 30-45%} tends to go down over time).]*

At ~3:15am EST, the crew supported a 20-min PAO TV downlink for a major press conference with Russian officials at TsUP/Moscow in observance of New Year. The participants at TsUP, headed by Anatoly Perminov (Head of the Russian Space Agency Roskosmos), included rocket & space industry leaders, cosmonauts (Solovyev, Padalka, Gidzenko), local & state government representatives, politicians, NASA delegates, and – most of all – Ded Moroz (“Grandfather Frost” of all Russia). Reportedly, the press conference “was fun!”

At ~6:35am, Yuri Lonchakov had a 15-min TV conference with Hegumen Iov of the Eastern Church. *[The Hegumen is the Abbott or Superior of a Monastery.]*

At ~10:25am, the crew downlinked a special New Year's message (being aired on NASA TV) expressing their year-end thoughts on the significance of the international outpost and their New Year's wish for the complex in 2009. The crew also extended “Peace” wishes to all countries partnering in the ISS, in their languages: English (Peace), Russian (Mir), Japanese (Heiwa), French (Paix), Dutch (Vrede), German (Friede), Danish/Norwegian/Swedish (Fred), Italian (Pace), Spanish (Paz).

In the SM, the FE-1 completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

The daily IMS maintenance was performed by Yuri from his discretionary “time permitting” task list, i.e., updating/editing of its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Also on Lonchakov’s discretionary list was the frequent status check on the Russian BIO-5 Rasteniya-1 (“Plants-1”) experiment, verifying proper operation of the BU Control Unit and MIS-LADA Module fans (testing their air flow by hand). *[Rasteniya-1 researches growth and development of plants under spaceflight conditions in the LADA-14 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP)],*

The station residents conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Conjunction Advisory: A new conjunction with the recurring Cosmos 2421 debris is being tracked, for a TCA (Time of Closest Approach) tomorrow morning (12/30) at 5:39am EST. Latest data show a total miss distance of 11.7 km (0.13 x 6.1 x - 10.0 km) which puts the conjunction into the Red zone, an imaginary oblong box around the ISS (probability of collision $P_c = 0.00076$). MCC-Houston is working with Russian Ballistic experts on avoidance maneuver options. Two prime options are tomorrow at 3:22am, one of 0.5 m/s, the other of 1.0 m/s delta-V. Analysts are looking at which one is preferable for downstream Progress 32P launch phasing.

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:40am EST [= epoch]):

Mean altitude -- 353.5 km

Apogee height -- 358.6 km

Perigee height -- 348.5 km

Period -- 91.61 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.000757

Solar Beta Angle -- -12.8 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 57 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57927

Significant Events Ahead (all dates Eastern Time, some changes possible!):

01/14/09 -- ISS reboost w/SM thrusters

02/09/09 -- Progress M-01M/31P undocking & deorbit

02/10/09 -- Progress 32P launch

02/12/09 -- Progress 32P docking

02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment

02/14/09 -- STS-119/Endeavour/15A docking

02/24/09 -- STS-119/Endeavour/15A undocking

02/26/09 -- STS-119/Endeavour/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress 32P undocking & deorbit

05/12/09 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

08/06/09 -- STS-128/Discovery/17A – MPLM (P), LMC, last crew rotation

08/XX/09 -- Soyuz 5R/MRM2 (Russian Mini Research Module, MIM2) on Soyuz

09/XX/09 -- H-IIB (JAXA HTV-1)

11/12/09 -- STS-129/Atlantis/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A – MPLM(P), LMC

04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1

05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4

12/XX/11-- Proton 3R/MLM w/ERA.

Note: The daily ISS On-Orbit Status reports can also be found at

ISS On-Orbit Status 12/28/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – off-duty day for CDR Fincke, FE-1 Lonchakov & FE-2 Magnus. Ahead: Week 10 of Increment 18.*

Mike Fincke & Sandra Magnus started their day with another download of last night's data of the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment from their Actiwatches to the HRF-1 (Human Research Facility 1) laptop as part of the week-long session with SLEEP. *[To monitor the crewmember's sleep/wake patterns and light exposure, Mike & Sandy wear a special Actiwatch device which measures the light levels encountered by them as well as their patterns of sleep and activity throughout the Expedition and use the payload software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list. It was the second session for Mike, the first for Sandra.]*

Mike serviced the US WRS (Water Recovery System) by refilling the WSTA (Water Storage Tank Assembly) with pretreated urine from EDV-U container (#810, then #882) for processing by the UPA (Urine Processing Assembly). *[The WSTA should be filled to no more than 75%. Recycled water from the PWD may now be used by the crew for non-oral hygiene purposes.]*

Yuri Lonchakov performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP-Moscow. Additionally, the FE-1 today checked up on the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem, gathering weekly data on total operating time & "On" durations for reporting to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO*

& KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]

The FE-1 had a number of discretionary tasks on his "time permitting" job list for today –

- Conducting the frequent status check on the Russian BIO-5 Rasteniya-1 ("Plants-1") experiment, verifying proper operation of the BU Control Unit and MIS-LADA Module fans (testing their air flow by hand). *[Rasteniya-1 researches growth and development of plants under spaceflight conditions in the LADA-14 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP)],*
- Running a session of the DZZ-2 "Diatomeya" ocean observations program, using an HDV camcorder for nocturnal observations of the ocean to detect and record bio-luminescent glows in high production water areas. According to available data, the glow may be visible as light greenish spots of low intensity. *[Target zones in the Pacific Ocean were New Zealand's North-Eastern offshore areas & the California peninsula, the Gulf of Carpentaria (Australia) and Queen Charlotte Bay, in the Indian & Pacific Oceans geological location north of Kerguelen Island and south of Aleutian Islands, in the Indian & Pacific Oceans the west of Australia to the east of New Zealand, and from south of the Madagascar Island to the north of New Zealand],*
- Another ECON KPT-3 session, making observations and taking aerial photography for Russia's Environmental Safety Agency (ECON) using the D2X with SIGMA 300-800mm telephoto lens, and
- Searching for and collecting hardware required for the externally installed OBSTANOVKA (Environment) experiment, including the Fluke 105B scopemeter with accessories, eight alkaline batteries for the scopemeter and the Elektronika-MMTs-1 Multimeter instrument. Four batteries were to be installed and both Fluke and MMTs-01 checked out. After a Langmuir Probe hardware familiarization review tomorrow (12/29), the first measurements of the plasma environment near the docked Soyuz spacecraft will be taken on 12/30 as part of the OBSTANOVKA experiment Part 1. *[The GFI-11/ OBSTANOVKA payload, along with the IMPULSE experiment, will use ionosphere probes and a pulsed plasma source to make scientific measurements of ionosphere parameters and plasma-wave characteristics.]*

Mike & Sandy's "job jar" task list for today had three voluntary work suggestions –

- Removing IWIS (Internal Wireless Instrumentation System) hardware (accelerometer & interface plate) from the WRS-2 rack to allow access for door opening, and later reinstalling the equipment in front of the rack,
- Loading the TOCA (Total Organic Carbon Analyzer) software update from

the TOCA USB drive on the SSC-7 (Station Support Computer 7) laptop.

[The update was written in response to the aborted TOCA run on 12/24.],
and

- For Mike to fill out the regular FFQ (Food Frequency Questionnaire) for the fourth time on the MEC (Medical Equipment Computer).

The station residents conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Fincke & Lonchakov talked with their families on scheduled PFCs (Private Family Conferences) via S-band/audio & Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop), Yuri at ~6:10am, Mike at ~3:45pm EST.

VolSci Update: For yesterday's Voluntary Weekend Science program, Mike received kudos from the Payload team: "Excellent job on SHERE's Dry Run yesterday! You are definitely ready for Wednesday's science runs, and we are eagerly looking forward to running them with you. Thank you very much for offering to do an additional science run, but we were just not ready to support it thermally in either the MSG or CGBA... We also appreciate the extra camera views you have been giving us in Columbus. It greatly helps the team's situational awareness, and it's almost like being there. Wish we were there!"

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:41am EST [= epoch]):

Mean altitude -- 353.6 km

Apogee height -- 358.7 km

Perigee height -- 348.5 km

Period -- 91.61 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007552

Solar Beta Angle -- -17.5 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 53 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57911

Significant Events Ahead (all dates Eastern Time, some changes possible!):

01/14/09 -- ISS reboost w/SM thrusters
02/09/09 -- Progress M-01M/31P undocking & deorbit
02/10/09 -- Progress 32P launch
02/12/09 -- Progress 32P docking
02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment
02/14/09 -- STS-119/Endeavour/15A docking
02/24/09 -- STS-119/Endeavour/15A undocking
02/26/09 -- STS-119/Endeavour/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress 32P undocking & deorbit
05/12/09 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

08/06/09 -- STS-128/Discovery/17A – MPLM (P), LMC, last crew rotation
08/XX/09 -- Soyuz 5R/MRM2 (Russian Mini Research Module, MIM2) on Soyuz
09/XX/09 -- H-IIB (JAXA HTV-1)
11/12/09 -- STS-129/Atlantis/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P), LMC
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4
12/XX/11-- Proton 3R/MLM w/ERA.

ISS On-Orbit Status 12/27/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – rest day for CDR Fincke, FE-1 Lonchakov & FE-2 Magnus.*

CDR Fincke & FE-2 Magnus started their day with another download of last night's data of the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment from their Actiwatches to the HRF-1 (Human Research Facility 1) laptop as part of the week-long session with SLEEP. *[To monitor the crewmember's sleep/wake patterns and light exposure, Mike & Sandy wear a special Actiwatch device which measures the light levels encountered by them as well as their patterns of sleep and activity throughout the Expedition and use the payload software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list. It was the second session for Mike, the first for Sandra.]*

The crew performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the SM (Service Module) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

As part of the house cleaning, Yuri Lonchakov conducted regular maintenance inspection & cleaning of fan screens in the FGB (TsV2), DC-1 (V3, VD1) and SM (VPkhO, VPO7, VGZhT2, VPrK, FS5, FS6, FS9 & FS14).

Later, when performing the routine daily servicing of the SOZh system (ECLSS/ Environment Control & Life Support System) in the SM, Yuri also temporarily powered down the Russian POTOK-150MK (150 micron) air filter unit of the SM's

SOGS air revitalization subsystem for the periodic cleaning of its pre-filter, using the vacuum cleaner with narrow-slit nozzle attachment. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

CDR Fincke serviced the US WRS (Water Recovery System) by refilling the WSTA (Water Storage Tank Assembly) with pretreated urine from EDV-U container for processing by the UPA (Urine Processing Assembly). *[The WSTA should be filled to no more than 75%. Recycled water from the PWD may now be used by the crew for non-oral hygiene purposes.]*

At ~9:00am EST, the crewmembers conducted their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-Houston and TsUP-Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

For his selected VolSci (Voluntary Weekend Science) program featuring a dry run with SHERE (Shear History Extensional Rheology Experiment), CDR Fincke –

- Reviewed SHERE experiment procedures for familiarization,
- Activated the MSG (Microgravity Science Glovebox),
- Powered up the SHERE hardware,
- Accessed the CGBA (Commercial Generic Bioprocessing Apparatus) to install the SHERE FM (Fluid Module) #46,
- Conducted a SHERE dry run using the test (dry) FM,
- Removed the FM from the CGBA, followed by SHERE data transfer,
- Turned off the SHERE/CGBA equipment,
- Transferred the data files to the MSG laptop, and
- Powered down the MSG.

FE-2 Magnus completed the regular bi-monthly reboots of the OCA Router and File Server SSC (Station Support Computer) laptops.

For her own VolSci today, Sandy Magnus had chosen a Space Careers Demo EPO (Education Payload Operations), creating an educational video discussing different careers found at NASA, to be used to produce an educational product to enhance existing education resources for students in grades 9-12. Afterwards, the video hardware was stowed again. *[For the Demo, Sandy reviewed procedures, set up the SONY PD100 camcorder (without tape) and conducted the demo which was downlinked via Ku-band & S-band and recorded on the ground, discussing personal career paths, NASA-related careers, and other careers affiliated with equipment*

and experiments on ISS.]

The FE-2 performed periodic service on the WPA (Water Processing Assembly) by filling two CWC-Is (Iodinated Contingency Water Containers, #1010 & #1008) with iodinated water from the PWD (Potable Water Dispenser) auxiliary port.

Working from his discretionary “as time permits” task list, FE-1 Lonchakov performed a session of the Russian GFI-8 "Uragan" (hurricane) earth-imaging program, using the NIKON D2X digital camera to take telephotos. *[Uplinked target zones were the Kilimanjaro Volcano, the Nicaragua Pacific Coastline, noteworthy scenes of the Andes, and Patagonia Ice Field Glaciers.]*

Yuri's voluntary task list also suggested another ECON KPT-3 session, making observations and taking aerial photography of Pacific Ocean surface contaminations for Russia's Environmental Safety Agency (ECON) using the D2X with SIGMA 300-800mm telephoto lens.

A third item on the “time permitting” task list for the FE-1 was to search for and collect hardware required for the externally installed OBSTANOVKA (Environment) experiment, including the Fluke 105B scopemeter with accessories, eight alkaline batteries for the scopemeter and the Elektronika-MMTs-1 Multimeter instrument. Four batteries were to be installed and both Fluke and MMTs-01 checked out. After a Langmuir Probe hardware familiarization review on 12/29, the first measurements of the plasma environment near the docked Soyuz spacecraft will be taken on 12/30 as part of the OBSTANOVKA experiment Part 1. *[The GFI-11/OBSTANOVKA payload, along with the IMPULSE experiment, will use ionosphere probes and a pulsed plasma source to make scientific measurements of ionosphere parameters and plasma-wave characteristics.]*

At ~1:40pm, Sandy had for a PFC (Private Family Conference), via S-band/audio and Ku-and/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop).

The station residents conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

TOCA Software Update: Based on the aborted TOCA (Total Organic Carbon Analyzer) run on 12/24, an update to the TOCA software has been uplinked to the TOCA USB drive connected to the SSC-7 (Station Support Computer 7) laptop. Performing the software upgrade this weekend was added to Mike Fincke's discretionary “job jar” task list. *[Although the upgrade is not mandatory for*

Monday's activities, it is highly desired as it will significantly increase the chances for a successful run.]

Weekly Science Update (*Expedition Eighteen -- Week 9*)

3-D SPACE: Complete.

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): Complete.

BCAT-3/4 (Binary Colloidal Alloy Test 3/4): Planned/Reserve.

BIO-4: Complete.

BIOLAB: Planned.

CARDIOCOG-2: Complete.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): In progress.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System):
Samples returned on 1J.

CSI-3/CGBA-5 (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus 5): Ongoing.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

EDR (European Drawer Rack): On 12/23, additional check-out tests of the PCDF EU (Protein Crystallization Diagnostic Facility Electronic Unit) have been successfully performed. These tests included command scripts uplinked to EDR. The whole ground segment infrastructure is okay and is awaiting the launch of the PCDF PU (Process Unit) on 15A.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

ENose (Electronic Nose): "ENose is operating normally. As of 12/23/08, we have

downloaded data files twice. We have analyzed 2 weeks of data, and have found nothing unexpected in the breathing air.”

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): Science acquisition for DEBIE-2, DOSTEL, EXPOSE, FIPEX, MEDET. On-ground troubleshooting for TRIBOLAB.

FSL (Fluid Science Laboratory): FSL is nominal.

GEOFLOW: For run#7, a higher corruption level of the downlinked data has been encountered, forcing the ground teams to postpone run#8 execution as scheduled on 12/22. In fact, the whole run#7 data set has been downlinked again on 12/22, still leading to some corrupted data but at different locations in the data stream. By merging the two downlinked data sets, the USOC teams have re-consolidated the run#7 in an acceptable way for the science teams. GEOFLOW science runs will be continued during the next weeks.

HDTV System Test DL (JAXA): Complete.

ICE CRYSTAL (JAXA): Ice Crystal experiment is going on. “This week, we have conducted 5 experiments during three nights from 12/23-12/24. Next run will be in next year, 1/5”.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Reserve.

Marangoni Experiment for ISS in JAXA FPEF (Fluid Physics Experiment Facility): In progress.

Micro-G Clay (JAXA EPO): Complete.

MISSE (Materials ISS Experiment): Ongoing.

Moon Photography from ISS (JAXA EPO): Complete.

MSG-SAME (Microgravity Science Glovebox): Complete.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

NOA-1/-2 (Nitric Oxide Analyzer, ESA): Complete.

NUTRITION w/REPOSITORY: In progress.

PADLES (Passive Dosimeter for Lifescience Experiment in Space): In progress.

PCRF (Protein Crystallization Research Facility) Reconfiguration (JAXA): Complete.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SAMPLE: Complete.

SHERE (Shear History Extensional Rheology Experiment): "SHERE is looking forward to the VolSci experiment familiarization and Dry Run with you on Saturday, Mike!"

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): In progress.

SOLAR (Solar Monitoring Observatory): The next Sun observation window is planned to start around 12/26.

SOLO (Sodium Loading in Microgravity): Complete.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): Reserve.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1/#2 (Waving and Coiling of Arabidopsis Roots at Different g-levels):
Complete/Planned.

CEO (Crew Earth Observations): Ongoing.

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:13am EST [= epoch]):

Mean altitude -- 353.7 km

Apogee height -- 358.8 km

Perigee height -- 348.5 km

Period -- 91.61 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007694

Solar Beta Angle -- -22.2 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 61 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57895

Significant Events Ahead (all dates Eastern Time, some changes possible!):

01/14/09 -- ISS reboost w/SM thrusters

02/09/09 -- Progress M-01M/31P undocking & deorbit

02/10/09 -- Progress 32P launch

02/12/09 -- Progress 32P docking

02/12/09 -- STS-119/Endeavour/15A launch -- S6 truss segment

02/14/09 -- STS-119/Endeavour/15A docking

02/24/09 -- STS-119/Endeavour/15A undocking

02/26/09 -- STS-119/Endeavour/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress 32P undocking & deorbit

05/12/09 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

08/06/09 -- STS-128/Discovery/17A – MPLM (P), LMC, last crew rotation

08/XX/09 -- Soyuz 5R/MRM2 (Russian Mini Research Module, MIM2) on Soyuz

09/XX/09 -- H-IIB (JAXA HTV-1)

11/12/09 -- STS-129/Atlantis/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A – MPLM(P), LMC

04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1

05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4

12/XX/11-- Proton 3R/MLM w/ERA.

ISS On-Orbit Status 12/26/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Fincke & FE-2 Magnus started their day with another download of last night's data of the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment from their Actiwatches to the HRF-1 (Human Research Facility 1) laptop as part of the week-long session with SLEEP. *[To monitor the crewmember's sleep/wake patterns and light exposure, Mike & Sandy wear a special Actiwatch device which measures the light levels encountered by them as well as their patterns of sleep and activity throughout the Expedition and use the payload software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list. It was the second session for Mike, the first for Sandra.]*

In the DC1 Docking Compartment, FE-1 Lonchakov terminated the discharge cycle of the second 825M3 Orlan battery pack and removed it from the charger.

The FE-1 also finished stowing the tools taken out on the EVA-21 spacewalk and updated the IMS (Inventory Management System). CDR Fincke took care of the US equipment used for the EVA, putting it back in stowage in the US Airlock.

Later, Lonchakov & Fincke closed out the SM PkhO (Service Module Transfer Compartment) and DC1, restoring the compartments to their initial state.

The FE-1 then re-installed the MATRYOSHKA-R (RBO-3-2) radiation suite's LULIN-5 electronics box and the associated anthropomorphic (human torso) "Phantom" unit in the DC1, followed by a brief checkout. *[The equipment had been temporarily stowed in the FGB. Data being accumulated by LULIN comprise measurement date, time, mode, three-directional flux data (per sq.cm per sec.), and three-directional dose rate.]*

Yuri also collected about an hour's worth of data of the Russian BIO-5 Rasteniya-1 ("Plants-1") experiment, with its BU Control Unit, for subsequent downlink to Earth as a checkout. *[Rasteniya-1 researches growth and development of plants under spaceflight conditions in the LADA-14 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP).]*

FE-2 Magnus printed out the instructions for the upcoming installation and subsequent activation & checkout (ACO) of the CMS ARED (Countermeasures System/ Advanced Resistive Exercise Device). Meanwhile, CDR Fincke transferred ARED components (6 bags, 3 items) from JAXA JLP (JEM Logistics Pressurized Segment) for temporary stowage in Node-1 to make room for the currently used IRED (Interim Resistive Exercise Device) in JLP.

Afterwards, Fincke & Magnus had an hour set aside for reviewing ARED installation and ACO procedures, followed by a 30 min. tagup with ground specialist via S-band/ audio & Ku-band/video to discuss the assembly activities next week.

Also in preparation of ARED installation Sandy set up two power tool batteries for the driver drill in the Lab for charging.

On ER2 (EXPRESS Rack 2), Magnus turned off the ENose (Electronic Nose) payload and relocated it to be independently powered from a Lab UOP (Utility Outlet Panel). *[ENose monitors the station's interior for harmful chemicals such as ammonia, mercury, methanol and formaldehyde, running continuously and autonomously. It is the first instrument aboard ISS which can detect and quantify chemical leaks or spills as they happen. If successful, ENose might be used in future space missions as part of an automated system to monitor and control astronauts' in-space environments. The shoebox-sized ENose contains an array of 32 sensors that can identify and quantify several organic and inorganic chemicals, including organic solvents and marker chemicals that signal the start of electrical fires. The sensors are polymer films that change their electrical conductivity in response to different chemicals, where the pattern of the sensor array's response depends on the particular chemical types present in the air. The instrument can analyze volatile aerosols and vapors, help monitor cleanup of chemical spills or leaks, and enable more intensive chemical analysis by collecting raw data and streaming it to a computer at JPL's ENose laboratory. The instrument, weighing less than nine pounds and requiring only 20 watts of power, has a wide range of chemical sensitivity, from fractional parts per million to 10,000 parts per million. Its data-analysis software can identify and quantify the release of chemicals within 40 minutes of detection. While ENose will look for 10 chemical types in this six-month experiment, it can be "trained" to detect many others.]*

The FE-2 then undertook another periodic relocation of the TEPC (Tissue Equivalent Proportional Counter) detector assembly, the primary radiation measurement tool in the ISS, today from the SM Panel 327 back to Node-2 inside the new portside CQ (Crew Quarters), utilizing UOP-3. *[TEPC had been moved to the SM by Fincke on 11/27, after having been in the Node-2 from 11/10.]*

In the Kibo JPM (JEM Pressurized Module), the CDR meanwhile performed Part 6 of the continuing troubleshooting of the CGSE (Common Gas Support Equipment), reconnecting the GBU (Gas Bottle Units) high-pressure QD (quick disconnect) for cycling, with CO₂ resupplied from the lower CGSE GBU, verifying proper line pressures via both lower and upper GBU pressure gauges to find the location of the suspected line blockage.

Sandy Magnus filled out the regular FFQ (Food Frequency Questionnaire), her fifth, on the MEC (Medical Equipment Computer). Mike Fincke's fourth FFQ activity is still on his "job jar" task list. *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

Afterwards, Sandy worked on the periodic inspection & cleaning of the FDS (Fire Detection & Suppression) system's SDs (smoke detectors) and bacterial filters in the US Airlock, Node-1, Node-2 and Lab. *[This activity, hard-scheduled for today, was listed yesterday among the "job jar" tasks as a discretionary item.]*

FE-1 Lonchakov collected the periodic readings of potentially harmful atmospheric contaminants in the SM, using the CMS (Countermeasure System), a component of the SKDS GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, today using preprogrammed microchips to measure for o-Xylol (1,2-Dimethylbenzol, C₈H₁₀) and Methyl-Mercaptan (Methanethiol, CH₄S).

Yuri also took the periodic readings with the Russian AOK GANK-4M instrument and calibrated the unit. *[AOK GANK-4M tests for Methane (CH₄), Ammonia (NH₃), Carbon Monoxide (CO), Formaldehyde (HCHO), Nitrogen Oxides (NO, NO₂), Hydrogen Chloride (HCl), Hydrogen Fluoride (HF), and Hydrogen Cyanide (HCN).]*

The FE-2 conducted the T+2d inflight microbiology analyses for the samples collected on 12/24 from the PWD (Potable Water Dispenser) Ambient plus SVO-ZV and SRV-K Warm taps. *[Sandy reported “yellow” for Coliform (= Negative), “130-ish purple dots” on the MCD (Microbial Capture Device) and a (nominal) incubation bag temperature of 80 degC. Photos were taken for return to Earth.]*

In the SM, the FE-1 completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

The daily IMS maintenance was performed by Sandy, consisting of updating/editing of its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

At ~3:15am EST, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~2:00pm, the ISS crew will have their regular weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. *[S/G-2 (Space-to-Ground 2) phone patch via SSC (Station Support Computer).]*

At ~4:30pm, Mike is scheduled for a PFC (Private Family Conference), via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop).

The station residents conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this “Gateway” website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 7:30am EST [= epoch]):

Mean altitude -- 353.7 km
Apogee height -- 358.9 km
Perigee height -- 348.6 km
Period -- 91.61 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.000768
Solar Beta Angle -- -27.0 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.72
Mean altitude loss in the last 24 hours -- 74 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 57879

Significant Events Ahead (all dates Eastern Time, some changes possible!):

01/14/09 -- ISS reboost w/SM thrusters
02/09/09 -- Progress M-01M/31P undocking & deorbit
02/10/09 -- Progress 32P launch
02/12/09 -- Progress 32P docking
02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment
02/14/09 -- STS-119/Endeavour/15A docking
02/24/09 -- STS-119/Endeavour/15A undocking
02/26/09 -- STS-119/Endeavour/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress 32P undocking & deorbit
05/12/09 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

08/06/09 -- STS-128/Discovery/17A – MPLM (P), LMC, last crew rotation
08/XX/09 -- Soyuz 5R/MRM2 (Russian Mini Research Module, MIM2) on Soyuz
09/XX/09 -- H-IIB (JAXA HTV-1)
11/12/09 -- STS-129/Atlantis/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P), LMC
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4
12/XX/11-- Proton 3R/MLM w/ERA.

Note: The daily ISS On-Orbit Status reports can also be found at

ISS On-Orbit Status 12/25/08

All ISS systems continue to function nominally, except those noted previously or below.

Merry Christmas!

CDR Fincke & FE-2 Magnus started their day with another download of last night's data of the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment from their Actiwatchs to the HRF-1 (Human Research Facility 1) laptop as part of the week-long session with SLEEP. *[To monitor the crewmember's sleep/wake patterns and light exposure, Mike & Sandy wear a special Actiwatch device which measures the light levels encountered by them as well as their patterns of sleep and activity throughout the Expedition and use the payload software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list. It was the second session for Mike, the first for Sandra.]*

FE-1 Lonchakov performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module), including the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Yuri also completed the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS (Russian Segment) hatchways, including the passageways PrK (SM Transfer Compartment)–PrK–RO (SM Working Compartment), PkhO (SM Transfer Compartment)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1.

In the DC1 Docking Compartment, the FE-1 terminated the discharge process on the first 825M3 Orlan battery pack in the ZU-S recharge unit and started it on the second set.

A newly added voluntary task for Mike Fincke & Sandy Magnus on their discretionary task list for today were the periodic inspection & cleaning of the FDS (Fire Detection & Suppression) system's SDs (smoke detectors) and bacteria filters in the US Airlock, Node-1, Node-2 and Lab.

As a second suggested task at her discretion, Sandy was to tear down and stow the BCAT-4 (Binary Colloid Alloy Test 4) hardware, including the 28V DC equipment and DCS-760 EarthKAM camera gear, which has been running in Node-2 since 12/20 as a VolSci (Voluntary Science) activity.

Filling out the regular FFQ (Food Frequency Questionnaire) for the fourth time on the MEC (Medical Equipment Computer) remains on Mike Fincke's "job jar" task list.

For talking with their families on the Christmas holiday, the CDR & FE-2 were scheduled for PFCs (Private Family Conferences), via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop), Mike at ~12:40pm, Sandy at ~2:20pm EST.

The station residents conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:38am EST [= epoch]):

Mean altitude -- 353.8 km

Apogee height -- 358.9 km

Perigee height -- 348.7 km

Period -- 91.62 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.000756

Solar Beta Angle -- -31.9 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 80 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57864

Significant Events Ahead (all dates Eastern Time, some changes possible!):

01/14/09 -- ISS reboost w/SM thrusters
02/09/09 -- Progress M-01M/31P undocking & deorbit
02/10/09 -- Progress 32P launch
02/12/09 -- Progress 32P docking
02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment
02/14/09 -- STS-119/Endeavour/15A docking
02/24/09 -- STS-119/Endeavour/15A undocking
02/26/09 -- STS-119/Endeavour/15A landing (nominal)

ISS On-Orbit Status 12/24/08

All ISS systems continue to function nominally, except those noted previously or below. **Christmas Eve.** >>>*Time seemed to stand still for a moment when 40 years ago today at ~5:00am ET in the morning, the crew of Apollo 8, Frank Borman, Jim Lovell and Bill Anders, fired the Service Module Propulsion System for 4 min 6.5 sec behind the Moon (i.e., out of our sight), beginning the first orbit (a 312 x 112 km ellipse) of their historical 10-orbit circumlunar exploration, humanity's greatest adventure of modern times. At 9:31pm in the evening (85h 40min Mission Elapsed Time), the crew took turns in reading opening passages from Genesis: "In the beginning God created heavens and the earth.....and God saw that it was good."*<<<<

CDR Fincke and FE-2 Magnus started their day by downloading the accumulated data of the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment from their Actiwatches to the HRF-1 (Human Research Facility 1) laptop as part of the week-long session with SLEEP. *[To monitor the crewmember's sleep/wake patterns and light exposure, Mike & Sandy wear a special Actiwatch device which measures the light levels encountered by them as well as their patterns of sleep and activity throughout the Expedition and use the payload software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list. It was the second session for Mike, the first for Sandra.]*

Fincke completed the standard 10-min post-EVA session of the medical PHS (Periodic Health Status) protocol, with Magnus assisting as CMO (Crew Medical Officer). *[The assessment is guided by the special IFEP software (In-Flight Examination Program) on the MEC (Medical Equipment Computer) laptop which also stores the data.]*

After wakeup, FE-1 Lonchakov's first task was to switch on the Russian POTOK-

150MK (150 micron) purification filter unit of the SOGS air revitalization subsystem in the SM (Service Module).

Fincke & Lonchakov cleaned up after the EVA-21 spacewalk. Specifically, they –

- Removed the BK-3 portable oxygen repressurization tanks (primary & backup) from the DC1 BSS (Orlan Interface Unit),
- Removed the BNP portable repress tank from the SM Work Compartment (RO) and stowed it,
- Removed the Orlan BRTA radio/telemetry unit batteries,
- Took post-EVA radiation readings of the “Pille-MKS” dosimeters carried by the spacewalkers in their Orlan suits,
- Put the EVA medical kits back in storage,
- Downlinked EVA-21 digital photography,
- Set up the first 825M3 Orlan battery for complete discharge/recharge,
- Removed the US EMU (Extravehicular Mobility Unit) lights & video camera from Yuri’s Orlan #26, and
- Configured the Orlan-M suits for drying out.

Later today, the Orlans and the BSS gear will be packed up and placed back in storage.

In the US Lab, Magnus took down the UOP DCP (Utility Outlet Panel/Display & Control Panel) bypass power cable to the VTR (Video Tape Recorder) at the Lab RWS (Robotics Work Station), used during the spacewalk with the SSRMS (Space Station Remote Manipulator System) TV cameras.

Afterwards, Sandy performed the regular periodic US WRS (Water Recovery System) sampling. *[After first setting up the TOCA (Total Organic Carbon Analyzer) by connecting its power cable to the UOP1 J3 outlet panel and hooking up its primed WPA (Water Processing Assembly) water sample hose to the WRS Rack 1, the FE-2 collected samples from the PWD (Potable Water Dispenser) Hot needle outlet for subsequent inflight processing with the TOCA plus WMK (Water Microbiology Kit) with MCD (Microbial Capture Device) and CDB (Coliform Detection Bag). After the analyses, the usual water reclamation from the sample bags via an absorbing towel (to be dried by airing) and data recording (from TOCA USB drive into the SSC7 laptop) concluded the activities. WRS sampling & checkouts are being conducted for 90 days, i.e., every 4 days: WRS water hose (TOCA inflight analysis) & microbial bag sample (inflight bacterial visual enumeration plus archival for return on 15A), every 8 days: an archival water sample (return on 15A), and monthly: a TOCA bag sample from PWD (tested inflight).]*

A new activity for Magnus today was the flushing of the WHC (Waste & Hygiene

Compartment) urine tank with a drink-bag full of non-iodinated water from the PWD.

[This activity will be performed every 10 days or so while the toilet is not in use. This will keep the WHC in good working order until it is used in January when KABIN (its privacy enclosure) is installed.]

The FE-2 also completed the periodic status check on the running payloads CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) and ENose (Electronic Nose), both located in the ER-2 (EXPRESS Rack 2). *[ENose monitors the station's interior for harmful chemicals such as ammonia, mercury, methanol and formaldehyde, running continuously and autonomously. It is the first instrument aboard ISS which can detect and quantify chemical leaks or spills as they happen. If successful, ENose might be used in future space missions as part of an automated system to monitor and control astronauts' in-space environments. The shoebox-sized ENose contains an array of 32 sensors that can identify and quantify several organic and inorganic chemicals, including organic solvents and marker chemicals that signal the start of electrical fires. The sensors are polymer films that change their electrical conductivity in response to different chemicals, where the pattern of the sensor array's response depends on the particular chemical types present in the air. The instrument can analyze volatile aerosols and vapors, help monitor cleanup of chemical spills or leaks, and enable more intensive chemical analysis by collecting raw data and streaming it to a computer at JPL's ENose laboratory. The instrument, weighing less than nine pounds and requiring only 20 watts of power, has a wide range of chemical sensitivity, from fractional parts per million to 10,000 parts per million. Its data-analysis software can identify and quantify the release of chemicals within 40 minutes of detection. While ENose will look for 10 chemical types in this six-month experiment, it can be "trained" to detect many others.]*

Starting a new round of the monthly preventive maintenance of RS (Russian segment) ventilation systems, Magnus performed a 1h 15m inspection and cleaning of Group A ventilator fans and grilles in the SM.

Later, the FE-2 completed the weekly 10-min. CWC (Contingency Water Container) inventory as part of on-going WRM (Water Recovery & Management) assessment of onboard water supplies. Updated "cue cards" based on the crew's water calldowns are sent up every other week. *[The current card (18-0006H), to be updated, lists 39 CWCs (~1,250.9 L total) for the four types of water identified on board: technical water (673.8 L, for Elektron electrolysis), potable water (530.4 L, incl. 174.6 L currently off-limit because of Wautersia bacteria), condensate water (0.0 L), waste/EMU dump and other (46.7 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]*

Sandy also completed the routine daily servicing of the SM's SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

The daily IMS (Inventory Management System) maintenance was on Sandy's voluntary "job jar" task list for today, consisting of updating/editing of its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew had their periodic PMCs (Private Medical Conferences) via S- & Ku-band audio/video, Mike at ~11:00am, Yuri at ~11:20am, Sandy at ~11:40am EST.

The station residents conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Working from his discretionary "time permitting" job list, Lonchakov conducted the frequent status check on the Russian BIO-5 Rasteniya-1 ("Plants-1") experiment, verifying proper operation of the BU Control Unit and MIS-LADA Module fans (testing their air flow by hand). *[Rasteniya-1 researches growth and development of plants under spaceflight conditions in the LADA-14 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP).]*

At ~10:30am EST, the ISS crew held their weekly teleconference with ISS Program Management at JSC/Houston via Ku-band/video & S-band/audio.

At ~2:30pm, CDR Fincke is scheduled for another 20-min. teleconference with Lee Archambault, CDR of the next Shuttle mission, STS-119/Endeavour-15A, in February.

CEO (Crew Earth Observations) photo targets uplinked for today were **Lake Nasser, Toshka Lakes, Egypt** *(aiming to the right of track for these lakes located in southern Egypt. Overlapping frames of both Lake Nasser and the smaller Toshka Lakes to the west were requested to track water levels and shoreline change)*, and **Volcan Colima, Mexico** *(weather was predicted to be mostly clear over the Colima volcanic complex. Two large cones, Nevado de Colima and Volcan de Colima, are the most prominent features; small cinder cones are located on the valley floor to the west and east. Overlapping nadir frames of the two cones and adjacent valley floor were requested. Gray or white plumes may be observed from*

Volcan de Colima).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:11am EST [= epoch]):

Mean altitude -- 353.9 km

Apogee height -- 359.0 km

Perigee height -- 348.8 km

Period -- 91.62 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007539

Solar Beta Angle -- -36.8 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 78 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57848

Significant Events Ahead (all dates Eastern Time, some changes possible!):

01/14/09 -- ISS reboost w/SM thrusters

02/09/09 -- Progress M-01M/31P undocking & deorbit

02/10/09 -- Progress 32P launch

02/12/09 -- Progress 32P docking

02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment

02/14/09 -- STS-119/Endeavour/15A docking

02/24/09 -- STS-119/Endeavour/15A undocking

02/26/09 -- STS-119/Endeavour/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress 32P undocking & deorbit

05/12/09 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

08/06/09 -- STS-128/Discovery/17A – MPLM (P), LMC, last crew rotation

08/XX/09 -- Soyuz 5R/MRM2 (Russian Mini Research Module, MIM2) on Soyuz

09/XX/09 -- H-IIB (JAXA HTV-1)

11/12/09 -- STS-129/Atlantis/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A – MPLM(P), LMC

04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1

05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4

12/XX/11-- Proton 3R/MLM w/ERA.

ISS On-Orbit Status 12/23/08

All ISS systems continue to function nominally, except those noted previously or below. *Crew rest day after the spacewalk. Crew sleep started this morning at 6:30am EST & ends tomorrow at 1:00am, returning the wake/sleep schedule back to normal.*

CDR Fincke & FE-1 Lonchakov's Orlan EVA-21 from the DC1 (Docking Compartment) airlock last night lasted 5 hrs 38 min. It was partially successful; some objectives were not achieved. The spacewalkers –

- Installed the Langmuir probe on the DC1 Docking Compartment (to measure electrical/plasma fields close to the docked Soyuz TMA-13 in support of the ongoing pyro bolt anomaly investigation);
- Removed/returned the BIORISK-MSN payload container #2 from the DC1;
- Installed & connected the IPI-SM monobloc unit of the Russian IMPULSE space experiment on the Service Module (large diameter), and
- Made a photographic survey of the ISS RS exterior & structure components ("Panorama-2008" DTO).

Mike & Yuri also installed the European EXPOSE-R payload on the SM shell (large diameter) but had to remove it again for return inside the ISS when it failed to activate and transmit telemetry on ground command.

The following tasks were then deferred for lack of time:

- Inspection & photography of the Progress 31P ASF1-M-VKA #2 antenna;
- Removing fasteners (Aramide straps) near docking target and AR-VKA & 2AR-VKA antenna areas on DC1;
- Closing MLI (Multi-Layer Insulation) flap on SM FP-10 connector patch panel, and
- Repositioning the SKK #9 removable cassette container to nominal position.

The spacewalk began at 7:51pm EST, 36 minutes late due to the pressure equalization valve (PEV; Russian: KVD) in the hatch between the spherical SM

PkhO (Transfer Compartment) and the DC1 SU (Transfer Vestibule) not opening on electric command (requiring FE-2 Magnus to enter the PkhO for manual cycling of the valve). The EVA ended at 1:29am. Subsequent repressurization of the DC1 from the SM PkhO failed when the KVD valve remained closed, even on an attempt by Sandy Magnus to open it manually from inside. The spacewalkers had to repressurize the DC1 from one of the backup BPN tanks (#7). The hatch could then be opened. The KVD valve suddenly became electrically functional again shortly before hatch opening (the second vestibule hatch, between the SU and the DC1 SO interior, could be opened OK during equalization).

[It was the 119th spacewalk for ISS assembly & maintenance and the 91st from the station (66 from Quest, 25 from Pirs, plus 28 from Shuttle) totaling 562h 44m; it was also the 19th this year. After today's EVA, a total of 159 spacewalkers (122 NASA astronauts, 26 Russians, and 11 astronauts representing Japan-1, Canada-4, France-1, Germany-2 and Sweden-3) have logged 751h 06min outside the station on building, outfitting & servicing. It was the 139th spacewalk involving U.S. astronauts.]

During EVA-21, FE-2 Magnus worked in Node-1, clearing out and transferring stowed equipment, relocating the SSC-6 (Station Support Computer 6) laptop and reconfiguring Node-1 UOP-2 (Utility Outlet Panel 2), all in preparation for next week's planned installation of the ARED (Advanced Resistive Exercise Device) which will block access to the NOD1P2 location.

Afterwards, Sandy replaced failed GLAs (General Luminaire Assemblies) in the JAXA Kibo modules, installing three BBAs (Baseplate Ballast Assemblies) & LHAs (Lamp Housing Assemblies) in the JLP (JEM Pressurized Logistics Segment) at locations FP1, FP2, PA2, and one BBA & LHA in the JPM (JEM Pressurized Module) at OF2.

After their return from the EVA this morning, Fincke & Lonchakov completed another session of the standard Russian crew health-monitoring program's medical assessment MO-9/Biochemical Urinalysis, after which Yuri restowed the Urolux equipment. *[MO-9 is conducted every 30 days (and also before and after EVAs) and is one of five nominal Russian medical tests adopted by NASA for U.S. crewmembers for IMG PHS (Integrated Medical Group/Periodic Health Status) evaluation as part of the "PHS/Without Blood Labs" exam. The analysis uses the sophisticated in-vitro diagnostic apparatus Urolux developed originally for the Mir program. Afterwards, the data are entered in the MEC (Medical Equipment Computer)'s special IFEP software (In-Flight Examination Program).]*

Later, Mike, Yuri & Sandy reset communications, conducted ISS activation operations and restored systems configurations in the DC1 & other RS modules to pre-EVA conditions, then installed DC1 and SM air ducts and activated the Vozdukh

CO₂ scrubber and Sputnik-SM amateur radio.

Cleaning up after the spacewalk, the CDR & FE-1 also –

- Secured the returned BIORISK-MSN payload container in a stowage bag for return to Earth,
- Removed the Orlan BRTA radio/telemetry unit batteries,
- Took post-EVA radiation readings of the “Pille-MKS” dosimeters carried by the spacewalkers in their Orlan suits,
- Deactivated the ASU toilet in the Soyuz spacecraft,
- Set up the Orlans for drying of their heat exchanger water supply lines, and
- Downlinked EVA-21 digital photography,

Bedtime began at 6:30am EST.

CEO (Crew Earth Observations) photo targets uplinked for today were **Johnston Island reef, central Pacific** (*ISS had a near-nadir pass over Johnston Island.*

*Aiming slightly to the right of track for the island and adjacent reefs. Detailed imagery will add to the existing time series of information on the island-reef system, specifically change to shorelines and reef extent), **American Samoa** (weather was predicted to be mostly clear over the eastern Samoan archipelago - this portion of the island chain is not well-documented with imagery. Looking for several irregular and widely spaced-islands; the “lazy S” shaped island of Tutuila marks the western extent of American Samoa. Overlapping frames of the islands and fringing reefs were requested in order to track morphological changes over time), and **Arkenu 1 and Arkenu 2 Impact Craters, Libya** (the two Arkenu impact structures are located within approximately 6 km of each other and are thought to result from fragments of the same meteor. Both structures appear as dark, elliptical features surrounded by bright dune sands. ISS had a nadir pass over the craters; overlapping frames, taken along track as the station approached and then departed the target were recommended).*

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 7:44am EST [= epoch]):

Mean altitude -- 354.0 km

Apogee height -- 359.1 km

Perigee height -- 348.8 km

Period -- 91.62 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.000766

Solar Beta Angle -- -41.7 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.72
Mean altitude loss in the last 24 hours -- 54 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 57832

Significant Events Ahead (all dates Eastern Time, some changes possible!):

02/09/09 -- Progress M-01M/31P undocking & deorbit
02/10/09 -- Progress 32P launch
02/12/09 -- Progress 32P docking
02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment
02/14/09 -- STS-119/Endeavour/15A docking
02/24/09 -- STS-119/Endeavour/15A undocking
02/26/09 -- STS-119/Endeavour/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress 32P undocking & deorbit
05/12/09 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

08/06/09 -- STS-128/Discovery/17A – MPLM (P), LMC, last crew rotation
08/XX/09 -- Soyuz 5R/MRM2 (Russian Mini Research Module, MIM2) on Soyuz
09/XX/09 -- H-IIB (JAXA HTV-1)
11/12/09 -- STS-129/Atlantis/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P), LMC
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4
12/XX/11-- Proton 3R/MLM w/ERA.

ISS On-Orbit Status 12/22/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 9 of Increment 18. Today's crew activities are centered mostly on tonight's Orlan EVA-21.*

Crew Sleep Cycle: Wakeup this morning: 10:45am EST; sleep: 6:30am tomorrow morning (until 12/24/Wednesday, 1:00am, i.e., back to normal).

FE-2 Magnus & CDR Fincke started their day again with the week-long SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment, using the payload software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop. *[To monitor the crewmember's sleep/wake patterns and light exposure, the crewmembers wear a special Actiwatch device which measures the light levels encountered by them as well as their patterns of sleep and activity throughout the Expedition and use the payload software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list. It was the second session for Mike, the first for Sandra.]*

After morning inspection, all pre-EVA activities proceeded smoothly and on schedule, starting out with Fincke & Lonchakov taking another MO-9 "Urolux" urine biochemistry test before breakfast. *[A second session with the Urolux equipment will be conducted by both crewmembers tomorrow morning (~2:30am) immediately after post-EVA station repress.]*

Pre-EVA preparations by the crew included –

- Closing the external shutters on the Lab and JPM (JEM Pressurized Module) science windows,
- Verifying that windows 6, 8, 9 of the SM RO (Service Module Work Compartment) and 12, 13, 14 of the SM PkhO (Transfer Compartment) are

- closed,
- Deactivating the Kenwood-D700/Sputnik-SM amateur radio equipment in the FGB to prevent RF interference with the Orlans' wireless in-suit Tranzit-B radio telemetry system,
- Changing the settings of the DSP pressure alarm sensors in the RS (Russian Segment),
- Deactivating the DS-7A Smoke Detector #1 in the SM PkhO,
- Setting up the PSS Caution & Warning System in the FGB,
- Deactivating the Vozdukh carbon dioxide (CO₂) removal system and the SKV air conditioner,
- Removing SM air ducts to enable RO-PkhO hatch closure,
- Deactivating VN1 & VN2 air heaters,
- Powering down ventilation fans in the SM (VK1, VK2, VK3, VK4, VKYu1, VKYu2),
- Turning off the SRVK-2M condensate water processor, and
- Powering off the electrical food heaters in the SM galley.

Mike Fincke & Yuri Lonchakov had about an hour reserved to complete setting up DC1 and PkhO systems for pre-EVA mode.

Next steps by Yuri & Mike were to –

- Check out the Orlan-M spacesuits and their systems as well as the suit interface control panels (BSS) in DC1 & PkhO,
- Retest the BK-3 primary & backup oxygen (O₂) tanks of the Orlans and DC1 (four total),
- Disassemble the DC1 air duct, but leaving the V3 fan in place, and
- Set up the STTS communications/telemetry links necessary for the spacewalk from the DC1. *[Most activities were paced by RGS (Russian ground site) comm window passes.]*

The CDR also test-“fired” the two D2X digital cameras and readied them in the DC1 for the spacewalk.

As a late-added activity, FE-2 Magnus reconfigured the WRS WPA (Water Recovery System/Water Processor Assembly) tank connection in the Lab, switching the waste/condensate water bus from the WRS tank to the Lab condensate tank.

[This reconfiguration became necessary when the WPA tank quantity yesterday exceeded an upper limit of 91%. A max filling of 95% will cause an overflow fault and shutdown of the WPA due of insufficient ullage. Since the deactivation of the Russian SKV air conditioner for the EVA is accelerating the filling rate, switching to the Lab condensate tank today became a necessary workaround. The UPA (Urine Processor Assembly) is currently shut down.]

Also currently deactivated, by ground commanding at ~11:00am, is the CDRA (Carbon Dioxide Removal Assembly) in the Lab.

After a midday “snack” (3:10-3:50pm), the spacewalkers, assisted by FE-2 Magnus, will conduct final inspections of the Orlan-M suits, BSS interface units & biomedical parameter telemetry to RGS (Russian Groundsite), including VHF/voice & biomedical electrode belt and telemetry hookups via the BSS (later by the wireless in-suit Tranzit-B radio telemetry system) for vital signs and equipment monitoring.

Magnus will configure the ISS for pre-EVA condition and support the spacewalkers in their preparations.

At ~5:00pm, in the DC1 & PkhO, after the Orlan & BSS systems checkouts Lonchakov & Fincke will be donning spacesuits and ancillary gear, assisting each other, then – with Sandy in the PkhO – close the hatchways between SM RO/PkhO and PkhO/SU (DC1 Transfer Vestibule) at ~5:35pm.

Magnus retreats into the FGB at ~6:20pm and closes the hatch to the SM, which now serves as a backup airlock to the DC1.

At ~4:50pm, ISS attitude control authority will be handed over to RS MCS (Motion Control System) to keep attitude stable during the (reactive) DC1 airlock depressurization. Then, the ISS will maneuver to a new EVA TEA (Torque Equilibrium Attitude), required due to the Port SARJ (Solar Alpha Rotary Joint) being moded from Autotrack to Parked position for the EVA. At 7:55pm, control will be returned to US Momentum Management to allow inhibiting Russian thrusters for safe work on the SM large diameter section. Thrusters will then be re-enabled (~12:32am). The US CMGs (Control Moment Gyroscopes) will be back in business tomorrow for the transition of the Port SARJ back to Autotrack (~10:40am).

The spacewalkers are scheduled to seal the Orlan backpacks at ~5:30pm, followed by Orlan & BSS controls checks. Final checkout of suits and their controls include checking for leaks during successive stages of depressurization. *[Pressure inside the Orlans will be reduced to 0.42 at (6.2 psi). After suit purge, the spacewalkers have a 30-minute oxygen prebreathe period, as pressures between DC-1 and the PkhO are equalized and then reduced further.]*

The spacewalk will begin after a final leak check on the four BK-3 O₂ tanks. At end of prebreathe, DC1 pressure will be down to 15 mmHg (Torr), holding for 5 min for a final cabin leak check, followed by switching the Orlans to autonomous (battery) suit power (~7:12pm) and opening of EV hatch #1 at ~7:15pm.

During the EVA-21, Sandy Magnus is scheduled for a 2.5-hour activity in Node-1, clearing out and transferring stowed equipment as well as relocating Node-1 UOP (Utility Outlet Panel) plug-ins in preparation for next week's planned installation of the ARED (Advanced Resistive Exercise Device).

Afterwards, Sandy will work in the Kibo modules and install three BBAs (Baseplate Ballast Assemblies) & LHAs (Lamp Housing Assemblies) in the JLP (JEM Pressurized Logistics Segment) at locations FP1, FP2, PA2, and one BBA & LHA in the JPM (JEM Pressurized Module) at OF2.

After Mike & Yuri's return and ingress from the EVA, expected tomorrow morning at around 1:25am, the DC1 airlock will be repressurized from SM cabin air, the hatches opened and the SM re-entered at around 2:05am.

Later, Fincke, Lonchakov and Magnus will reset communications, conduct ISS activation operations and restore systems configurations in the DC1 and other RS modules to pre-EVA conditions, then install DC1 and SM air ducts and activate the Vozdukh CO₂ scrubber and Sputnik-SM amateur radio.

Cleaning up after the spacewalk, the CDR & FE-1 will –

- Secure the returned BIORISK-MSN payload container in a stowage bag for return to Earth,
- Remove the Orlan BRTA radio/telemetry unit batteries,
- Take post-EVA radiation readings of the "Pille-MKS" dosimeters carried by the spacewalkers in their Orlan suits,
- Deactivate the ASU toilet in the Soyuz spacecraft,
- Set up the Orlans for drying of their heat exchanger water supply lines, and
- Downlink EVA-21 digital photography,

Sandy Magnus is timelined for her regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer and RED resistive exercise device.

EVA-21 Timeline Preview: The EVA-21 by Lonchakov (EV1/blue stripe) & Fincke (EV2/red stripe) today is scheduled to begin at ~7:15pm EST (DC1 EV hatch open), to last an estimated 6 hrs 10 min, i.e., concluding at approximately 1:25am. Russian attitude thrusters will be inhibited by TsUP ground commanding at specific times when the spacewalkers work on the SM RO large diameter (l.d.) and SM AO (Assembly Compartment). Main objectives of the EVA are to –

- *Install a Langmuir Probe on the DC1 Docking Compartment (to measure plasma fields close to Soyuz in support of the ongoing pyro bolt anomaly*

investigation);

- *Install & connect the EXPOSE-R monobloc unit on the SM RO I.d.;*
- *Install & connect the IPI-SM monobloc unit of the IMPULSE space experiment on the RO I.d.;*
- *Remove/return the BIORISK-MSN payload container #2 from the DC1;*
- *Conduct "SWG" Omega watch experiment operations;*
- *Inspect & photograph Progress 31P ASF1-M-VKA #2 antenna;*
- *Remove fasteners (Aramide straps) near docking target and AR-VKA & 2AR-VKA antenna areas on DC1(if time permits);*
- *Close MLI (Multi-Layer Insulation) flap on SM FP-10 connector patch (if time permits);*
- *Re-install SKK #9 removable cassette container in nominal position (if time permits); and*
- *Monitor conditions ISS RS exterior and structure components ("Panorama-2008" DTO, if time permits).*

Correction: Due to EVA-caused timeline constraints, the crew had to cancel the planned multi-language Christmas Day Message announced here yesterday.

However, the 40-year Apollo 8 Anniversary on 12/24 will be commemorated with a previously recorded message.

No CEO photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:39am EST [= epoch]):

Mean altitude -- 354.0 km

Apogee height -- 359.3 km

Perigee height -- 348.8 km

Period -- 91.62 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007788

Solar Beta Angle -- -46.5 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 41 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57817

Significant Events Ahead (all dates Eastern Time, some changes possible!):

12/22/08 -- Russian EVA-21 (hatch opening ~7:15pm; ingress 1:25am);

02/09/09 -- Progress M-01M/31P undocking & deorbit

02/10/09 -- Progress 32P launch

ISS On-Orbit Status 12/21/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – pre-EVA rest day for CDR Fincke, FE-1 Lonchakov & FE-2 Magnus. Ahead: Week 9 of Increment 18.*

>>>This morning at 7:04am EST, Winter began officially.

*>>>Today 40 years ago, humankind broke the taboo of Earth constraints and fulfilled a millennia-old dream when, at 7:51am EST, Frank Borman, Jim Lovell and Bill Anders launched at KSC to break away from Earth in **Apollo 8** and head for the Moon. “This is not the end but the beginning...” said NASA Administrator Dr. Thomas Paine (act.).*

CDR Fincke & FE-2 Magnus started their day by downloading the accumulated data of the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment from their Actiwatches to the HRF-1 (Human Research Facility 1) laptop as part of the week-long session with SLEEP. *[To monitor the crewmember’s sleep/wake patterns and light exposure, the crewmembers wear a special Actiwatch device which measures the light levels encountered by them as well as their patterns of sleep and activity throughout the Expedition and use the payload software for data logging and filling in questionnaire entries in the experiment’s laptop session file on the HRF-1 laptop. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew’s discretionary “job jar” task list. It was the second session for Mike, the first for Sandra.]*

After wakeup, before breakfast & first exercise, Mike Fincke, with Sandy Magnus assisting as CMO (Crew Medical Officer), completed a pre-EVA session with the Russian crew health-monitoring program's medical assessment MO-9/Biochemical Urinalysis. *[MO-9 is conducted every 30 days (and also before and after EVAs) and is one of five nominal Russian medical tests adopted by NASA for U.S. crewmembers for IMG PHS (Integrated Medical Group/Periodic Health Status)]*

evaluation as part of the "PHS/Without Blood Labs" exam. The analysis uses the sophisticated in-vitro diagnostic apparatus Urolux developed originally for the Mir program. Afterwards, the data are entered in the MEC (Medical Equipment Computer)'s special IFEP software (In-Flight Examination Program).]

Afterwards, the CDR –

- Set up the batteries of the D2X cameras for tomorrow's Orlan EVA-21 in the US Airlock for charging and later terminated the process after a minimum of 3 hours charging, and
- Filled the DIDs (Disposable In-suit Drink Bags) and installed them in the Orlan-M suits.

Also in preparation for the Russian spacewalk, FE-1 Lonchakov –

- Functionally tested the hatch KVDs (pressure equalization valves, U.S.: PEVs) in the DC1 and Service Module Transfer Compartment (SM PkhO) from their EVA support panels (POV);
- Configured the CCPK (Crew Contamination Protection Kit, Russian: PNST) in the DC1, for protecting the spacewalkers from FORP (Fuel/Oxidizer Reaction Products, e.g., N-nitrosodimethylamine, NDMA), i.e., incompletely-burnt fuel residue on the SM hull from yaw/pitch thruster plumes *[the protective gear kits for use during and after the EVA in case the Orlans are inadvertently contaminated, are extensively equipped with wet wipes, dry towels, goggles, IPK gas masks and half masks, latex gloves, high performance filters, trash containers, etc. Towels used for wiping gloves etc. will be thrown overboard in retrograde direction (i.e., against flight direction)]*,
- Retrieved three "Pille-MKS" radiation dosimeters, recording their dosages and equipping each Orlan (in pocket on left calf) with a sensor unit (A0309 & A0310) *[a third sensor, A0308, remains on duty for SM background readings on the Pille Reader tray]*; and
- Activated the ASU toilet system in the Soyuz spacecraft (for use by the FE-2 during the SM lockout).

Lonchakov performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP-Moscow. Additionally, the FE-1 today checked up on the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem, gathering weekly data on total operating time & "On" durations for reporting to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

In preparation for the EVA, Yuri also supported the ground in powering down the Elektron-VM oxygen (O₂) generator, safety-purging its BZh Liquid Unit with nitrogen (N₂) at 0.65 kg/cm² via its KE3 and VN3 valves.

For the external video coverage of the spacewalk, FE-2 Magnus set up the SSRMS (Space Station Remote Manipulator System) video camera connection by hooking up the UOP DCP (Utility Outlet Panel/Display & Control Panel) power bypass cable at the Lab RWS (Cupola Robotic Work Station).

Sandy also recorded TOCA (Total Organic Carbon Analyzer) results and conducted the T+2d inflight microbiology analyses for the samples collected on 12/19 from the PWD (Potable Water Dispenser) Ambient plus SVO-ZV and SRV-K Warm taps.

[Sandy reported "yellow" for Coliform (= Negative), "no purple dots" on the MCD (Microbial Capture Device) and a (nominal) incubation bag temperature of 80 degC. "All was OK..."]

Fincke & Lonchakov had their pre-EVA PMCs (Private Medical Conferences) via S- & Ku-band audio/video, Mike at ~10:10am, Yuri at ~11:30am EST.

At ~12:25pm, Mike held his weekly PFC (Private Family Conference) via S-band/ audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop).

The station residents conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Working from his discretionary "time permitting" job list, Yuri Lonchakov conducted the frequent status check on the Russian BIO-5 Rasteniya-1 ("Plants-1") experiment, verifying proper operation of the BU Control Unit and MIS-LADA Module fans (testing their air flow by hand). *[Rasteniya-1 researches growth and development of plants under spaceflight conditions in the LADA-14 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP).]*

EVA-21 Timeline Preview: The Orlan EVA-21 by Lonchakov (EV1/blue stripe) & Fincke (EV2/red stripe) tomorrow is scheduled to begin at ~7:15pm EST (DC1 EV hatch open), to last an estimated 6 hrs 10 min, i.e., concluding at approximately 1:25am. Russian attitude thrusters will be inhibited by TsUP ground commanding at specific times when the spacewalkers work on the SM RO (Working Compartment, l.d./large diameter) and SM AO (Assembly Compartment). Main

objectives of the EVA are to –

- *Install a Langmuir Probe on the DC1 Docking Compartment;*
- *Install & connect the EXPOSE-R monobloc unit on the SM RO I.d.;*
- *Install & connect the IPI-SM monobloc unit of the IMPULSE space experiment on the RO I.d.;*
- *Remove/return the BIORISK-MSN payload container #2 from the DC1;*
- *Conduct “SWG” Omega watch experiment operations;*
- *Inspect & photograph Progress 31P ASF1-M-VKA #2 antenna;*
- *Remove fasteners (Aramide straps) near docking target and AR-VKA & 2AR-VKA antenna areas on DC1(if time permits);*
- *Close MLI (Multi-Layer Insulation) flap on SM FP-10 connector patch (if time permits);*
- *Re-install SKK #9 removable cassette container in nominal position (if time permits); and*
- *Monitor conditions ISS RS exterior and structure components (“Panorama-2008” DTO, if time permits).*

Crew Sleep Cycle Shift (EST):

- Sleep tonight (12/21): -- 4:30pm
- Wake (12/22, Mon.) -- 10:45am
- Sleep (12/23, Tues.): -- 6:30am
- Wake (12/24, Wed.): -- 1:00am (nominal).

Christmas Day Message: On 12/24, the day when trailblazing Apollo 8 arrived in lunar orbit 40 years ago, the ISS crew will downlink a message commemorating the event and extending “Peace” wishes to all countries partnering in the ISS, in their languages:

English (Peace), Russian (Mir), Japanese (Heiwa), French (Paix), Dutch (Vrede), German (Friede), Danish/Norwegian/Swedish (Fred), Italian (Pace), Spanish (Paz).

Let your neighbors know!

No CEO photo targets uplinked for today.

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:25am EST [= epoch]):

Mean altitude -- 354.0 km

Apogee height -- 359.3 km

Perigee height -- 348.8 km

Period -- 91.62 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007782

Solar Beta Angle -- -51.4 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 49 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57801

Significant Events Ahead (all dates Eastern Time, some changes possible!):

12/22/08 -- Russian EVA-21 (hatch opening ~7:15pm; ingress 1:25am);

02/09/09 -- Progress M-01M/31P undocking & deorbit

02/10/09 -- Progress 32P launch

02/12/09 -- Progress 32P docking

02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment

02/14/09 -- STS-119/Endeavour/15A docking

02/24/09 -- STS-119/Endeavour/15A undocking

02/26/09 -- STS-119/Endeavour/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress 32P undocking & deorbit

05/12/09 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

08/06/09 -- STS-128/Discovery/17A – MPLM (P), LMC, last crew rotation

08/XX/09 -- Soyuz 5R/MRM2 (Russian Mini Research Module, MIM2) on Soyuz

09/XX/09 -- H-IIB (JAXA HTV-1)

11/12/09 -- STS-129/Atlantis/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A – MPLM(P), LMC

04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1

05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4

12/XX/11-- Proton 3R/MLM w/ERA.

ISS On-Orbit Status 12/20/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – rest day for CDR Fincke, FE-1 Lonchakov & FE-2 Magnus.*

The crew started out with a 2-hr. review of the updated timeline and procedures for the Orlan EVA-21 on 12/22 (Monday), including tagging up with ground specialists at TsUP-Moscow to discuss specifics based on uplinked instructional material on execution sequences of selected tasks. *(See timeline below).*

For her VolSci (Voluntary Science) program session today, FE-2 Magnus configured the BCAT-4 (Binary Colloid Alloy Test 4) payload in the Node-2, checked it out and started the experiment. *[After first familiarizing herself with payload hardware & operations, Sandy set up the experiment along with camcorder and still camera, taking video of herself performing homogenization on sample 2, the first crystal check of the session on sample 10, still imagery of any crystals found plus sample photography. The FE-2 then initiated the activity of automated photography of sample 2 with the Kodak DCS-760 digital still camera controlled by the EarthKAM software running on an SSC-13 (Station Support Computer 13).]*

At ~9:00am EST, the crewmembers conducted their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-Houston and TsUP-Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

Continuing the extended leak checking of the spare BZh Liquid Unit (#056) for the Elektron O₂ generator, FE-1 Lonchakov charged the unit once again with pressurized N₂ from the BPA Nitrogen Purge Unit (#23) to 1 atm (1 kg/cm²). The last test pressurization to monitor for leakage was on 11/20. *[Objective of the monthly checkout of the BZh, which has been in stowage for about 2 years, is to check for leakage and good water passage through the feed line inside of the BZh*

(from ZL1 connector to the buffer tank) and to check the response of the Electronics Unit's micro switches (signaling "Buffer Tank is Empty" & "Buffer Tank is Full". During Elektron operation, the inert gas locked up in the BZh has the purpose to prevent dangerous O₂/H₂ mixing. A leaking BZh cannot be used.)

In the SM (Service Module), Yuri also completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

The station residents conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Sandy Magnus filled out the regular FFQ (Food Frequency Questionnaire), her fourth, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

Port CQ Update: After the extensive deployment & checkout activities on the Portside Crew Quarters in Node-2 by CDR Fincke & FE-2 Magnus, the CQ has been determined to be habitable, and the crew was given permission to sleep in it. A few remaining tasks need to be completed, scheduled for the week of 1/5/09. Starboard CQ outfitting will be undertaken following the Port CQ completion.

VOA Update: After the recent VOA OMIs (Volatile Organics Analyzer/On-orbit Maintenance Items) spares changeout activities by Sandy Magnus, ground specialists are still investigating why they cannot get VOA back up and running. While an issue with the hard drive is being suspected, a complete troubleshooting plan is currently being put together.

EVA-21 Timeline Preview: The Orlan EVA-21 by Lonchakov (EV1/blue stripe) & Fincke (EV2/red stripe) on 12/22 is scheduled to begin at ~7:15pm EST (DC1 EV

hatch open), to last an estimated 6 hrs 10 min, i.e., concluding at approximately 1:25am. Russian attitude thrusters will be inhibited by TsUP ground commanding at specific times when the spacewalkers work on the SM RO (Working Compartment, I.d./large diameter) and SM AO (Assembly Compartment). Main objectives of the EVA are –

- *Install a Langmuir Probe on the DC1 Docking Compartment;*
- *Install & connect the EXPOSE-R monobloc unit on the SM RO I.d.;*
- *Install & connect the IPI-SM monobloc unit of the IMPULSE space experiment on the RO I.d.;*
- *Remove/return the BIORISK-MSN payload container #2 from the DC1;*
- *Conduct “SWG” project timer operations;*
- *Inspect & photograph Progress 31P ASF1-M-VKA #2 antenna;*
- *Remove fasteners (Aramide straps) near docking target and AR-VKA & 2AR-VKA antenna areas on DC1(if time permits);*
- *Close MLI (Multi-Layer Insulation) flap on SM FP-10 connector patch (if time permits);*
- *Re-install SKK #9 removable cassette container in nominal position (if time permits); and*
- *Monitor conditions ISS RS exterior and structure components (“Panorama-2008” DTO, if time permits).*

Weekly Science Update (*Expedition Eighteen -- Week 8*)

3-D SPACE: Complete.

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): Complete.

BCAT-3/4 (Binary Colloidal Alloy Test 3/4): Planned/Reserve.

BIO-4: Complete.

BIOLAB: Planned.

CARDIOCOG-2: Complete.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): “Sandy, thanks for selecting and completing your first CCISS session as a Voluntary Science option. We appreciate your participation.”

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System):
Samples returned on 1J.

CSI-3/CGBA-5 (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus 5): Ongoing.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

EDR (European Drawer Rack): Planned.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): Science acquisition for DEBIE-2, DOSTEL, EXPOSE, FIPEX, MEDET. On-ground troubleshooting for TRIBOLAB.

FSL (Fluid Science Laboratory): FSL is nominal.

GEOFLOW: “Sandy, thanks for increasing the torque of the FSL Anti-Vibration Mount (AVM), so that it is not necessary to lock/unlock the FSL Facility Core Element (FCE) for ISS reboost events. Science run #5, run#6 and run#7 have been successfully performed on 12/11, 12/16 and 12/18 respectively. All data have been downlinked and new science runs are planned in the next weeks”

HDTV System Test DL (JAXA): Complete.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

ICE CRYSTAL (JAXA): The experiment is ongoing and nominal.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Reserve.

Marangoni Experiment for ISS in JAXA FPEF (Fluid Physics Experiment Facility): In progress.

Micro-G Clay (JAXA EPO): Complete.

MISSE (Materials ISS Experiment): Ongoing.

Moon Photography from ISS (JAXA EPO): Complete.

MSG-SAME (Microgravity Science Glovebox): Complete.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

NOA-1/-2 (Nitric Oxide Analyzer, ESA): Complete.

NUTRITION w/REPOSITORY: "Mike and Sandy, Thanks for the great work in completing your FD60 and FD30 sessions. The crew notes you both sent down were very helpful, and the Nutrition team appreciates the attention to detail!"

PADLES (Passive Dosimeter for Lifescience Experiment in Space): In progress.

PCRF (Protein Crystallization Research Facility) Reconfiguration (JAXA): Complete.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SAMPLE: Complete.

SHERE (Shear History Extensional Rheology Experiment): Planned.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): "Sandy, thanks for donning your Actiwatch on the Shuttle. Your remaining Sleep Activities include monthly downloads of your Actiwatch, three weeks of sleep logging, and doffing the Actiwatch on the Shuttle on your way home. We are currently targeting

next week for your first week of Sleep logging. Any additional sleep logging is above and beyond and greatly appreciated by the PI.

Mike, thanks for downloading your and Sandy's Actiwatch as Voluntary Science. Choosing this option prevented a loss of data from Sandy's Actiwatch filling up and stopping recording. We are currently targeting next week for your first week of Sleep logging. In progress."

SOLAR (Solar Monitoring Observatory): The next Sun observation window is planned to start around 12/26.

SOLO (Sodium Loading in Microgravity): Complete.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): Reserve.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1/#2 (Waving and Coiling of Arabidopsis Roots at Different g-levels): Complete/Planned.

CEO (Crew Earth Observations): "Through 12/17 we have received a total of 5,608 frames of your CEO imagery for review and cataloging. Photos with times corresponding to our CEO target request times are reviewed first and since last week included: Aurora Australis – 28 frames in two sessions – no Aurora noted; and the Pilcomayo River & Megafan, Paraguay – 3 frames – target not acquired due to inadequate illumination (our bad). You acquired excellent imagery earlier of Mount Vesuvius (both with and without snow). You also acquired great contextual imagery of Lake Poopo (apparently bone dry – first time observed this decade). Recent aurora viewing conditions were poor, at best. Thanks for looking and trying. You did get some beautiful 400mm views of the Moon. You also recently acquired imagery of agricultural areas near the Rio Parapeti in Bolivia. A comparison of your image with one from STS-73 in 1995 will be published in NASA/GSFC's Earth Observatory website this weekend. The comparison illustrates the dramatic expansion of agricultural activity by the Bolivians into their rainforest region. Nice work!"

CEO photo targets uplinked for today were **South Tibesti Megafans, Africa** (*ISS had a nadir pass over the Ke River megafan, a large ancient river channel system south of the Tibesti Mts. Looking for a discontinuous, overlapping pattern of stream*

*channels south of the mountains. While the area is now part of the arid Sahara of southern Libya/northern Chad, approximately 8000 years ago the climate was much wetter and active rivers flowed here. The South Tibesti megafans represent a potential analog to features observed on Mars), **Tenoumer Impact Crater, Mauritania** (looking slightly to the right of track for this well-preserved, 2 km diameter impact crater. Looking for a dark circular structure to the east and north of two large dune fields with striking parallel dune sets. Overlapping frames taken slight to the right of track are suggested to capture the crater), and **Popocatepetl Volcano, Mexico** (weather was predicted to be clear over this large stratovolcano located 70 km to the southeast of Mexico City. Three major explosive eruptions have occurred in the very recent geologic past, producing pyroclastic flows and lahars that affected the basins surrounding the volcano. Mapping frames of the volcano and flanks are requested to capture current summit glacier extent and cone geomorphology. Gas and steam emissions may also be observed at the volcano).*

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:06am EST [= epoch]):

Mean altitude -- 354.1 km

Apogee height -- 359.3 km

Perigee height -- 348.9 km

Period -- 91.62 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007742

Solar Beta Angle -- -56.1 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 41 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57785

Significant Events Ahead (all dates Eastern Time, some changes possible!):

12/22/08 -- Russian EVA-21 (wake 9:30am; hatch opening ~7:15pm; ingress 1:25am 12/23; sleep 7:10am);

02/09/09 -- Progress M-01M/31P undocking & deorbit

02/10/09 -- Progress 32P launch

02/12/09 -- Progress 32P docking

02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment

02/14/09 -- STS-119/Endeavour/15A docking

02/24/09 -- STS-119/Endeavour/15A undocking

02/26/09 -- STS-119/Endeavour/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress 32P undocking & deorbit
05/12/09 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

08/06/09 -- STS-128/Discovery/17A – MPLM (P), LMC, last crew rotation
08/XX/09 -- Soyuz 5R/MRM2 (Russian Mini Research Module, MIM2) on Soyuz
09/XX/09 -- H-IIB (JAXA HTV-1)
11/12/09 -- STS-129/Atlantis/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P), LMC
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4
12/XX/11-- Proton 3R/MLM w/ERA.

Note: The daily ISS On-Orbit Status reports can also be found at

ISS On-Orbit Status 12/19/08

All ISS systems continue to function nominally, except those noted previously or below. *Crew sleep cycle today: Wake – 4:30am; sleep – 3:00pm EST. (Tomorrow: Wake – 1:00am; sleep – 4:30pm, i.e., back to normal).*

After yesterday's completion of all Orlan-M suit preparations, dry-run activities began today at ~1:25am EST with CDR Fincke tearing down and removing the air ducts between the SM PkhO (Service Module Transfer Compartment) and DC1 Docking Compartment/airlock (skipping ventilation fan V3) to make room for the subsequent suited exercise.

At the same time, FE-1 Lonchakov worked on configuring the communications systems in the DC1 for the exercise. *[The suited run requires wireless Tranzit-B suit radio telemetry on both semisets (activated: 2:56am) and temporary deactivation of the Russian VHF channel 1 (Very High Frequency, Russian: UKV1, for ultra-shortwave) to avoid interference from extraneous radio stations to the Orlans while over Russian ground stations (RGS, DO 3/4). All EVA preps were monitored by the ground via audio, the reason for the early morning time of the training run. Tranzit-B TM was turned off at ~3:10am EST.]*

After another functionality and leak checking of the Orlan-Ms, their equipment and their interface units (BSS) in the DC1 & PkhO, the crew began donning EVA gear at ~2:15am, including putting on personal gear bags, biomed harness, thermal underwear, LCG (liquid cooling garment), low-noise headset, gloves, etc.

After another checkout of comm hookups & biomedical parameter telemetry via the BSS Orlan interface system for vital signs & equipment monitoring, suiting up then culminated in ingress in the Orlans (~3:15am) through their "backdoors" and sealing off of the backpacks.

Next in line were –

- More functionality checkouts of the suits and their BSS controls (e.g.,

temperature control handling, water cooling system ops, preliminary Orlan & BSS leak checks),

- Preliminary dimensional suit fit checks at reduced suit pressure of 0.4 at/5.9 psi, and
- About an hour of testing/training of suited mobility & translation inside the DC1, beginning at ~3:55am.

[These “intramural” exercises included translation to all DC1 work stations with mated fluid umbilical, assessment of how the interior DC1 config impacts operations with various gear & accessories such as the POV (EVA support panel) and BSS, moving the BRT (Body Restraint Tether) with a CLB (Crew Lock Bag) and securing the BRT on a handrail, retrieving the Kodak 760 camera from the KPU tool carrier and stowing it temporarily on the OTA swing arm, turning helmet lights & Yuri’s WVS (Wireless Video System) camera on and off, etc.]

FE-2 Magnus participated in part of the exercise by checking out her comm links.

Egress from the Orlans was at about 5:00am, followed by a one-hour lunch break.

Afterwards, Lonchakov & Fincke restored communications settings in DC1 to nominal ops and performed post-training close-out activities, including air duct assembly. Later, after the Orlans were confirmed to be dry, they were re-equipped by Mike & Yuri with fresh consumables/replaceable elements for the spacewalk on Monday.

Meanwhile, Sandra Magnus spent more time with the periodic US WRS (Water Recovery System) sample analyses. *[After first setting up the TOCA (Total Organic Carbon Analyzer) by connecting its power cable to the UOP1 J3 outlet panel and hooking up its primed WPA (Water Processing Assembly) water sample hose to the WRS Rack 1, the FE-2 collected samples from the PWD (Potable Water Dispenser) Hot needle outlet for subsequent inflight processing with the TOCA plus WMK (Water Microbiology Kit) with MCD (Microbial Capture Device) and CDB (Coliform Detection Bag). A PWD post-flight analysis sample was archived for return on 15A. After the analyses, the usual water reclamation from the sample bags via an absorbing towel (to be dried by airing) and data recording (from TOCA USB drive into the SSC7 laptop) concluded the activities.]*

Magnus also offloaded accumulated urine from a Russian EDV-U container (#851) into the UPA. *[EDV-U #851, approaching expiration, is being replaced by #810.]*

In JAXA’s Kibo JPM (JEM Pressurized Module), the FE-2 supported SSIPC (Space Station Integration & Promotion Center) at Tsukuba/Japan in troubleshooting the MMA (Microgravity Measurement Apparatus) by activating the UDC (Utility DC/DC Converter) and MMA components at the Ryutai Rack and standing by for

power-cycling the NCU (Network Control Unit) if required. About 7.5 hrs later, Sandy deactivated the MMA again (~12:40pm EST).

Also in Kibo, Magnus performed troubleshooting on the JEM CGSE (Common Gas Support Equipment) by connecting the upper & lower CO₂ supply lines from the GBUs (Gas Bottle Units) and checking pressure readings to track down a suspected blockage.

For the Japanese ICE CRYSTAL (Study of Microgravity Effect for Pattern Formation of Dendritic Crystal by a Method of in-situ Observation) experiment which resulted in the first, headline-making images of space-grown (zero-G) ice crystals (snow flakes), the FE-2 installed a new pass-through plate ("C") on the SCOF (Solution Crystallization Observation Facility), stowing the previous plate ("B") in a bag for return to Earth.

Afterwards, Sandy performed routine maintenance on the CSA-CP (Compound Specific Analyzer-Combustion Products) units, first replacing the battery of the prime CSA-CP unit with a fresh spare (#1101), then zero-calibrating all units. *[The CSA-CP is a passive cabin atmosphere monitor that provides quick response capability during a combustion event (fire). Its collected data are stored on a logger. Following zero calibration, the backup units were stowed in the Node-1, along with the sampling pump, while the prime unit was deployed at the SM Central Post.]*

The FE-2 had another 2h 45m on her timeline for Part 2 of deploying & checking out the first Crew Quarter (CQ) rack in Node-2, at portside (NOD2P5), readying it for occupancy by Mike Fincke. *[Setting up the living quarters for use involved removing numerous launch locks and protective covers, installing interior sound-dampening blankets, electronics, power connections etc. Work progress was delayed yesterday when Sandy, upon removing the intake cover for the CQ fan, discovered the head of one of three fastener screws to be stripped. A procedure was uplinked overnight for the FE-2 to remove the rounded-out screw.]*

Somewhat belatedly, Magnus cleared out the CBCS (Centerline Berthing Camera System) from the Node-2 and stowed the equipment to protect it against possible damage. *[CBCS, which was used at the Node-2 nadir hatch to support MPLM "Leonardo" docking, was not stowed during ULF2 as originally planned.]*

Sandy also completed the routine daily servicing of the SM's SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV*

waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]

The daily IMS (Inventory Management System) maintenance was on Sandy's voluntary "job jar" task list for today, consisting of updating/editing of its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

At 1:45pm, the FE-2 supported the periodic VHF-1 emergency communications check over NASA's VHF (Very High Frequency) stations, today with the Wallops VHF Site (1:48pm), talking with Houston/Capcom, MSFC/PAYCOM (Payload Operation & Integration Center Communicator), Moscow/GLAVNI (TsUP Capcom), EUROCOM/Munich and JCOM/Tsukuba in the normal fashion via VHF radio from a handheld microphone and any of the USOS ATUs (Audio Terminal Units).

[Purpose of the test is to verify signal reception and link integrity, improve crew proficiency, and ensure minimum required link margin during emergency (no TDRS) and special events (such as a Soyuz relocation).]

Working from his discretionary "time permitting" job list, Yuri Lonchakov conducted the frequent status check on the Russian BIO-5 Rasteniya-1 ("Plants-1") experiment, verifying proper operation of the BU Control Unit and MIS-LADA Module fans (testing their air flow by hand). *[Rasteniya-1 researches growth and development of plants under spaceflight conditions in the LADA-14 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP).]*

The station residents conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (FE-2, FE-1) and VELO bike with bungee cord load trainer (FE-1).

Both the CDR and the FE-2 had their next regular FFQ (Food Frequency Questionnaire) sessions on their discretionary "job jar" task lists, their fourth, filing the forms on the MEC (Medical Equipment Computer). *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

At ~12:20pm, the ISS crew had their regular weekly tagup with the Lead Flight

Director at JSC/MCC-H via S-band/audio. *[S/G-2 (Space-to-Ground 2) phone patch via SSC (Station Support Computer).]*

WRM Update: An updated WRM (Water Recovery Management) “cue card” was uplinked yesterday for the crew’s reference, updated with the latest water audit.

[The new card (18-0006H) lists 39 CWCs (~1,250.9 L total) for the four types of water identified on board: technical water (673.8 L, for Elektron electrolysis), potable water (530.4 L, incl. 174.6 L currently off-limit because of Wautersia bacteria), condensate water (0.0 L), waste/EMU dump and other (46.7 L).

Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]

SARJ Autotrack Test: To supplement data collected during ULF2, ground controllers last night successfully concluded a series of tests to gather data to characterize the performance of the Starboard Solar Alpha Rotary Joint during autotrack mode. EWIS (External Wireless Instrumentation System) and SDMS (Structural Dynamic Measurement System) data were collected, including at an angle sweep offset by 90 deg. The test took place over 5 orbits.

CEO (Crew Earth Observations) photo targets uplinked for today were **Beijing, China Aerosol** (weather was predicted to be clear over the Beijing metropolitan area, providing an opportunity to photograph aerosols over the city. Looking to the right of track as ISS passed over Bohai Bay [also known as the Bohai Sea] and the Yellow Sea. Stratification of pollution haze should have been visible in an Earth limb view over the metropolitan area; also of interest are images that capture the orientation and extent of a visible pollution plume), **North Mariana Islands, & Guam, Pacific Ocean** (ISS orbit track passed over the northern Marianas island chain. Overlapping, nadir viewing images of the northernmost islands and surrounding reefs were requested to track shoreline change and reef extent over time), **Southwest Algeria Megafans** (the crew had a nadir pass over the northwestern portion of these recently recognized inland deltas. This megafan complex was created by rivers that flowed west and northwest from the Adrar N'Ahnnet Mountains in southwestern Algeria. Overlapping frames, taken along track, were requested to map channel positions and the extent of sedimentary deposits), and **Soufriere Hills Volcano, Montserrat** (the Soufriere Hills volcano comprises the southern half of the island of Montserrat in the Lesser Antilles chain. An active and highly dangerous volcano, eruptions beginning in 1995 caused the evacuation and destruction of the capitol city of Plymouth. Overlapping frames of the island were requested to capture both the morphology of the volcano and extent of visible eruptive products. Gas, steam, and ash plumes may also be visible).

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the

Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:54am EST [= epoch]):

Mean altitude -- 354.1 km

Apogee height -- 359.4 km

Perigee height -- 348.9 km

Period -- 91.62 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007777

Solar Beta Angle -- -60.7 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 18 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57770

Significant Events Ahead (all dates Eastern Time, some changes possible!):

12/22/08 -- Russian EVA-21 (wake 9:30am; hatch opening ~7:15pm; ingress 1:25am 12/23; sleep 7:10am);

02/09/09 -- Progress M-01M/31P undocking & deorbit

02/10/09 -- Progress 32P launch

02/12/09 -- Progress 32P docking

02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment

02/14/09 -- STS-119/Endeavour/15A docking

02/24/09 -- STS-119/Endeavour/15A undocking

02/26/09 -- STS-119/Endeavour/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress 32P undocking & deorbit

05/12/09 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

08/06/09 -- STS-128/Discovery/17A – MPLM (P), LMC, last crew rotation

08/XX/09 -- Soyuz 5R/MRM2 (Russian Mini Research Module, MIM2) on Soyuz

09/XX/09 -- H-IIB (JAXA HTV-1)

11/12/09 -- STS-129/Atlantis/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A – MPLM(P), LMC

04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1

05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4

12/XX/11-- Proton 3R/MLM w/ERA.

ISS On-Orbit Status 12/18/08

All ISS systems continue to function nominally, except those noted previously or below. Sleep cycle shifting begins tonight for EVA-21 by moving bedtime 90 min to the left, i.e., from 4:30pm to 3:00pm. Wakeup tonight: 11:30pm EST.

Yuri Lonchakov performed the periodic maintenance of the active Russian BMP (Harmful Impurities Removal System) by terminating the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system and starting it on bed #2. The process will be closed down at ~2:45pm EST.

[Regeneration of each of the two cartridges takes about 12 hours and is conducted normally only during crew awake periods except for last night. The BMP's regeneration cycle is currently done every 20 days (last time done: 11/28-29).]

Working in the DC1 Docking Compartment, CDR Fincke & FE-1 Lonchakov continued preparations for tomorrow's suited dry-run and the EVA-21 spacewalk on 12/22 (Monday), by –

- Performing pressure checks on the portable O₂ tanks (BK-3) and portable air repress bottles (BNP),
- Conducting BRTA (radio telemetry unit) checkouts for the Orlans & BSS interface units,
- Setting up Orlan BRTK "Korona" comm configuration, running voice checks and testing medical parameter acquisition of the BETA-08 ECG (electrocardiograph) harnesses with the "Gamma-1M" med complex from the PKO med exam panel for vital signs & equipment monitoring,
- Installing US EMU (Extravehicular Mobility Unit) lights and one wireless video camera (for Yuri) on the Orlan-M suits,
- Installing Orlan attached hardware (OTA) plus taking photos of the outfitted Orlans for downlink (OTA equipment includes: right-hand swing arm with tool caddy, small trash bag, SWG space launch project stop watch, promotional OMEGA watches, wire ties, tethers, camera, wrench and cutters),
- Preparing auxiliary NASA equipment to be used in Orlan plus taking photos of the outfitted Orlans for downlink,

- Mounting the Fresnel lens viewing aid in the helmets,
- Filling the DIDBs (disposable in-suit drink bags) and installing them in the suits,
- Unstowing EVA emergency first-aid medical packs and stowing them in the DC1, and
- Testing the proper function of the hatch pressure equalization valve (PEV; Russian: KVD) from the POV panels in the SM PkhO (Service Module Transfer Compartment) and DC1.

[The checkouts of the Orlan “Korona” communication links, which include VHF/voice and biomedical electrode belt and telemetry hookups via the BSS (after egress to be switched to the wireless in-suit radio telemetry system Tranzit-B), showed a failed voice link in the current hard-wired onboard configuration. Troubleshooting by TsUP-Moscow and crew is underway.]

Additionally, the FE-1 worked on the second unit of the EXPOSE-R payload, securing its exposed bolts with Aramide tape for safety during egress and translation to its external installation site.

In the DC1, Yuri configured two connectors on the PPS-1 payload panel for the OBSTANOVKA (Environment) payload by covering them with protective caps. *[The GFI-11/OBSTANOVKA payload, along with the IMPULSE experiment, will be installed externally for using ionosphere probes and a pulsed plasma source to make scientific measurements of ionosphere parameters and plasma-wave characteristics.]*

The three crewmembers had 1h set aside for reviewing flight procedures and DC1 airlock operations for the spacewalk. *[Egress is currently scheduled for 7:15pm EST on 12/22, with ingress expected at ~1:25am on 12/23. EV1/Lonchakov will wear Orlan #26 with blue stripe, EV2/Fincke Orlan #27 with red stripe. During the EVA, all hatches in the USOS (US Segment) will remain open, and FE-2 Magnus will be able to move freely about the cabin, including the FGB. The toilet in the Soyuz, docked at the FGB nadir port, will be On. The SM PkhO hatches will be closed, separating the SM from the rest of the ISS in order to serve as a backup airlock to the DC1. SM systems will be powered down (Vozdukh, Elektron, SKV/air conditioner, ASU/toilet). In the USOS, CDRA (Carbon Dioxide Removal Assembly) will be on standby and TCCS (Trace Contaminant Control System) will be powered down. The Lab RWS (Robotics Workstation) will be On so that video from the WVS (Wireless Video System) and outboard cameras (P1LOOB/P1 Lower Outboard, S1LOOB, P1LOIB/P1 Lower Inboard) can be piped in for Sandy’s viewing.]*

Since the WHC (Waste & Hygiene Compartment), while being now fully functional,

is currently on hold pending installation of the privacy enclosure, CDR Fincke reconfigured the UPA (Urine Processor Assembly) for receiving urine from a Russian EDV-U container instead of the WHC (by disconnecting the WHC urine jumper and replacing it with an EDV transfer hose), then filled the WSTA with pretreated urine.

Sandra Magnus meanwhile conducted the T+2d inflight microbiology analyses for the samples collected on 12/16 from the PWD (Potable Water Dispenser) Ambient plus SVO-ZV and SRV-K Warm taps. *[Sandy reported “yellow” for Coliform (= Negative) and “purple colonies” in the MCD (Microbial Capture Device), i.e., about 85 tiny dots. Pictures were taken.]*

The FE-1 collected the periodic readings of potentially harmful atmospheric contaminants in the SM, using the CMS (Countermeasure System), a component of the SKDS GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, today using preprogrammed microchips to measure for o-Xylol (1,2-Dimethylbenzol, C_8H_{10}) and Methyl-Mercaptan (Methanethiol, CH_4S).

The FE-2 had 2.5 hrs on her timeline for Part 1 of deploying and checking out the first Crew Quarter (CQ) rack in Node-2, Port 5 (NOD2P5). *[For the initial rotation of the rack away from the wall, Mike Fincke provided assistance. Sandy then proceeded to make cable connections and to apply power. Telemetry states and verification of correct wiring connections were later to be made remotely by MCC-H controllers. Each of the two CQs, which arrived on ULF2, has a speaker installed which connects to the Node-2 ATUs (Audio Terminal Units) via the CQ patch panel. Preflight ground testing has uncovered major audio feedback issues when trying to transmit within ~4 ft of the CQ speaker which, however, can be used for C&W (Caution & Warning) alarm and S/G (Space-to-Ground) monitoring purposes until the problem is fixed.]*

Magnus performed maintenance on two HRDs (High Rate Dosimeters) by replacing their AAA batteries with fresh ones from the battery “pantry” (four AAAs per unit). *[Batteries are replaced in both units yearly to ensure the HRDs are ready to be used in a contingency situation.]*

The FE-2 also completed the weekly 10-min. CWC (Contingency Water Container) inventory as part of on-going WRM (Water Recovery & Management) assessment of onboard water supplies. Updated “cue cards” based on the crew’s water calldowns are sent up every other week. *[The current card (18-0006G), to be updated, lists 39 CWCs (~1,272.9 L total) for the four types of water identified on board: technical water (695.8 L, for Elektron electrolysis), potable water (530.4 L, incl. 174.6 L currently off-limit because of Wautersia bacteria), condensate water*

(0.0 L), waste/EMU dump and other (46.7 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]

The station residents conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), and RED resistive exercise device (FE-2).

Sandy completed the routine daily servicing of the SM's SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

At ~4:45am EST, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~7:07am, the CDR powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, & power supply) and conducted, at 7:12am, a ham radio session with Scuola Elementare Faleriense "Gianni Rodari", Porto S. Elpidio, Italy. *[The school "Gianni Rodari" is located in Porto Sant'Elpidio, a small town in Southern Italy. It is situated on the shore of the Adriatic Sea, 50 km away from Ancona and 30 km from the city of San Benedetto del Tronto. "Gianni Rodari" is a big primary school including a kindergarten. The school offers practical courses and projects such as the radio contact with the ISS. Another important and exciting project for the pupils is the construction and test of the "coherer", the primitive radio signal detector. It was invented by Temistocle Calzecchi Onesti, who demonstrated in experiments in 1884 through 1886 that iron filings contained in an insulating tube will conduct an electrical current under the action of an electromagnetic wave. This discovery was important for the later work of Sir Oliver Lodge, Edouard Branly and Guglielmo Marconi in the development of the radio. Onesti lived in Monterubbiano, a small village near the city of Porto Sant'Elpidio. Questions to Mike were uplinked beforehand. "How are you?"; "What's your name and how old are you?"; "How long are you already onboard the ISS on this mission?"; "What do you feel during takeoff?"; "Are you afraid of anything during your stay onboard the ISS?"; "When did you decide to become an astronaut?"; "Did you have good marks at school?"; "What do you see right now when you look through the window of your spaceship?"; "What exactly is a black hole?"; "Do you see any planet from the spaceship?"; "What does the spaceship*

inside look like?"]

KURS Testing: Tonight at ~10:14pm EST, TsUP-Moscow will conduct tests of the automated radio flight system KURS-P (on SM) and KURS-A (on Progress 31P) in loop, for one and two strings. Necessary pre-test activities include turning on SM KURS heaters, activating KURS antennas and frequency generator heaters, BITS2-12 onboard telemetry measurement system, US-22 matching unit and the CSB KURS Approach Test Program.

Conjunction Update: Last night's (11:46pm EST) conjunction with space debris (Object 29406, SL-12 rocket) did not require crew action (taking temporary refuge in the Soyuz spacecraft), although notification had been received too late for a DAM (Debris Avoidance Maneuver). Miss distance, determined ~4.1 hrs before TCA (Time of Closest Approach), was 18.8 km.

CEO (Crew Earth Observations) photo target uplinked for today was Mumbai, India Aerosol (*looking to the right of track for aerosol plumes associated with the Mumbai metropolitan area. Mumbai is India's largest city, and one of the world's largest megacities. Looking for stratification or color changes within the atmosphere over Mumbai - photography of these features are useful for analysis of urban atmospheric and pollution dynamics. Sulfur-rich industrial smog appears lighter and gray when seen on the limb, and black carbon from urban fires and diesel oil burning appear as more yellow, red and brown layers*).

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:39am EST [= epoch]):

Mean altitude -- 354.2 km

Apogee height -- 359.4 km

Perigee height -- 349.0 km

Period -- 91.62 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007727

Solar Beta Angle -- -65.1 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 155 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57754

Significant Events Ahead (*all dates Eastern Time, some changes possible!*):

12/19/08 -- Russian EVA-21 Suited Exercise (wake 11:30pm 12/18; sleep 3:00pm 12/19);

12/22/08 -- Russian EVA-21 (wake 9:30am; hatch opening ~7:15pm; ingress 1:25am 12/23; sleep 7:10am);
02/09/09 -- Progress M-01M/31P undocking & deorbit
02/10/09 -- Progress 32P launch
02/12/09 -- Progress 32P docking
02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment
02/14/09 -- STS-119/Endeavour/15A docking
02/24/09 -- STS-119/Endeavour/15A undocking
02/26/09 -- STS-119/Endeavour/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress 32P undocking & deorbit
05/12/09 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

08/06/09 -- STS-128/Discovery/17A – MPLM (P), LMC, last crew rotation
08/XX/09 -- Soyuz 5R/MRM2 (Russian Mini Research Module, MIM2) on Soyuz
09/XX/09 -- H-IIB (JAXA HTV-1)
11/12/09 -- STS-129/Atlantis/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P), LMC
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4
12/XX/11-- Proton 3R/MLM w/ERA.

ISS On-Orbit Status 12/17/08

All ISS systems continue to function nominally, except those noted previously or below. >>>Today 105 years ago, the Wright Brothers conducted the first controlled, powered & sustained heavier-than-air human flight (1903). The feat, at Kill Devil Hills, NC, by Orville, lasted 12 sec and covered 120 ft.<<<

Use of the DC1 Docking Compartment as airlock for the upcoming EVA-21 on 12/22 requires it to be isolated from the Progress M-01M/31P cargo ship currently docked to its nadir port. To this end, FE-1 Lonchakov & CDR Fincke began their day with –

- Activating the Progress (i.e., SUBA/Onboard Equipment Control System & SOTR/Thermal Control System),
- Removing the air heater/fan unit & air duct from the passageway,
- Collapsing the duct and stowing it with the heater assembly in the Russian segment (RS),
- Removing the quick-release screw clamps which rigidize the docking joint (with RS thrusters inhibited during the clamp removal (3:00am-4:40am EST),
- Closing the DC1-SU and SU-31P hatches (~3:20am), and
- Performing the usual one-hour leak check on both hatches (ending at ~4:40am).

Other preparations in the DC1 by Lonchakov & Fincke for the suited dry-run on 12/19 (Friday) and the spacewalk on 12/22 (Monday) included –

- Configuring the STTS communications link to support their presence in “Pirs”,
- Performing ORU (on-orbit replaceable unit) installations on the Orland, such as primary BK-3 oxygen (O₂) tanks, batteries on BRTA radio telemetry units, LP-9 LiOH cans, moisture collectors & FOP feedwater filters, IK-0702 CO₂ measurement unit filter, tool caddy, trash bags and tethers);
- Installing an additional BNP portable repress O₂ tank assembly in the DC1 (in case the PkhO-SU pressure equalization valve fails to open),

- Resizing the Orlan-M spacesuits #26 & #27 according to an uplinked resize table (to be repeated as necessary during the dry-run and under reduced airlock pressure), and
- Preparing & gathering crew-preference US EVA tools and systems hardware.

In the US Airlock, FE-2 Magnus terminated the recharge of EMU battery #2037 in the BSA BC4 (Battery Stowage Assembly/Battery Charger 4) and stowed it for supporting the Russian Orlan-EVA.

Also in support of EVA-21, Sandy Magnus worked with Kapton tape, scissors and tape measure to jerry-rig an extension for the pull tab on the US REBA (Rechargeable EVA Battery Assembly) which allows activation of the battery once it is installed in the Orlan-M.

Afterwards, Sandy retrieved EHIP (EMU Helmet Interchangeable Portable) light batteries #1028 & #1029 plus REBA battery #1008 and set them up for recharge. The process will be terminated tonight before sleep time and the batteries stowed for EVA-21.

The FE-1 performed the periodic maintenance of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The process will be terminated tomorrow morning after crew sleep, followed by Bed #2 regeneration. (Last time done: 11/28-29). *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle is normally done every 20 days.]*

The FE-2 conducted major IFM (Inflight Maintenance) on the VOA (Volatile Organics Analyzer) by –

- Removing the assembly from the CHeCS (Crew Health Care Systems) rack at LAB1S4,
- Changing out VOA components (N₂ Dryer, O₂ Scrubber, VOA Hard Disk, GC (Gas Chromatograph) Cooling Fan, Recirculation & Air-in Sieve Packs),
- Re-installing the VOA in the rack, and
- Removing Inlet & Exhaust caps.

[With its RPC (Remote Power Controller) switch ON, the VOA will be activated from the ground.]

For cooling, Sandy afterwards hooked up MTL (Moderate Temperature Loop) jumpers to the CHeCS rack at the UIP (Utility Interface Panel) and Z-panel.

Yuri Lonchakov conducted monthly maintenance on the deactivated Russian IK0501 GA (Gas Analyzer) of the SOGS Pressure Control & Atmospheric Monitoring System by replacing its CO₂ filter assembly (BF) with a new unit from FGB stowage (done last: 11/5), then reactivating the unit. The old filter was discarded.

The FE-1 performed more troubleshooting in the FGB to investigate an unexplained “smoke” indication light on the PSS status panel, today checking connectors behind panel 306 and associated instruments. *[A check behind panel 429 on 12/13 failed to clear the issue.]*

Sandy Magnus completed the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur). Afterwards, the FE-2 discussed IMS stowage ops with ground specialists in a 20-min. teleconference.

Mike Fincke continued the preparation for cold stowage in the MELFI (Minus Eighty Degree Laboratory Freezer for ISS) for future samples by completing the ninth ICEPAC insertion into the freezer after ULF-2, today retrieving another four -32 degC ICEPAC belts and placing them into Dewar 3, Tray A/Sections 3 & 4 and Tray B/Sections 1 & 4 for cooling down.

Afterwards, Mike conducted the periodic status check on the running payloads CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) and ENose (Electronic Nose), both located in the ER-2 (EXPRESS Rack 2). *[ENose monitors the station's interior for harmful chemicals such as ammonia, mercury, methanol and formaldehyde, running continuously and autonomously. It is the first instrument aboard ISS which can detect and quantify chemical leaks or spills as they happen. If successful, ENose might be used in future space missions as part of an automated system to monitor and control astronauts' in-space environments. The shoebox-sized ENose contains an array of 32 sensors that can identify and quantify several organic and inorganic chemicals, including organic solvents and marker chemicals that signal the start of electrical fires. The sensors are polymer films that change their electrical conductivity in response to different chemicals, where the pattern of the sensor array's response depends on the particular chemical types present in the air. The instrument can analyze volatile aerosols and vapors, help monitor cleanup of chemical spills or leaks, and enable more intensive chemical analysis by collecting raw data and streaming it to a computer at JPL's ENose laboratory. The instrument, weighing less than nine pounds and requiring only 20 watts of power, has a wide range of chemical sensitivity, from fractional parts per million to 10,000 parts per million. Its data-analysis software can identify and*

quantify the release of chemicals within 40 minutes of detection. While ENose will look for 10 chemical types in this six-month experiment, it can be "trained" to detect many others.]

The FE-2 completed the routine daily servicing of the SM's SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

Working from his discretionary "time permitting" job list, Yuri conducted the frequent status check on the Russian BIO-5 Rasteniya-1 ("Plants-1") experiment, verifying proper operation of the BU Control Unit and MIS-LADA Module fans (testing their air flow by hand). *[Rasteniya-1 researches growth and development of plants under spaceflight conditions in the LADA-14 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP).]*

The station residents conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR, FE-2, FE-1) and VELO bike with bungee cord load trainer (FE-1).

At ~2:05pm EST, CDR Fincke held a 15-min. teleconference with Lee Archambault, CDR of the next Shuttle mission, STS-119/Endeavour-15A, in February '09.

ISS Reboost Test: Last night's reboost test maneuver using the Progress 31P mid-ring thrusters was nominal. The thruster firing (duration: 9m 28s) took place at 10:58:50 pm EST and resulted in a delta-V of 0.49 m/s/1.61 ft/s (expected: 0.5 m/s/1.64 ft/s) and a mean altitude increase of 0.84 km/0.45 nmi (expected: 0.9 km/0.5 nmi). Attitude control authority will be handed over to Russian MCS (Motion Control System) at 9:10pm and returned to US Momentum Management at 11:45pm.

[31P is docked to the DC1 nadir port, i.e., radially, and the burn was performed in LVLH +XVV attitude (local vertical-local horizontal/+X axis into the velocity vector, i.e., flying bow-forward), the first time for this type of translational maneuver. Purpose of this reboost was to test the Progress mid-ring (lateral) thrusters to support a DAM (Debris Avoidance Maneuver) when a Soyuz is docked to the SM aft port (17S is currently docked at the FGB nadir port). The test burn also started the phasing for the STS-119/15A and 32P launches.]

Conjunction Advisory: A new conjunction with space debris (Object 29406, SL-12) is being tracked with high priority for its closest approach tonight at 11:46pm EST, with at a radial miss distance of ~0.171 km. Due to late notification, it is too late for

any decision on a DAM (Debris Avoidance Maneuver). More data will be received and evaluated in the next several hours. The conjunction had not been identified prior to the reboost test due to its extremely sparse tracking over the past few weeks.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:22am EST [= epoch]):

Mean altitude -- 354.3 km

Apogee height -- 359.4 km

Perigee height -- 349.2 km

Period -- 91.63 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007626

Solar Beta Angle -- -69.1 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.71

Mean altitude gain in the last 24 hours -- 840 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57738

Significant Events Ahead (*all dates Eastern Time, some changes possible!*):

12/19/08 -- Russian EVA-21 Suited Exercise (wake 11:30pm 12/18; sleep 3:00pm 12/19);

12/22/08 -- Russian EVA-21 (wake 9:30am; hatch opening ~7:15pm; sleep 7:10am 12/23);

02/09/09 -- Progress M-01M/31P undocking & deorbit

02/10/09 -- Progress 32P launch

02/12/09 -- Progress 32P docking

02/12/09 -- STS-119/Endeavour/15A launch -- S6 truss segment

02/14/09 -- STS-119/Endeavour/15A docking

02/24/09 -- STS-119/Endeavour/15A undocking

02/26/09 -- STS-119/Endeavour/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress 32P undocking & deorbit

05/12/09 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

08/06/09 -- STS-128/Discovery/17A -- MPLM (P), LMC, last crew rotation

08/XX/09 -- Soyuz 5R/MRM2 (Russian Mini Research Module, MIM2) on Soyuz

09/XX/09 -- H-IIB (JAXA HTV-1)
11/12/09 -- STS-129/Atlantis/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P), LMC
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4
12/XX/11-- Proton 3R/MLM w/ERA.

ISS On-Orbit Status 12/16/08

All ISS systems continue to function nominally, except those noted previously or below.

Before morning inspection and breakfast, FE-1 Lonchakov terminated his fourth experiment session for the long-term Russian sleep study MBI-12/SONOKARD, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

Servicing the new WRS (Water Recovery System), FE-2 Magnus –

- Collected the periodic samples from the PWD (Potable Water Dispenser) Ambient and the SVO-ZV tap and the SRV-K Warm tap,
- Analyzed in-flight samples with the TOCA (Total Organic Carbon Analyzer) via the TOCA water sampling hose, the WMK MCD (Water Microbiology Kit/ Microbial Capture Devices) for microbial traces, and the CDB (Coliform Detection Bag) for inflight coliform indications (Magenta for Positive, Yellow for Negative),
- Stowed away the usual SRV-K Warm & SVO-ZV tap archival samples to be returned on 15A for post-flight analysis on the ground, and, after the analyses,
- Performed data recording and, for conserving water, the usual water reclamation from the sample bags via an absorbing towel (to be dried by airing) and concluded the activities.

[The TOCA performed successfully. WRS sampling & checkouts are regularly

conducted for 90 days: every 4 days – WRS water hose (TOCA inflight analysis) & microbial bag sample (inflight bacterial visual enumeration plus archival for return on 15A), every 8 days – an archival water sample (return on 15A), and monthly – a TOCA bag sample from PWD (tested inflight). Coliform bacteria are the commonly-used bacterial indicator of sanitary quality of foods and water. They are defined as rod-shaped Gram-negative non-spore forming organisms that ferment Lactose with the production of acid and gas when incubated at 35-37 degC. Coliforms are abundant in the feces of warm-blooded animals, but can also be found in the aquatic environment, in soil and on vegetation. In most instances, coliforms themselves are not the cause of sickness, but they are easy to culture and their presence is used to indicate that other pathogenic organisms of fecal origin may be present.]

As part of the regular physical fitness check prior to Orlan spacewalks, it was Yuri Lonchakov's turn today for the Russian MO-5 MedOps protocol of cardiovascular assessment during graded physical load on the VELO cycle ergometer, his second, assisted by Mike Fincke as CMO (Crew Medical Officer). *[The assessment uses the Gamma-1 ECG equipment with biomed harness, skin electrodes and a blood pressure and rheoplethysmograph cuff wired to the cycle ergometer's instrumentation panels. Measurements were telemetered down via VHF to RGS (Russian Groundsite) during a comm window at 4:43am EST (DO4. For the graded-load exercise, the subject works the pedals after a prescribed program at load settings of 125, 150, and 175 watts for three minutes each. Data output involves a kinetocardiogram, rheoplethysmogram, rheoencephalogram and a temporal pulsogram.]*

Major focus for CDR Fincke & FE-1 Lonchakov today was on Orlan spacesuit activities in the DC1 "Pirs" Docking Compartment, to go on for the next several days, preparing spacewalk hardware for the EVA-21 on 12/22 and the prior simulation exercises on 12/19.

After configuring the DC1 communications system for their presence, Yuri & Mike –

- Configured & tested the EVA support panels (POV) in the SM PkhO (Service Module Transfer Compartment) *[to be used for leak checks and valve tests on the Orlan suits, BSS interface units & hatch KVDs (pressure equalization valves)],*
- Checked out the BSS interface unit in the PkhO,
- Tested the Orlan BSS plus cooling loops and their degassing (i.e., liquid/gas separation) both in the DC1 and in the SM PkhO,
- Set up BNP portable repress O₂ tank #3 in the SM RO (Working Compartment). and
- Activated & inspected their spacesuits *[Orlan #27 (red stripe) for EV1/Lonchakov, #26 (blue stripe) for EV2/Fincke].*

Additionally, the FE-1 worked on the EXPOSE-R payload, securing its lid with Aramide tape to ensure it stays closed during egress and translation to its external installation site.

Yuri also took the periodic and pre-EVA sensor readings of the Russian "Pille-MKS" (MKS = ISS) radiation dosimetry experiment which has ten sensors placed at various locations in the Russian segment (DC1, SM starboard & port cabin windows, ASU toilet facility, control panel, etc.). The Pille Reader was left powered up. *[Nine of the ten dosimeters are read manually.]*

Later, Lonchakov & Fincke installed the StM Docking Mechanism between Progress M-01M/31P and the DC1 airlock. *[StM is the "classic" probe-and-cone type, consisting of an active docking assembly (ASA) with a probe (SSh), which fits into the cone (SK) on the passive docking assembly (PSA) for initial soft dock and subsequent retraction to hard dock. The ASA is mounted on the Progress' cargo module (GrO), while the PSA sits on the docking ports of the SM, FGB and DC1.]*

Sandra Magnus finished transferring and unpacking US cargo items delivered on 31P.

In the U.S. Airlock, Magnus terminated the discharge on EMU (Extravehicular Mobility Unit) battery #2074 and initiated it on battery #2037 in the BSA BC4 (Battery Stowage Assembly/Battery Charger 4). *[The periodic maintenance consists of fully discharging (and later recharging) the storage units to prolong their useful life. After end of the maintenance cycle, Sandy restored the SSC laptop, which is used in DOS mode for the automated procedure, to nominal ops.]*

The FE-2 also continued the preparation of the MELFI (Minus Eighty Degree Laboratory Freezer for ISS) for future sample storing by completing the eighth ICEPAC insertion into the freezer after ULF-2, today retrieving another two -32 degC ICEPAC belts and placing them into Dewar 2, Tray C/Section 1 & Tray D/Section 4 for cooling down.

CDR Fincke used the electronic Velocicalc instrument to take the periodic THC IMV (Temperature & Humidity Control/Intermodule Ventilation) air flow measurements of relative humidity (dew point, wet bulb temp), temperature and air velocity (flow rate) between modules. *[There is no direct measurement of airflow except as reflected by, and calculated (with Velocicalc) from, differences in atmosphere partial pressures measured at selected points between the RS and USOS. ppCO₂ is a good yardstick since for example an increasing ppCO₂ in the Lab not reflected in the SM would indicate that Vozdukh is not receiving the air from the Lab at an*

efficient rate. Periodic air flow degradation checks support establishing a most effective fan cleaning schedule.]

In preparation for tonight's reboost test, Sandy Magnus tightened an AVM (Anti Vibration Mount) bracket bolt on the ESA FSL FCE (Fluid Science Laboratory/Facility Core Element) in the COL (Columbus Orbital Laboratory). *[The lower right AVM bracket of the FCE has only one bolt working. To protect the AVM against reboost loads, the torque on the bolt had to be increased (to 22 inch-lb) and the other (loose) bolt secured with Kapton tape.]*

Sandy also completed the routine daily servicing of the SM's SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

For tonight's thruster maneuver, the FE-2 also closed the protective shutters of the Lab & JPM (JEM Pressurized Module) science windows.

EWIS (External Wireless Instrumentation System) and IWIS (Internal Wireless Instrumentation System) were to be activated by ground commanding for capturing structural dynamics data of the station during the reboost firing.

The crew had their periodic PMCs (Private Medical Conferences) via S- & Ku-band audio/video, Yuri at ~8:55am, Sandy at ~10:05am, and Mike at ~12:00pm EST.

The station residents conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1/MO-5).

ISS Reboost Test: Tonight the station will perform a test maneuver using the Progress 31P mid-ring thrusters. The thruster firing (duration: 9m 28s) is scheduled at 10:58:50 pm EST. Expected delta-V: 0.5 m/s (1.64 ft/s), with a mean altitude increase of ~0.9 km (0.5 nmi). Attitude control authority will be handed over to Russian MCS (Motion Control System) at 9:10pm and returned to US Momentum Management at 11:45pm. *[31P is docked to the DC1 nadir port, i.e., radially, and the burn will be done in LVLH +XVV attitude (local vertical-local horizontal/+X axis into the velocity vector, i.e., flying bow-forward), the first time for this type of translational maneuver. The purpose of this reboost is to test the Progress mid-ring (lateral) thrusters to support a DAM (Debris Avoidance Maneuver) when a Soyuz is docked to the SM aft port (17S is currently docked at the FGB nadir port). The test*

burn will also start the phasing for the STS-119/15A and 32P launches.]

CEO (Crew Earth Observations) photo targets uplinked for today were **Teide Volcano, Canary Is.** *(at 3,718m above sea level and about 7,500m above the ocean floor, this is the highest point on both Spain and the Atlantic Ocean. ISS pass was in late afternoon with partly cloudy conditions expected [low clouds swirling around the islands]. Looking well right of track [SW] for Tenerife Island with sun glint further to the SW. Using the long lens settings for detail).*

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 7:43am EST [= epoch]):

Mean altitude -- 353.5 km

Apogee height -- 358.1 km

Perigee height -- 348.9 km

Period -- 91.61 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006856

Solar Beta Angle -- -72.3 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 33 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57722

Significant Events Ahead *(all dates Eastern Time, some changes possible!):*

12/16/08 -- ISS reboost test (~10:58pm; 0.5 m/s)

12/19/08 -- Russian EVA-21 Suited Exercise (wake 11:30pm 12/18; sleep 3:00pm 12/19);

12/22/08 -- Russian EVA-21 (wake 9:30am; hatch opening ~7:15pm; sleep 7:10am 12/23);

02/09/09 -- Progress M-01M/31P undocking & deorbit

02/10/09 -- Progress 32P launch

02/12/09 -- Progress 32P docking

02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment

02/14/09 -- STS-119/Endeavour/15A docking

02/24/09 -- STS-119/Endeavour/15A undocking

02/26/09 -- STS-119/Endeavour/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress 32P undocking & deorbit

05/12/09 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

08/06/09 -- STS-128/Discovery/17A – MPLM (P), LMC, last crew rotation

08/XX/09 -- Soyuz 5R/MRM2 (Russian Mini Research Module, MIM2) on Soyuz

09/XX/09 -- H-IIB (JAXA HTV-1)

11/12/09 -- STS-129/Atlantis/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A – MPLM(P), LMC

04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1

05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4

12/XX/11-- Proton 3R/MLM w/ERA.

ISS On-Orbit Status 12/15/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 8 of Increment 18.*

FE-2 Magnus' first activity this morning was to start on Day 2 of her FD30 (Flight Day 30) session with the NASA/JSC experiment NUTRITION w/Repository, finishing the 24 hrs urine collection period with first void this morning. *[The NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by supercold MELFI dewars), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

CDR Fincke, FE-1 Lonchakov and the FE-2 began their workday before breakfast with the periodic session of the Russian biomedical routine assessment PZEh-MO-7/Calf Volume Measurement. *[Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference points, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures.]*

As part of the regular physical fitness check prior to an Orlan spacewalk, Mike Fincke undertook the Russian MO-5 MedOps protocol of cardiovascular assessment during graded physical load on the VELO cycle ergometer, his first, assisted by Yuri Lonchakov as CMO (Crew Medical Officer). *[The assessment uses the Gamma-1 ECG equipment with biomed harness, skin electrodes and a blood pressure and rheoplethysmograph cuff wired to the cycle ergometer's instrumentation panels. Measurements were telemetered down via VHF to RGS (Russian Groundsite) during a comm window at 4:16am EST (DO4. For the graded-load exercise, the subject works the pedals after a prescribed program at load*

settings of 125, 150, and 175 watts for three minutes each. Data output involves a kinetocardiogram, rheoplethysmogram, rheoencephalogram and a temporal pulsogram.]

In the SM (Service Module), Lonchakov repeated a software upgrade of the Russian BSMM (Multi-Channel Matching Unit) payload computer which had failed on 12/10. The new software (vers. 3.0) was loaded from a CD-ROM on the RSS1 laptop. After the program installation, communications between the BSMM computer and the RSS1 laptop were checked with the RSC-Energia PingMaster application. *[BSMM is part of the OpsLAN (Operations Local Area Network), which also includes such items as the BSPN (Payload Server), OBC (Onboard Controller) for RokvISS, and GTS (Global Timing System). During the 12/10 attempt, new files were not copied from the CD disk.]*

Fincke meanwhile continued the preparation of the MELFI (Minus Eighty Degree Laboratory Freezer for ISS) for future sample storing by completing the seventh ICEPAC insertion into the freezer after ULF-2, today retrieving another two -32 degC ICEPAC belts and placing them into Dewar 2, Tray B/Section 1 & Tray D/Section 1 for cooling down.

For tomorrow night's planned ISS reboost (~11:00pm EST), the CDR powered up the IWIS (Internal Wireless Integrated System) with its RSU (Remote Sensor Unit) accelerometers in the Lab, Node-1 & Node-2 plus the NCU (Network Control Unit). *[SM & FGB RSUs not required. IWIS will gather structural dynamics data during the thruster firing, to be downlinked later via OCA.]*

After setting up comm connections for their extended work in the DC1 (Docking Compartment), Mike & Yuri continued their preparations for the ORLAN-suited dry run later this week (12/19) and the EVA-21 next week (12/22). *[The crewmembers tagged up with ground specialists on VHF, terminated the charging process on the second 825M3 battery pack, consolidated & bundled equipment for carrying outside, took documentary photography & video, and downlinked the imagery to the ground for specialist review.]*

In the U.S. Airlock (A/L), Magnus initiated maintenance discharge on one of two EMU (Extravehicular Mobility Unit) batteries (#2075); later, she ran the process also on the second (#2074). *[The periodic maintenance consists of fully discharging (and later recharging) the storage units to prolong their useful life. After end of the maintenance cycle, Sandy restored the SSC laptop, which is used in DOS mode for the automated procedure, to nominal ops.]*

Fincke supported POIC (Payload Operation & Integration Center)/Huntsville in powering up the MSG (Microgravity Science Glovebox) Rack, then prepared its

SHERE (Shear History Extension Rheology Experiment) payload for new experimentation. *[Mike activated the experiment hardware, conducted a checkout and loaded the SHERE payload with new software from the A31p MLC (MSG Laptop Computer). Afterwards, the MSG was configured for Standby and the laptop powered down.]*

Sandy Magnus had 2 hrs set aside to work in the Kibo JPM (JEM Pressurized Module) on troubleshooting the CO₂ CGSE (Common Gas Supply Equipment) by installing a position holder in the CO₂ valve unit to keep the SSV (Self Shut-off Valve) opened permanently. *[On 8/8, the CBEF (Cell Biology Experiment Facility) in the SAIBO Rack experienced a sudden unexpected pressure drop at the CGSE CO₂ high-pressure sensor, from 3000 kPa to 500 kPa within 1.5 minutes, followed by a very gradual pressure decrease. Specialists believe that the SSV closed itself unexpectedly, thus contributing to the sudden pressure decrease. Also suspected was leakage from the CO₂ supply line, but no leak was found on the systems side. Later, SSIPC (Space Station Integration & Promotion Center)/Tsukuba concluded that the CO₂ leak location for the observed gradual pressure decrease was the MVV (Manual Vent Valve) of the SAIBO Rack. The crew closed the MVV, and no leak was observed afterward. The fix by Magnus today keeps the SSV fully open so that it will not unexpectedly close again (this does not affect safety since even if CO₂ should be released into the cabin upon failure of the pressure regulator, its partial pressure will never go to the limit.)*

In the RS (Russian Segment), Lonchakov used CWC (Contingency Water Container) #1030 for the periodic (about twice a month) replenishing of the Elektron oxygen generator's water supply for electrolysis, filling the KOV thermal loops' EDV container. Once filled, the EDV was connected to the BPK transfer pump for processing. *[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]*

The FE-2 performed troubleshooting on the flush water inlet of the WHC (Waste & Hygiene Compartment), then worked on WHC systems activation & checkout. *[Wearing protective gloves, goggles and dust mask, Sandy was to remove a panel, inspect valve components & jumper connectors on the WHC and UPA (Urine Processor Assembly), reclose the panel and proceed with initial activation procedures.]*

Yuri completed the routine daily servicing of the SM's SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO*

& KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]

As part of the SOZh servicing, the FE-1 conducted the periodic checkout/verification of IP-1 airflow sensors in the various RS hatchways. *[They include the “thoroughfares” SM PrK (Transfer Compartment)–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, and FGB GA–Node-1.]*

Lonchakov also completed the periodic data collection on the long-term BIO-5 Rasteniya-1 ("Plants-1") experiment, copying data from its built-in control computer to a PCMCIA memory card for subsequent downlink to the ground via OCA. The regular periodic equipment status check was listed for today on the Russian discretionary “as time permits” task list. *[Rasteniya-1 researches growth and development of plants under spaceflight conditions in the LADA-14 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). The payload hardware includes a module (MIS/Module for the Investigation of Substrates), the MIS control unit (BU), a nitrogen purge unit (BPA) and other accessories. During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. LADA consists of a wall-mounted growth chamber that provides long-term, ready access for crewmember interaction. It provides light and root zone control but relies on the cabin environmental control systems for humidity, gas composition, and temperature control. Cabin air is pulled into the leaf chamber, flows over the plants and vents through the light bank to provide both plant gas exchange and light bank cooling.]*

The FE-2 performed the monthly maintenance on the CEVIS (Cycle Ergometer with Vibration Isolation), particularly with an eye on the 6-inch isolator units which Greg Chamitoff had installed on 9/25. Magnus reported that isolator cables all look normal.

The station residents conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

At ~4:20pm, just before sleep time, Yuri will set up the Russian MBI-12 SONOKARD (Sonocard) payload and start his fourth experiment session, using a sports shirt from the SONOKARD kit with a special device in the pocket for testing a new method for acquiring physiological data without using direct contact on the skin. Measurements are recorded on a data card for return to Earth.

[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]

At ~11:30am EST, Sandy Magnus conducted a 20-min. S-band/Ku-band audio/video teleconference with her successor, JAXA Astronaut Koichi Wakata, who will replace Magnus during the STS-119-15A docked period in February 2009. *[While Sandy will return to Earth with 15A on 2/26, Koichi will remain as ISS FE-2 until STS-127-2J/A end of May 2009.]*

At ~11:25am, the FE-2 powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, & power supply) and conducted, at 11:50am, a ham radio session with King George Elementary School, Moose Jaw, Saskatchewan/Canada. *[King George School is a Kindergarten-to-Grade-Eight school of 370 students. The study of space has been an integral part of the King George Science program for years. It is a topic that captures the hearts and imaginations of staff and students alike. Class activities would include researching Canada's participation in the space program, developing a model for an Earth-orbiting space station and comparing the training for such roles as a payload specialist, a researcher, an engineer, or a navigator. Questions to Sandy were uplinked beforehand. "What is the most visible man made structure seen from space?"; "If you could bring only one luxury to space with you, what would it be and why?"; "In your opinion, what is the hardest task to complete on the International Space Station?"; "Has any astronaut become ill on the ISS?"; "How long will you be in space, and what is the longest a person has been in space?"; "How frustrating does it get not being able to do things as easily as you can do them on Earth?"; "When you go outside to work on the space station or do other experiments, how does it make you feel?"; "How much training does it take to be an astronaut?"; "Have you ever waken up in the middle of the night and thought "Where am I?"; "What is it like not being with your family for long periods of time?"]*

ISS Reboost Preview: Tomorrow's ISS reboost by Progress 31P is scheduled for a TIG (Time of Ignition) of about 10:58pm EST for ~6 min, to yield an expected delta-V of 0.5 m/s. Attitude control authority will be handed over to the Russian MCS (Motion Control System) at 9:00pm and returned to US Momentum Management at 11:20pm.

No CEO (Crew Earth Observations) photo target uplinked for today due to lighting conditions in the northern hemisphere that place targets outside the CEO team's

criteria for illumination and visibility. Normal targets are expected to return on 12/18.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:46am EST [= epoch]):

Mean altitude -- 353.5 km

Apogee height -- 358.1 km

Perigee height -- 348.9 km

Period -- 91.61 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006823

Solar Beta Angle -- -74.4 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 35 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57707

Significant Events Ahead (*all dates Eastern Time, some changes possible!*):

12/16/08 -- ISS reboost (~10:58pm; 0.5 m/s)

12/19/08 -- Russian EVA-21 Suited Exercise (wake 11:30pm 12/18; sleep 3:00pm 12/19);

12/22/08 -- Russian EVA-21 (wake 9:30am; hatch opening ~7:15pm; sleep 7:10am 12/23);

02/09/09 -- Progress M-01M/31P undocking & deorbit

02/10/09 -- Progress 32P launch

02/12/09 -- Progress 32P docking

02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment

02/14/09 -- STS-119/Endeavour/15A docking

02/24/09 -- STS-119/Endeavour/15A undocking

02/26/09 -- STS-119/Endeavour/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress 32P undocking & deorbit

05/12/09 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

08/06/09 -- STS-128/Discovery/17A – MPLM (P), LMC, last crew rotation

08/XX/09 -- Soyuz 5R/MRM2 (Russian Mini Research Module, MIM2) on Soyuz

09/XX/09 -- H-IIB (JAXA HTV-1)

11/12/09 -- STS-129/Atlantis/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P), LMC
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4
12/XX/11-- Proton 3R/MLM w/ERA.

ISS On-Orbit Status 12/14/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – off-duty day for CDR Fincke, FE-1 Lonchakov & FE-2 Magnus. Ahead: Week 8 of Increment 18.*

CDR Fincke's first activity this morning was to start on the second day of his FD60 (Flight Day 60) session with the NASA/JSC experiment NUTRITION w/Repository. This was an all-day session, the third for Mike, of collecting urine samples several times for 24 hrs, to continue through first void tomorrow morning. *[The NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by supercold MELFI dewars), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

For FE-2 Magnus, it was the first day of her second (FD30) NUTRITION w/Repository session of collecting blood and urine samples, after last night's start of her 8-hr fast for today's blood sampling. *[After performing phlebotomy with the help of CDR Fincke, i.e., drawing blood samples (from an arm vein), Sandra's samples were first allowed to coagulate in the Repository for 20-30 minutes, then spun in the HRF RC (Human Research Facility/Refrigerated Centrifuge) and finally placed in MELFI (Minus-Eighty Laboratory Freezer for ISS). No thruster activity was allowed during the blood drawing. The RC was later powered off after a temperature reset to limit wear on the compressor, and cleaned.]*

FE-1 Lonchakov performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP-Moscow. Additionally, the FE-1 today

checked up on the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem, gathering weekly data on total operating time & "On" durations for reporting to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

In preparation for the Orlan dry-run on 12/19 and the EVA-21 on 12/22, Lonchakov terminated the charging on the first Orlan 825M3 battery pack started yesterday in the DC1 (Docking Compartment) and initiated the process on the second pack.

CDR Fincke serviced the US WRS (Water Recovery System) by refilling the WSTA (Water Storage Tank Assembly) with pretreated urine from EDV-U container for processing by the UPA (Urine Processing Assembly). *[The WSTA should be filled to no more than 60%. Recycled water from the PWD may now be used by the crew for non-oral hygiene purposes.]*

Mike Fincke also completed the visual "T+2 Day" microbial (bacterial & fungal) analysis of the potable water samples collected by Sandy on 12/12 from the WRS (Water Recovery System) and processed on board with the MCDs (Microbial Capture Devices) and CDBs (Coliform Detection Bags). *[WRS samplings are regularly conducted for 90 days, specifically every 4 days: WRS water hose (TOCA inflight analysis) & microbial bag sample (inflight bacterial visual enumeration plus archival for return on 15A), every 8 days: an archival water sample (return on 15A), and monthly: a TOCA bag sample from the PWD (Potable Water Dispenser, tested inflight). Coliform bacteria are the commonly-used bacterial indicator of sanitary quality of foods and water. They are defined as rod-shaped Gram-negative non-spore forming organisms that ferment Lactose with the production of acid and gas when incubated at 35-37 degC. Coliforms are abundant in the feces of warm-blooded animals, but can also be found in the aquatic environment, in soil and on vegetation. In most instances, coliforms themselves are not the cause of sickness, but they are easy to culture and their presence is used to indicate that other pathogenic organisms of fecal origin may be present.]*

In JAXA's Kibo JPM (JEM Pressurized Module), Mike supported SSIPC (Space Station Integration & Promotion Center)/Tsukuba activities by activating the MMA (Microgravity Measurement Apparatus) and its laptop (MLT), first powering up the MMA's NCU/RSU (Network Control Unit/Remote Sensor Unit) set from the Ryutai rack's UDC (Utility DC-to-DC Converter), then turning on both NCU/RSU and MLT. *[All payload activities except UDS/MMA on/off can be performed remotely by the ground.]*

For Yuri Lonchakov, it was time again for recharging the Motorola Iridium-9505A satellite phone brought up on Soyuz 17S, a monthly routine job and his third time. *[After retrieving it from its location in the TMA-13/17S Descent Module (BO), Yuri initiated the recharge of its lithium-ion battery, monitoring the process every 10-15 minutes as it took place. Upon completion at ~10:15am EST, the phone was returned inside its SSSP Iridium kit and stowed back in the BO's operational data files (ODF) container. The satphone accompanies returning ISS crews on Soyuz reentry & landing for contingency communications with SAR (Search-and-Rescue) personnel after touchdown (e.g., after an "undershoot" ballistic reentry, as happened during the recent 15S return). The Russian-developed procedure for the monthly recharging has been approved jointly by safety officials. During the procedure, the phone is left in its fire-protective fluoroplastic bag with open flap. The Iridium 9505A satphone uses the Iridium constellation of low-Earth orbit satellites to relay the landed Soyuz capsule's GPS (Global Positioning System) coordinates to helicopter-borne recovery crews. The older Iridium-9505 phones were first put onboard Soyuz in August 2003. The newer 9505A phone, currently in use, delivers 30 hours of standby time and three hours of talk, up from 20 and two hours, respectively, on the older units.]*

The station residents conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

The crewmembers had their weekly PFCs (Private Family Conferences) via S-band/ audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop), Yuri at ~6:20am, Sandy at ~1:10pm, Mike at ~3:35pm EST.

Working off the Russian discretionary "if time permits" task list, Lonchakov performed a session of the DZZ-2 "Diatomeya" ocean observations program, using the NIKON-F5 DCS still camera and the HDV (high-definition) video camcorder from SM window 8 for two periods of ~20 min each for recording bio-luminescent glow of high production zones in the Indian and Pacific Oceans. According to the available data, the glow can be observed as light spots having a weak greenish tint.

[Target zones in the Indian and Pacific Oceans were from the west of Australia to the east of New Zealand, and from south of the Madagascar Island to the north of New Zealand.]

Also off the work suggestions list, Yuri conducted another session for Russia's Environmental Safety Agency (EKON), making observations and taking KPT-3 aerial photography of environmental conditions on earth using the Nikon D2X with the SIGMA 300-800mm telephoto lens.

As a third item on the discretionary job list, the FE-1 conducted the frequent status check on the Russian BIO-5 Rasteniya-1 ("Plants-1") experiment, verifying proper operation of the BU Control Unit and MIS-LADA Module fans (testing their air flow by hand). *[Rasteniya-1 researches growth and development of plants under spaceflight conditions in the LADA-14 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). The payload hardware includes a module (MIS/ Module for the Investigation of Substrates), the MIS control unit (BU), a nitrogen purge unit (BPA) and other accessories. During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. LADA consists of a wall-mounted growth chamber that provides long-term, ready access for crewmember interaction. It provides light and root zone control but relies on the cabin environmental control systems for humidity, gas composition, and temperature control. Cabin air is pulled into the leaf chamber, flows over the plants and vents through the light bank to provide both plant gas exchange and light bank cooling.]*

No CEO (Crew Earth Observations) photo target uplinked for today due to lighting conditions in the northern hemisphere that place targets outside the CEO team's criteria for illumination and visibility. Normal targets are expected to return on 12/18.

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:25am EST [= epoch]):

Mean altitude -- 353.5 km

Apogee height -- 358.1 km

Perigee height -- 349.0 km

Period -- 91.61 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006785

Solar Beta Angle -- -74.8 deg (magnitude **peaking**)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 36 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57691.

Significant Events Ahead (*all dates Eastern Time, some changes possible!*):

12/19/08 -- Russian EVA-21 Suited Exercise (wake 11:30pm 12/18; sleep 3:00pm 12/19);

12/22/08 -- Russian EVA-21 (wake 9:30am; hatch opening ~7:15pm; sleep 7:10am 12/23);

02/09/09 -- Progress M-01M/31P undocking & deorbit
02/10/09 -- Progress 32P launch
02/12/09 -- Progress 32P docking
02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment
02/14/09 -- STS-119/Endeavour/15A docking
02/24/09 -- STS-119/Endeavour/15A undocking
02/26/09 -- STS-119/Endeavour/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress 32P undocking & deorbit
05/12/09 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

08/06/09 -- STS-128/Discovery/17A – MPLM (P), LMC, last crew rotation
08/XX/09 -- Soyuz 5R/MRM2 (Russian Mini Research Module, MIM2) on Soyuz
09/XX/09 -- H-IIB (JAXA HTV-1)
11/12/09 -- STS-129/Atlantis/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P), LMC
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4
12/XX/11-- Proton 3R/MLM w/ERA.

ISS On-Orbit Status 12/13/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – half-duty day for CDR Fincke, FE-1 Lonchakov & FE-2 Magnus.*

>>>Yesterday (12/12) Russia's RSC (Rocket & Space Corporation)-Energia, named after S.P. Korolev, celebrated its **90th** Anniversary. Congratulations, partners!<<< For another momentous event, **see the item on Regen-ECLSS below.**

The crew performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the SM (Service Module) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

As part of the house cleaning, Yuri Lonchakov conducted regular maintenance inspection & cleaning of fan screens in the FGB (TsV2), DC-1 (V3) and SM (VPkhO, VPrK, FS5, FS6 & FS9). *[The activity included an audit of a bag (#363-17) for dust filter cartridges with vertical corrugation. If found, Yuri was to replace the SM & DC1 dust filters with them rather than cleaning the former.]*

Later, when performing the routine daily servicing of the SOZh system (ECLSS/ Environment Control & Life Support System) in the SM, Yuri also temporarily powered down the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem for the periodic cleaning of its pre-filter, using the vacuum cleaner with narrow-slit nozzle attachment. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

CDR Fincke's first activity this morning was to start on his FD60 (Flight Day 60) session with the NASA/JSC experiment NUTRITION w/Repository. This is an all-day session, the third for Mike, of collecting a blood sample plus urine samples several times for 24 hrs, to continue through first void tomorrow morning. *[After performing phlebotomy with the help of FE-2 Magnus, i.e., drawing blood samples (from an arm vein), the samples were first allowed to coagulate in the Repository for 20-30 minutes, then spun in the HRF RC (Human Research Facility/Refrigerated Centrifuge) and finally placed in MELFI (Minus-Eighty Laboratory Freezer for ISS). No thruster activity was allowed during the blood drawing. The RC was later powered off after a temperature reset to limit wear on the compressor, and cleaned. The NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by supercold MELFI dewars), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

Sandra Magnus will start her FD30 NUTRITION session tomorrow, with her 8-hr fast beginning tonight (~7:40pm EST).

For her VolSci (Voluntary Weekend Science) Program today, FE-2 Magnus performed Part 2 of a major clean-up job of the JAXA "Marangoni" experiment in the Kibo JPM (Japanese Pressurized Module), estimated at ~3.5 hrs. The task required the MWA (Maintenance Work Area) and a downlink from the JPM internal camera to SSIPC (Space Station Integrated Promotion Center) in Tsukuba for ground support of the crew activity. Afterwards, the FPEF (Fluid Physics Experiment Facility) hardware was stowed. Part 1 of the clean-up was completed on 12/6. *[Work objective was to clean up spilled silicone oil inside the Marangoni Experiment Cell (MS) to prevent the Core from being further contaminated and to protect the hardware for the next Marangoni Experiment #2 on Increment 19. Part 1 involved removing the MS from the FPEF and disassembling the Experiment Core from the MS. Today's Part 2 was the actual silicone oil clean-up in the Core.]*

For his VolSci part, Mike Fincke started the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment for himself & the FE-2 by downloading older Actiwatch data from the Reader, then initializing the Actiwatches and decabling & stowing the Reader. Mike & Sandy then donned the Actiwatches. *[To monitor the crewmember's sleep/wake patterns and light exposure, the two crewmembers will be wearing the special Actiwatch device which measures the light levels encountered by them as well as their patterns of sleep and activity]*

throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]

The CDR also worked on the new FCF CIR (Fluids & Combustions Facility/ Combustion Integrated Rack), on which he had started outfitting on 12/6. *[Today Mike disconnected the CIR accumulator, removed the FCF upper & lower door launch locks, adjusted the EEU (Experiment Exchange Unit) airflow bypass, set the facility's valve timers and installed an absorber cartridge. The FCF Rack upper & lower doors were then closed for MDCA (Multi-user Droplet Combustion Apparatus) outfitting. Background: The MDCA is a multi-user facility designed to accommodate different droplet combustion science experiments, using the CIR of the NASA Glenn Research Center's FCF. The MDCA, in conjunction with the CIR, will allow for cost effective extended access to the microgravity environment, not possible on previous space flights. The MDCA contains the hardware and software required to conduct unique droplet combustion experiments in space. It consists of a CIA (Chamber Insert Assembly), an Avionics Package, and a multiple array of diagnostics.]*

For his daily work on the new WRS (Water Recovery System), Mike Fincke filled the UPA WSTA (Urine Processor Assembly/Water Storage Tank Assembly) from a Russian EDV-U container with pre-treated urine. *[Today is a momentous day: **For the first time, pre-treated urine has been processed into distillate by the UPA and then that distillate has been sent to the WPA (Water Processor Assembly), where it is being processed into the water that the OGS (Oxygen Generator System) is currently using to make the oxygen in the air the crew is breathing! All of the regenerative ECLSS racks are finally working together. Thanks to the crew's hard work, the hard work of their shuttle crewmates, and the years of hard work of all those on the ground we now have a closed system on board!]***

The FE-1 performed troubleshooting in the FGB to investigate an unexplained "smoke" indication light on the PSS status panel, checking connectors behind panel 429 and associated instruments.

In the DC1 (Docking Module), Lonchakov set up and initiated charging on an Orlan 825M3 battery pack, preparatory to the Orlan spacesuit activations and checkout for the EVA-21 dry-run next week (12/19).

At ~10:30am EST, the crewmembers conducted their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-Houston and TsUP-Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any

concerns about future on-orbit events.

Working from his discretionary “as time permits” task list, Yuri conducted another ECON KPT-3 test session, making observations and taking aerial photography for Russia's Environmental Safety Agency (ECON) using the D2X with SIGMA 300-800mm telephoto lens.

The station residents conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

At ~8:15am EST, the crew supported a formal live PAO TV downlink with greetings and congratulations to a special Russian educational event at the S.P. Korolev Russian National Children & Youth Center for Aerospace Education, scheduled for January 21-23, 2009, under the Memorial Museum of Cosmonautics in Moscow (the “Tsiolkovsky Monument”), for the Third Russian Youth Science Readings in honor of Sergey Pavlovich Korolev *[with the participation of 250 high-school and university students from 24 Russian regions, Belorussia and Kazakhstan. “...The new year, just like the year past, is rich with space milestones. The most notable are the half-century anniversaries of the first successful launches to the Moon with Luna-1, Luna-2 (Mechta/Dream) and Luna-3 ...”]*

At ~10:55am, Yuri had a telephone interview with the editor of the Russian Cosmos Magazine. *[Prepared questions: “Please tell us what you’ve able to accomplish by this time”; “Tell us about our EVA preparation and what you are going to do”; “About your crewmates: what kind of climate you have at the station, what you are doing in your spare time”; “Have you been able to see and photograph something that you had discussed with MIIGAİK (Moscow Engineering Institute for Geodesics, Aerial Survey, and Mapping) and Victor Savinykh?”]*

Weekly Science Update (Expedition Eighteen -- Week 7

3-D SPACE: Complete.

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): Complete.

BCAT-3/4 (Binary Colloidal Alloy Test 3/4): Planned/Reserve.

BIO-4: Complete.

BIOLAB: “Thanks for retrieving hardware items from Progress and reconfiguring the BIOLAB sub-systems to continue the troubleshooting and prepare for WAICO

Run#2.”

CARDIOCOG-2: Complete.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): In progress.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System): Samples returned on 1J.

CSI-3/CGBA-5 (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus 5): Ongoing.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

EDR (European Drawer Rack): Planned.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): Science acquisition for DEBIE-2, DOSTEL, EXPOSE, FIPEX, MEDET. On-ground troubleshooting for TRIBOLAB.

FSL (Fluid Science Laboratory): FSL is nominal.

GEOFLOW: “Sandy, thanks for unlocking the Facility Core Element (FCE) to enable the re-start of the GEOFLOW science acquisition. Run#5 was successfully performed on 12/11. Subsequent runs will be ground commanded in the next couple of days.”

HDTV System Test DL (JAXA): Complete.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

ICE CRYSTAL (JAXA): The experiment is ongoing and nominal.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Reserve.

Marangoni Experiment for ISS in JAXA FPEF (Fluid Physics Experiment Facility): In progress.

Micro-G Clay (JAXA EPO): Complete.

MISSE (Materials ISS Experiment): Ongoing.

Moon Photography from ISS (JAXA EPO): Complete.

MSG-SAME (Microgravity Science Glovebox): Complete.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

NOA-1/-2 (Nitric Oxide Analyzer, ESA): Complete.

NUTRITION w/REPOSITORY: In progress.

PADLES (Passive Dosimeter for Lifescience Experiment in Space): In progress.

PCRF (Protein Crystallization Research Facility) Reconfiguration (JAXA): Complete.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SAMPLE: Complete.

SHERE (Shear History Extensional Rheology Experiment): Planned.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): In progress.

SOLAR (Solar Monitoring Observatory): The next Sun observation window is planned to start around 12/25.

SOLO (Sodium Loading in Microgravity): Complete.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): Reserve.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1/#2 (Waving and Coiling of Arabidopsis Roots at Different g-levels): Complete/Planned.

No CEO (Crew Earth Observations) photo target uplinked for today due to lighting conditions in the northern hemisphere that place targets outside the CEO team's criteria for illumination and visibility. Normal targets are expected to return on 12/18.

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

Conjunction Update: The predicted conjunction with Object 24076 (Pegasus rocket debris) today (12/13, 3:16pm EST) "went away", never requiring DAM (Debris Avoidance Maneuver) planning.

ISS Orbit (as of this morning, 8:10am EST [= epoch]):

Mean altitude -- 353.6 km

Apogee height -- 358.1 km

Perigee height -- 349.0 km

Period -- 91.61 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006767

Solar Beta Angle -- -73.4 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.72
Mean altitude loss in the last 24 hours -- 26 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 57675.

Significant Events Ahead (*all dates Eastern Time, some changes possible!*):

12/19/08 -- Russian EVA-21 Suited Exercise (wake 11:30pm 12/18; sleep 3:00pm 12/19);
12/22/08 -- Russian EVA-21 (wake 9:30am; hatch opening ~7:15pm; sleep 7:10am 12/23);
02/09/09 -- Progress M-01M/31P undocking & deorbit
02/10/09 -- Progress 32P launch
02/12/09 -- Progress 32P docking
02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment
02/14/09 -- STS-119/Endeavour/15A docking
02/24/09 -- STS-119/Endeavour/15A undocking
02/26/09 -- STS-119/Endeavour/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress 32P undocking & deorbit
05/12/09 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

08/06/09 -- STS-128/Discovery/17A – MPLM (P), LMC, last crew rotation
08/XX/09 -- Soyuz 5R/MRM2 (Russian Mini Research Module, MIM2) on Soyuz
09/XX/09 -- H-IIB (JAXA HTV-1)
11/12/09 -- STS-129/Atlantis/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P), LMC
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4
12/XX/11-- Proton 3R/MLM w/ERA.

ISS On-Orbit Status 12/12/08

All ISS systems continue to function nominally, except those noted previously or below.

Continuing preparations for the Orlan EVA-21 on 12/22, CDR Fincke & FE-1 Lonchakov had ~90 min reserved for configuring the DC1 (Docking Compartment) and SM PkhO (Service Module Transfer Compartment) for the spacewalk dry-run on 12/19 and the EVA itself. *[Work focused on making room in these compartments by temporarily removing & relocating equipment, based on an uplinked IMS (Inventory Management System) list of 79 items. The relocation involved such items as Bioecology canisters, electronics units, Biorisk gear, BRTA-2 radio-telemetry units, a UFK cosmonaut seat, electrical umbilicals, tools, bags, etc. Also included were two Orlan spacesuits (type M & MK) which were temporarily moved, by agreement, to the US Node-2.]*

As part of the DC1 cleanup, the FE-1 performed a brief data check of the MATRYOSHKA-R (RBO-3-2) radiation suite's LULIN-5 electronics box, then removed the LULIN unit and the associated anthropomorphic (human torso) "Phantom" unit from their locations and stowed them temporarily in the FGB. *[Data being accumulated by LULIN comprise measurement date, time, mode, three-directional flux data (per sq.cm per sec.), and three-directional dose rate.]*

Later, Lonchakov also transferred BIO-2/BIORISK-MSV containers to the SM and set them up at various sites for exposure to the local environment. *[BIORISK entails a series of experiments designed to expose samples of materials to study adaptation and changes of bacteria & fungi within the typical micro biota residing on structural materials of space-flown equipment. Early data from these experiments already point to significant effects of space flight on growth, reproduction, and biological properties of test microbes and fungi. BIORISK-KM experiments deal with "passive" materials, BIORISK-MSV with microorganisms-materials within the SM and BIORISK-MSN with microorganisms-materials outside the ISS.]*

Two additional hours were reserved for Yuri & Mike to set up EVA tools & hardware clusters in the DC1, prepare the KPU-EVA tool carrier ("caddy"), bundle the EXPOSE-R & IPI-SM monoblocs and pack the Langmuir Probe with its connectors & cables for taking outside.

FE-2 Magnus spent more time with WRS (Water Recovery System) sample analysis. *[After first installing the TOCA (Total Organic Carbon Analyzer) by connecting its power cable to the UOP1 outlet panel and hooking up its water sample hose to the WRS Rack 1, Magnus collected samples from the PWD (Potable Water Dispenser) Hot needle outlet for subsequent inflight processing using the TOCA and WMK (Water Microbiology Kit) with MCD (Microbial Capture Device) and CDB (Coliform Detection Bag). The usual water reclamation from the sample bags via an absorbing towel (to be dried by airing) and data recording after the analyses concluded the activities. This was the first time TOCA sampled from the WPA (Water Processing Assembly) hose (which had to be primed beforehand).]*

Using the ISS vacuum cleaner, Sandy worked on the OGS (Oxygen Generation System) Rack in the Lab to clean the foam sound muffler filter of its AAA (Avionics Air Assembly) and to take documentary photographs of the cleaned filter.

After inspecting the AAA, Magnus configured the OGS Rack for activation. *[Initial activation steps involved accessing the OGS Rack front and mating the O₂ outlet jumper QD (Quick Disconnect) at the N₂ Purge ORU (Orbit Replaceable Unit, LAB1PD1 panel). Sandy's preps included placing a securing tape over the OGS De-Ionizing Bed front-end cap fasteners (to prevent them from coming loose in the event of accidental internal high pressure). Powering up the OGA (Oxygen Generation Assembly), configuring its software and activating the OGA for O₂ production were then to be ground-commanded from MCC-H.]*

Yuri Lonchakov, with Mike Fincke assisting, performed the periodic (monthly) functional closure test of the Vozdukh CO₂ (carbon dioxide) removal system's spare emergency vacuum valves (AVK), in the spare parts kit. *[The AVKs are crucial because they close the Vozdukh's vacuum access lines in the event of a malfunction in the regular vacuum valves (BVK) or a depressurization in the Vozdukh valve panel (BOA). Access to vacuum is required to vent CO₂ during the regeneration of the absorbent cartridges (PP).]*

Sandra Magnus conducted the regular bi-monthly reboots of the OCA Router and File Server SSC (Station Support Computer) laptops.

Following up on the on-going X2 INTR4 software updates by the ground, the FE-2 unstowed the three Warning Books from Lab, SM and FGB and performed Part 2 of updating them with replacement pages and P&I (pen & ink) changes, for the INT R4 upgrading of INT MDMs. *[Part 1, for the new PVCU (Photovoltaic Controller Unit) MDM upgrades with PVCU R3 software, was done by Sandy on 12/10.]*

CDR Fincke unstowed and set up the NUTRITION w/Repository hardware for this weekend's sessions by himself and FE-2 Magnus for urine and blood collection. For his own blood draw tomorrow, Mike's 8-hr fast begins tonight (~7:40pm EST). *[The new NUTRITION sessions will be Mike's 60-day collection and Sandy's 30-day collection.]*

Sandy filled out the regular FFQ (Food Frequency Questionnaire), her third, on the MEC (Medical Equipment Computer). Mike Fincke's third FFQ session is currently shown on his discretionary "job jar" task list. *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

Magnus completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The FE-2 also took care of the daily IMS maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Working off his discretionary job list, Yuri conducted the frequent status check on the Russian BIO-5 Rasteniya-1 ("Plants-1") experiment, verifying proper operation of the BU Control Unit and MIS-LADA Module fans (testing their air flow by hand).

[Rasteniya-1 researches growth and development of plants under spaceflight conditions in the LADA-14 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP).]

Sandra completed another one of the periodic inspections of the RED (Resistive Exercise Device) canister cords and accessories, currently done every two weeks.

In the Kibo JPM (JEM Pressurized Module), the FE-2 deactivated the UDC (Utility DC/DC Converter) and MMA (Microgravity Measurement Apparatus) components at the Ryutai Rack.

At ~3:15am EST, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~9:15am EST, CDR Fincke powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, & power supply) and conducted, at 9:20am, a ham radio session with 2 Circolo Didattico, San Giuseppe, Mola di Bari, Italy. *[The Didactic Center "San Giuseppe" is located in Mola di Bari, a city in Southern Italy. The school center includes two primary schools and three kindergartens. There are more than 800 pupils and 70 teachers. The primary schools have multimedia facilities and scientific laboratories. The pupils play an active role in a numerous projects, they gain experience on music, dance, theatre, physical education and more. Questions to Mike were uplinked beforehand. "How do you feel in Space?"; "How many satellites are flying in the Earth's orbit?"; "How do you rest onboard the ISS?"; "What studies are necessary to become an astronaut?"; "Which tools do you use when you work outside the ISS?"; "Can you see the hole in the ozone layer from the ISS?"; "How is the junction between two spaceships made?"; "Why do you have zero gravity in Space?"; "Have you ever seen anything strange outside the ISS?"; "What do you see at this moment when you look through the window of the ISS?"]*

At ~2:40pm, the ISS crew had their regular weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. *[S/G-2 (Space-to-Ground 2) phone patch via SSC (Station Support Computer).]*

At ~4:30pm, Sandy is scheduled for her weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop).

The station residents conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

X2 INT R4 Software Transition Update: Starting 12/9 and running through tomorrow, MCC-Houston is executing procedures to transition several ISS MDMs (Multiplexer/Demultiplexer) computers to new software versions (without requiring crew participation). Today's transition involved the remaining INT MDM from

INTSYS R3 to R4, then swapping it to Primary. *[Last night, an unexpected failure of the PVCU (Photovoltaic Controller Unit) 2B MDM was experienced. 4B is now prime, with 2B in backup mode. The "signatures" look very similar to the 2A/4A failure that occurred earlier in the week. The anomaly is under investigation.]*

Conjunction Update: The conjunction with the Cosmos satellite debris, Object 2421, for 12/12 (Friday) at 7:45pm EST, has moved out of the threshold box. No DAM (Debris Avoidance Maneuver) planning is required. Another conjunction, with Object 24076 (Pegasus rocket debris) is being assessed. TCA: 12/13 (Saturday) at 3:16pm EST with a predicted miss distance of ~11.3 km (to be updated). Maneuver Go/No-Go: 12/12, 3:46pm.

No CEO (Crew Earth Observations) photo target uplinked for today due to lighting conditions in the northern hemisphere that place targets outside the CEO team's criteria for illumination and visibility. Normal targets are expected to return on 12/18.

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 7:44am EST [= epoch]):

Mean altitude -- 353.6 km

Apogee height -- 358.2 km

Perigee height -- 349.1 km

Period -- 91.61 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006749

Solar Beta Angle -- -70.6 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 22 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57659.

Significant Events Ahead (*all dates Eastern Time, some changes possible!*):

12/19/08 -- Russian EVA-21 Suited Exercise (wake 11:30pm 12/18; sleep 3:00pm 12/19);

12/22/08 -- Russian EVA-21 (wake 9:30am; hatch opening ~7:15pm; sleep 7:10am 12/23);

02/09/09 -- Progress M-01M/31P undocking & deorbit

02/10/09 -- Progress 32P launch

02/12/09 -- Progress 32P docking

02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment

02/14/09 -- STS-119/Endeavour/15A docking

02/24/09 -- STS-119/Endeavour/15A undocking

02/26/09 -- STS-119/Endeavour/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress 32P undocking & deorbit
05/12/09 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/27/09 -- Soyuz TMA-15/19S launch
Six-person crew on ISS
08/06/09 -- STS-128/Discovery/17A – MPLM (P), LMC, last crew rotation
08/XX/09 -- Soyuz 5R/MRM2 (Russian Mini Research Module, MIM2) on Soyuz
09/XX/09 -- H-IIB (JAXA HTV-1)
11/12/09 -- STS-129/Atlantis/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P), LMC
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4
12/XX/11-- Proton 3R/MLM w/ERA.

ISS On-Orbit Status 12/11/08

All ISS systems continue to function nominally, except those noted previously or below.

Continuing preparations for the Orlan EVA-21 on 12/22, CDR Fincke & FE-1 Lonchakov started out with the mandatory Russian pre-EVA MedOps procedure MO-6 (Hand-Cycle Ergometry) in the SM (Service Module), assisting each other in turn and supported by tagup with ground specialists on DO2 (~4:05pm EST), who are to clear them for spacewalking. *[Because cosmonauts in early Russian programs have shown noticeable decrease in arm muscle tone, TsUP/IBMP (MCC-Moscow/Institute of Biomedical Problems) physical fitness experts have groundruled the handgrip/arm tolerance test analysis (hand ergometry) as a standard pre-Orlan EVA requirement. For MO-6, the subject dons the ECG (electrocardiogram) biomed harness, attaches three skin electrodes and plugs the harness into the PKO medical exam panel on the cycle ergometer. The other crewmember assists. The 30-min exercise itself starts after 10 seconds of complete rest, by manually rotating the cycle's pedals, set at 150 W, backwards until "complete exhaustion".]*

Second on the list of spacewalk preparations for Lonchakov & Fincke was a 2-hr. task of locating and readying Russian EVA equipment & tools, supported by an uplinked list of 31 items and a specialist tagup. *[Yuri & Mike gathered the KPU tool "caddy" with hammer, cutter, pry bar and scissors, the EXPOSE-R, Langmuir Probe & IPI-SM payload monoblocs, cable reels, clamps, bungees, tethers, wire ties, cotton gloves, etc.]*

Later, getting set up for the standard suited dry run on 12/19, the FE-1 & CDR also readied and checked out replaceable components (OTA) and auxiliary gear for their particular Orlan "skafandr" suits. *[These include portable primary & reserve O₂ tanks (BK-3), storage batteries (825M3), LiOH canisters (PL-9), moisture collectors, liquid cooling garments (KVO), comm headsets (ShL-10),*

gloves (GP-10K), thermal comfort undergarments (BK-10), socks, diapers, filters for feedwater lines (FOR), Orlan CO₂ measurement units (IK), degassing pump unit (BOS), etc. One of the Orlan suits will have to be temporarily stowed in the USOS (Node-2) to make room for the EVA in the DC1.]

For his daily work on the new WRS (Water Recovery System), Mike Fincke reconfigured the UPA (Urine Processor Assembly) to draw urine from a Russian EDV-U container instead of the newly installed WHC (Waste & Hygiene Compartment), then filled the UPA WSTA (Water Storage Tank Assembly) with EDV-U pretreated urine. *[During the activation process on 12/9 the UPA shut down due to a “low waste tank quantity” sensor reading. Approximately 500 mL of urine were found to have back-flowed from UPA into the WHC, probably into a hose launched “dry” (empty) since a careful search by the crew found no leak. Today Mike refilled the WSTA, and the UPA was restarted nominally, without glitch. Note: Recycled water from the US PWD (Potable Water Dispenser) may now be used by the crew for non-oral hygiene purposes, pending confirmation that NASA water specialists have cleared PWD analysis results with RS specialists.]*

Mike Fincke & Yuri Lonchakov both took the periodic O-OHA (on-orbit hearing assessment) test, a 30-min. NASA environmental health systems examination to assess the efficacy of acoustic countermeasures, using a special MEC (Medical Equipment Computer) laptop application. It was Mike’s & Yuri’s second O-OHA test; Sandra Magnus had her first test on 11/23. *[The O-OHA audiography test involves minimum audibility measurements for each ear over a wide range of frequencies (0.25-10 kHz) and sound pressure levels, with the crewmembers using individual-specific Prophonics earphones, new Bose ANC headsets (delivered on 30P) and the SLM (sound level meter). To conduct the testing, the experimenter is supported by special EarQ software on the MEC, featuring an up/down-arrow-operated slider for each test frequency that the crewmember moves to the lowest sound pressure level at which the tone can still be heard. The baseline test is required not later than about Flight Day 14 for each new Expedition and is then generally performed once per month. Note: There have been temporary hearing deficits documented on some U.S. and Russian crewmembers, all of which recovered to pre-mission levels.]*

In the JAXA JLP (JEM Logistics Module Pressurized Section), FE-2 Magnus prepared for the JLP EFU13 (Exposed Facility Unit 13) checkout by setting up and connecting SLT-2 (System Laptop Terminal 2) to the JLP EDU (EEU/ Experiment Exchange Unit Driver Unit), then performing the checkout and afterwards cleaning up, stowing SLT-2 and all cables. *[The Kibo EF (Exposed Facility) will be delivered next May on Flight 2J (STS-127/Endeavour), along with the ELM-ES (Experiment Logistics Module-Exposed Section).]*

In the COL (Columbus Orbital Laboratory), Magnus prepared the WAICO (Waving & Coiling of Arabidopsis at Different Gravity Levels) experiment in the BLB (Biolab) for operation by transferring eight newly arrived ECs (Experiment Containers) from Progress 31P and installing them in the BLB's TCU (Thermal Control Unit), after removing the TCU's AAS (Automatic Ambient Stowage) insert and ATCS (Active Thermal Control System) insert/insulation.

Fincke completed the weekly 10-min. CWC (Contingency Water Container) inventory as part of on-going WRM (Water Recovery & Management) assessment of onboard water supplies. Updated "cue cards" based on the crew's water calldowns are sent up every other week. *[The new card (18-0006G) lists 39 CWCs (~1,272.9 L total) for the four types of water identified on board: technical water (695.8 L, for Elektron electrolysis), potable water (530.4 L, incl. 174.6 L currently off-limit because of Wautersia bacteria), condensate water (0.0 L), waste/EMU dump and other (46.7 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]*

It was Mike's turn to prepare the MELFI (Minus Eighty Degree Laboratory Freezer for ISS) for future samples, by completing the sixth ICEPAC insertion into MELFI after ULF-2, today retrieving another two -32 degC ICEPAC belts and placing them into Dewar 1, Tray C/Section 1 & 4 for cooling down.

The CDR also performed the regular 30-day inspection of the new AED (Automated External Defibrillator) in the CHeCS (Crew Health Care Systems) rack. *[The AED is a portable electronic device that automatically diagnoses the potentially life threatening cardiac arrhythmias of ventricular fibrillation and ventricular tachycardia in a patient. It then can treat them through defibrillation, i.e., the application of electrical therapy which stops the arrhythmia, allowing the heart to re-establish an effective rhythm. AEDs are generally either held by trained personnel who will attend events or are public access units which can be found in places including corporate and government offices, shopping centers, airports, restaurants, casinos, hotels, sports stadiums, schools and universities, community centers, fitness centers, health clubs and any other location where people may congregate.]*

The FE-1 collected the periodic readings of potentially harmful atmospheric contaminants in the SM, using the CMS (Countermeasure System), a component of the SKDS GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, today using preprogrammed microchips to measure for o-Xylol (1,2-Dimethylbenzol, C_8H_{10}) and Methyl-Mercaptan (Methanethiol, CH_4S).

Sandy checked out the US SLM (Sound Level Meter) instrument and then used it to conduct the periodic noise level measurements program in the station interior for a 2-hr acoustic survey, including transfer of the recorded data to the MEC (Medical Equipment Computer). *[A total of 46 acoustic measurements were obtained, specifically at 14 locations in the Lab, 12 locations in the SM, three locations in the A/L (US Airlock), seven locations in COL, and eight locations in Node-2. The survey also includes two crew preference locations taken at their perceived loudest locations in the station. The SLM gives instantaneous noise levels and their frequency spectra, which are transferred to the MEC laptop via an RS232 cable and later downlinked with regular CHeCS (Crew Health Care Systems) data dump or via OCA.]*

Yuri completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The FE-1 also took care of the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Magnus meanwhile conducted the monthly 50-min FDS PEP (Fire Detection & Suppression/Portable Emergency Provisions) safety inspection/audit in the ISS modules. *[The IMS-supported inspection verifies that PFEs (Portable Fire Extinguishers), PBAs (Portable Breathing Apparatus) and EHTKs (Extension Hose/Tee Kits) are free of damage to ensure their functionality and to track shelf life/life cycles on the hardware.]*

Before the crewmembers started their exercise sessions on the TVIS, the FE-2 set up the video equipment for filming the subsequent workouts on the treadmill for biomechanical evaluation of their performance and assessment of the hardware status by ground engineers. Afterwards, the camera gear was torn down & stowed and the video recording prepared for downlinking.

The station residents conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1). *[For Sandy, the TVIS video run, with a full body FOV (field of view), was her 30-day requirement, while Mike & Yuri fulfilled their 60-90-day requirement which calls for a FOV that includes the hip and feet striking the running belt.]*

Magnus today had 30 min. to herself for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residence, if she/he chooses to take it.

X2 INT R4 Software Transition Update: Starting 12/9 and running through the weekend ahead, MCC-Houston is executing procedures to transition several ISS MDMs (Multiplexer/Demultiplexer) computers to new software versions (without requiring crew participation). Today's transition involved one INT MDM from INTSYS R3 to R4 software (leaving it in Primary), the LA-1 MDM from LSYS-1 R3 to R4, the LA-2 MDM from LSYS-2 R2 to R3, the Node-2-1 MDM from N2SYS-1 R1 to R2 and the Node-2-2 MDM from N2SYS-2 R1 to R2. *[After an unexpected transition of the PVCU (Photovoltaic Controller Unit) 4A MDM out of Primary, the MDM was switched back to Primary yesterday, with the applicable Flight Rule (not making a suspect MDM prime) waived to collect data and to maintain operating all MDMs on the same software version. The remaining PVCU 4 software transition will continue on 12/14 (Sunday); non-PVCU 4 portion of transition continues as scheduled.]*

Conjunction Update: Another TCA (Time of Closest Approach) is currently being assessed for a new conjunction with the Cosmos satellite, Object 2421, for 12/12 (Friday) at 7:45pm EST. Miss distance currently estimated at ~8.76 km. MCC-Houston will work DAM (Debris Avoidance Maneuver) options with TsUP-Moscow if needed. This recurring object requires continued monitoring.

EVA-21 Timeline Preview (preliminary): The Orlan EVA-21 by Lonchakov (EV1) & Fincke (EV2) on 12/22 is scheduled to begin at ~7:15pm EST (DC1 EV hatch open), to last an estimated 6 hrs 10 min, i.e., concluding at approximately 1:25am. Russian attitude thrusters will be inhibited by TsUP ground commanding at specific times when the spacewalkers work on the SM RO (Working Compartment, I.d./large diameter) and SM AO (Assembly Compartment). Main objectives of the EVA are –

- Install a Langmuir Probe on the DC1 Docking Compartment;
- Install & connect the EXPOSE-R monobloc unit on the SM RO I.d.;
- Install & connect the IPI-SM monobloc unit of the IMPULSE experiment on the RO I.d.;
- Remove/return the BIORISK-MSN payload container #2 from the DC1;
- Conduct "SWG" Project timer operations;
- Remove fasteners (Aramide straps) near docking target and AR-VKA & 2AR-VKA antennas installation on DC1 (if time permits);
- Close MLI (Multi-Layer Insulation) flap on SM FP-10 connector patch (if time permits);
- Re-install SKK #9 removable cassette container in nominal position (if time permits); and

- Monitor conditions ISS RS exterior and structure components (“Panorama-2008” DTO, if time permits).

Uncrewed Station Ops Preview: One of the contingencies associated with the Orlan EVA-21 could require uncrewed station operation for some time. Progress M-01M/31P will be prepared for ground-commanded contingency undocking. Most of the USOS (US Segment) preparations for this eventuality will be done by Mike Fincke & Sandy Magnus next week, such as transferring selected hardware to the RS (Russian Segment), setting up a PCS (Portable Computer System) laptop in the FGB as backup to the PCS in the RS, powering down ham/amateur radio equipment, reconfiguring some LAN software (NetMeeting, KFX), powering down the COL PWS (Columbus Orbital Laboratory Portable Workstation) laptop, and closing selected hatches. The IATCS (Internal Thermal Control System) will be configured as usual for uncrewed ops, some racks will be jumpered to the LTL (Low Temperature Loop) in case they need cooling, and some remaining hatches will be closed, before Sandy moves to the Soyuz Descent Module (SA) and closes the hatch between it and the Orbital Module (BO).

No CEO (Crew Earth Observations) photo target uplinked for today due to lighting conditions in the northern hemisphere that place targets outside the CEO team’s criteria for illumination and visibility. Normal targets are expected to return on 12/18.

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this noon, 12:01pm EST [= epoch]):

Mean altitude -- 353.6 km

Apogee height -- 358.2 km

Perigee height -- 349.1 km

Period -- 91.61 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006778

Solar Beta Angle -- -66.9 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 11 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57646.

Significant Events Ahead (*all dates Eastern Time, some changes possible!*):

12/19/08 -- Russian EVA-21 Suited Exercise (wake 11:30pm 12/18; sleep 3:00pm 12/19);

12/22/08 -- Russian EVA-21 (wake 9:30am; hatch opening ~7:15pm; sleep 7:10am 12/23);

02/09/09 -- Progress M-01M/31P undocking & deorbit
02/10/09 -- Progress 32P launch
02/12/09 -- Progress 32P docking
02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment
02/14/09 -- STS-119/Endeavour/15A docking
02/24/09 -- STS-119/Endeavour/15A undocking
02/26/09 -- STS-119/Endeavour/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress 32P undocking & deorbit
05/12/09 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

08/06/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation
08/XX/09 -- Progress/MRM2 (Russian Mini Research Module, MIM2) on Soyuz
09/XX/09 -- H-IIB (JAXA HTV-1)
11/12/09 -- STS-129/Endeavour/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Endeavour/ULF4 – ICC-VLD, MRM1 (contingency)
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osp/iss_reports/index.htm

ISS On-Orbit Status 12/10/08

All ISS systems continue to function nominally, except those noted previously or below.

Before breakfast & first exercise, CDR Fincke, FE-1 Lonchakov & FE-2 Magnus completed a full session with the Russian medical assessment MO-9/Biochemical Urinalysis. Afterwards, the FE-1 closed out and stowed the Urolux hardware.

[MO-9 is conducted every 30 days (and also before and after EVAs) and is one of five nominal Russian medical tests adopted by NASA for U.S. crewmembers for IMG PHS (Integrated Medical Group/Periodic Health Status) evaluation as part of the "PHS/Without Blood Labs" exam. The analysis uses the sophisticated in-vitro diagnostic apparatus Urolux developed originally for the Mir program. Afterwards, the data are entered in the MEC (Medical Equipment Computer)'s special IFEP software (In-Flight Examination Program).]

Later, Yuri undertook his first periodic (generally monthly) health test with the cardiological experiment PZEh MO-1 ("Study of the Bioelectric Activity of the Heart at Rest") on the TVIS (Treadmill with Vibration Isolation System), with Mike assisting as CMO (Crew Medical Officer). *[Equipment used were VPG/Temporal Pulsogram and ECG/Electrocardiogram Data Output Devices (USI). During the 30-min. test, the FE-1 tagged up with ground specialists on an RGS (Russian Groundsite) pass at ~5:16am EST via VHF for data downlink from the VPG and Gamma-1M ECG for about 5-6 minutes.]*

Lonchakov also loaded new software (vers. 3.0) on the Russian BSMM (Multi-Channel Matching Unit) payload computer from a CD on the RSS1 laptop. After the software installation, communications between the BSMM computer and the RSS1 laptop were checked with the RSC-Energia PingMaster application. *[BSMM is part of the OpsLAN (Operations Local Area Network), which also includes such items as the BSPN (Payload Server), OBC (Onboard Controller) for RokvISS, and GTS (Global Timing System).]*

CDR Fincke performed a run with the MedOps experiment WinSCAT (Windows Spaceflight Cognitive Assessment Tool), his first onboard session, by logging in on the MEC and conducting the psychological evaluation exercise on the laptop-based WinSCAT experiment. *[WinSCAT is a monthly time-constrained questionnaire test of cognitive abilities, routinely performed by astronauts aboard the ISS every 30 days before or after the PHS (periodic health status) test or on special CDR's, crewmembers or flight surgeons request.]*

In the Kibo JPM (Japanese Pressurized Module), FE-2 Magnus supported Tsukuba flight controllers by configuring the CB (Clean Bench) subrack facility for inactivity and stowage. *[Ground commanding of JPM payloads is done by JAXA's SSIPC (Space Station Integration & Promotion Center) at Tsukuba/Japan. The CB, a subrack of the Saibo ("living cell") Rack, provides a germ-free environment for life science and biotechnological experiments. It has a specially designed microscope that operates with bright-field, phase-contrast and fluorescence modes.]*

It was Sandra's turn today to prepare the MELFI (Minus Eighty Degree Laboratory Freezer for ISS) for future samples, by completing the fifth ICEPAC insertion into MELFI after ULF-2, today retrieving another two -32 degC ICEPAC belts and placing them into Dewar 1, Tray B/Section 3 & 4 for cooling down.

The crew conducted the regular fire drill/OBT (on-board training), a mandatory periodic one-hour exercise (including ground debrief conference). *[Primary goal of this Russian-led interactive exercise is to maintain crew skills in responding to a fire and to provide the station residents with the most realistic emergency training possible. The drill is always conducted with the support of all MCCs (TsUP-Moscow, MCC-Houston, COL-CC, SSIPC/Tsukuba) in close coordination. It should be performed every 2.5 months, but not later than 1 month prior to end of Increment. OBT objectives are to (a) practice fire response procedures (FRPs) and all incorporated actions for the case of a software-detected fire to locate, extinguish, and verify extinguishing attempts; (b) browse through RS laptop and the Signal-VM fire detection system displays as well as the automated software (algorithms) response to the fire event; (c) practice crew communication necessary to perform emergency FRPs; (d) ensure familiarization with support equipment (CSA-CP compound specific analyzer-combustion products, PBAs portable breathing assemblies, PFE/OSP-4 portable fire extinguishers, and IPK-1M gas masks to be used for fire suppression). These exercises do not actually use any fire equipment but simulate such actions with comm channels, PBAs, CSA-CP and laptop displays to the maximum extent possible. The Emergency Procedures OBT concluded with a 15-min. debrief with Russian/U.S. ground specialists at ~1:50pm EST via S-band.]*

Fincke retrieved and stowed the four passive FMK (Formaldehyde Monitoring Kit) sampling assemblies deployed by Magnus on 12/8 in the Lab (at P3, below CEVIS)

and Service Module (SM, at the most forward handrail, on panel 307), to catch any atmospheric formaldehyde on a collector substrate for subsequent analysis on the ground. *[Two monitors each are usually attached side by side, preferably in an orientation with their faces perpendicular to the direction of air flow.]*

Sandy completed the routine daily servicing of the SM's SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

As part of the SOZh servicing, the FE-2 conducted the periodic checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the passageways SM PrK (Service Module Transfer Compartment)–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, and FGB GA–Node-1.

Magnus also performed the regular daily IMS (Inventory Management System) maintenance task by updating/editing the IMS standard “delta file” including stowage locations for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Afterwards, Sandy completed the periodic status check on the running payloads CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) and ENose (Electronic Nose), both located in the ER-2 (EXPRESS Rack 2).

The FE-2 also completed the visual “T+2 Day” microbial (bacterial & fungal) analysis of the potable water samples collected on 12/8 from the WRS (Water Recovery System) and processed on board with the MCDs (Microbial Capture Devices) and CDBs (Coliform Detection Bags). *[WRS samplings are regularly conducted for 90 days, specifically every 4 days: WRS water hose (TOCA inflight analysis) & microbial bag sample (inflight bacterial visual enumeration plus archival for return on 15A), every 8 days: an archival water sample (return on 15A), and monthly: a TOCA bag sample from PWD (tested inflight). Coliform bacteria are the commonly-used bacterial indicator of sanitary quality of foods and water. They are defined as rod-shaped Gram-negative non-spore forming organisms that ferment Lactose with the production of acid and gas when incubated at 35-37 degC. Coliforms are abundant in the feces of warm-blooded animals, but can also be found in the aquatic environment, in soil and on vegetation. In most instances, coliforms themselves are not the cause of sickness, but they are easy to culture and their presence is used to indicate that other pathogenic organisms of fecal origin may be present.]*

After repositioning and activating the MATRYOSHKA-R (RBO-3-2) radiation instrumentation in the SM (panel 326) yesterday, Yuri Lonchakov removed the newly installed PCMCIA (Portable Computer Memory Card International Adapter) ALC-957 card from the AST Spectrometer for a functions check, reviewing and archiving its files on the RSK-1 laptop and later inserting the memory card again in the AST for more recording. *[RBO-3-2 is using the ESA/RSC-Energia experiment ALTCRISS (ALC/Alteino Long Term monitoring of Cosmic Rays on the ISS) with its AST Spectrometer and ALC equipment in the SM.]*

Following up on the on-going X2 INTR4 software updates by the ground, Sandra Magnus unstowed the three Warning Books from Lab, SM and FGB and updated them, in Part 1, with replacement pages and P&I (pen & ink) changes for the new PVCU (Photovoltaic Controller Unit) MDM upgrades with PVCU R3 software. Part 2, for the INT R4 upgrading of INT MDMs, will follow at a later date. *[See also update note, below.]*

Sandy also worked in the COL (Columbus Orbital Laboratory), unlocking the GEOFLOW FSL FCE (Fluid Science Laboratory/Facility Core Element), which had been locked for recent vehicle traffic such as 30P undocking and 31P docking for protection. *[This task, yesterday shown on the discretionary "job jar" list, was today hard scheduled for the FE-2.]*

In continuing preparations for the upcoming Russian Orlan EVA-21 on 12/22 (Monday), FE-1 Lonchakov & CDR Fincke conducted a four-hour review of familiarization material, watching a training video and studying the preliminary EVA timeline (details, see below). *[More preparations will include MO-6 Hand Ergometry & Orlan equipment gathering tomorrow (12/11), Orlan and EVA tools/equipment configuring on 12/12, MO-5 Cardiovascular Evaluation on 12/16 & 12/16, Progress 31P preparations for contingency undocking on 12/17, etc.]*

The station residents conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1/MO-1, FE-2), RED (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Sandy again had an hour to herself for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residence, if she/he chooses to take it.

At ~3:30am EST, Yuri Lonchakov downlinked two PAO TV messages of greetings and congratulations, one to the Republic of Kazakhstan on its Independence Day (Kazakhstan proclaimed its independence from the former Soviet Union on

December 16, 1991, and Nursultan Nazarbayev was democratically elected the first President of the country), the other to the Awards Department of the Russian Federation's Ministry of Defense on its 30th anniversary.

At ~5:05am, Sandra Magnus powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, & power supply) and conducted, at 5:10am, a 10-min. ham radio session with Istituto Comprensivo "Marco Polo" in Grado, Italy. *[Grado is a little town on the northernmost coast of the Adriatic Sea, 80 km east of Venice, between the rivers Isonzo & Tagliamento. It has a remarkable history: it was under the Roman Empire, it defended the inhabitants against Attila in 452 AD; it became Austrian after the Treaty of Campo Formio in 1797 and again Italian after the 1st World War. Today, Grado has 8600 inhabitants and the economy is based on tourism and fishing industry. The "Marco Polo" is a secondary school but it includes also a primary school. 550 students attend the school. Questions to Sandy were uplinked beforehand. "How many spacesuits do you have onboard and what kind of spacesuits do you use for the extra-vehicle-activities?"; "How much time can you stay outside during an EVA?"; "Do you use spacesuits equipped with rockets to move around the ISS?"; "Were you instructed to repair all the station's equipment?"; "How much time would it take to change the ISS' orbit in order to avoid an impact with space debris?"; "What kind of experiments are you doing during this mission and what are they useful for?"; "How many experiments are you supervising every day?"; "Is every astronaut trained just for special tasks or can everybody do everything onboard?"; "What repair parts do you have on board?"; "For how much time does the ISS' air supply last?"; "Do you think that you will participate in the assembling of another space station in the future?"].*

Working off his discretionary job list, Yuri conducted the frequent status check on the Russian BIO-5 Rasteniya-1 ("Plants-1") experiment, verifying proper operation of the BU Control Unit and MIS-LADA Module fans (testing their air flow by hand).

[Rasteniya-1 researches growth and development of plants under spaceflight conditions in the LADA-14 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP).]

EVA-21 Timeline Preview (preliminary): The Orlan EVA-21 by Lonchakov (EV1) & Fincke (EV2) on 12/22 is scheduled to begin at ~7:15pm EST (DC1 EV hatch open), to last an estimated 6 hrs 10 min, i.e., concluding at approximately 1:25am. Russian attitude thrusters will be inhibited by TsUP ground commanding at specific times when the spacewalkers work on the SM RO (Working Compartment, I.d./large diameter) and SM AO (Assembly Compartment). Main objectives of the EVA are –

- Install a Langmuir Probe on the DC1 Docking Compartment;
- Install & connect the EXPOSE-R monobloc unit on the SM RO I.d.;
- Install & connect the IPI-SM monobloc unit of the IMPULSE experiment on

the RO I.d.;

- Remove/return the BIORISK-MSN payload container #2 from the DC1;
- Conduct "SWG" Project timer operations;
- Remove fasteners (Aramide straps) near docking target and AR-VKA & 2AR-VKA antennas installation on DC1 (if time permits);
- Close MLI (Multi-Layer Insulation) flap on SM FP-10 connector patch (if time permits);
- Re-install SKK #9 removable cassette container in nominal position (if time permits); and
- Monitor conditions ISS RS exterior and structure components ("Panorama-2008" DTO, if time permits).

Uncrewed Station Ops Preview: One of the contingencies associated with the Orlan EVA-21 could require uncrewed station operation for some time. Progress M-01M/31P will be prepared for ground-commanded contingency undocking. Most of the USOS (US Segment) preparations for this eventuality will be done by Mike Fincke & Sandy Magnus next week, such as transferring selected hardware to the RS (Russian Segment), setting up a PCS (Portable Computer System) laptop in the FGB as backup to the PCS in the RS, powering down ham/amateur radio equipment, reconfiguring some LAN software (NetMeeting, KFX), powering down the COL PWS (Columbus Orbital Laboratory Portable Workstation) laptop, and closing selected hatches. The IATCS (Internal Thermal Control System) will be configured as usual for uncrewed ops, some racks will be jumpered to the LTL (Low Temperature Loop) in case they need cooling, and some remaining hatches will be closed, before Sandy moves to the Soyuz Descent Module (SA) and closes the hatch between it and the Orbital Module (BO).

X2 INT R4 Software Transition: Starting yesterday and running through 12/12, MCC-Houston is executing procedures to transition several ISS MDMs (Multiplexer/Demultiplexer) computers to new software versions. No crew participation is required. Today's transition involves the second of each pair of PVCU (Photovoltaic Controller Unit) MDMs from PVCA R2 to PVCA R3. This concludes the transition of all six PVCU MDMs.

Conjunction Update: One TCA (Time of Closest Approach) is currently being assessed for another conjunction with the Cosmos satellite, Object 2421, for tonight at 6:57pm EST. No DAM (Debris Avoidance Maneuver) is needed, but specialists believe that this recurring object requires continued monitoring.

CEO (Crew Earth Observations) photo target uplinked for today was Pilcomayo River and megafan, Paraguay (*crews have difficulty locating this large river that exits the Andes Mts. because it stops flowing, for unknown reasons, near the Andes. [Slight tectonic subsidence is the probable explanation since its flow has*

remained steady for decades]. The neighboring Bermejo River just south is more visible because its flow reaches the main Parana trunk river. Requested were oblique panoramas looking left to help orient future crew imaging of the Pilcomayo River and megafan. [By switching courses repeatedly and depositing its sediment over millions of years, this river has produced the largest megafan on Earth, occupying 220,000 sq.km, that is, all of western Paraguay).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:26am EST [= epoch]):

Mean altitude -- 353.6 km

Apogee height -- 358.2 km

Perigee height -- 349.0 km

Period -- 91.61 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006827

Solar Beta Angle -- -62.7 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 27 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57628.

Significant Events Ahead (*all dates Eastern Time, some changes possible!*):

12/22/08 -- Russian EVA-21 (hatch opening ~7:15pm)

02/09/09 -- Progress M-01M/31P undocking & deorbit

02/10/09 -- Progress 32P launch

02/12/09 -- Progress 32P docking

02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment

02/14/09 -- STS-119/Endeavour/15A docking

02/24/09 -- STS-119/Endeavour/15A undocking

02/26/09 -- STS-119/Endeavour/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress 32P undocking & deorbit

05/12/09 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

08/06/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation

08/XX/09 -- Progress/MRM2 (Russian Mini Research Module, MIM2) on Soyuz

09/XX/09 -- H-IIB (JAXA HTV-1)

11/12/09 -- STS-129/Endeavour/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Endeavour/ULF4 – ICC-VLD, MRM1 (contingency)
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 12/09/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Fincke unstowed, set up and activated the hardware for the new ENose (Electronic Nose) experiment on ER2 (EXPRESS Rack 2) in the US Lab. *[ENose, which monitors the station's interior for harmful chemicals such as ammonia, mercury, methanol and formaldehyde, running continuously and autonomously, is the first instrument aboard ISS which can detect and quantify chemical leaks or spills as they happen. If the experiment is successful, ENose might be used in future space missions as part of an automated system to monitor and control astronauts' in-space environments. The shoebox-sized ENose contains an array of 32 sensors that can identify and quantify several organic and inorganic chemicals, including organic solvents and marker chemicals that signal the start of electrical fires. The sensors are polymer films that change their electrical conductivity in response to different chemicals, where the pattern of the sensor array's response depends on the particular chemical types present in the air. The instrument can analyze volatile aerosols and vapors, help monitor cleanup of chemical spills or leaks, and enable more intensive chemical analysis by collecting raw data and streaming it to a computer at JPL's ENose laboratory. The instrument, weighing less than nine pounds and requiring only 20 watts of power, has a wide range of chemical sensitivity, from fractional parts per million to 10,000 parts per million. Its data-analysis software can identify and quantify the release of chemicals within 40 minutes of detection. While ENose will look for 10 chemical types in this six-month experiment, it can be "trained" to detect many others.]*

In the SM (Service Module), FE-1 Lonchakov continued spent another 3 hrs on the time-consuming work of installing and connecting cables for the Progress 31P-delivered new payload EXPOSE-R which he and CDR Fincke will install externally during the Russian EVA-21 on 12/22. The outfitting was supported by ground

specialist tagup were required. *[EXPOSE-R comprises a suite of nine ESA astrobiology experiments with organisms to be exposed to solar UV (ultraviolet), vacuum, cosmic rays and perpetual temperature variations as the station passes through areas of direct sunlight and the cold darkness of Earth's shadow. EXPOSE-R is equipped with three trays which are loaded with a variety of biological samples including plant seeds and spores of bacteria, fungi and ferns. They will be exposed to the harsh space environment for about one and a half years. EXPOSE-R will join EXPOSE-E, a similar & complementary set of trays filled with terrestrial organisms which is already installed on the outside of the Columbus module as one of the nine payloads of the EuTEF (European Technology Exposure Facility). At the end of the exposure period, the EXPOSE-R trays will be retrieved from their location and returned to Earth with a Russian Soyuz spacecraft.]*

After deactivation/reactivation of the BITS1-12 & VD-SU control mode, required for the EXPOSE installations, the FE-1 performed the regular check on the BRI Smart Switch Router computer and its Ethernet connection to assess any impact of these activities on Ethernet comm. *[BRI is part of the RS OpsLAN (Russian Segment/ Operations Local Area Network), with connections to the three SSC clients, the Ethernet tie-in with the US network, and a network printer in the RS.]*

Afterwards, Yuri also supported the reactivation of the Elektron oxygen generator at 32 amps by the ground by monitoring the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating. *[The gas analyzer used on the Elektron during nominal operations for detecting hydrogen (H₂) in the O₂ line (which could cause overheating) is not included in the control algorithm until 10 minutes after Elektron startup. Elektron had been turned off for yesterday's installation of a new EMI filter and today's cabling work (which included making connections to the BITS2-12 Onboard Telemetry Measurement System).]*

After performing the periodic hot water flush of the PWD (Potable Water Dispenser), CDR Fincke worked for the next three hours on the WHC (Waste & Hygiene Compartment), activating and checking out the system (by self-test). The WHC activation was cut short by a premature UPA (Urine Processing Assembly) shutdown. *[Before turning on the pretreat & water pump, Mike verified that all three handwheel-driven valves (RU-2, RU-4, RU-5) were in the Open position.]*

Working ~2.5 hrs in the JAXA JPM (Japanese Experiment Module), FE-2 Magnus repackaged eight cables of the JEM Robotics BDS (Backup Drive System) in a stowage bag for consolidation, making room in a larger CTB (Cargo Transfer Bag, J-T1) for stowing an HCTL (Heater Controller) which she then removed in the "neighboring" JLP (JEM Logistics Pressurized Segment) from the Ovhd Stbd

Endcone location, replacing it with an EDU (Equipment Exchange Unit Driver Unit) for future JLP EFU (Exposed Facility Unit) operations.

Yuri Lonchakov conducted the periodic data collection on the long-term BIO-5 Rasteniya-1 ("Plants-1") experiment, copying data from its built-in control computer to a PCMCIA memory card for subsequent downlink to the ground via OCA.

[Rasteniya-1 researches growth and development of plants under spaceflight conditions in the LADA-14 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). The payload hardware includes a module (MIS/Module for the Investigation of Substrates), the MIS control unit (BU), a nitrogen purge unit (BPA) and other accessories. During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. LADA consists of a wall-mounted growth chamber that provides long-term, ready access for crewmember interaction. It provides light and root zone control but relies on the cabin environmental control systems for humidity, gas composition, and temperature control. Cabin air is pulled into the leaf chamber, flows over the plants and vents through the light bank to provide both plant gas exchange and light bank cooling.]

Performing regular service on the MATRYOSHKA-R (RBO-3-2) radiation instrumentation in the SM (panel 326), the FE-1 changed the position of the AST Spectrometer and kits containing passive dosimeters on Panel 326 (rotation around their axes), installed the ALC-957 PCMCIA (Portable Computer Memory Card International Adapter) memory card and activated the Spectrometer, making sure that the memory card is actually recording data. *[RBO-3-2 is using the ESA/RSC-Energia experiment ALTCRISS (ALC/Alteino Long Term monitoring of Cosmic Rays on the ISS) with its Spectrometer (AST) and ALC equipment, which is periodically moved around and now located again in the SM.]*

Sandra Magnus took GSC (Grab Sample Container) air samples in the center of the Lab, SM (Service Module) and COL (Columbus Orbital Laboratory), while Yuri Lonchakov used the Russian AK-1M absorber to collect air samples in the SM & FGB, recording date, time & location. Kits and pouches were then stowed for return to Earth.

In the RS (Russian Segment), Mike Fincke worked on the SM ASU (Toilet Facility), performing the monthly 30-min. maintenance/servicing of the facility by changing out replaceable ASU parts with new components, i.e., the urine receptacle (MP) and a filter insert (F-V). The old parts were discarded as trash.

Yuri pumped water from the Progress 31P's BV2 Rodnik tank to the ISS, filling two EDV containers.

Mike completed the fourth ICEPAC insertion into the MELFI (Minus Eighty Degree Laboratory Freezer for ISS) after ULF-2, today retrieving another two -32 degC ICEPAC belts and placing them into Dewar 1, Tray D/Section 3 & 4.

For her physical workout on the RED (Resistive Exercise Device), Sandra set up the video camcorder for filming and recording the sessions via ground commanding. Afterwards, the video equipment was put back in stowage, and the video was to be downlinked from the VTR (Video Tape Recorder) by ground commanding. *[The RED video, showing the apparatus on the "ceiling" hatch of the Node, is periodically required to support biomechanical evaluation of the exercising crewmember and assessment of the on-orbit setup of equipment during data collection.]*

The station residents conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Sandy Magnus performed the monthly & quarterly TVIS treadmill maintenance. *[The inspection checks out the TVIS in the current SLD (subject loading device) contingency configuration, primarily looking at the condition of the SPDs (subject positioning devices) with clamp/rope assembly wire rope isolators for fraying and damage, and recording time & date values.]*

Yuri completed the routine daily servicing of the SM's SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

The FE-2 took care of the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew had their periodic PMCs (Private Medical Conferences) via S- & Ku-band audio/video, Sandy at ~9:05am, Mike at ~9:45am, and Yuri at ~1:30pm EST.

Sandy again had an hour to herself for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residence, if she/he chooses to take it.

At ~10:40am, Magnus powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, & power supply) and conducted, at 11:45am, a ham radio session with Stephen F. Austin Elementary School, Richmond, Texas. *[The students at Stephen F. Austin Elementary School in Richmond, Texas have studied space and the identifying characteristics of objects in our solar system, including the sun, planets and moon. Each year the fifth grade students participate in a simulated space shuttle mission, performing tasks that would happen on a regular shuttle flight. Each grade level is involved in some manner with the various missions that occur throughout the day. The school has integrated the ARISS contact as part of this activity. Questions to Sandy were uplinked beforehand. "How would you be rescued if you floated off during a spacewalk?"; "What does a hurricane look like from the Space Station?"; "Do you burn calories the same way in space as on Earth?"; "Have you ever seen the Aurora Borealis from space?"; "Has an asteroid ever hit the space station?"; "Is sleeping on the space station difficult because you are weightless?"; "Do you tell the time the same way in space as on Earth?"; "What is the most life-changing experiment you have done?"; "Have you seen any unusual objects floating around in space?"; "How do you train for zero gravity?"]*

At ~11:45am, Mike & Sandra supported a 20-min. Educational PAO TV event with 5th & 6th grade students at Corpus Christi, TX, assembled in STARBASE Atlantis.

A new task item added to Sandy's & Mike's discretionary "job jar" is to unlock the GEOFLOW FSL FCE (Fluid Science Laboratory/Facility Core Element) in the COL, which had been locked for recent vehicle traffic such as 30P undocking and 31P docking.

A second voluntary "job jar" task concerns cargo bag reconfiguration and stowage in the JAXA JPM, today already started by the FE-2.

MSS Software Upgrade: Yesterday, MCC-Houston successfully uplinked a software upgrade for the Mobile Servicing System, from Vers. 5.1 to 5.2, to all three C&C MDMs (Command & Control Multiplexer/Demultiplexers). Today, the SPDM (Special Purpose Dexterous Manipulator) was powered up from the ground as a partial software checkout, and in preparation for next week's SPDM on-orbit checkout session 2.

X2 INT R4 Software Transition: Starting today and running through 12/12, MCC-Houston is executing procedures to transition several ISS MDMs to new software versions. No crew participation is required. Today's transition involves one of each pair of PVCU (Photovoltaic Controller Unit) MDMs from PVCA R2 to PVCA R3. The PVCA R3 MDM will be left in Primary.

MT Translation: After the normal pre-site video survey, the Mobile Transporter was successfully translated yesterday from WS7 (Worksite 7) to WS4 via ground commanding.

WRM Update: An updated WRM (Water Recovery Management) “cue card” was uplinked yesterday for the crew’s reference, updated with the latest water audit.

[The new card (18-0006G) lists 39 CWCs (~1,272.9 L total) for the four types of water identified on board: technical water (695.8 L, for Elektron electrolysis), potable water (530.4 L, incl. 174.6 L currently off-limit because of Wautersia bacteria), condensate water (0.0 L), waste/EMU dump and other (46.7 L).

Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]

Conjunction: One TCA (Time of Closest Approach) is currently being assessed for another conjunction with the Cosmos satellite, Object 2421, for tomorrow, 12/10, at 6:57pm EST. Based on current tracking, NASA specialists do not recommend DAM (Debris Avoidance Maneuver) planning but believe that this recurring object requires continued monitoring.

CEO (Crew Earth Observations) photo targets uplinked for today were **East Haruj Megafans, Libya** (*nadir swath immediately left of track requested. Rivers from the Tibesti Mts--hundreds of km to the south--used to deliver sediment to the Mediterranean Sea during wetter climatic periods in the past. These sediment masses reach very large proportions [megafans], and have engulfed several rock outcrops. Images will allow comparison of Earth stream/sediment patterns with patterns of layered sediments banked against impact craters on Mars*), and **Mount Vesuvius, Italy** (*looking left for the prominent cone of Vesuvius on the plains south of Naples*).

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this noon, 12:24pm EST [= epoch]):

Mean altitude -- 353.7 km

Apogee height -- 358.3 km

Perigee height -- 349.0 km

Period -- 91.61 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006914

Solar Beta Angle -- -58.1 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 35 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 57615.

Significant Events Ahead (*all dates Eastern Time, some changes possible!*):

12/22/08 -- Russian EVA-21 (hatch opening ~7:15pm)
02/09/09 -- Progress M-01M/31P undocking & deorbit
02/10/09 -- Progress 32P launch
02/12/09 -- Progress 32P docking
02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment
02/14/09 -- STS-119/Endeavour/15A docking
02/24/09 -- STS-119/Endeavour/15A undocking
02/26/09 -- STS-119/Endeavour/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress 32P undocking & deorbit
05/12/09 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

08/06/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation
08/XX/09 -- Progress/MRM2 (Russian Mini Research Module, MIM2) on Soyuz
09/XX/09 -- H-IIB (JAXA HTV-1)
11/12/09 -- STS-129/Endeavour/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Endeavour/ULF4 – ICC-VLD, MRM1 (contingency)
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at

ISS On-Orbit Status 12/08/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 7 of Increment 18.*

In the SM (Service Module), FE-1 Lonchakov worked his way through a 4-hr. job of installing and connecting cables for the Progress 31P-delivered new payload EXPOSE-R which he and CDR Fincke will install externally during the Russian EVA-21 on 12/22. The outfitting was supported by ground specialist tagup were required. *[EXPOSE-R comprises a suite of nine ESA astrobiology experiments with organisms to be exposed to solar UV (ultraviolet), vacuum, cosmic rays and perpetual temperature variations as the station passes through areas of direct sunlight and the cold darkness of Earth's shadow. EXPOSE-R is equipped with three trays which are loaded with a variety of biological samples including plant seeds and spores of bacteria, fungi and ferns. They will be exposed to the harsh space environment for about one and a half years. EXPOSE-R will join EXPOSE-E, a similar & complementary set of trays filled with terrestrial organisms which is already installed on the outside of the Columbus module as one of the nine payloads of the EuTEF (European Technology Exposure Facility). At the end of the exposure period, the EXPOSE-R trays will be retrieved from their location and returned to Earth with a Russian Soyuz spacecraft.]*

After deactivation/reactivation of the BITS1-12 & VD-SU control mode, required for the EXPOSE installations, the FE-1 performed the regular check on the BRI Smart Switch Router computer and its Ethernet connection to assess any impact of these activities on Ethernet comm. *[BRI is part of the RS OpsLAN (Russian Segment/Operations Local Area Network), with connections to the three SSC clients, the Ethernet tie-in with the US network, and a network printer in the RS.]*

FE-2 Magnus collected the periodic samples from the WRS WPA (Water Recovery System/Water Processing Assembly), which then were analyzed with –

- TOCA (Total Organic Carbon Analyzer),
- WMK MCD (Water Microbiology Kit/Microbial Capture Devices) for inflight

- microbial processing, and
- CDB (Coliform Detection Bag) for inflight coliform indications (Magenta for Positive, Yellow for Negative).
- In addition, the usual archival sample was stowed away for post-flight analysis on the ground.

[WRS sampling & checkouts are regularly conducted for 90 days: every 4 days – WRS water hose (TOCA inflight analysis) & microbial bag sample (inflight bacterial visual enumeration plus archival for return on 15A), every 8 days – an archival water sample (return on 15A), and monthly – a TOCA bag sample from PWD (tested inflight). Coliform bacteria are the commonly-used bacterial indicator of sanitary quality of foods and water. They are defined as rod-shaped Gram-negative non-spore forming organisms that ferment Lactose with the production of acid and gas when incubated at 35-37 degC. Coliforms are abundant in the feces of warm-blooded animals, but can also be found in the aquatic environment, in soil and on vegetation. In most instances, coliforms themselves are not the cause of sickness, but they are easy to culture and their presence is used to indicate that other pathogenic organisms of fecal origin may be present.]

Sandy also conducted the periodic deployment of four passive FMK (Formaldehyde Monitoring Kit) sampling assemblies in the Lab (at P3, below CEVIS) and SM (at the most forward handrail, on panel 307) for two days, to catch any atmospheric formaldehyde on a collector substrate for subsequent analysis on the ground.

[Two monitors each are usually attached side by side, preferably in an orientation with their faces perpendicular to the direction of air flow.]

More work was performed by CDR Fincke on readying the WHC (Waste & Hygiene Compartment)/toilet for use, today by installing & routing the urine jumper and the flush water jumper (between the P1 & P2 positions in the US Lab). *[For mating the flush water jumper to the feed water QD (quick disconnect) on the Z-Panel, the CDR temporarily removed the interfering OGS (Oxygen Generation System) feed water QD from the OGS Z-Panel. The three jumper connections remain loose, to be fully mated during the subsequent WHC umbilical mating.]*

Fincke also conducted the regular periodic leak checks on the WRS-1 & WRS-2 racks, after temporarily powering down & disconnecting the WPA tank for the checks and instead connecting the WRS to the Lab condensate tank. Later, Mike switched the hose back from the Lab condensate tank to the WPA.

After the WRS rack rotations for the leak checking and before reconfiguring the OGS rack (see above), Mike relocated the TOCA from its temporary location on the OGS to the WRS-2 rack.

Sandra Magnus conducted the periodic PCS (Portable Computer System) laptop

battery checks and reboots on all active US PCS and on the COL PWS (Portable Work Station) laptop (once/month). *[Lab RWS laptop: 100% charged, reboot successful; Cupola RWS: off; JPM (Japanese Pressurized Module) PCS: 100% charged, reboot successful; Airlock (A/L) PCS: off; SM PCS: 97% charged, reboot successful; COL RWS: reboot successful.]*

In the Soyuz 13S spacecraft, docked at the FGB nadir port, FE-1 Lonchakov deactivated the gas analyzer, a periodic 48-hr. checkup activity.

Afterwards, with the Elektron oxygen generator turned off, Yuri installed a new EMI (Electro-Magnetic Interference) filter (FPP) on the Elektron's ST-64 current stabilizer. *[The electronic filter is designed to protect visiting vehicles, such as the HTV (H-II Transfer Vehicle), from RF/EMI.]*

Fincke performed the third ICEPAC insertion into the MELFI after ULF-2, today retrieving two -32 degC ICEPAC belts and placing them into Dewar 1, Tray D/ Section 1 & 2.

In preparation for upcoming CHeCS (Crew Health Care Systems) Rack 1 installation work, Magnus swapped TCS (Thermal Control System) jumpers, demating a supply line at the Lab1S4 Z-Panel, then quickly connecting an MTL (Moderate Temperature Loop) supply jumper instead, followed by repressurization and startup of the MTL by the ground, which finally switched to single LTL (Low Temperature Loop) to regain MTL cooling. *[MTL depress & shutdown was done because of a LAB1S4 supply line QD known to leak when demated.]*

In JAXA's Kibo JPM, the FE-2 supported SSIPC (Space Station Integration & Promotion Center)/Tsukuba activities by activating the MMA (Microgravity Measurement Apparatus) and its laptop (MLT), first powering up the MMA's NCU/RSU (Network Control Unit/Remote Sensor Unit) set from the Ryutai rack's UDC (Utility DC-to-DC Converter), then turning on both NCU/RSU and MLT. *[All payload activities except UDS/MMA on/off can be performed remotely by the ground.]*

Working on the MATRYOSHKA-R (RBO-3-2) radiation instrumentation in the SM (panel 326), Lonchakov turned off the AST Spectrometer, taking radiation measurements, then removed the PCMCIA (Portable Computer Memory Card International Adapter) ALC-956 memory card and checked number and size of its data files. Card 956 was then stowed in a kit, with the AST Spectrometer remaining deactivated. The activity and hardware was photo documented, with the images processed for downlink via OCA.

Yuri completed the routine daily servicing of the SM's SOZh system (Environment

Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

Sandy Magnus performed the regular daily IMS (Inventory Management System) maintenance task by updating/editing the IMS standard “delta file” including stowage locations for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The FE-2 also conducted a run with the MedOps experiment WinSCAT (Spaceflight Cognitive Assessment Tool for Windows), her first onboard session, by logging in on the MEC (Medical Equipment Computer) laptop and performing the psychological evaluation exercise on the laptop-based WinSCAT application. *[WinSCAT is a monthly time-constrained questionnaire test of cognitive abilities, routinely performed by astronauts aboard the ISS every 30 days before or after the PHS (periodic health status) test or on special CDR's, crewmembers or flight surgeons request. The test uses cognitive subtests that measure sustained concentration, verbal working memory, attention, short-term memory, spatial processing, and math skills. The five cognitive subtests are Coding Memory - Learning, Continuous Processing Task (CPT), Match to Sample, Mathematics, and Coding Delayed Recall. These WinSCAT subtests are the same as those used during NASA's long-duration bed rest studies.]*

Sandy again had an hour to herself for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residence, if she/he chooses to take it.

The station residents conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

At ~10:15am EST, FE-2 Magnus held a 20-min. teleconference with ground specialists to discuss ULF-2 transfer issues.

At ~11:30am, Sandy conducted a 15-min. CDD (Crew Discretionary Conference).

At ~11:50am, Magnus powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, & power supply) and conducted, at 11:55am, a ham radio session with Ellis School, Belleville, Illinois. *[Ellis School is located 15 min. from St. Louis and serves approximately 400*

students ranging from kindergarten through fourth grade. Ellis school has been named a No Child Left Behind-Blue Ribbon winner for 2008. Only 21 schools in Illinois received this honor and Ellis School was the only school in Southern Illinois to be named a Blue Ribbon School. Nationwide, 329 schools were selected as Blue Ribbons Schools. The students that talked to Sandy on board the ISS were 16 third graders that have been studying about the shuttle, ISS and the planets during this year at school. The questions that they asked were developed by themselves over the past few weeks. Questions to Sandy were uplinked beforehand. "Is it fun to float in the ISS, what do you like to do best when you are floating?"; "How can you tell if it is day or night in space when you are inside the ISS?"; "How do you move the robotic arm?"; "Is there a limit of how many days a person can live on the ISS and stay in space?"; "Since you are going to be on the ISS for Christmas, how are you going to get your presents?"; "Do you watch TV or movies in the ISS and if so, which ones?"; "How did it feel when you took off on Endeavour, was it scary?"; "What was the first thing you did when you got into space?"; "How long does it take to get from Earth to the ISS?"; "How funny do you think a bird would look if it was flying inside the ISS-would it fly like a bird on Earth?"].]

Working off his discretionary job list, the FE-1 conducted the frequent status check on the Russian BIO-5 Rasteniya-1 ("Plants-1") experiment, verifying proper operation of the BU Control Unit and MIS-LADA Module fans (testing their air flow by hand). *[Rasteniya-1 researches growth and development of plants under spaceflight conditions in the LADA-14 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). The payload hardware includes a module (MIS/ Module for the Investigation of Substrates), the MIS control unit (BU), a nitrogen purge unit (BPA) and other accessories. During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. LADA consists of a wall-mounted growth chamber that provides long-term, ready access for crewmember interaction. It provides light and root zone control but relies on the cabin environmental control systems for humidity, gas composition, and temperature control. Cabin air is pulled into the leaf chamber, flows over the plants and vents through the light bank to provide both plant gas exchange and light bank cooling.]*

No CEO (Crew Earth Observation) photo targets uplinked today.

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 11:59am EST [= epoch]):

Mean altitude -- 353.7 km
Apogee height -- 358.3 km
Perigee height -- 349.1 km
Period -- 91.61 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0006778
Solar Beta Angle -- -53.4 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.72
Mean altitude loss in the last 24 hours -- 170 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 57599.

Significant Events Ahead *(all dates Eastern Time, some changes possible!):*

12/07/08 -- Progress M-65/30P reentry (after 3 weeks autonomous flight for geophysical experiments)
12/22/08 -- Russian EVA-21 (hatch opening ~7:15pm)
02/09/09 -- Progress M-01M/31P undocking & deorbit
02/10/09 -- Progress 32P launch
02/12/09 -- Progress 32P docking
02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment
02/14/09 -- STS-119/Endeavour/15A docking
02/24/09 -- STS-119/Endeavour/15A undocking
02/26/09 -- STS-119/Endeavour/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress 32P undocking & deorbit
05/12/09 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

08/06/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation
08/XX/09 -- Progress/MRM2 (Russian Mini Research Module, MIM2) on Soyuz
09/XX/09 -- H-IIB (JAXA HTV-1)
11/12/09 -- STS-129/Endeavour/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Endeavour/ULF4 – ICC-VLD, MRM1 (contingency)
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 12/07/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – off-duty day for CDR Fincke, FE-1 Lonchakov & FE-2 Magnus. Ahead: Week 7 of Increment 18.*

FE-1 Lonchakov performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP-Moscow. Additionally, the FE-1 today checked up on the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem, gathering weekly data on total operating time & "On" durations for reporting to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

CDR Fincke serviced the US WRS (Water Recovery System) by refilling the WSTA (Water Storage Tank Assembly) with pretreated urine from EDV-U container for processing by the UPA (Urine Processing Assembly). *[The WSTA should be filled to no more than 60%. Besides the regular refilling for processing, WRS sampling & checkouts are being conducted for 90 days: every 4 days – WRS water hose (TOCA inflight analysis) & microbial bag sample (inflight bacterial visual enumeration plus archival for return on 15A), every 8 days – an archival water sample (return on 15A), and monthly – a TOCA bag sample from PWD (tested inflight).]*

Lonchakov had ~40 min to downlink five TV PAO messages of greetings for various upcoming anniversaries and holidays: (1) to the workers of the S.P. Korolev Experimental Machine-Building Plant on the plant's 90th anniversary; (2) to personnel of the Reutov City Garrison Military Court on its 40th anniversary; (3) to the Military Counterintelligence Department of the Petrograd-Leningrad

Military District on their 90th anniversary; (4) to the FSB Academy Science & Education Department on Russia's National Security Service Personnel Day; and (5) to the personnel of the Criminal Investigation Bureau #8 of the Russian Ministry of Interior.

The station residents conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

The CDR & FE-2 had their weekly PFCs (Private Family Conferences) via S-band/ audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop), Mike at ~2:50pm, Sandra at ~3:35pm EST.

Working off the Russian discretionary "if time permits" task list, Lonchakov performed a session of the DZZ-2 "Diatomeya" ocean observations program, using the NIKON-F5 DCS still camera and the HDV (high-definition) video camcorder from SM window 8 for ~20 min for digital photo/video documentation of Pacific Ocean and North Atlantic color contrast formations and cloud cover along the flight path. *[Target zones in the Pacific Ocean and North Atlantic were from the west of Chile to the west of Ireland, and from the east of New Zealand to offshore Mexico.]*

Also off the work suggestions list, Yuri conducted another session for Russia's Environmental Safety Agency (EKON), making observations and taking KPT-3 aerial photography of environmental conditions on earth using the Nikon D2X with the SIGMA 300-800mm telephoto lens.

As a third item on the discretionary job list, the FE-1 conducted the frequent status check on the Russian BIO-5 Rasteniya-1 ("Plants-1") experiment, verifying proper operation of the BU Control Unit and MIS-LADA Module fans (testing their air flow by hand). *[Rasteniya-1 researches growth and development of plants under spaceflight conditions in the LADA-14 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). The payload hardware includes a module (MIS/ Module for the Investigation of Substrates), the MIS control unit (BU), a nitrogen purge unit (BPA) and other accessories. During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. LADA consists of a wall-mounted growth chamber that provides long-term, ready access for crewmember interaction. It provides light and root zone control but relies on the cabin environmental control systems for humidity, gas composition, and temperature control. Cabin air is pulled into the leaf chamber, flows over the plants and vents through the light bank to provide both plant gas exchange and light bank cooling.]*

Vo/Sci Kudos: Mike & Sandy received special kudos from ground teams for the great jobs with their selected Voluntary Weekend Science activities on their off-duty day, yesterday, Fincke for his preparations of the FCF CIR (Fluids & Combustions Facility/Combustion Integrated Rack) outfitting, Magnus for the JAXA Marangoni Clean Up (Part 1 of 2), very important for the next Marangoni Experiment Series. *Arigato Gozaimasu!*

No CEO (Crew Earth Observation) photo targets uplinked today.

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 5:18am EST [= epoch]):

Mean altitude -- 353.8 km

Apogee height -- 358.2 km

Perigee height -- 349.4 km

Period -- 91.62 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006517

Solar Beta Angle -- -48.6 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 64 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57579.

Significant Events Ahead (*all dates Eastern Time, some changes possible!*):

12/07/08 -- Progress M-65/30P reentry (after 3 weeks autonomous flight for geophysical experiments)

12/22/08 -- Russian EVA-21 (hatch opening ~7:15pm)

02/09/09 -- Progress M-01M/31P undocking & deorbit

02/10/09 -- Progress 32P launch

02/12/09 -- Progress 32P docking

02/12/09 -- STS-119/Endeavour/15A launch -- S6 truss segment

02/14/09 -- STS-119/Endeavour/15A docking

02/24/09 -- STS-119/Endeavour/15A undocking

02/26/09 -- STS-119/Endeavour/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress 32P undocking & deorbit

05/12/09 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

08/06/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation

08/XX/09 -- Progress/MRM2 (Russian Mini Research Module, MIM2) on Soyuz

09/XX/09 -- H-IIB (JAXA HTV-1)

11/12/09 -- STS-129/Endeavour/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A – MPLM(P)

04/08/10 -- STS-132/Endeavour/ULF4 – ICC-VLD, MRM1 (contingency)

05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 12/06/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – off-duty day for CDR Fincke, FE-1 Lonchakov & FE-2 Magnus.*

The crew performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the SM (Service Module) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

As part of the house cleaning, Yuri Lonchakov conducted regular maintenance inspection & cleaning of fan screens in the FGB (TsV2), DC-1 (V3) and SM (VPkhO, VPrK, FS5, FS6 & FS9).

For her VolSci (Voluntary Weekend Science) Program today, FE-2 Magnus had selected Part 1 of a major clean-up job of the JAXA Marangoni experiment in the Kibo JPM (Japanese Pressurized Module), estimated at ~3.5 hrs. The task required the MWA (Maintenance Work Area) and a downlink from the JPM internal camera to SSIPC (Space Station Integrated Promotion Center) in Tsukuba for ground support of the crew activity. *[Work objective was to clean up spilled silicone oil inside the Marangoni Experiment Cell (MS) to prevent the Core from being further contaminated and to protect the hardware for the next Marangoni Experiment #2 on Increment 19. Part 1 today involved removing the MS from the FPEF (Fluid Physics Experiment Facility) and disassembling the Experiment Core from the MS. The actual silicone oil clean up in the Core will be performed in Part 2 at a later date.]*

For his VolSci part, Mike Fincke prepared the MDCA CIA (Multi-user Droplet Combustion Apparatus/Chamber Insert Assembly) for initial installation. *[The*

MDCA is a multi-user facility designed to accommodate different droplet combustion science experiments, using the CIR (Combustion Integrated Rack) of the NASA Glenn Research Center's FCF (Fluids & Combustion Facility). The MDCA, in conjunction with the CIR, will allow for cost effective extended access to the microgravity environment, not possible on previous space flights. The MDCA contains the hardware and software required to conduct unique droplet combustion experiments in space. It consists of a CIA, an Avionics Package, and a multiple array of diagnostics.]

At ~9:00am EST the crewmembers conducted their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-Houston and TsUP-Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

CDR Fincke serviced the new WRS (Water Recovery System) by refilling the WSTA (Water Storage Tank Assembly) with pretreated urine from EDV-U container for processing. *[The WSTA should be filled to no more than 60%.]*

Sandy filled out the regular FFQ (Food Frequency Questionnaire), her second, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software.*

Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]

In the US Lab, Mike de-installed the UOP DCP (Utility Outlet Panel/Display & Control Panel) bypass power cable to the VTR (Video Tape Recorder) at the Lab & Cupola RWS (Robotics Work Stations), now no longer required for a while.

At ~6:00am EST, Yuri Lonchakov downlinked a New Year's video message of greetings to TsUP/Moscow via MCC-Houston (Ku- & S-band).

The FE-1 completed the routine daily servicing of the SM's SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

The ISS crew completed their physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Weekly Science Update (*Expedition Eighteen -- Week 6*)

3-D SPACE: PCMCIA card with results from session of Greg Chamitoff were downloaded on ULF-2.

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): Complete.

ANITA (Analyzing Interferometer for Ambient Air): Complete. Hardware returned on ULF-2.

BCAT-3/4 (Binary Colloidal Alloy Test 3/4): Looking forward to a possible Voluntary Science run in NODE-2 on 12/13-14.

BIO-4: ROALD samples returned on ULF-2.

BIOLAB: The activity to remove a stuck triple contained syringe on 12/2 was not successful. The crew reported that the syringe is moveable, but the piston is still held by the inner gripper inner gripper mechanism of the Handling Mechanism arm, although the TM shows it to be released. The activity was aborted.

CARDIOCOG-2: Complete.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): In progress.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System): Samples returned on 1J.

CSI-3/CGBA-5 (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus 5): "Thank you for exposing the Nectar which will provide food for the butterflies once they emerge. From video and images captured this week it appears the caterpillars are having difficulty pupating, but it is unclear whether this is due to the micro-g environment. The possibilities of a butterfly emerging from a chrysalis are decreasing with time, but all hope is not lost. The spiders remain well-fed and active in micro-g. All previously planned data on the spiders have been

collected and are being analyzed. Because the spiders are doing well, data will continue to be collected for further analysis. The spider and caterpillar data are generating positive feedback from teachers whose students are enthusiastically engaged in tracking the progress of the CSI-3 experiment.”

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

EDR (European Drawer Rack): A software upgrade activity for Laptop and RIC was successfully performed on 12/3 with the support of the crew. This upgrade is required to prepare for the Protein Crystallization Diagnostic Facility (PCDF) experiment during the 15A Stage. Subsequently also PCDF-EU check-out was completed and images were received on the ground.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): The Data Handling Processing Unit (DHPU) MIL-BUS error has occurred again on 11/30. Similar MIL Bus errors have occurred on 11/5, 11/15, 11/17 and 11/20. Ground teams are investigating what causes this increased frequency of failures.-- DEBIE-2: 24-hrs science scripts executed from 11/29 to 12/2;-- DOSTEL: On-going science acquisition - nominal;-- EuTEMP: Currently inactive as planned;-- EVC: troubleshooting was planned on 12/3-4, awaiting results;-- EXPOSE: On-going science acquisition - nominal;-- FIPEX: New EOP started on 12/3;-- MEDET: On-going science acquisition - nominal; -- PLEGPAY: Inactive, “Experiment 1” memory has been erased on 10/30. Plasma generation capability has been disabled;-- TRIBOLAB: Anomaly with the TRIBOLAB Ball Bearing experiment shaft motor, currently being analyzed, unfortunately does not look good. It looks like Ball Bearing motor shaft is severely damaged.

FSL (Fluid Science Laboratory): FSL is nominal.

GEOFLOW: MMA (Microgravity Measurement Apparatus) measurements during ULF-2 undocking could not be recorded due to issue with ground commanding/display. The issue was resolved and MMA measurements could be collected during 31P docking. Ground infrastructure at MARS USOC will be upgraded to support

GEOFLOW science acquisition as of week#7.

HDTV System Test DL (JAXA): Complete.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

ICE CRYSTAL (JAXA): Since it started on 12/1, the experiment has been running successfully. After the super cooling temperature was changed, we are now observing the crystallization of Ice during night time on ISS.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System):
“Thanks for operating Lab-on-a-Chip for Voluntary Science. We got good feedback from your comments and video. Your dispensing technique was great; I liked the way you held the Reader with your left hand to steady yourself. The data was also pretty interesting. The most interesting number out of the five that appeared on the display is the first one, called "Sample ng/mL". It tells you how much 'fungi' you have in your sample, and ranges between 1-100 ng/mL. The readings you obtained from the ATU (23.8 ng/mL) and Biolab glove box (<1.26ng/mL), were similar to those obtained by Greg in the US Lab and Node 1 (between 1 and 18 ng/mL). Trace levels of fungi such as these are common on all surfaces and are of no real concern. Readings above 75 ng/mL are potential indications of more established fungal growth.”

Marangoni Experiment for ISS in JAXA FPEF (Fluid Physics Experiment Facility):
In progress.

Micro-G Clay (JAXA EPO): Complete.

MISSE (Materials ISS Experiment): Ongoing.

Moon Photography from ISS (JAXA EPO): Complete.

MOP (Motion Perception in Zero-G): Three ULF-2 astronauts have participated in this experiment (daily questionnaires)

MSG-SAME (Microgravity Science Glovebox): Complete.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MUSCLE-G (LBP/Low Back Pain): Six ULF- astronauts have participating in this experiment (daily questionnaires)

NOA-1/-2 (Nitric Oxide Analyzer, ESA): Complete.

NUTRITION w/REPOSITORY: In progress.

PADLES (Passive Dosimeter for Lifescience Experiment in Space): In progress.

PCRF (Protein Crystallization Research Facility) Reconfiguration (JAXA): Complete.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SAMPLE: Complete.

SHERE (Shear History Extensional Rheology Experiment): SHERE is standing by and ready for any science operations in the MSG during the month of December.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): In progress.

SOLAR (Solar Monitoring Observatory): The Sun visibility window started on 11/21 and ended in the night from 12/1 to 2. After a last sun tracking of 4.5 min which started around GMT336/22:50, SOLAR was put in idle mode on 337/00:34. A software patch was successfully uploaded on 11/20 and SOLAR is now running version 4.7 and is in Pointing Mode. The new SOLAR software release is currently loaded on the RAM memory, and it will be transferred to the SOLAR Flash Disk on 12/5. In the night of 12/2-3, SOLAR experienced a loss of ancillary data. The issue is under investigation to avoid impact during next Sun visibility window.-- SOVIM: No science acquisition, non-nominal mode: Trouble-shooting activities were not successful. Unfortunately results look not good for instrument. - SOLSPEC: science acquisition until 12/1-2, out of sun visibility since;-- SOLACES: science

acquisition until 12/1-2, out of sun visibility since.

SOLO (Sodium Loading in Microgravity): Blood and urine samples from Greg Chamitoff were returned with ULF-2.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): Reserve.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): The 4 remaining EC's (Experiment Containers) were returned with ULF-2, although it is not foreseen to analyze them for scientific purpose.

CEO (Crew Earth Observations): "For this past week the crew captured some good quality imagery, with regard to sharpness and content. We note in particular detailed images of the pyramids and urban scenes nearby, complex landscapes of megafan plains in Argentina (Bermejo R.), several Andes lakes and a 800 mm view of the Mt Nemut Caldera, Turkey near L. Van. The image chosen for this week's Earth Observatory website submission is a detailed 800mm shot of Deriba Caldera in western Sudan, with a central Asian dust storm for next week."

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

Significant Events Ahead (*all dates Eastern Time, some changes possible!*):

12/07/08 -- Progress M-65/30P reentry (after 3 weeks autonomous flight for geophysical experiments)

12/22/08 -- Russian EVA-21 (hatch opening ~7:15pm)

02/09/09 -- Progress M-01M/31P undocking & deorbit

02/10/09 -- Progress 32P launch

02/12/09 -- Progress 32P docking

02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment

02/14/09 -- STS-119/Endeavour/15A docking

02/24/09 -- STS-119/Endeavour/15A undocking

02/26/09 -- STS-119/Endeavour/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress 32P undocking & deorbit
05/12/09 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

08/06/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation
08/XX/09 -- Progress/MRM2 (Russian Mini Research Module, MIM2) on Soyuz
09/XX/09 -- H-IIB (JAXA HTV-1)
11/12/09 -- STS-129/Endeavour/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Endeavour/ULF4 – ICC-VLD, MRM1 (contingency)
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 12/05/08

All ISS systems continue to function nominally, except those noted previously or below.

FE-2 Magnus worked in the JAXA JPM (Japanese Pressurized Module) –

- First powering down the HTV PROX (H-II Transfer Vehicle proximity operations) Rack after its successful checkout runs by herself & the ground,
- Cleaning up the HCP (Hardware Command Panel) by removing and stowing the HCP from Node-2 and the US Lab with its cables, then
- Activating the JEMRMS (JEM Robotic Manipulator System) with its two monitors, CCP (Camera Control Panel) and EXT2 power outlet for the subsequent maneuvering of the MA (Main Arm) into position for viewing the relocation of the ESP-3 (External Stowage Platform 3) with the SSRMS (Space Station Remote Manipulator System), and finally
- Deactivating the UDC (Utility DC/DC Converter) and MMA (Microgravity Measurement Apparatus) components at the Ryutai Rack.

Later, after the ESP-3 relocation, Magnus reconfigured the JEMRMS PTU ELBOW (Pan & Tilt Unit/Elbow camera) in stowed position & deactivated it, along with its EXT2-powered JMUs (Joint Motor Units) motors, CCP and monitors 1,2.

After turning on the CUPola PCS (Portable Computer System) laptop in the Lab for today's activities, CDR Fincke started the DOUG (Dynamic Onboard Ubiquitous Graphics) application to support the ESP-3 relocation. *[DOUG is a special application running on the MSS (Mobile Service System) RWS (Robotics Workstation) laptops that provides a graphical birdseye-view image of the external station configuration and the SSRMS arm, showing its real-time location and configuration on a laptop during its operation.]*

Fincke & Magnus then worked with the SSRMS through the steps necessary for ESP-3 relocation:

- Unlatching the MCAS (Mobile Base System [MBS] Common Attachment

- System),
- Demating the ESP-3 and moving it to its regular location on the P3 truss zenith UCCAS (Unpressurized Cargo Carrier Attachment System),
 - Obtaining First Stage Capture after positive RTL (Ready to Latch) indications,
 - Limping the robotarm (brakes off),
 - Completing Second Stage UCCAS Capture, then applying brakes and
 - Ungrappling the ESP-3.

Finally, the SSRMS was “walked” to the MBS PDGF-3 (Power & Data Grapple Fixture 3) for “parking”, releasing the MBS PDGF-4 with its other LEE (Latching End Effector).

FE-1 Lonchakov set up the hardware for the Russian MBI-21 PNEVMOKARD experiment and conducted the session, his second, which forbids moving or talking during data recording. The experiment is controlled from the RSE-med A31p laptop, equipped with new software, and uses the TENZOPLUS sphygmomanometer to measure arterial blood pressure. Obtained test data were then downlinked via OCA. *[PNEVMOKARD (Pneumocard) attempts to obtain new scientific information to refine the understanding about the mechanisms used by the cardiorespiratory system and the whole body organism to spaceflight conditions. By recording (on PCMCIA cards) the crewmember's electrocardiogram, impedance cardiogram, low-frequency phonocardiogram (seismocardiogram), pneumotachogram (using nose temperature sensors), and finger photoplethysmogram, the experiment supports integrated studies of (1) the cardiovascular system and its adaptation mechanisms in various phases of a long-duration mission, (2) the synchronization of heart activity and breathing factors, as well as the cardiorespiratory system control processes based on the variability rate of physiological parameters, and (3) the interconnection between the cardiorespiratory system during a long-duration mission and the tolerance of orthostatic & physical activities at the beginning of readaptation for predicting possible reactions of the crewmembers organism during the their return to ground.]*

Following up on her earlier biochemical sample analyses, Sandy Magnus retrieved the Coliform water samples obtained and processed on 11/26 from the WPA (Water Processing Assembly) and PWD (Potable Water Dispenser) from their temporary incubation bag and inspected them for coliform indications (Magenta for Positive, Yellow for Negative). *[Coliform bacteria are the commonly-used bacterial indicator of sanitary quality of foods and water. They are defined as rod-shaped Gram-negative non-spore forming organisms that ferment Lactose with the production of acid and gas when incubated at 35-37 degC. Coliforms are abundant in the feces of warm-blooded animals, but can also be found in the aquatic environment, in soil and on vegetation. In most instances, coliforms themselves are*

not the cause of sickness, but they are easy to culture and their presence is used to indicate that other pathogenic organisms of fecal origin may be present.]

Mike Fincke serviced the new WRS (Water Recovery System) by performing the regular leak checks on the WRS-1 & WRS-2 racks and later refilling the WSTA (Water Storage Tank Assembly) with pretreated urine from EDV-U container for processing. *[WRS sampling & checkouts are being conducted for 90 days: every 4 days – WRS water hose (TOCA inflight analysis) & microbial bag sample (inflight bacterial visual enumeration plus archival for return on 15A), every 8 days – an archival water sample (return on 15A), and monthly – a TOCA bag sample from PWD (tested inflight).]*

In the Soyuz 13S spacecraft, docked at the FGB nadir port, FE-1 Lonchakov turned on the gas analyzer, a periodic 48-hr. checkup activity.

In the Service Module (SM), Yuri also performed major maintenance/service on the SRV-K2M condensate water recovery system by –

- Replacing its end-of-life filter reactor (F-R),
- Inspecting & cleaning the sediment trap pipe filter insert and
- Replacing the BRPK-1 Condensate Separation & Pumping Unit 1.

Afterwards, the temporarily disconnected BITS2-12 Onboard Telemetry Measurement System was hooked up again.

As a relatively new regular activity after deactivation/reactivation of the BITS1-12 and VD-SU control mode, the FE-1 then checked the BRI Smart Switch Router computer and its new Ethernet connection to assess any impact of these activities on Ethernet comm, followed by dumping BRI log files from the RSS1 laptop for downlinking to the ground. *[BRI is part of the RS OpsLAN (Russian Segment/Operations Local Area Network), with connections to the three SSC clients, the Ethernet tie-in with the US network, and a network printer in the RS.]*

Sandy Magnus again had an hour to herself for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residence, if she/he chooses to take it.

The FE-1 spent another ~1:20h on Progress 31P unloading, keeping track of moves & locations in the IMS (Inventory Management System) and guided by an uplinked transfer list. *[Equipment delivered by the cargo ship include food containers, a new BKO multifiltration unit, five fresh BK-3M oxygen bottles for Orlan-M EVAs, a MNR separator pump, a new AK-1M air sampler kit, personal oral hygiene articles (SLG), a BPK condensate feed unit & its control panel, a Penguin-3 suit, an electrical stimulation suit, ASU toilet inserts, etc.]*

Working from his discretionary (as time permits" task list, the FE-1 completed the routine daily servicing of the SM's SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

Also from the suggested jobs list, Yuri performed the regular daily IMS maintenance task by updating/editing the IMS standard "delta file" including stowage locations for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

A third task for Lonchakov's choice was the regular status check on the Russian BIO-5 Rasteniya-1 ("Plants-1") experiment. *[Rasteniya-1 researches growth and development of plants under spaceflight conditions in the LADA-14 "greenhouse" from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). The payload hardware includes a module (MIS/Module for the Investigation of Substrates), a MIS control unit (BU), a nitrogen purge unit (BPA) and other accessories. During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording.]*

CDR Fincke's first run with the MedOps experiment WinSCAT (Spaceflight Cognitive Assessment Tool for Windows), originally hard-scheduled for today, remains on his discretionary "job jar" task list. *[WinSCAT is a monthly laptop-based time-constrained questionnaire test of cognitive abilities, routinely performed by astronauts aboard the ISS every 30 days before or after the PHS (periodic health status) test or on special CDR's, crewmembers or flight surgeons request. The test uses cognitive subtests that measure sustained concentration, verbal working memory, attention, short-term memory, spatial processing, and math skills. The five cognitive subtests are Coding Memory - Learning, Continuous Processing Task (CPT), Match to Sample, Mathematics, and Coding Delayed Recall. These WinSCAT subtests are the same as those used during NASA's long-duration bed rest studies.]*

At ~3:15am EST, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~4:25am, Yuri conducted a PAO TV conference exchange with children of the Togliatti School for the on-air premiere of a social and education project "Adult Talk.

How to Become Successful?" launched by the Togliatti TV channel and sponsored by Togliatti Mayor's Office Department of Education in mid-December. *[Togliatti (or Tolyatti) is a city in Samara Oblast (formerly Kuybyshev. The city was named after Palmiro Togliatti, the longest-serving secretary of the Italian Communist Party. The show will have one rule: an adult must provide a candid answer to each question asked by a child. One may only refuse to answer a very personal question. Some questions of the school children to Yuri were: "Do land and water have the same color in various parts of the Earth globe?"; "Does space have day and night?"; "Is it true that the Earth has a shape of a globe? Or is it oblate?"; "Everybody talks about bad state of environment. Can you see from space that it is really gotten worse?"; "To fly to space (not as a tourist, but as a cosmonaut) does one have to be, for example, a biologist or zoologist? In other words, an expert in some field? To what institution of higher learning one should go to study to become a cosmonaut?"; "What does a cosmonaut do on the ground, when he is not in space? How does he support his family? Or should every cosmonaut also have an Earthly profession?"; "People of what professions are needed in space?"; "What is a definition of success for a cosmonaut? Whether you did or did not fly to space? What if you did not make it?"; "Do you have a pet at home? If yes, then who takes care of it when you are away?"; "Can you tell us when you are going to fly over Togliatti so we could see you and wave at you?"]*

At ~8:10am, Yuri & Mike linked up with TsUP stowage specialists via S-band to conduct the weekly IMS tagup, discussing inventory & stowage issues, equipment locations and cargo transfers.

At ~2:45pm, the ISS crew will have their regular weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. *[S/G-2 (Space-to-Ground 2) phone patch via SSC (Station Support Computer)].*

The ISS crew completed their physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (FE-1).

CEO (Crew Earth Observations) photo targets uplinked for today were Southwest Algeria Megafans (*nadir and near-nadir mapping swaths just right of track were requested for ~60 secs. Weather should have been clear over this repeat Saharan site. Two megafans, different in color, occupy the foot of low mountains. Their formative streams are only active during very occasional heavy storms [perhaps once per decade or longer]. The fans were laid down during prior humid climates, the last humid period being centered ~10,000 years ago. The megafans are analogs for features on Mars. Visual cues are major linear dunes located just left of track, and contorted rocks immediately beyond the target*), Central Algeria

Megafans (*northeast of the target above lies a complex of smaller fans, all right of track. Detailed images of these features were requested. Visual cues are linear dunes left of the target [north] and the smaller Tifernine dunes just beyond [southeast]*), and Mississippi Delta Region (*weather was predicted clear over the delta. Nadir pass to document coastal wetland recovery*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 5:55am EST [= epoch]):

Mean altitude -- 353.9 km

Apogee height -- 358.3 km

Perigee height -- 349.5 km

Period -- 91.62 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006484

Solar Beta Angle -- -38.8 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 50 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57547.

Significant Events Ahead (*all dates Eastern Time, some changes possible!*):

12/07/08 -- Progress M-65/30P reentry (after 3 weeks autonomous flight for geophysical experiments)

12/22/08 -- Russian EVA-21 (hatch opening ~7:15pm)

02/09/09 -- Progress M-01M/31P undocking & deorbit

02/10/09 -- Progress 32P launch

02/12/09 -- Progress 32P docking

02/12/09 -- STS-119/Endeavour/15A launch -- S6 truss segment

02/14/09 -- STS-119/Endeavour/15A docking

02/24/09 -- STS-119/Endeavour/15A undocking

02/26/09 -- STS-119/Endeavour/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress 32P undocking & deorbit

05/12/09 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

08/06/09 -- STS-128/Atlantis/17A -- MPLM (P), last crew rotation

08/XX/09 -- Progress/MRM2 (Mini Research Module, MIM2) on Soyuz

09/XX/09 -- H-IIB (HTV-1)
11/12/09 -- STS-129/Endeavour/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Endeavour/ULF4 – ICC-VLD, MRM1 (contingency)
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 12/04/08

All ISS systems continue to function nominally, except those noted previously or below. >>>Today is the Columbus laboratory's 300th day in orbit.<<<

At ~4:00am EST, TsUP-Moscow conducted the standard dynamic firing tests with the newly arrived Progress M-01M/31P, for which FE-2 Magnus (at ~2:55am) closed the protective science windows shutters in the JAXA JPM (Japanese Pressurized Module) and US Lab. Electrical integration of 31P systems into the ISS RS (Russian Segment) was successfully tested yesterday. *[The tests, which also checked ISS roll control (31P being radially docked at the DC1 Docking Compartment), were successful. For the firings, ISS attitude control authority was handed over to RS MCS (Russian Segment Motion Control System) at 3:40am and returned to US CMG (Control Moment Gyroscope) Momentum Management at 5:48am. The DPO-B (Approach & Attitude Control) thruster tests, intended to check 31P's full integration into the ISS steering logic and ensure thruster functionality on both manifolds in providing attitude control, reboots and DAMs (debris avoidance maneuvers), did not require any powerdowns. They are also used to determine which thruster manifold, of two jets each, will be considered the primary one for reboots and DAMs. Later, Lab & JPM science window shutters were opened again.]*

Afterwards, FE-2 Magnus powered down and stowed the IWIS (Internal Wireless Instrumentation System) sensors which were used to take structural dynamics measurements during the thruster firings.

In the SM (Service Module), FE-1 Lonchakov continued the outfitting & setting up of SUBA/Onboard Equipment Control System and SBI/Onboard Data Measuring & Storage System instruments with the new BSK-5V/Power Switch Assembly 5V (Blok cilovoiv kommutatsii-5V) for the upcoming Russian experiment IMPULSE, delivered on 31P. CDR Fincke assisted later with the mating of the instrument components to the BITS2-12/Onboard Telemetry Measurement System.

[IMPULSE, along with the new experiment OBSTANOVKA (Environment), will be

using ionosphere probes and a pulsed plasma source for making scientific measurements of ionosphere parameters and plasma-wave characteristics.]

As a relatively new regular activity after deactivation/reactivation of the BITS1-12 and VD-SU control mode, Yuri then checked the BRI Smart Switch Router computer and its new Ethernet connection to assess any impact of these activities on Ethernet comm. *[BRI is part of the RS OpsLAN (Operations Local Area Network), with connections to the three SSC clients, the Ethernet tie-in with the US network, and a network printer in the RS.]*

CDR Fincke continued his work on the WRS (Water Recovery System), connecting the UPA (Urine Processing Assembly) Compressor-M's power cable to the EXPRESS Rack and starting the filling of the WSTA (Water Storage Tank Assembly) with pretreated urine from EDV-U container for processing.

Sandra Magnus set up the camcorder equipment for taking video of herself performing her first session of the general U.S. MedOps PFE (Periodic Fitness Evaluation) program on the CEVIS (Cycle Ergometer with Vibration Isolation), filmed via VTR (Video Tape Recorder) by Mike Fincke who assisted as CMO (Crew Medical Officer). *[The footage was downlinked afterwards for biomechanical evaluation of the exercising crewmember and assessment of the on-orbit setup of equipment during data collection and hardware status.]*

In preparation for tomorrow's scheduled ESP-3 (External Stowage Platform 3) relocation from the MCAS (Mobile Base System [MBS] Common Attachment System) to the zenith side of the P3 truss element UCCAS (Unpressurized Cargo Carriers Attachment System), Mike Fincke & Sandy Magnus conducted the usual one-hour review of DOUG (Dynamic Onboard Ubiquitous Graphics) software. *[The SSRMS (Space Station Remote Manipulator System) was "walked" yesterday by ground commanding to the MBS PDGF-4 (Power & Data Grapple Fixture 4), then released its other end at the Node-2 PDGF and maneuvered into position for today's MT (Mobile Transporter) translation to WS-7 (Worksite 7), performed by ground control at 11:40am-1:10pm. Tomorrow, Mike & Sandy will relocate the ESP-3 (External Stowage Platform 3) from the MBS MCAS to its permanent place on the P3 truss.]*

The FE-2 received great kudos from the HTV (H-II Transfer Vehicle) team at the SSIPC (Space Station Integration & Promotion Center) at Tsukuba/Japan for completing all planned PROX HCP (Hardware Command Panel) functional checks yesterday, in one day.

In the US A/L (Airlock), the CDR set up EMUs (Extravehicular Mobility Units) #3004 & #3005 with their SCUs (Service & Cooling Umbilicals) and initiated the standard

one-hour scrubbing process on the spacesuits' cooling water loops, filtering ionic and particulate matter (via a 3-micron filter), then reconfigured the cooling loops and started the ~2hr biocide filtering. Scrubbing termination, disassembly of the EMU water processing kit and stowing the equipment followed. *[Loop scrubbing, incl. iodination of the LCVGs (Liquid Cooling & Ventilation Garments) for biocidal maintenance, is done to eliminate any biomass and particulate matter that may have accumulated in the loops.]*

Magnus completed the weekly 10-min. CWC (Contingency Water Container) inventory as part of on-going WRM (Water Recovery & Management) assessment of onboard water supplies. Updated "cue cards" based on the crew's water calldowns are sent up every other week. *[The new card (18-0006F) lists 38 CWCs (1,302.2 L total) for the four types of water identified on board: technical water (688.9 L, for Elektron electrolysis), potable water (530.4 L, incl. 174.6 L currently off-limit because of Wautersia bacteria), condensate water (36.2 L), waste/EMU dump and other (46.7 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]*

CDR Fincke's first run with the MedOps experiment WinSCAT (Spaceflight Cognitive Assessment Tool for Windows), originally hard-scheduled for today, was moved to Mike's discretionary "job jar" task list. *[WinSCAT is a monthly laptop-based time-constrained questionnaire test of cognitive abilities, routinely performed by astronauts aboard the ISS every 30 days before or after the PHS (periodic health status) test or on special CDR's, crewmembers or flight surgeons request. The test uses cognitive subtests that measure sustained concentration, verbal working memory, attention, short-term memory, spatial processing, and math skills. The five cognitive subtests are Coding Memory - Learning, Continuous Processing Task (CPT), Match to Sample, Mathematics, and Coding Delayed Recall. These WinSCAT subtests are the same as those used during NASA's long-duration bed rest studies.]*

Sandy performed the periodic status check on the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) payload, located in the ER-2 (EXPRESS Rack 2).

The FE-2 also completed the routine daily servicing of the SM's SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

Later, Sandy had an hour to herself for general orientation (station familiarization &

acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residence, if she/he chooses to take it.

The ISS crew completed their physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2/PFE), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (FE-1).

At ~1:20pm EST, CDR Fincke powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, & power supply) and conducted, at 1:25pm, a ham radio session with Quispamsis Elementary/Middle School, Quispamsis, New Brunswick, Canada. *[Sessions providing information on topics directly related to the ARISS (Amateur Radio on ISS) have been made available to the student body and staff by various mentors. Coordination with the Education Office of the Canadian Space Agency has resulted in a variety of materials being made available. Future plans with the CSA include a visit from an Agency representative to both participating Schools. On a much lighter note, a QMS dance planned for the same week as the contact will have a "space" theme. It was expected that 500 students as well as staff from both schools, parents and friends were to be in attendance during the contact. Representatives from the School District and three of Government (Municipal, Provincial and Federal) were invited. Media coverage was expected to include Regional and National outlets for radio, television and press. Questions to Mike were uplinked beforehand. "Does it take a lot of physical effort to live and work in microgravity?"; "What is the best part of your job?"; "Was there anyone or anything that inspired you to become an Astronaut?"; "Can you describe one experiment that is going on in the Space Station?"; "What does it feel like in space?"; "What do you do with any free time that you have?"; "Do you think Astronauts will go to Mars?"; "At night can you see lights on Earth?"; "What is it you hear and see during a space walk?"; "What have you found to be the most difficult task to perform in space?"; "How is Dexter performing?"]*

At ~2:15pm EST, the ISS crew held its weekly teleconference with ISS Program Management at JSC/Houston via Private S/G2, S-band/audio.

CEO (Crew Earth Observations) photo targets uplinked for today were **Lake Poopo, Bolivia** *(ISS had a nadir pass over this lake. It lies in the transitional climate between permanent Lake Titicaca to the north and the usually dry salt lakes Uyuni and Coipasa to the south. Poopo's water levels respond to El Niño events in an opposite sense to coastal Peru: they drop when El Niño events occur and slowly rise in the years between El Niños. It is time to document the status of the lake again),* **Mauna Loa Volcano, Hawaii** *(looking just right of track for this and the next target, both on the big island of the Hawaiian chain where weather was predicted*

*clear. Mauna Loa is among Earth's most active volcanoes, having erupted 33 times since the first well-documented historical eruption of 1843. Its most recent eruption was in 1984. "Mauna Loa" means "Long Mountain," an appropriate name since the visible part of the volcano stretches for about 120 km from the southern tip of the island to the coastline near Hilo), and **Kilauea Volcano, Hawaii** (looking further right, just beyond Mauna Loa. Detailed images were requested).*

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:37am EST [= epoch]):

Mean altitude -- 354.0 km

Apogee height -- 358.2 km

Perigee height -- 349.7 km

Period -- 91.62 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006347

Solar Beta Angle -- -33.9 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude gain in the last 24 hours -- 8 m (31P thruster firings)

Revolutions since FGB/Zarya launch (Nov. 98) -- 57534.

Significant Events Ahead (*all dates Eastern Time, some changes possible!*):

12/07/08 -- Progress M-65/30P reentry (after 3 weeks autonomous flight for geophysical experiments)

12/22/08 -- Russian EVA-21

02/09/09 -- Progress M-01M/31P undocking & deorbit

02/10/09 -- Progress 32P launch

02/12/09 -- Progress 32P docking

02/12/09 -- STS-119/Endeavour/15A launch -- S6 truss segment

02/14/09 -- STS-119/Endeavour/15A docking

02/24/09 -- STS-119/Endeavour/15A undocking

02/26/09 -- STS-119/Endeavour/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress 32P undocking & deorbit

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

07/30/09 -- STS-128/Atlantis/17A -- MPLM (P), last crew rotation

10/15/09 -- STS-129/Endeavour/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Endeavour/ULF4 – ICC-VLD, MRM1 (contingency)
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 12/03/08

All ISS systems continue to function nominally, except those noted previously or below.

Before morning inspection and breakfast, FE-1 Lonchakov terminated his third experiment session for the long-term Russian sleep study MBI-12/SONOKARD, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

For today's WRS (Water Recovery System) sample analysis, FE-2 Magnus performed the TOCA (Total Organic Carbon Analyzer) software loading with an updated release, delayed from yesterday by incorrectly configured files on the USB drive. The correct files were uplinked last night.

Subsequently, CDR Fincke and Magnus collected potable water samples from the WPA (Water Processing Assembly) and PWD (Potable Water Dispenser) via H₂O transfer common hose, which Mike then analyzed in the TOCA, with Sandy later recording the data.

Afterwards, Fincke temporarily disconnected the WPA tank and instead connected the WRS to the Lab condensate tank, in order to conduct extensive leak checks on the WRS-1 & WRS-2 racks. Later, Mike switched the hose back from the Lab condensate tank to the WPA.

As part of his regular physical fitness evaluation, FE-1 Lonchakov undertook the Russian MO-5 MedOps protocol of cardiovascular assessment during graded physical load on the VELO cycle ergometer, his first, assisted by his Fincke CMO (Crew Medical Officer). *[The assessment uses the Gamma-1 ECG equipment with biomed harness, skin electrodes and a blood pressure and rheoplethysmograph cuff wired to the cycle ergometer's instrumentation panels. Measurements were telemetered down via VHF to RGS (Russian Groundsite) during a comm window at 5:25am EST (DO1). For the graded-load exercise, the subject works the pedals after a prescribed program at load settings of 125, 150, and 175 watts for three minutes each. Data output involves a kinetocardiogram, rheoplethysmogram, rheoencephalogram and a temporal pulsogram.]*

Sandy Magnus continued the critical HCP C/O (Hardware Command Panel checkout) activity in the US Lab for the JAXA HTV (H-II Transfer Vehicle) PROX (proximity) space-to-space communication system which she ran in onboard test mode yesterday. Today the C/O was linked to with the Tanegashima ground station (GS) in Japan, with Sandy's actual HCP commands expected to be received at the GS. *[The HCP is part of the PROX system, mostly located in the ICS rack, consisting also of a PROX antenna, a PROX-GPS (Global Positioning System) antenna, and PROX comm equipment for the HTV. When the HTV approaches the ISS, the external PROX antenna, which contains GPS receivers, will initiate communications with the HTV. The ISS orbital location and speed are immediately relayed to the HTV through the PROX. At the same time, data from the HTV are relayed to the ISS. In addition, the antenna relays commands sent from the ground to the HTV.]*

For the upcoming Russian experiment IMPULSE, Yuri Lonchakov performed the first part of an extensive routing & cabling of SUBA Onboard Equipment Control System and SBI Onboard Data Measuring & Storage System instruments in the SM (Service Module), today unstowing the BSK-5V (Power Switch Assembly 5V, Blok cilovoiy kommutatsii-5V) components and readying the commutator for tomorrow's outfitting and connecting.

Lonchakov conducted the periodic data collection on the long-term BIO-5 Rasteniya-1 ("Plants-1") experiment, copying data from its built-in control computer to a PCMCIA memory card for subsequent downlink to the ground via OCA. The regular periodic equipment status check was listed for today on the Russian discretionary "as time permits" task list. *[Rasteniya-1 researches growth and development of plants under spaceflight conditions in the LADA-14 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). The payload hardware includes a module (MIS/Module for the Investigation of Substrates), the MIS control unit (BU), a nitrogen purge unit (BPA) and other accessories. During its*

operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. LADA consists of a wall-mounted growth chamber that provides long-term, ready access for crewmember interaction. It provides light and root zone control but relies on the cabin environmental control systems for humidity, gas composition, and temperature control. Cabin air is pulled into the leaf chamber, flows over the plants and vents through the light bank to provide both plant gas exchange and light bank cooling.]

The FE-1 also replaced procedures pages in RODF (Russian Operations Data File) books with updates delivered on Progress 31P. *[Changes involve the books on Medical Experiments (ME), Technical Experiments (TE), Scientific Experiments (NE), Progress M-01M/31P Transfer Ops. (new book replacing the old), RS EVA (2 new books), one ODF DVD disk with EVA-21 training video, and two ODF CD-ROM disks.]*

The US SODF (Systems Operations Data File) Medical Checklist book was updated by Magnus with P&I (Pen & Ink) changes.

Michael Fincke performed the periodic battery replacement in the prime CSA-CP (Compound Specific Analyzer-Combustion Products, #1045) unit.

In the US Airlock (A/L), the CDR then initiated the 85-day maintenance cycle on the first two EMU (Extravehicular Mobility Unit) batteries (#2074, #2075) in BCM3 (Battery Charger Module 3) and BCM4 in the US Airlock. The 16-Volt discharge takes ~13 hrs. *[The periodic battery maintenance consists of fully discharging and then recharging the storage units to prolong their useful life. After end of the maintenance cycle, Mike will restore the SSC (Station Support Computer) laptop, which is used in DOS mode for the automated discharge procedure, to nominal ops. In the early ISS years, these battery discharges/recharges had to be done manually.]*

In the A/L “bake-out” oven, Fincke also started the regeneration of the used METOX (Metal Oxide) CO₂ absorption canisters #0007 & #0011.

Yuri completed the routine daily servicing of the SM's SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

The FE-1 also conducted the periodic checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the passageways SM PrK (Service Module Transfer Compartment)–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, and FGB GA–Node-1.

The regular daily IMS (Inventory Management System) maintenance task was also performed by Lonchakov by updating/editing the IMS standard “delta file” including stowage locations for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

In the COL (Columbus Orbital Module), FE-2 Magnus collected the equipment required for the subsequent software upgrade of the EDR (European Drawer Rack) laptop and performed the upgrade to Release 2.0.7, in three consecutive parts, mostly done without requiring continuous crew presence.

Afterwards, Sandy worked on troubleshooting the Ethernet connectivity of the MMA MLT (Microgravity Measurement Apparatus/MMA Laptop) in the Kibo JPM (Japanese Pressurized Module). *[MMA activities were aborted by the inability of the MLT to communicate via the PEHG (Payload Ethernet Hub Gateway). Troubleshooting was to include disconnecting & reconnecting the LAN cable and rebooting the MLT.]*

Fincke & Magnus completed the regular monthly session (their first) of the CHeCS (Crew Health Care Systems) emergency medical operations OBT (On-Board Training) drill, a 30-min. exercise to refresh their CMO (Crew Medical Officer)’s acuity in a number of critical health areas. The proficiency drills today focused on eye treatment. *[The HMS (Health Maintenance Systems) hardware, including ACLS (Advanced Cardiac Life Support) equipment, may be used in contingency situations where crew life is at risk. To maintain proficiency, crewmembers spend one hour per month reviewing HMS and ACLS equipment and procedures via the HMS and ACLS CBT (computer-based training). The training drill, each crewmember for him/herself, refreshes their memory of the on-orbit stowage and deployment locations, equipment etc. and procedures.]*

The new E-18 crewmember, Sandra Magnus, guided by CDR Fincke, performed a mandatory one-hour refresher OBT, i.e., an emergency equipment location & status drill for the case of rapid cabin depressurization, with Russian, US, European & Japanese specialists standing by at their control centers for crew questions or comments. The rule is that the emergency egress exercise should be performed by every new station crewmember once within seven days after departure of the previous crew. *[Background: Purpose of the drill is to (a) familiarize the new station resident with the location of hardware and the positions of valves used in*

emergency situations, (b) familiarize the crewmember with the egress route to the Soyuz, (c) practice crew emergency joint activities, and (d) identify crew comments and suggestions that arise during training regarding crew procedures and equipment. The full crew participates in the Soyuz checks, which are led by the Soyuz CDR (Lonchakov). After the Soyuz checks, the ISS CDR and the FE-2 proceeded with the remaining steps in the US Lab, Node-1, Node-2, COL and the two Kibo modules. The exercise was topped off by a thorough debrief with the ground via S-band. For the case of an onboard fire and for emergency descent, there are other mandatory emergency drill OBTs.]

In preparation for upcoming sample stowage, the FE-2 followed up on yesterday's ICEPAC insertion into MELFI (Minus-Eighty Laboratory Freezer for ISS) by retrieving two additional -32degC ICEPAC belts from stowage and inserting them into Dewar 1/Tray A, Sections 3 & 4.

Lonchakov spent another ~2 hrs on Progress 31P unloading, keeping track of moves & locations in the IMS and guided by an uplinked transfer list. *[Equipment delivered by the cargo ship include food containers, a new BKO multifiltration unit, five fresh BK-3M oxygen bottles for Orlan-M EVAs, a MNR separator pump, a new AK-1M air sampler kit, personal oral hygiene articles (SLG), a BPK condensate feed unit & its control panel, a Penguin-3 suit, an electrical stimulation suit, ASU toilet inserts, etc.]*

Sandy had an hour to herself for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residence, if she/he chooses to take it.

The ISS crew completed their physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

A new addition to the US discretionary "job jar" task list for FE-2 Magnus today was a run with the MedOps experiment WinSCAT (Spaceflight Cognitive Assessment Tool for Windows), her first onboard session, by logging in on the MEC (Medical Equipment Computer) laptop and performing the psychological evaluation exercise on the laptop-based WinSCAT application. *[WinSCAT is a monthly time-constrained questionnaire test of cognitive abilities, routinely performed by astronauts aboard the ISS every 30 days before or after the PHS (periodic health status) test or on special CDR's, crewmembers or flight surgeons request. The test uses cognitive subtests that measure sustained concentration, verbal working memory, attention, short-term memory, spatial processing, and math skills. The five cognitive subtests are Coding Memory - Learning, Continuous Processing Task*

(CPT), Match to Sample, Mathematics, and Coding Delayed Recall. These WinSCAT subtests are the same as those used during NASA's long-duration bed rest studies.]

ESP-3 Relocation Lookahead: Return of the External Stowage Platform 3 from its current (temporary) location on the MBS (Mobile Base System) to the zenith side of the P3 truss with the SSRMS (Space Station Remote Manipulator System) is planned for 12/5 (Friday).

CEO (Crew Earth Observations) photo targets uplinked for today were **Southwest Algeria Megafans** (*nadir and near-nadir mapping swaths were requested for ~60 secs. over this large site. Two megafans ["inland deltas"]—one very large at 320 km radius—shows obvious radiating surface streams. The fans were laid down by rivers that flowed west out of local mountains when climates were wetter 5–15,000 years ago. These huge sediment masses have only recently been identified in this remotest part of the Sahara Desert. They are an analog for parts of Mars where enormous quantities of layered, apparently river-laid sediment, occur [especially in the high-interest area, Sinus Meridiani, where the rover Opportunity is still functioning]. Sediment has buried the base of hills along the northeast side of the megafan in a way that simulates buried Martian impact craters. Visual cues are major linear dunes located to the NW, and contorted rocks immediately east), and **Central Algeria Megafans** (*northeast of the target above lies a complex of smaller fans, all right of track. Understanding details of these complex patterns will allow more sophisticated modeling of sedimentary layers on Mars [underway]).**

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:31am EST [= epoch]):
Mean altitude -- 353.9 km
Apogee height -- 358.5 km
Perigee height -- 349.4 km
Period -- 91.62 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0006711
Solar Beta Angle -- -28.9 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.72
Mean altitude loss in the last 24 hours -- 94 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 57518.

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):
12/07/08 -- Progress M-65/30P reentry (after 3 weeks autonomous flight for

geophysical experiments)

12/17/08 -- Progress M-01M/31P thruster firing (test with Soyuz docked at SM aft);

12/18/08 -- Russian EVA-21

02/09/09 -- Progress M-01M/31P undocking & deorbit

02/10/09 -- Progress 32P launch

02/12/09 -- Progress 32P docking

02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment

02/14/09 -- STS-119/Endeavour/15A docking

02/24/09 -- STS-119/Endeavour/15A undocking

02/26/09 -- STS-119/Endeavour/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress 32P undocking & deorbit

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

07/30/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation

10/15/09 -- STS-129/Endeavour/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A – MPLM(P)

04/08/10 -- STS-132/Endeavour/ULF4 – ICC-VLD, MRM1 (contingency)

05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 12/02/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Fincke, FE-1 Lonchakov & FE-2 Magnus began their workday before breakfast with the periodic session of the Russian biomedical routine assessments PZEH-MO-7/Calf Volume Measurement & PZEH-MO-8/Body Mass Measurement, using the IM mass measurement device which Yuri broke down afterwards for stowage. *[Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference points, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures. For determining body mass in zero-G, where things are weightless but not massless, the Russian IM "scales" measure the inertial forces that arise during the oscillatory motion of a mass driven by two helical metering springs with known spring constants. By measuring the time period of each oscillation of the unknown mass (the crewmember) and comparing it to the period of a known mass, the crewmember's mass is calculated by the computer and displayed.]*

FE-2 Magnus ended her FD15 (Flight Day 15) session with the NASA/JSC experiment NUTRITION w/Repository, her first, by collecting a final urine sample upon wakeup for storage in the MELFI (Minus-Eighty Laboratory Freezer for ISS). The sampling kit was then stowed away. Sandra's next activity with this experiment will be the FD30 session. *[The current NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

For the second checkout for the JAXA HTV (H-II Transfer Vehicle) PROX space-to-space communication system, the FE-2 connected the drag-thru cable and powered up the PROX system at the ICS (Inter-orbit Communication System) rack, then set up the HCP (Hardware Command Panel) in the US Lab for a functional selfcheck by pressing buttons and checking responses. *[The checkout was then performed again from the ground during overflight of the Japan ground station at Tanegashima. The HCP is part of the PROX system, mostly located in the ICS rack, consisting also of a PROX antenna, a PROX-GPS (Global Positioning System) antenna, and PROX comm equipment for the HTV (H-II Transfer Vehicle). When the HTV approaches the ISS, the external PROX antenna, which contains GPS receivers, will initiate communications with the HTV. The ISS orbital location and speed are immediately relayed to the HTV through the PROX. At the same time, data from the HTV are relayed to the ISS. In addition, the antenna relays commands sent from the ground to the HTV.]*

CDR Fincke had ~4:45 hrs set aside for installing the new WHC (Waste & Hygiene Compartment) rack in the Lab and configuring it for activation, in two parts, separated by a rest period for lunch.

FE-1 Lonchakov spent ~4 hrs on Progress 31P unloading and keeping track of moves & locations in the IMS (Inventory Management System), guided by an uplinked transfer list. *[Equipment delivered by the cargo ship include food containers, a new BKO multifiltration unit, five fresh BK-3M oxygen bottles for Orlan-M EVAs, a MNR separator pump, a new AK-1M air sampler kit, personal oral hygiene articles (SLG), a BPK condensate feed unit & its control panel, a Penguin-3 suit, an electrical stimulation suit, ASU toilet inserts, etc.]*

Yuri also launched Part 2 of the MAI-75 experiment by activating the hardware during overflight of receiving stations and later turning it off again. *[MAI-75 is essentially a Kenwood amateur radio station with special VS-N1 (Visual Communicator) gear for downlinking photographic images in SSTV (Slow Scan Television) mode. The payload, which is run in automatic mode until the hardware is deactivated, is named after the renowned Moscow Aviation Institute (MAI) and its 75th anniversary, whose reputation is based on the large number of famous aviators and rocket scientists that received their academic education here. Among the alumni are Academicians and Corresponding Members of the Russian Academy of Sciences. Over 100 General and Chief Designers earned their degree at MAI, with famous rocket scientists like Makeyev, Mishin, Nadiradze and Yangel. MAI also fostered 20 Pilot-Cosmonauts, almost 100 famous test pilots, Heroes of the Soviet Union and Russia. The amateur radio (ham) equipment aboard the ISS for downlinking SSTV imagery is an MAI product.]*

One of the more pleasant jobs for Sandy today had to be her feeding the butterflies

in their Butterfly Habitat of the CGBA-5/CSI-3 (Commercial Generic Bioprocessing Apparatus Science Insert 3). *[This involved powering down and decabling the payload, sliding it out of its stowage locker and pulling a knob in its interior to expose nectar to the butterflies. The steps were then reversed and the payload powered up again.]*

Inside the Progress 31P, CDR Mike Fincke meanwhile unstowed a bag with new PCBA (Portable Clinical Blood Analyzer) cartridges bag with two measurement pouches, which he then inserted in the MELFI (Minus-Eighty Laboratory Freezer for ISS) for the upcoming SOLO (Sodium Loading in Microgravity) experiment which calls for blood and urine samples.

In preparation for the upcoming sample stowage, the FE-2 also prepared the MELFI by retrieving two -32deg ICEPAC belts from stowage and inserting both into Dewar 1/Tray A, Sections 1 & 2.

Magnus finished her VolSci (Voluntary Science) session with the CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS) experiment, started yesterday, by wrapping up its 24-hr heart rate data collection. *[After doffing the HM2 (Holter Monitor 2) equipment with its six electrode leads and two CCISS Actiwatches, Sandy downloaded their accumulated data to the HRF2 (Human Research Facility 2) PC2 laptop, then stowed the equipment.]*

Afterwards, the FE-2 went on a search for two CTBs (Cargo Transfer Bags, #1002, #1313) and did locate them in the back of an overhead storage space in the Kibo JPM.

In the COL (Columbus Orbital Laboratory), Sandy relocated BIOLAB syringe equipment.

Yuri Lonchakov completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module).

[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

FE-2 Magnus performed the planned TOCA (Total Organic Carbon Analyzer) software upgrade with improved parameters based on a previous downlink, by installing a USB drive, then transferring the new data and finally rebooting TOCA, now ready for sample analysis.

The three crewmembers completed the monthly session (their first) of the CHeCS (Crew Health Care Systems) emergency medical operations OBT drill, a 30-min.

exercise (+30 min. for pen & ink procedures updates) to refresh their CMO (Crew Medical Officer)'s acuity in a number of critical health areas. The proficiency drill today focused on CPR (cardiopulmonary resuscitation), specifically on tracheal intubation. *[The HMS (Health Maintenance Systems) hardware, including ACLS (Advanced Cardiac Life Support) equipment, may be used in contingency situations where crew life is at risk. To maintain proficiency, crewmembers some time each month reviewing HMS and ACLS equipment and procedures via the HMS and ACLS CBT (computer-based training). The training drill, each crewmember for him/herself, refreshes their memory of the on-orbit stowage and deployment locations, equipment etc. and procedures.]*

VolSci Program Preview: For the weekend of 12/6 & 12/7, Mike and Sandy were offered three choices for the Voluntary Weekend Science program: (1) JAXA Marangoni Clean Up (Part 1 of 2) of Silicone Oil inside the Marangoni Experiment Cell; (2) ESA Video Lesson ESA - 1 (VLE-1) - "Design elements that improve living/working", demonstrating how effective industrial design can help overcome the living/working problems on the ISS; and (3) Video Lesson ESA – 1 (VLE-1) - "An ordinary meal", highlighting the different ways of eating during the day, focusing on a solitary and ordinary breakfast during a working day on the ISS.

FE-2 Magnus had an hour to herself for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residence, if she/he chooses to take it.

The ISS crew completed their physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-2, FE-1), and VELO bike with bungee cord load trainer (FE-1).

The crew had their periodic PMCs (Private Medical Conferences) via S- & Ku-band audio/video, Sandy at ~10:25am, Yuri at ~10:40am, and Mike at ~1:25pm EST.

At ~4:00pm, the ISS crew will have their regular weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. *[S/G-2 (Space-to-Ground 2) phone patch via SSC (Station Support Computer)].*

At ~4:20pm, just before sleep time, Yuri will set up the Russian MBI-12 SONOKARD (Sonocard) payload and start his third experiment session, using a sports shirt from the SONOKARD kit with a special device in the pocket for testing a new method for acquiring physiological data without using direct contact on the skin. Measurements are recorded on a data card for return to Earth.

[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2)

systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]

CEO (Crew Earth Observations) photo targets uplinked for today were Sao Paulo-Rio de Janeiro Aerosol (*looking right for possible smog plumes blowing offshore from these great cities. Smog is visible best against the sea as background. Views outside the glint disc are preferred and views through possible scattered cumulus are useful*), and Ouarkiz Impact Crater, Algeria (*evening light should be strong enough to see this almost completely circular 3.5 km-diameter structure, but also to reveal much detail. Looking left of track just within the dark ranges of the Atlas Mt. foothills*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 11:12am EST [= epoch]):

Mean altitude -- 354.0 km

Apogee height -- 358.4 km

Perigee height -- 349.7 km

Period -- 91.62 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006479

Solar Beta Angle -- -24.0 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 27 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57504.

Significant Events Ahead (*all dates Eastern Time, some changes possible*.):

12/07/08 -- Progress M-65/30P reentry (after 3 weeks autonomous flight for geophysical experiments)

12/17/08 -- Progress M-01M/31P thruster firing (test with Soyuz docked at SM aft);

12/18/08 -- Russian EVA-21

02/09/09 -- Progress M-01M/31P undocking & deorbit

02/10/09 -- Progress 32P launch

02/12/09 -- Progress 32P docking

02/12/09 -- STS-119/Endeavour/15A launch -- S6 truss segment

02/14/09 -- STS-119/Endeavour/15A docking

02/24/09 -- STS-119/Endeavour/15A undocking

02/26/09 -- STS-119/Endeavour/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress 32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/27/09 -- Soyuz TMA-15/19S launch
Six-person crew on ISS
07/30/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation
10/15/09 -- STS-129/Endeavour/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Endeavour/ULF4 – ICC-VLD, MRM1 (contingency)
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 12/01/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 6 of Increment 18. The ISS crewmembers, CDR Michael Fincke, FE-1 Yuri Lonchakov and FE-2 Sandra Magnus, are back on their regular wake/sleep cycle (1:00am – 4:30pm EST).*

STS-126/Endeavour returned to Earth last night after 15d 20h 29m in space, i.e., the longest Shuttle mission to ISS so far, touching down at Edwards Air Force Base, California, on the first opportunity at 4:25pm EST, after 250 orbits & 6.6 million miles. Gregory Chamitoff's total time in space is 183d 22m (178d 23h 50m on board ISS). *[It was the 124th flight of a Space Shuttle, the 27th Shuttle mission to visit the station, the 22nd for Endeavour and the 52nd Shuttle landing at Edwards.]*

As part of the crew's regular morning inspection tour, FE-1 Lonchakov conducted the routine checkup of DC1 (Docking Compartment) circuit breakers and fuses. *[The monthly checkup in the "Pirs" module looks at AZS circuit breakers on the BVP Amp Switch Panel (they should all be On) and the LEDs (light-emitting diodes) of 14 fuses in fuse panels BPP-30 & BPP-36.]*

The crew performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the SM (Service Module) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

As part of the house cleaning, Yuri conducted regular maintenance inspection & cleaning on fan screens in the FGB (TsV2), DC-1 (V3) and SM (VPkhO, VPrK, FS5, FS6 & FS9).

First activity this morning for FE-2 Magnus was to start on her Flight Day 15 (FD15) session with the NASA/JSC experiment NUTRITION w/Repository. This was an all-day session, the first for Sandy, of collecting urine samples several times for 24 hrs, to continue through first void tomorrow morning. *[After performing phlebotomy with the help of CDR Fincke, i.e., drawing blood samples (from an arm vein), the samples were first allowed to coagulate in the Repository for 20-30 minutes, then spun in the HRF RC (Human Research Facility/Refrigerated Centrifuge) and finally placed in MELFI (Minus-Eighty Laboratory Freezer for ISS). No thruster activity was allowed during the blood drawing. The RC was later powered off after a temperature reset to limit wear on the compressor, and cleaned. The NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by supercold MELFI dewars), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

In preparation for an upcoming software update, Fincke relocated the TOCA (Total Organic Carbon Analyzer) USB drive to the SSC-7 laptop.

Both Magnus and Fincke took on VolSci (Voluntary Science) activities today: The FE-2, who had chosen CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS) for her VolSci option, started out by changing out the UltraBay drive of the HRF2 (Human Research Facility 2) PC2 laptop. Sandy then began her first 24-hr. on-orbit session with the CCISS experiment (with Mike acting as operator and photographer) by donning the HM2 (Holter Monitor 2) and the CBPD (Continuous Blood Pressure Device), performing the Baro Study, and starting the 24-hr passive heart rate data collection. Data are recorded on a PCMCIA memory card, with the HRF (Human Research Facility) rack laptop for control. Equipment doffing and stowage is scheduled tomorrow after the 24-hr period, followed by data downlink on Wednesday. *[CCISS studies the effects of long-duration spaceflight on crewmembers' heart functions and their blood vessels that supply the brain (= "cerebrovascular"). Learning more about the changes in cardiovascular & cerebrovascular systems in zero-G could lead to specific countermeasures that might better protect future space travelers. For the Baro study of CCIS, heart rate and blood pressure are being recorded for resting and timed breathing for 5 min, with no caffeine or food (water is acceptable) allowed two hours before the start of the Baro Study and no exercise prior to the Baro Study.]*

For his own VolSci selection, a Phase 2 sampling session with the LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System), CDR Fincke

reviewed an OBT (Onboard Training) brief, then completed sampling/swabbing at two different sites in the COL (Columbus Orbital Module), using the Glucan LAL Cartridges which specifically detect the fungal cell wall molecule “glucan”.

[LOCAD uses small, thumb-sized “microfluidic” cartridges that are read by the experiment reader. The cartridges contain dried extract of horseshoe crab blood cells (LAL/Limulus amebocyte lysate) and colorless dye. LAL tests are used for the detection and quantification of bacterial endotoxins: in the presence of the bacteria, the dried extract reacts strongly to turn the dye a green color. Therefore, the more green dye, the more microorganisms there are in the original sample. Glucans are complex carbohydrate (sugar, D-glucose) macromolecules. The handheld device tests this new analysis technology by sampling for the presence of gram negative bacteria in the sample in about 15 minutes, showing the results on a display screen. Background: Lab-on-a-Chip technology has an ever-expanding range of applications in the biotech industry. Chips are available (or in development) which can also detect yeast, mold, and gram positive bacteria, identify environmental contaminants, and perform quick health diagnostics in medical clinics. The technology has been used to swab the MERs (Mars Exploration Rovers) for planetary protection. With expanded testing on ISS, began by Sunita Williams in March/April last year, this compact technology has broad potential applications in space exploration--from monitoring environmental conditions to monitoring crew health. The current study should prepare for long-duration exploration by demonstrating a system that enables the crew to perform biochemical analysis in space without having to return samples to Earth.]

In the newly arrived Progress M-01M/31P, docked at the DC1 nadir port, Lonchakov installed the LKT local temperature sensor switch (TA251M1B) of the BITS2-12 onboard telemetry system and its ROM/read-only memory unit (PZU TA765B), both kept in storage from an earlier vehicle.

Afterwards, Yuri performed the routine task of taking two photos of the internal part of the DC1 nadir port’s SSVP-StM docking cone, used for yesterday’s Progress TORU linkup. The pictures, which are necessary to refine the current understanding of docking conditions (particularly after the rare manual TORU docking), were then transferred to OCA for subsequent downlinking. *[The objective is to take photo imagery of the scratch or scuff mark left by the head of the active docking probe on the internal surface of the passive drogue (docking cone) ring, now rotated out of the passageway. As other crewmembers before him, the FE-1 used the Nikon D1X digital still camera to take two pictures each with the hatch closed down.]*

In the RS (Russian Segment), Lonchakov used CWC (Contingency Water

Container) #1069 for the periodic (about twice a month) replenishing of the Elektron oxygen generator's water supply for electrolysis, filling the KOV thermal loops' EDV container. Once filled, the EDV was connected to the BPK transfer pump for processing. *[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]*

The FE-1 also set up and activated the SSTV (Slow Scan TV) equipment for conducting the MAI-75 experiment, essentially a ham radio set-up with Kenwood VS-N1 (Visual Communicator) gear for downlinking photographic images. The experiment is run in automatic mode until the hardware is deactivated. *[The payload is named after the renowned Moscow Aviation Institute (MAI) whose reputation is based on the large number of famous aviators and rocket scientists that received their academic education here. Among the alumni are Academicians and Corresponding Members of the Russian Academy of Sciences. Over 100 General and Chief Designers earned their degree at MAI, with famous rocket scientists like Makeyev, Mishin, Nadiradze and Yangel. MAI also fostered 20 Pilot-Cosmonauts, almost 100 famous test pilots, Heroes of the Soviet Union and Russia. The amateur radio (ham) equipment aboard the ISS for downlinking SSTV imagery is an MAI product.]*

In JAXA's Kibo JPM (Japanese Pressurized Module), Sandy Magnus supported the new ICE CRYSTAL experiment, ground-commanded from the SSIPC (Space Station Integration & Promotion Center) at Tsukuba/Japan, by activating the MMA (Microgravity Measurement Apparatus) and its laptop (MLT), first powering up the MMA's NCU/RSU (Network Control Unit/Remote Sensor Unit) set from the Ryutai rack's UDC (Utility DC-to-DC Converter), then turning on both NCU/RSU and MLT. *[Sandy set up the SCOF (Solution Crystallization Observation Facility) for the ICE CRYSTAL (The Study on Microgravity Effect for Pattern Formation of Dendritic Crystal by a Method of in-situ Observation) payload on 11/27, the first of the JAXA Increment 18 experiments. It evaluates the factors that lead to pattern formation in ice crystals in microgravity. Tsukuba/SSIPC successfully completed optical adjustments of the payload by end of last week. During Increment 18, 105 runs (parameters) are planned, usually during crew sleep time to avoid microgravity disturbance. All activities except UDS/MMA on/off can be performed remotely by the ground.]*

The FE-1 collected the periodic readings of potentially harmful atmospheric contaminants in the SM, using the CMS (Countermeasure System), a component of the SKDS GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, today using preprogrammed microchips to measure for o-Xylol (1,2-Dimethylbenzol, C₈H₁₀) and Methyl-Mercaptan (Methanethiol, CH₄S).

Yuri also completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The ISS crew completed their physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-2, FE-1), and VELO bike with bungee cord load trainer (FE-1).

At ~3:00am EST, CDR Fincke powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, & power supply) and conducted, at 3:05am, a ham radio session with St Anthony's College, Shillong, India. *[St. Anthony's College is the Alma Mater of Mr. Rupesh Saikia, Mike Fincke's father-in-law. Founded in 1934 by Fathers of the Don Bosco Society, St. Anthony's is one of the oldest colleges in the North East India. The college is situated in Shillong, a picturesque hill station in India, considered as the 'Scotland of the East'. Since its humble beginning 74 years ago, the college has grown manifold in size and ranking. Today, it has 28 departments with 120 teaching staff, 60 support staff and over 2100 students, and is considered as a premier institute of education in the whole country of India. Students from the various states of the country as well as some foreign countries like Nepal, Bhutan, Bangladesh, Zambia etc. are studying here. Questions to Mike were uplinked beforehand. "Do you see any man-made objects like the Great Wall of China or the Pyramids etc from the ISS on earth?"; "How does the human body adjust the balance in outer space?"; "Do you notice any affect of pollution or climate change destroying the beauty of the earth?"; "What type of food do you eat and drink there?"; "What is it you miss most of the earth as you are out in the space?"; "What do you do when one of you get sick?"; "Do you make oxygen there? How do you breathe?"; "What happens when you are in space and the shuttle starts to malfunction?"; "How does it feel to come back into the earth's atmosphere?"; Can You say something in Assamese?"; "We came to know that you know several languages like Japanese, Russian etc. Do you want to learn some words of Khasi language, the language of our state?"]*

At ~2:30pm, the crewmembers are scheduled to convene for their standard bi-weekly teleconference with the JSC Astronaut Office (Steve Lindsey), via S-band S/G-2 audio & phone patch.

Working off the Russian discretionary "time permitting" task list, Lonchakov performed the regular status check on the Russian BIO-5 Rasteniya-1 ("Plants-1") experiment. *[Rasteniya-1 researches growth and development of plants under*

spaceflight conditions in the LADA-14 “greenhouse” from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). The payload hardware includes a module (MIS/ Module for the Investigation of Substrates), a MIS control unit (BU), a nitrogen purge unit (BPA) and other accessories. During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording.]

Remaining on Sandy’s voluntary “job jar” task list is to route a cable between the Node-2 and the HCP (Hardware Command Panel) in the JPM (but not yet mated since it is a hatch drag-thru line). *[The HCP is part of the PROX system, mostly located in the ICS (Inter-orbit Communication System) Rack, consisting also of a PROX antenna, a PROX-GPS (Global Positioning System) antenna, and PROX comm equipment for the HTV (H-II Transfer Vehicle). When the HTV approaches the ISS, the external PROX antenna, which contains GPS receivers, will initiate communications with the HTV. The ISS orbital location and speed are immediately relayed to the HTV through the PROX. At the same time, data from the HTV are relayed to the ISS. In addition, the antenna relays commands sent from the ground to the HTV.]*

Progress M-01M/31P Docking Update: Yesterday’s manual docking of 31P by Yuri Lonchakov with the TORU came about because of a computer malfunction. During the spacecraft’s final approach, at a range of 20-30m at ~7:22am EST, the Progress computer aborted the final approach and initiated a backout to Stationkeeping, also switching from Kurs-A Set 1 to Set 2. This left TsUP-Moscow with two options for completing the docking: (1) Re-initiating final approach in automated mode with the Kurs-A Set 2, or (2) directing the crew to take manual control via TORU. TsUP opted for the latter. The crew switched to TORU immediately and completed the docking manually at 7:28am. TsUP is investigating this anomaly and has not yet determined the root cause.

No CEO photo targets uplinked for today.

CEO photography can be studied at this “Gateway” website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 3:13am EST [= epoch]):

Mean altitude -- 354.1 km

Apogee height -- 358.4 km

Perigee height -- 349.8 km

Period -- 91.62 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006389

Solar Beta Angle -- -19.3 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 133 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57483.

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

12/07/08 -- Progress M-65/30P reentry (after 3 weeks autonomous flight for geophysical experiments)

12/17/08 -- Progress M-01M/31P thruster firing (test with Soyuz docked at SM aft);

12/18/08 -- Russian EVA-21

02/09/09 -- Progress M-01M/31P undocking & deorbit

02/10/09 -- Progress 32P launch

02/12/09 -- Progress 32P docking

02/12/09 -- STS-119/Endeavour/15A launch -- S6 truss segment

02/14/09 -- STS-119/Endeavour/15A docking

02/24/09 -- STS-119/Endeavour/15A undocking

02/26/09 -- STS-119/Endeavour/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress 32P undocking & deorbit

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

07/30/09 -- STS-128/Atlantis/17A -- MPLM (P), last crew rotation

10/15/09 -- STS-129/Endeavour/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A -- Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A -- MPLM(P)

04/08/10 -- STS-132/Endeavour/ULF4 -- ICC-VLD, MRM1 (contingency)

05/31/10 -- STS-133/Endeavour/ULF5 -- ELC3, ELC4 (contingency).

ISS On-Orbit Status 11/30/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – Progress docking day for CDR Fincke, FE-1 Lonchakov & FE-2 Magnus. Crew wake-up 3:00am; sleep 4:30pm EST. Ahead: Week 6 of Increment 18.*

Yest kasaniye! At 7:28am EST, Progress M-01M (31P) docked smoothly at the DC1 (Docking Compartment) nadir port under manual TORU control by Lonchakov & Fincke, followed by a final DPO post-contact thrusting burn, docking probe retraction and hook closure (“sborka”) after motion damp-out, while the ISS was in free drift for ~20 min. At “hooks closed” signal, the SM (Service Module) returned to active attitude control, maneuvering the ISS to LVLH TEA (local vertical/local horizontal Torque Equilibrium Attitude). Control authority returned to US Momentum Management at ~8:55am. *[Launched on 11/26 (7:38am EST), the cargo vehicle took two days longer than usual for the flight to the ISS to allow enough checkout time for its new avionics. The 7288-kg (16,070-lb) mass cargo drone delivered 2676 kg (5,900 lb) of various supplies to the ISS, including 28 kg (62 lb) oxygen, 21 kg (46 lb) air, 185 kg (408 lb) water, 296 kg (653 lb) food, 1,120 kg (2469 lb) propellant (for ISS needs), 321 kg (708 lb) US items, 171 kg (377 lb) sanitary & hygienic items, 19 kg (42 lb) fire-protection items, 133 kg (293 lb) medical items, 103 kg (227 lb) utilization/science payloads and various equipment. 31P is the first of a new, upgraded version of the cargo ship, equipped with a new state-of-the art digital computer system and more-compact radiotelemetry avionics. The new equipment allows automatic diagnostics for the comm paths between telemetry system & computer system elements and provides digital interfaces for integrating all the spacecraft systems into the ISS. It has 75 kg (165 lb) less dry mass than previous Progress vehicles, allowing more cargo, and has 15 fewer parts. Note: Soyuz & Progress flights are supported by (currently) 11 RGS stations: five connected to TsUP-Moscow by fiber-optic land line, four by the “Primyorka” geostationary satellite, and two in autonomous mode. Real-time commanding is normally performed directly by the RGS sites, with voice link to/from TsUP. There is also a tracking ship, “Cosmonaut Posayev” (KVP 47), in the port of*

Kaliningrad.]

STS-126/Endeavour Landing: Both landing opportunities at KSC have been waived off for today due to inclement weather conditions. Endeavour will land at Edwards/California at the first opportunity – 4:25m EST, after deorbit burn at 3:19pm. If the landing takes place as planned, ULF-2 mission duration will be 15d 20h 26m. Gregory Chamitoff's total time in space will be 183d 19m (178d 23h 47m on board ISS).

Most of the crew's time today went to preparing and supporting the Progress 31P docking. Pre-docking activities called for Sandra Magnus to –

- Ensure closure of the protective shutters of the science window in the JAXA JPM (JEM Pressurized Module) and in the US Lab,
- Power down the amateur radio equipment in the FGB, to prevent RF (radio frequency) interference with Progress final approach and docking, and
- Activate & configure the A31p laptop to support the transmission of MPEG2 streaming video from the RS via OpsLAN/Ku-band and US assets to Moscow.

Mike Fincke & Yuri Lonchakov meanwhile prepared their workplace at the TORU control station in the SM and operated the controls for the final approach & docking of the cargo ship. *[TORU is the manual mode through which a crewmember can perform necessary guidance functions from the SM in the event of a failure of the KURS automated rendezvous and docking (AR&D) of the Progress. TsUP-Moscow selected the TORU mode after the failure of the Kurs antenna ASF2 (also referred to as 2ASF1-M-VKA No. 2) failed to deploy after launch on 11/26. The antenna was later deployed by direct command and brought online during docking day at a distance of 1 km from the ISS and used during final approach (starting at ~160 m). However, since TsUP was uncertain whether troubleshooting could be completed by docking day, TORU was selected to be on the safe side. Lonchakov, supported by Fincke, controlled the cargo ship's motions from the TORU control panel with two hand controllers, viewing the approach to the ISS from a Progress point-of-view through the Klest-M television camera mounted on the Progress. Remote TORU control from the ground is not available.]*

After the cargo ship's successful docking, activities by Yuri & Mike included –

- Shutting off TORU and reconfiguring the STTS telephone/telegraph subsystem to normal ops *[the "Voskhod-M" STTS enables telephone communications between the SM, FGB, DC1 and USOS, and also with users on the ground over VHF channels selected by an operator at an SM comm panel, via STTS antennas on the SM's outside. There are six comm panels in the SM with pushbuttons for accessing any of three audio channels, plus an intercom channel. Other modes of the STTS include*

telegraphy (teletype), EVA voice, emergency alarms, Packet/Email, and TORU docking support];

- Conducting the standard one-hour leak checking of the docking vestibule and fuel/oxidizer transfer line interface between Progress and DC1 *[during leak checking and initial clamp installation, Russian thrusters were inhibited (as was the case during docking)];*
- Opening the hatches (~10:20am) and installing the QD (quick disconnect) screw clamps (BZV) of the docking & internal transfer mechanism (SSVP) to rigidize the coupling;
- Performing the standard air sampling inside Progress with the Russian AK-1M air sampler;
- Powering down the spacecraft and installing the ventilation/heating air duct (~11:15am);
- Dismantling & removing the video/MPEG equipment for the TV Ku-band downlink of the docking; and
- Dismantling the docking mechanism (StM, Stykovochnovo mekhanizma) between the cargo ship and the DC1 (~12:00pm). *[The StM is the "classic" probe-and-cone type, consisting of an active docking assembly (ASA) with a probe (SSh), which fits into the cone (SK) on the passive docking assembly (PSA) for initial soft dock and subsequent retraction to hard dock. The ASA is mounted on the Progress' cargo module (GrO), while the PSA sits on the docking ports of the SM, FGB and DC1.]*

Before sleep time, Fincke & Lonchakov also have about an hour reserved for starting 31P unloading and cargo transfers, foremost fresh veggies and other food items.

FE-2 Magnus meanwhile performed the standard sensor calibration on the CSA-O₂ (Compound Specific Analyzer-Oxygen) units #1043 & #1059, delivered on 1J, using a new calibration adapter (#1001), brought up by 30P. *[Sandy reported an initial gas pressure of 1500 psi and final gas pressure of 1400 psi. Flow rate: 10 fps. For #1059, peak reading was 22% O₂ and the final cabin value was 22%; for #1043, peak: 25.3%, final cabin value: 22%.]*

The FE-2 also completed another one of the periodic inspections of the RED (Resistive Exercise Device) canister cords and accessories, currently done every two weeks.

In the SM, Magnus conducted the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS), including the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among*

else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

SOZh checkups by Sandy included the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem, gathering weekly data on total operating time & "On" durations for reporting to TsUP-Moscow.

The FE-2 handled the daily IMS (Inventory Management System) maintenance, updating/editing the standard IMS "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Later, Magnus had about 1.5 hrs for unpacking and IMS-supported stowing of ULF2-delivered cargo items.

In preparation for upcoming sample storage requirements, the FE-2 rearranged box modules in the MELFI (Minus Eighty Degree Laboratory Freezer for the ISS) in the US Lab, swapping Dewar 3/Tray A (Section 1,2) with Dewar 4/Tray B (Section 3 and 4).

And before sleep time, Sandy will break out and set up the NUTRITION with Repository hardware for her first session, starting tomorrow with blood draw and urine collections. The protocol requires Magnus to begin the usual 8-hr fast tonight by 5:00pm EST, i.e., no food or drink, but water consumption is highly encouraged to ensure proper hydration. *[Sandy's 24-hour urine collect starts with the first void of the day tomorrow morning and continues through the first void Monday morning. The NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by supercold MELFI dewars), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

The FE-2 today performed the first leak check of WRS1 (Water Recovery System 1) and WRS2. *[Since the racks are still powered, the leak check was an external visual check only, without touching internal parts.]*

Before sleep time, Mike Fincke will voluntarily complete the software loading and hardware setup for the MERLIN (Microgravity Experiment Research Locker/Incubator) payload, which had been added to the "job jar" task list yesterday.

The ISS crew completed their physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

ISS Crew Sleep Shift Planning: To synchronize the ISS crew's timeline with STS-126/ULF-2 undocking yesterday, ISS crew wake/sleep cycle has undergone a number of one-hour shifts which started on 11/25. After today's shift, wake/sleep schedule returns to "normal" tomorrow (all times EST):

11/30	Wake: 3:00am – 4:30pm
12/01	Wake: 1:00am – 4:30pm

No CEO photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:43am EST [= epoch]):

Mean altitude -- 354.2 km

Apogee height -- 358.5 km

Perigee height -- 349.8 km

Period -- 91.62 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006502

Solar Beta Angle -- -14.5 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 44 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57471.

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

11/30/08 -- STS-126/Endeavour/ULF-2 landing (EDW/1st: 4:25m; EDW/2nd: 6:03pm.);

12/07/08 -- Progress M-65/30P reentry (after 3 weeks autonomous flight for geophysical experiments)

12/17/08 -- Progress M-01M/31P thruster firing (test with Soyuz docked at SM aft);

12/18/08 -- Russian EVA-21

02/09/09 -- Progress M-01M/31P undocking & deorbit

02/10/09 -- Progress 32P launch

02/12/09 -- Progress 32P docking

02/12/09 -- STS-119/Endeavour/15A launch -- S6 truss segment

02/14/09 -- STS-119/Endeavour/15A docking

02/24/09 -- STS-119/Endeavour/15A undocking
02/26/09 -- STS-119/Endeavour/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress 32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

07/30/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation
10/15/09 -- STS-129/Endeavour/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Endeavour/ULF4 – ICC-VLD, MRM1 (contingency)
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 11/29/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – off-duty day for CDR Fincke, FE-1 Lonchakov & FE-2 Magnus. Crew wake-up 4:30am; sleep 6:00pm EST.*

Yuri Lonchakov performed the periodic maintenance of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #2 of the regenerable dual-channel filtration system. The process will be terminated at ~5:45pm EST. Bed #1 regeneration was performed yesterday.

[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently (last time: 11/7-8).]

In the Service Module (SM), the FE-1 completed the routine daily servicing of the SOZh system (ECLSS/Environment Control & Life Support System). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

Yuri also temporarily powered down the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem for the periodic cleaning of its pre-filter, using the vacuum cleaner with narrow-slit nozzle attachment.

For her initial use of the TVIS treadmill, Sandy Magnus installed and checked out the SPD (Subject Positioning Device) top assemblies for safety, required for her first seven TVIS uses.

In preparation for the Progress docking, FE-2 Magnus closed the protective window shutters in the Lab and Kibo JPM (Japanese Pressurized Module).

A new item added to Sandy's voluntary "job jar" task list is to route a cable between the Node-2 and the HCP (Hardware Command Panel) in the JPM (but not yet mated since it is a hatch drag-thru line). *[The HCP is part of the PROX system, mostly located in the ICS (Inter-orbit Communication System) Rack, consisting also of a PROX antenna, a PROX-GPS (Global Positioning System) antenna, and PROX comm equipment for the HTV (H-II Transfer Vehicle). When the HTV approaches the ISS, the external PROX antenna, which contains GPS receivers, will initiate communications with the HTV. The ISS orbital location and speed are immediately relayed to the HTV through the PROX. At the same time, data from the HTV are relayed to the ISS. In addition, the antenna relays commands sent from the ground to the HTV.]*

Also showing on Magnus' task list is software loading and hardware setup for the MERLIN (Microgravity Experiment Research Locker/Incubator) payload, with the latter requiring prior notification of POIC (Payload Operation & Integration Center/Huntsville).

Working from his discretionary "as time permits" task list, Yuri conducted another run of the Russian DZZ-2 "Diatomeya" ocean observations program, using the NIKON-F5 DCS still camera and the HDV (high-definition) video camcorder from SM window #7 for ~25 min to record Pacific Ocean surface features East of New Zealand and offshore of Panama, as affected by underlying terrain.

A second job for Yuri's choice was another ECON KPT-3 test session, making observations and taking aerial photography of Pacific Ocean surface contaminations for Russia's Environmental Safety Agency (ECON) using the D2X with SIGMA 300-800mm telephoto lens.

Fincke & Magnus are scheduled for their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop), Sandy at ~1:30pm EST, Mike at ~3:05pm.

The ISS crew completed their physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-2, FE-1), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Mike & Yuri had a 1-hr. conference via S-band with ground specialists at TsUP-Moscow to discuss timeline and procedures for tomorrow's Progress docking:

Timeline for Progress M-01M/31P Rendezvous & Docking on 11/30 (all times EST):

- SM Solar Arrays feathering ~5:30am
- VHF Comm Pass (RGS) 5:36-15:58am
- Kurs-A Activation 5:40am
- Kurs-P Activation 5:42am
- Kurs signal acquisition assured 6:09am (2)
- Kurs Test Disabled 6:38am (6)
- SM GO for final approach ~6:42am (T7)
- Begin Flyaround @ 400 m ~6:52am
- Begin stationkeeping ~7:01am
- Final approach init. ~7:16am
- Local Sunset 7:23am
- Contact (capture) ~7:25am (T9)
- SM Kurs-P deact. on mech. capture (3)
- Local Sunrise 7:56am

ISS Crew Sleep Shift Planning: To synchronize the ISS crew's timeline with STS-126/ULF-2 undocking yesterday, ISS crew wake/sleep cycle has undergone a number of one-hour shifts which started on 11/25. For the next three days, the wake/sleep shift schedule is as follows, returning to "normal" on 12/1 (all times EST):

11/29	Wake: 4:30am – 6:00pm
11/30	Wake: 2:30am – 4:30pm
12/01	Wake: 1:00am – 4:30pm

Weekly Science Update (*Expedition Eighteen -- Week 5*)

3-D SPACE: Last (fourth) session for Greg has been successfully performed on 11/23. "Thank you, Greg, for your nice participation to the experiment as first test subject! We are glad that you also enjoyed it."

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): Complete.

ANITA (Analyzing Interferometer for Ambient Air): Complete.

BCAT-3/4 (Binary Colloidal Alloy Test 3/4): No news.

BIO-4: Complete.

BIOLAB: Some BIOLAB troubleshooting activities, which consist of removing a stuck triple contained syringe, are currently planned on 12/2.

CARDIOCOG-2: Complete.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): In progress. For the next CCISS session, Mike will be using a newly refurbished unit that will arrive on ULF-2.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System): Samples returned on 1J.

CSI-3/CGBA-5 (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus 5): "The hungry caterpillars wish to thank you for supplying them with fresh food! We expect at least one or two of them to form chrysalises in the coming week. This past week we saw each spider build an excellent web. The smaller spider has been hiding the past two days and we suspect she is preparing to molt. We may see a much larger spider emerge if/when she comes out of hiding. The fruit flies are flourishing."

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

EDR (European Drawer Rack): A software upgrade activity is currently planned on 12/03 with the support of the crew. This upgrade is required to prepare for the PCDF (Protein Crystallization Diagnostic Facility) experiment during the 15A Stage.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): The DHPU (Data Handling Processing Unit) MIL-BUS error occurred again on 11/20, but instruments were brought back to nominal operations within 2.5 hrs. Similar MIL Bus errors have occurred on 11/5, 11/15 and 11/17. Ground teams are now investigating what could cause this increased frequency of failures. -- DEBIE-2: 24-hrs science script executed, to support debris monitoring in conjunction with the ULF2 EVAs to clean the SARJ. -- DOSTEL: On-going science acquisition - nominal;-- EuTEMP: Currently inactive as planned;-- EVC: on 11/20, the instrument was within temperature limits to be re-activated, but due to a problem of High-Data Downlink

no acquisition was made.-- EXPOSE: On-going science acquisition - nominal;-- FIPEX: Next script will run after the ULF2 EVAs are completed. Test of the atomic oxygen sensors has been performed on 11/25;-- MEDET: On-going science acquisition - nominal; -- PLEGPAY: Inactive, "Experiment 1" memory has been erased on 10/30. Plasma generation capability has been disabled;-- TRIBOLAB: On 11/18 and 11/20, the instrument transitioned to non-nominal mode (NNM). Anomaly with the TRIBOLAB Ball Bearing experiment shaft motor, currently being analyzed, unfortunately it does not look good.

FSL (Fluid Science Laboratory): FSL is nominal.

GEOFLOW: Additional MMA (Microgravity Measurement Apparatus) measurements will be acquired during ULF-2 undocking, and during 31P docking (TBC). It is planned to resume the GEOFLOW science runs after 31P docking. Ground infrastructure at MARS USOC will be upgraded to support GEOFLOW science acquisition as of Week 7.

HDTV System Test DL (JAXA): Complete.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: "Sandra, thank you for your diligence in collecting your saliva samples for the Integrated Immune experiment. The data you are collecting falls in the middle of the experiments life, and therefore is critical in determining the significance of space flight altered immune function. The blood draw was on 11/27, fulfilling the other half of the data requirement and completing this immune session."

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): In progress.

Marangoni Experiment for ISS in JAXA FPEF (Fluid Physics Experiment Facility): In progress.

Micro-G Clay (JAXA EPO): Complete.

MISSE (Materials ISS Experiment): Ongoing.

Moon Photography from ISS (JAXA EPO): Complete.

MOP (Motion Perception in Zero-G): Three ULF-2 astronauts have participated in this experiment (daily questionnaires)

MSG-SAME (Microgravity Science Glovebox): Complete.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MUSCLE-G (LBP/Low Back Pain): Six ULF2 astronauts have participating in this experiment (daily questionnaires)

NOA-1/2 (Nitric Oxide Analyzer, ESA): Complete.

NUTRITION w/REPOSITORY: In progress.

PADLES (Passive Dosimeter for Lifescience Experiment in Space): In progress.

PCRF (Protein Crystallization Research Facility) Reconfiguration (JAXA): Complete.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SAMPLE: Complete.

SHERE (Shear History Extensional Rheology Experiment): The new Fluid Modules are now on-orbit. SHERE should be ready to begin flight operations after the first week of December.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): In progress.

SOLAR (Solar Monitoring Observatory): The Sun visibility window started on 11/21. Some anomalies are currently being worked for SOLACES and SOVIM instruments. A software patch was successfully uploaded on 11/20 and SOLAR is now running version 4.7 and is in Pointing Mode. The new SOLAR software release is currently loaded on the RAM memory, and it will be transferred to the

SOLAR Flash Disk on 12/4. The current Sun observation window is planned to finish on 12/2. Several observation orbits (total: 22) had to be skipped during the ULF-2 mission, due to SARJ clean-up activities and STS water dumps.-- SOVIM: No science acquisition, non-nominal mode: instrument power consumption was much lower than expected in nominal mode. Trouble-shooting activities were performed on 11/11 and these were not successful. Ground teams are analyzing the data, before next attempts are planned. -- SOLSPEC: on-going science acquisition;-- SOLACES: on-going science acquisition.

SOLO (Sodium Loading in Microgravity): Blood and urine samples from Greg Chamitoff are being returned with ULF-2.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): Reserve.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): New passive items have been launched with Progress 31P to prepare the next WAICO run.

CEO (Crew Earth Observations): "There won't be any CEO inputs until 12/1. We stand down from CEO ops and assist with shuttle imagery tasks during shuttle missions."

No CEO photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:01am EST [= epoch]):

Mean altitude -- 354.2 km

Apogee height -- 358.9 km

Perigee height -- 349.6 km

Period -- 91.62 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006898

Solar Beta Angle -- -9.8 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours – 155 m

Revolutions since FGB/Zarya launch (Nov. 98) – 57454.

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

11/30/08 -- STS-126/Endeavour/ULF-2 landing (nom. KSC, ~1:19pm; KSC/2nd:

2:55pm; EDW/1st: 4:24pm; EDW/2nd: 5:59pm.);

11/30/08 -- Progress M-01M/31P docking – DC1 Nadir (~7:23am)

12/07/08 -- Progress M-65/30P reentry (after 3 weeks autonomous flight for geophysical experiments)

12/17/08 -- Progress M-01M/31P thruster firing (test with Soyuz docked at SM aft);

12/18/08 -- Russian EVA-21

02/09/09 -- Progress M-01M/31P undocking & deorbit

02/10/09 -- Progress 32P launch

02/12/09 -- Progress 32P docking

02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment

02/14/09 -- STS-119/Endeavour/15A docking

02/24/09 -- STS-119/Endeavour/15A undocking

02/26/09 -- STS-119/Endeavour/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress 32P undocking & deorbit

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

07/30/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation

10/15/09 -- STS-129/Endeavour/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A – MPLM(P)

04/08/10 -- STS-132/Endeavour/ULF4 – ICC-VLD, MRM1 (contingency)

05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 11/28/08

All ISS systems continue to function nominally, except those noted previously or below. *Flight Day 15 (FD15) of STS-126/ULF-2. ISS crew work cycle today: Wake 5:55am EST; sleep 8:00pm.*

ISS and STS-126/Endeavour are flying in separate orbits again.

After final departure preparations on both sides of the hatches (closed yesterday on ISS side at ~6:00pm EST), Endeavour undocked this morning at 9:47am from PMA-2 (Pressurized Mating Adapter 2) after a total docked time of 11d 16h 46m. *[For undocking, the station was turned at ~8:30am from -XVV through ~180 deg to +XVV ZLV (+x-axis in velocity vector, z-axis in local vertical, i.e., flying Shuttle in front again), put briefly on free drift for the undocking and then moded to ULF-2 Stage attitude of +XVV TEA (Torque Equilibrium Attitude).]*

Undocking was ~2 min prior to midnight, to ensure good lighting during the subsequent flyaround (sunrise: ~10 min before flyaround start). After separation, Endeavour completed the 360-deg station flyaround and obtained photo/video imagery of the ISS. The first two separation burns were completed by 11:15am. *[Endeavour mass at undocking: 230,836 lbs (104,705 kg).]*

KSC landing is nominally expected on 11/30 (Sunday) at ~1:19pm EST. *[If the landing occurs as planned, ULF-2 mission duration will be 15d 17h 24m. Gregory Chamitoff's total time in space will be 182d 21h 17m (178d 20h 45m on board ISS).]*

FE-1 Lonchakov performed the periodic maintenance of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The process will be terminated at ~7:45pm EST and Bed #2 regeneration performed tomorrow. (Last time done: 11/7-8). *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle is normally done every 20 days.]*

Before and during the Orbiter undocking, CDR Fincke stood by at the Cupola RWS (Robotics Workstation) A31p laptop with a stopwatch to monitor the proper performance of automatic undocking software for the PMA-2 departure under Russian thruster attitude control. Later, the CDR powered down the laptop. *[The procedure provides for the crewmember to take over the automatic operational attitude control sequence manually if the software does not resume control after the period of free drift a few minutes after physical separation. Free drift is employed to prevent a conflict between the control systems of the two vehicles (ISS & Shuttle) and to "limp" (unload) the docking mechanisms.]*

FE-2 Sandra Magnus used the Kodak DCS760 digital camera and PD-100 camcorder to document the undocking, backing away & separation of the Endeavour.

After the undocking, Fincke depressurized the PMA-2 to prevent humidity condensation and pressure fluctuations. Leak checking followed for the standard one hour. Afterwards, the necessary testing equipment was torn down.

Mike also deconfigured the BPSMU (Battery Powered Speaker Microphone Unit) and its long drag-through cable, used during the docked phase, and stowed the equipment.

FE-1 Lonchakov completed the reconfiguration of the Russian telephone/telegraph subsystem (STTS) to its post-undocking settings, from its primary string back to nominal mode on the backup string. This also severed the VHS (UHF) channel to the receding Shuttle Orbiter and restored the RSA-2 S/G (Space-to-Ground) comm configuration on Panel 3. *[The "Voskhod-M" STTS enables telephone communications between the SM, FGB, DC1 Docking Compartment and U.S. segment (USOS), and also with users on the ground over VHF channels selected by an operator at an SM comm panel, via STTS antennas on the SM's outside. There are six comm panels in the SM with pushbuttons for accessing any of three audio channels, plus an intercom channel. Other modes of the STTS include telegraphy (teletype), EVA voice, emergency alarms, Packet/Email, and TORU docking support.]*

While Mike & Sandy were busy with the undocking, Yuri performed a number of maintenance job, starting with a ventilation efficiency test on two (of eight) molybdenum 800A battery boxes (A107, A108) in the SM (Service Module). *[The measurements of temperature (degC) and air flow rate (m/sec) were taken with the TTM-2 heat-loss anemometer/thermometer instrument of the Russian KPT-2 science payload BAR-RM, after it was freshly charged and calibrated.]*

Lonchakov also performed scheduled IFM (in-flight maintenance) on the SM's condensate water processor (SRV-K2M) by removing & replacing its water-conditioning unit purification columns (BK BKV) with a new spare (#601011). The old unit was stowed for disposal on Progress 31P. (Last time done: 8/6). *[The SRV-K2M, with its BKO multifiltration unit, converts collected condensate into drinking water by removing dissolved mineral and organic impurities from the condensate. Downstream from it the condensate water is treated in the BKV water conditioning unit with salts for taste and silver ions for preservation, before it flows to the KPV potable water container from which the reclaimed water is dispensed warm or hot for drinking and preparation of food and beverages.]*

Sandy Magnus, the new FE-2, performed the periodic status check on the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) payload, located in the ER-2 (EXPRESS Rack 2).

In the SM, Yuri conducted the routine daily servicing of the SOZh system (ECLSS/ Environment Control & Life Support System). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

The FE-1 also completed the daily IMS (Inventory Management System) maintenance, updating/editing the standard IMS "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Working from his discretionary "as time permits" task list, Yuri performed a session of the Russian GFI-8 "Uragan" (hurricane) earth-imaging program, using the NIKON D2X digital camera to take telephotos. *[Uplinked target zones were the southern & northern ice fields of Patagonia, glaciers sliding into Chilean fiords from the main ice plateau, the Falkland oceanic current, the Andes, and glaciers in New Zealand.]*

Yuri's voluntary task list also suggested another ECON KPT-3 session, making observations and taking aerial photography of Pacific Ocean surface contaminations for Russia's Environmental Safety Agency (ECON) using the D2X with SIGMA 300-800mm telephoto lens.

As a third item on the discretionary job list, Lonchakov repeated the initialization of the long-term BIO-5 Rasteniya-1 ("Plants-1") experiment, which had failed on 11/18. Afterwards, Yuri was to assure himself of the operation of the BU Control Unit and MIS-LADA Module fans (testing their air flow by hand). *[Rasteniya-1*

researches growth and development of plants under spaceflight conditions in the LADA-14 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). The payload hardware includes a module (MIS/Module for the Investigation of Substrates), the MIS control unit (BU), a nitrogen purge unit (BPA) and other accessories. During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. LADA consists of a wall-mounted growth chamber that provides long-term, ready access for crewmember interaction. It provides light and root zone control but relies on the cabin environmental control systems for humidity, gas composition, and temperature control. Cabin air is pulled into the leaf chamber, flows over the plants and vents through the light bank to provide both plant gas exchange and light bank cooling.]

At ~1:00pm, MCC-Houston will be remotely downloading the structural dynamics measurements of the Shuttle undocking by the IWIS (Internal Wireless Instrumentation System) from the SSC-4 (Station Support Computer 4), then reprogram the IWIS for the Progress 31P docking on Sunday. [The crew was advised to “be hands off” of SSC-4 during this time.]

The ISS crew completed their physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (FE-1).

ISS Crew Sleep Shift Planning: To synchronize the ISS crew’s timeline with STS-126/ULF-2 undocking tomorrow, ISS crew wake/sleep cycle is undergoing a number of one-hour shifts which started on 11/25. The early undock time this morning (9:47am) drove crew wakeup 2.5 hrs earlier, to ~7:00am. For the next four days, the wake/sleep shift schedule is as follows, returning to “normal” on 12/1 (all times EST):

11/28	Wake: 5:55am – 8:00pm
11/29	Wake: 4:30am – 6:00pm
11/30	Wake: 2:30am – 4:30pm
12/01	Wake: 1:00am – 4:30pm

No CEO photo targets uplinked for today.

CEO photography can be studied at this “Gateway” website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 7:31pm EST [= epoch]):

Mean altitude -- 354.4 km

Apogee height -- 359.0 km

Perigee height -- 349.8 km

Period -- 91.63 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006852

Solar Beta Angle -- -5.2 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.71

Mean altitude loss in the last 24 hours -- 23 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57438.

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

11/30/08 -- STS-126/Endeavour/ULF-2 landing (KSC, ~1:19pm);

11/30/08 -- Progress M-01M/31P docking -- DC1 Nadir (~7:23am)

12/07/08 -- Progress M-65/30P reentry (after 3 weeks autonomous flight for geophysical experiments)

12/17/08 -- Progress M-01M/31P thruster firing (test with Soyuz docked at SM aft);

12/18/08 -- Russian EVA-21

02/09/09 -- Progress M-01M/31P undocking & deorbit

02/10/09 -- Progress 32P launch

02/12/09 -- Progress 32P docking

02/12/09 -- STS-119/Endeavour/15A launch -- S6 truss segment

02/14/09 -- STS-119/Endeavour/15A docking

02/24/09 -- STS-119/Endeavour/15A undocking

02/26/09 -- STS-119/Endeavour/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress 32P undocking & deorbit

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

07/30/09 -- STS-128/Atlantis/17A -- MPLM (P), last crew rotation

10/15/09 -- STS-129/Endeavour/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A -- Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A -- MPLM(P)

04/08/10 -- STS-132/Endeavour/ULF4 -- ICC-VLD, MRM1 (contingency)

05/31/10 -- STS-133/Endeavour/ULF5 -- ELC3, ELC4 (contingency).

ISS On-Orbit Status 11/27/08

All ISS systems continue to function nominally, except those noted previously or below. *Flight Day 14 (FD14) of STS-126/ULF-2. ISS crew work cycle today: Wake 6:55am EST; sleep 9:25am; Shuttle crew: 10:55am (both until 5:55am tomorrow, i.e., one hour earlier).*

The ISS and Shuttle crews have a well-deserved half day off, and they will enjoy a Thanksgiving meal together.

For the biomed experiment INTEGRATED IMMUNE (Validating Procedures for Monitoring Crew member Immune Function), FE-2 Chamitoff and FE-2-18 Magnus conducted their final Liquid Saliva collections in the morning, and later Steve Bowen came over to draw a blood sample from Sandra. The Saliva Return Pouches and Blood Sleeves were then stored at ambient temperature on the Shuttle Middeck for return to ground. *[IMMUNE protocol requires the collection to occur first thing post-sleep, before eating, drinking and brushing teeth, and all samples are stored at ambient temperature. Along with NUTRITION (Nutritional Status Assessment), INTEGRATED IMMUNE samples & analyzes participant's blood, urine, and saliva before, during and after flight for changes related to functions like bone metabolism, oxidative damage and immune function to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects.]*

CDR Fincke performed another periodic relocation of the TEPC (Tissue Equivalent Proportional Counter) detector assembly, the primary radiation measurement tool in the ISS, today from the Node-2 (loc. PD3/2) back to the

Service Module (SM), Panel 327, and connected the IVCPD (Intravehicular Charged Particle Directional Spectrometer/TEPC power/data cable to the CHeCS UOP5 (Crew Health Care Systems/Utility Outlet Panel 5) on Panel 450.

[TEPC had been moved to the Node-2 by Mike on 11/10, after having been in the SM from 9/30.]

Later today, Sandy Magnus & Greg Chamitoff have an hour set aside to (carefully!) remove frozen science samples from the MELFI and stow them in two DCBs (Double Cold Bags), then moved them to the Shuttle Middeck for return to Earth.

With all planned WRS (Water Recovery System) water samples collected & safely stowed aboard Endeavour, Mike Fincke will reconfigure the compressor power feed for transferring liquid waste to the UPA (Urine Processing Assembly, disconnecting it at ER2 (EXPRESS Rack 2) and reconnecting it at the ER6/Galley rack (thus removing the cable that was stretched across the Lab).

Afterwards, the CDR will perform another set of thorough leak checks of the WPA (Water Processing Assembly) in the WRS Rack, then take an atmospheric sample in the center of the Lab with the U.S. GSC (Grab Sample Container), using GSCs #1050, for return to the ground.

Preparatory to hatch closure tonight, the Shuttle crewmembers are finishing up the transfers of their EMU/spacesuits and other return cargo to the Shuttle middeck.
[At wake-up this morning, 96% of transfers were complete, with approximately 3.25 hrs remaining for middeck transfers.]

CDR Ferguson & CDR Fincke will tear down and remove the oxygen transfer system which was used to pump O₂ over from the Shuttle to the ISS. MCC-Houston will then reconfigure the A/L CCAA (Airlock Common Cabin Air Assembly). *[About 25 lbs O₂ were transferred to the A/L HPTs (High Pressure Tanks). Another ~20 lbs was used for repressurizing the ISS cabin atmosphere.]*

Chris Ferguson also will transfer SSC (Station Support Computer) equipment to the ISS, including an AFD PCS (Portable Computer System), three A31p 60 GB HDDs (Hard Disk Drives), an A31p Ultraport camera, and a Wireless Network Card.

In the Kibo JPM (Japanese Pressurized Module), Sandy Magnus will set up the SCOF (Solution Crystallization Observation Facility) for the ICE CRYSTAL (The Study on Microgravity Effect for Pattern Formation of Dendritic Crystal by a Method of in-situ Observation) payload, the first of the JAXA Increment 18 experiments.
[ICE CRYSTAL evaluates the factors that lead to pattern formation in ice crystals in microgravity.]

At ~3:26pm, PLT Boe & MS4 Kimbrough are scheduled to maneuver the SRMS (Shuttle Remote Manipulator System) with the OBSS (Orbiter Boom Sensor System) to undock position. *[After undocking and before entry on Sunday, the OBSS will be used for another inspection of the Orbiter TPS (Thermal Protection System).]*

The traditional **Crew Farewell** ceremony is timelined for ~5:55pm EST, followed by air duct removal and hatch closure (“Weigh Anchor! Set Sail!”) at ~6:00pm, handled on the ISS side by Fincke & Magnus, on the Orbiter side by Kimbrough & Stefanyshyn-Piper. *[Afterwards (~6:04pm), Chris switches attitude control authority of the mated stack from ISS CMG TA (Control Moment Gyroscope Thruster Assist) mode to Orbiter ORB control and, Heidemarie & Shane will initiate the standard one-hour leak check on the ODS (Orbiter Docking System). Preparatory to the ODS depress venting, Mike has closed the protective window shutters in the JPM earlier today.]*

Endeavour is scheduled to **undock** from ISS tomorrow morning at 9:47am, in local darkness, followed by the standard flyaround in daylight, for a total docked time of 11d 16h 46m (13d 13h 52m in space). After a one-orbit flyaround for photo imaging at 400-600 ft, first separation burn of Endeavour will be at ~11:03am, the second at ~11:30am and the third at ~12:15pm. Landing is set for Sunday, 11/30, nominally at KSC at 1:18pm EST. If so, total mission duration for STS-126/ULF-2 will have been 15d 17h 23m. Gregory Chamitoff’s total time in space will be 182d 21h 16m, with 178d 20h 44m on board ISS.

The ISS crew completed their physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2-18), TVIS treadmill (CDR, FE-1), RED (CDR), and VELO bike with bungee cord load trainer (FE-1).

ISS Crew Sleep Shift Planning: To synchronize the ISS crew’s timeline with STS-126/ULF-2 undocking tomorrow, ISS crew wake/sleep cycle is again undergoing a number of one-hour shifts which started on 11/25. The early undock time (9:47am) drives crew wakeup 2.5 hrs earlier, to ~7:00am by today. For the next five days, the wake/sleep shift schedule is as follows, returning to “normal” on 12/1 (all times EST):

11/27	Wake: 6:55am – 9:25pm
11/28	Wake: 5:55am – 8:00pm
11/29	Wake: 4:30am – 6:00pm
11/30	Wake: 2:30am – 4:30pm
12/01	Wake: 1:00am – 4:30pm

12/02	Wake: 1:00am – 4:30pm
-------	-----------------------

No CEO photo targets uplinked for today.

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 12:08pm EST [= epoch]):

Mean altitude -- 354.4 km

Apogee height -- 359.1 km

Perigee height -- 349.6 km

Period -- 91.63 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.000706

Solar Beta Angle -- -0.7 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.71

Mean altitude loss in the last 24 hours – 23 m

Revolutions since FGB/Zarya launch (Nov. 98) – 57426.

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

11/28/08 -- STS-126/Endeavour/ULF-2 undocking (~9:47am);

11/30/08 -- STS-126/Endeavour/ULF-2 landing (KSC, ~1:18pm);

11/30/08 -- Progress M-66/31P docking – DC1 Nadir (~7:23am)

12/07/08 -- Progress M-65/30P reentry (after 3 weeks autonomous flight for geophysical experiments)

12/18/08 -- Russian EVA-21

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment

02/14/09 -- STS-119/Endeavour/15A docking

02/24/09 -- STS-119/Endeavour/15A undocking

02/26/09 -- STS-119/Endeavour/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress M-67/32P undocking & deorbit

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

07/30/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation

10/15/09 -- STS-129/Endeavour/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Endeavour/ULF4 – ICC-VLD, MRM1 (contingency)
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm

HAPPY THANKSGIVING!

ISS On-Orbit Status 11/26/08

All ISS systems continue to function nominally, except those noted previously or below. *Flight Day 13 (FD13) of STS-126/ULF-2. ISS crew work cycle today: Wake 7:55am EST; sleep 10:25am; Shuttle crew: 10:55am (both until 6:55am tomorrow, i.e., one hour earlier).*

Progress M-01M/31P (No. 401) launched on time this morning at Baikonur at 7:38 am EST. Ascent was nominal and the vehicle reached orbital insertion at 7:47:23am. All appendages (antennae & solar arrays) deployed nominally except for one of the KURS-A antennas (2ASF1-M-VKA) for narrow-field proximity ranging, range rate updates & angles measurement, which remained retracted until it was successfully deployed on DO3 (Daily Orbit 3) by direct ground commanding during RGS (Russian Groundsite) pass. *[The 7288-kg mass cargo ship will deliver 2676 kg of various supplies to the ISS, including 28 kg oxygen, 21 kg air, 185 kg water, 296 kg food, 1120 kg propellant (for ISS needs), 321 kg US items, 171 kg sanitary & hygienic items, 19 kg fire-protection items, 133 kg medical items, 103 kg utilization/science payloads and various equipment. 31P is the first of an upgraded version of the cargo ship, equipped with a new state-of-the art digital computer system and more-compact radiotelemetry avionics. The new equipment allows automatic diagnostics for the comm paths between telemetry system & computer system elements and provides digital interfaces for integrating all the spacecraft systems into the ISS. It has 165 lbs less dry mass than previous Progress vehicles, allowing more cargo, and has 15 fewer parts. Note: Soyuz & Progress flights are supported by (currently) 11 RGS stations: five connected to TsUP-Moscow by fiber-optic land line, four by the "Primyorka" geostationary satellite, and two in autonomous mode. Real-time commanding is normally performed directly by the RGS sites, with voice link to/from TsUP. There is also a tracking ship, "Cosmonaut Posayev" (KVP 47), in the port of Kaliningrad.]*

UPA Update: The UPA (Urine Processing Assembly) has been performing nominally. After its first flawless run for the planned 5 hrs, the UPA, which works with an advanced technique called Vapor Compression Distillation (VCD), was

nominally shut down late on 11/24. This was followed by a 3-hr cool-down cycle and a reactivation for a second successful run of 4.25 hrs, with nominal shutdown. Yesterday, the UPA ran again for another 7 hrs, performing nominally. A fourth run was then completed overnight, the last planned run for the docked mission. *[UPA startup was delayed briefly for this last run due to a sticky check valve in the MTL (Moderate Temperature Loop). After being fully seated, UPA ran fine.]*

WPA Update: All WPA (Water Processing Assembly) operations to date have been nominal. The third WPA processing activity was initiated on 11/24 for a successful overnight run. Today, Sandra Magnus & Mike Fincke are offloading the processed water from the WPA to a CWC (Contingency Water Container, #1018), collecting a sample and then draining the accumulator. A fourth run (to process at least 13 lbs of distillate or condensate) will then be initiated by the ground, and another sample taken after its completion. If time allows, Sandy will subject the sample to inflight microbiology analysis using the MCDs (microbial capture devices) of the WMK (water microbiology kit).

TOCA Update: Yesterday, a software patch was uplinked to the TOCA (Total Organic Carbon Assembly). While working to initiate another run, Sandy Magnus found a small leak at the GLS (Gas/Liquid Separator). The GLS was removed & replaced (R&R'd) with one of three on-orbit spares, which fixed the leak. The failed GLS will be returned. It will be used by the crew to process WPA & PWD samples (can be deferred to post-undock). *[Also being considered is an R&R of the TOCA oxidizer which may be faulty (based on its current reading during calibration on 11/21), but not before ULF-2 undocking due to crew time constraints. There are four spares onboard.]*

PWD Update: Yesterday, Magnus first vented, then filled the PWB (Potable Water Bus). Sandy then activated the PWD (Potable Water Dispenser), flushed it with potable water, and followed with an ambient water flush. Samples are being obtained today for return on the Shuttle Middeck as well as for WMK analysis and TOCA processing.

SARJ Update: After the extensive cleaning & lubricating work on the ULF-2 spacewalks, the Stbd SARJ (Solar Alpha Rotary Joint) was rotated through 720 deg (two rotations) in Autotrack mode for the first time in over a year to measure mechanical resistance in the motor current. The rotation required significantly less energy than before, as indicated by the motor current which averaged 0.17A (amperes), with a peak of 0.35 A (pre-repair current draws: 0.7-0.9A; begin of service life: 0.15A). The Stbd SARJ also showed negligible vibration during rotation. It was returned to Directed Position later in the day. The Port SARJ, which also was lubricated, as a precautionary measure, and had performed well, was returned to Autotrack.

FE-2-18 Magnus continued her first session with the biomed experiment INTEGRATED IMMUNE (Validating Procedures for Monitoring Crew member Immune Function), today collecting dry saliva samples throughout the day (five 1-min collections). *[IMMUNE protocol requires the collection to occur first thing post-sleep, before eating, drinking and brushing teeth, and all samples are stored at ambient temperature. Along with NUTRITION (Nutritional Status Assessment), INTEGRATED IMMUNE samples & analyzes participant's blood, urine, and saliva before, during and after flight for changes related to functions like bone metabolism, oxidative damage and immune function to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects. The saliva is collected in two forms, dry and liquid. The dry samples are collected at intervals during the collection day using a specialized book that contains filter paper. The liquid saliva collections require that the crewmember soak a piece of cotton inside their mouth and place it in a salivette bag; there are four of the liquid collections during docked operations.]*

In preparation for Progress M-01M/31P docking on 11/30 (Sunday), CDR Fincke & FE-1 Lonchakov completed the standard three-hour training course with the TORU teleoperator system which provides a manual backup mode to the Progress' KURS automated rendezvous radar system. Afterwards, Mike & Yuri tagged up with a TORU instructor at TsUP/Moscow via S-band audio. *[The drill included procedure review, rendezvous, docking data and rendezvous math modeling data review, fly-around, final approach, docking and off-nominal situations (e.g., video or comm loss). Three modes were simulated on the RSK1 laptop: two with 31P from stationkeeping range (~150 m) in sunlight (insolation), and 31P in final approach (from 50 m) in darkness (eclipse). The TORU teleoperator control system lets a SM-based crewmember perform the approach and docking of automated Progress vehicles in case of KURS failure. Receiving a video image of the approaching ISS, as seen from a Progress-mounted docking television camera ("Klest"), on a color monitor ("Simvol-Ts", i.e. "symbol center") which also displays an overlay of rendezvous data from the onboard digital computer, the CDR would steer the Progress to mechanical contact by means of two hand controllers, one for rotation (RUO), the other for translation (RUD), on adjustable armrests. The controller-generated commands are transmitted from the SM's TORU control panel to the Progress via VHF radio. In addition to the Simvol-Ts color monitor, range, range rate (approach velocity) and relative angular position data are displayed on the "Klest-M" video monitor (VKU) which starts picking up signals from Progress when it is still approximately 8 km away. TORU is monitored in real time from TsUP over Russian ground sites (RGS) and via Ku-band from Houston, but its control cannot be taken over from the ground. On 11/30, Progress KURS will be activated at ~5:39am EST on Daily Orbit 1 (DO1), SM KURS two minutes later. S-band (UKV-*

2) radar will be switched on at a range of ~9 km, Progress headlight & video at ~8 km. Flyaround to the SM aft docking port (~400 m range, in sunlight) starts at 6:51am. Start of final approach: ~7:15 (DO2) in sunlight, contact: ~7:23am (in darkness).]

CDR Ferguson & MS1 Pettit meanwhile began the series of steps necessary to close out and lock up the MPLM (Multipurpose Logistics Module) for tomorrow's transfer to the Endeavour cargo bay with MPLM egress, first removing the PFE (Portable Fire Extinguisher) and PBA (Portable Breathing Apparatus) from "Leonardo" and stowing them in Node-1 & Node-2.

Next, the MPLM was deactivated, all jumpers & ducting removed and thermal covers re-installed, followed by installation of the CBM (Common Berthing Mechanism) center disk cover to restore thermal & meteoroid debris protection to the Node-2 radial (nadir) port, using a modified approach to avoid damage to CBM CPA (Controller Panel Assembly) connectors.

After Chris and Don have closed hatches, FE-2 Chamitoff will depressurize the MPLM/Node-2 vestibule for a 30-min leak check.

Later in the day, FE-2-18 Magnus & MS4 Kimbrough will support the ground in demating the Node-2 CBM by removing CBM bolts and deploying latches.

At ~4:45pm, Pettit & Kimbrough will grapple the MPLM with the SSRMS (Space Station Remote Maneuvering System), then unberth it and transfer it to the Shuttle (~5:30pm) for re-berthing in its cargo bay.

FE-2 Chamitoff returned the VCA1 (Video Camera Assembly 1) to its place in the COL (Columbus Orbital Module) and installed it on the seat track at Port Endcone/Aft side.

CDR Ferguson configured the oxygen transfer gear between the Orbiter and ISS and initiated another transfer of O₂ to the HPTs (High-Pressure Tanks) mounted on the U.S. Airlock (A/L). The transfer equipment will be torn down tomorrow.

Gregory & Sandy had more time reserved for standard joint "handover" activities, to be continued through the docked period ahead. Today this activity included a familiarization with DCB (Double Cold Bag) packing procedures preparatory to tomorrow's transfer of critical samples to the Shuttle Middeck prior to hatch closure (~6:10pm).

MS3 Stefanyshyn-Piper & FE-2-18 Magnus have several hours set aside for

restowing EVA tools in the A/L.

Meanwhile, the Shuttle crew is scheduled to transfer their EMU/spacesuits to the Shuttle, along with remaining Middeck equipment.

Mike Fincke spent some time in the Kibo JPM (Japanese Pressurized Module) to take documentary photography. *[Objects of interest were a recently installed ZSR (Zero-G Stowage Rack) to confirm that there is no interference between it and heaters/harnesses in JPM, and the rear of a second ZSR plus stowage arrangement behind hard dummy panels.]*

Later tonight, Yuri Lonchakov will conduct the routine maintenance of the SOZh/ECLSS system, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier].*

Also on Yuri's schedule for today was the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS (Russian Segment) hatchways, including the passageways PrK (SM Transfer Compartment)–PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1. *[This checkup is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons, and one of the two Russian SKV air conditioners off (SKV-1).]*

Additionally, the FE-1 will complete the periodic daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Greg Chamitoff again had 1:15h to himself for the regular crew departure preparations, working on the standard end-of-increment cleanup preparatory to his return to Earth later this month. *[It is usual for crewmembers to be granted reduced workdays for making their departure preparations, as their return date approaches.]*

The ISS crew completed their physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2-18), TVIS treadmill (CDR, FE-1, FE-2), RED (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

VolSci Look-ahead: For this weekend's VolSci (Voluntary Science) program, Mike & Sandy were asked to consider two options at their choice: (1) a LOCAD-PTS (Lab-On-A-Chip Application Development – Portable Test System) surface sampling session in COL using Glucan LAL cartridges, targeting fungus on ISS surfaces; and (2), for Sandy (assisted by Mike), a session with the CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS) experiment which studies the effects of long-duration spaceflight on crewmembers' heart functions and their blood vessels that supply the brain.

ISS Crew Sleep Shift Planning: To synchronize the ISS crew's timeline with STS-126/ULF-2 undocking, ISS crew wake/sleep cycle is again undergoing a number of shifts which started on 11/25. The early undock time (9:47am) drives crew wakeup 2.5 hrs earlier, to 7:00am by FD14. For the next six days, the wake/sleep shift schedule is as follows (all times EST):

11/26	Wake: 7:55am – 10:25pm
11/27	Wake: 6:55am – 9:25pm
11/28	Wake: 5:55am – 8:00pm
11/29	Wake: 4:30am – 6:00pm
11/30	Wake: 2:30am – 4:30pm
12/01	Wake: 1:00am – 4:30pm
12/02	Wake: 1:00am – 4:30pm

No CEO photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:13am EST [= epoch]):

Mean altitude -- 354.4 km

Apogee height -- 359.1 km

Perigee height -- 349.7 km

Period -- 91.63 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007009

Solar Beta Angle -- 3.7 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.71

Mean altitude gain in the last 24 hours -- 250 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57407.

Significant Events Ahead (all dates Eastern Time, some changes possible.):

11/28/08 -- STS-126/Endeavour/ULF-2 undocking (~9:47am);
 11/30/08 -- STS-126/Endeavour/ULF-2 landing (KSC, ~1:18pm);
 11/30/08 -- Progress M-66/31P docking – DC1 Nadir (~7:23am)
 12/07/08 -- Progress M-65/30P reentry (after 3 weeks autonomous flight for geophysical experiments)
 12/18/08 -- Russian EVA-21
 02/09/09 -- Progress M-66/31P undocking & deorbit
 02/10/09 -- Progress M-67/32P launch
 02/12/09 -- Progress M-67/32P docking
 02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment
 02/14/09 -- STS-119/Endeavour/15A docking
 02/24/09 -- STS-119/Endeavour/15A undocking
 02/26/09 -- STS-119/Endeavour/15A landing (nominal)
 03/25/09 -- Soyuz TMA-14/18S launch
 03/27/09 -- Soyuz TMA-14/18S docking (DC1)
 04/05/09 -- Soyuz TMA-13/17S undocking
 04/07/09 -- Progress M-67/32P undocking & deorbit
 05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 05/27/09 -- Soyuz TMA-15/19S launch
 Six-person crew on ISS
 07/30/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation
 10/15/09 -- STS-129/Endeavour/ULF3 - ELC1, ELC2
 12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
 02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
 04/08/10 -- STS-132/Endeavour/ULF4 – ICC-VLD, MRM1 (contingency)
 05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 11/25/08

All ISS systems continue to function nominally, except those noted previously or below. *Flight Day 12 (FD12) of STS-126/ULF-2. ISS crew work cycle today: Wake 8:55am EST; sleep 11:25am; Shuttle crew: 11:55am (both until 7:55am tomorrow, i.e., one hour earlier).*

Mission ULF-2's **EVA-4 was completed successfully** last night by Steve Bowen & Shane Kimbrough in 6h 7min, accomplishing all of its objectives.

[During the spacewalk, (EV2) & Kimbrough (EV3) –

- *Completed Stbd SARJ (Solar Alpha Rotary Joint) maintenance: cleaning, lubricating & installing the final TBA (Trundle Bearing Assembly) #3 (deferred from EVA-3);*
- *Installed MLI (Multi-Layer Insulation) Covers 17 & 18 (deferred from EVA-3);*
- *Lubricated the Port SARJ as preventive maintenance;*
- *Installed an ETVCG (External TV Camera Group) camera at CP-7 (Camera Position 7) on the S0/P1 truss interface (2 of 3 bolts engaged); camera is required for JAXA HTV (H-II Transfer Vehicle) berthing in Sept. 2009;*
- *Manually Retracted Structural Latch 1 of the JAXA EFBM (External Facility Berthing Mechanism); completion confirmed by Fincke from unlit LED (Light Emitting Diodes) on internal BCDU (Berthing Mechanism Control & Driver Unit);*
- *Re-installed EFBM center cover after EVA-1 temporary stow; and*
- *Installed GPS (Global Positioning System) Antenna A on Kibo JPM (JEM Pressurized Module).*

The EVA, originally planned for 6:30h, was cut short by 23 min, again due to elevated CO₂ (carbon dioxide) level (3.99 mmHg) in Shane Kimbrough's EMU. Not completed were:

- *Installation of JEM GPS Antenna B;*
- *Infrared imagery of S1 Radiator & P1 Radiator (get-aheads).*

Official start time of the spacewalk was 1:24pm EST, and it ended at 7:31m. Total

EVA duration (PET = Phase Elapsed Time) was 6h 7min. It was the 118th spacewalk for ISS assembly & maintenance and the 90th from the station (66 from Quest, 24 from Pirs, plus 28 from Shuttle) totaling 557h 07m, the fourth EVA for Expedition 18 and the 18th so far this year (including two Russian Orlan EVAs). It was the third spacewalk for Bowen (19h 56m tot.) and the second for Kimbrough (12h 52m tot.). After today's EVA, a total of 157 spacewalkers (121 NASA astronauts, 25 Russians, and 11 astronauts representing Japan-1, Canada-4, France-1, Germany-2 and Sweden-3) have logged 745h 29min outside the station on building, outfitting & servicing. It was the 138th spacewalk involving U.S. astronauts.

After the spacewalkers' ingress (7:31pm EST), post-EVA activities by MS4 Kimbrough, MS2 Bowen, FE-2 Chamitoff, CDR Fincke & CDR Ferguson in the A/L consisted of --

- Recharging the EMU/spacesuits with water from PWR (Payload Water Reservoir),
- Reconnecting the LTAs (Lower Torso Assemblies) to the EMUs
- Capping the UIA (Umbilical Interface Assembly),
- Initiating battery charging in the A/L BSA (Battery Stowage Assembly),
- Taking photographs of the EMU gloves for downlink and inspection,
- Downlinking EVA photography.

Today, Shuttle crewmembers Bowen, Kimbrough and Stefanyshyn-Piper are working on reconfiguring the EMUs (Extravehicular Mobility Units) and other EVA equipment/tools for transfer to the MPLM and the Middeck.

FE-2-18 Sandra Magnus photographed and labeled the returned GPS-B antenna and stowed it in a bag in the JPM. *[The GPS B antenna will be installed on the JPM during a future EVA. Both antennas are required for HTV docking in Sept. 2009.]*

WRS/WPA (Water Recovery System/Water Processing Assembly) Update: CDR Fincke is continuing to work on the WRS/WPA which has been operating nominally since yesterday (two nominal runs over four hours each). *[After re-filling the UPA (Urine Processing Assembly) with EDV-pretreated urine, Mike checked again today for leaks. Later, he will collect water samples of the WPA's second run (one purge bag, one post-flight analysis packet, one TOCA sample), before transferring the recycled water from the WPA to CWCs (Contingency Water Containers, #1017 & 1018) with iodine, using a common H₂O hose, conduct an in-flight chemistry/microbiology analysis of a sample with the U.S. WMK (water microbiology kit), then temporarily stow the equipment. Background:* Two additional fasteners were installed yesterday on the WRS DA (Distillation Assembly) structural mounting

plate, followed by retorquing of all DA fasteners. In addition, Fincke & Pettit installed an IWIS RSU (Internal Wireless Instrumentation System/Remote Sensor Unit) to obtain structural vibrational data from the activated UPA (required for subsequent engineering analysis and assessment with respect to any impacts on micro-G science payloads and other station systems). The UPA is running continuously today, and at one time reportedly generated a "washing machine" noise, as expected due to the hard (undampened) mounting. If no further anomalies occur until 3:00pm EST today (cutoff for MPLM stowage), there is no need for the DA to return to Earth.]

The TOCA (Total Organic Carbon Analyzer) is operating nominally after yesterday's troubleshooting (removal of trapped air bubbles by flushing a re-circulating section of the liquid pump via "dead-heading"). A sample from the WRS was obtained and successfully run through the TOCA, followed by data downlink to MCC-Houston for analysis. A second sample is being analyzed today.

FE-2-18 Sandra Magnus is completing the installation of the Galley's PWD (Potable Water Dispenser) standoff hose from the LAB1S7 rack location along the LAB1P4 & LAB1O4 racks. *[The work includes taking documentary photography of the installation, followed by activation & checkout of the hose, first flushing it from an iodine-treated CWC (#1059), followed by vacuum-backfilling and then using about 2 L of ambient water (~2 L) for flushing, in small increments (to gain flight data on WPA accumulator pressure range).]*

Greg Chamitoff & Don Pettit prepared the spare JEM CBM CPA-4 (Common Berthing Mechanism/Controller Panel Assembly 4) by carefully removing its MLI cover (there are two ground wires between MLI & CPA), then installed the spare at the Node-2 nadir CBM in place of the failed CPA-4. *[This allows MCC-Houston to prepare the Node-2 Nadir CBM during crew sleep for tomorrow's (11/26) MPLM demating.]*

Chamitoff and Magnus had more time reserved for standard joint "handover" activities, to be continued through the docked period ahead.

FE-1 Lonchakov started a new round of the periodic preventive maintenance of RS (Russian Segment) ventilation systems in the FGB (Funktsionalnyi-Grusovoi Blok), cleaning the grille of the TsV1 fan.

Afterwards, the FE-1 worked his way through an extensive five-hour teardown of the Russian MATRYOSHKA-R (RBO-3-2) radiation suite in the SM (Service Module). *[Yuri dismantled the antropomorphic (human torso) "Phantom" and removed its PILLE radiation detectors, five NTDPs (Nuclear Track Detector Packages) and 356 TLDs (Thermoluminescent Detectors) from its torso layers. The*

detectors will then be pre-packed for return to Earth and handed over to the Shuttle crew, while the Matryoshka hardware is to be temporarily stowed in the FGB.]

Later tonight, Lonchakov will conduct the routine maintenance of the SOZh/ECLSS system, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier].*

Also on Yuri's schedule for today is the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS (Russian Segment) hatchways, including the passageways PrK (SM Transfer Compartment)–PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1. *[This checkup is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons, and one of the two Russian SKV air conditioners off (SKV-1).]*

As an addition to his discretionary “as time permits” task list for today, Yuri will complete the periodic daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The “scavenging” of MPLM (Multipurpose Logistics Module) GLAs (General Luminaire Assemblies) for use as spares on the ISS, deferred from yesterday's schedule, is one of Sandy's jobs today.

Afterwards, the FE-2-18 is to inspect the MPLM hatch seal for any possible damage following the rack translations of the preceding days.

Preparatory to today's scheduled combined waste water dump from the Shuttle, Mike Fincke verified closure of the protective window shutters in the Kibo JPM. Then, at ~11:20am, CDR Ferguson maneuvered the ISS/Shuttle stack into the proper attitude, and at ~11:38am the venting commenced (in retrograde direction). Later, –XVV attitude (Shuttle bottom facing opposite to flight direction for TPS protection) was restored with Shuttle thrusters (ORB mode) at ~1:05pm and taken over by CMG Momentum Management. *[The water vent (from Orbiter, CWC 1076 & PWR 1025) had been coordinated with Russian specialists who require a 5-day separation between the dump and the arrival of Progress 31P.]*

At ~5:05pm EST, the combined crew is scheduled for three PAO interviews with

KARE-TV, Minneapolis, MN (Diana Pierce, Pat Evans), KPAM-AM Radio, Portland, OR (Terry Travis) and WTXF-TV, Philadelphia, PA (Sabrina Wolman).

At ~9:22pm, CDR Fincke will power up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, & power supply) and conduct, at 9:27pm, a ham radio exchange with Wairarapa Home School Association, Carterton, Wairarapa, New Zealand. *[The Association is a support group for many of the Home Schoolers in the Wairarapa province located about 90 km Northeast on Highway 2 from the Capital City, Wellington. The organization provides a point of communication for events and resources that are in the Wairarapa and for parents to plan events that will provide for educational and social activities for our families. The Wairarapa in Maori means "sea of sparkling waters" from Lake Wairarapa, a fresh water lake in the province. It is a rural community consisting of dairying, cattle, sheep, timber, cropping and some fruit growing industries. Some families live in remote areas in the farming community and others live in the eight country towns; Masterton is the main town in the province. The children who will be asking the questions are schooled by their parents from a Correspondence curriculum, the ages of the children range from 5 to 14 years--many come from big families, where English is their first language.*

Questions to Mike were uplinked beforehand. "What made you want to be an astronaut?"; "How long do you go into space for, and what are you doing up there?"; "Have you gone outside the space station yet?"; "What can you see out the window?"; "What does the Milky Way and other planets look like from the space station?"; "Have you ever seen a shooting star, and what did it look like from the space station?"; "How do you exercise in space?"; "Is the cabin pressurized so you can eat food like we do on earth, or do you float around like they do on movies and have to drink pureed food?"; "What happens if there is a fire on the space station?"; "How do you handle it when two of you have an argument on the space station?"; "What is the operating system for your computers on board the space station?"]

The ISS crew completed their physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-1, FE-2), TVIS treadmill (CDR, FE-2), RED (CDR, FE-2-18), and VELO bike with bungee cord load trainer (FE-1).

Transfers: MPLM (Multi-Purpose Logistics Module) cargo transfers are being completed today. Middeck transfers are on schedule. 22 lbs of O₂ (oxygen) was transferred from the Shuttle today. *[As of this morning, Middeck cargo transfers were 69% complete, MPLM 96%, total 89%.]*

No CEO photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 5:17am EST [= epoch]):

Mean altitude -- 354.1 km
Apogee height -- 358.8 km
Perigee height -- 349.4 km
Period -- 91.62 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.000704
Solar Beta Angle -- 8.0 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.72
Mean altitude loss in the last 24 hours -- 126 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 57390.

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

11/26/08 -- Progress M-66/31P launch
11/28/08 -- STS-126/Endeavour/ULF-2 undocking (~9:47am);
11/30/08 -- STS-126/Endeavour/ULF-2 landing (KSC, ~1:18pm);
11/30/08 -- Progress M-66/31P docking -- DC1 Nadir (~7:23am)
12/07/08 -- Progress M-65/30P reentry (after 3 weeks autonomous flight for geophysical experiments)
12/18/08 -- Russian EVA-21
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Endeavour/15A launch -- S6 truss segment
02/14/09 -- STS-119/Endeavour/15A docking
02/24/09 -- STS-119/Endeavour/15A undocking
02/26/09 -- STS-119/Endeavour/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/27/09 -- Soyuz TMA-15/19S launch
Six-person crew on ISS
07/30/09 -- STS-128/Atlantis/17A -- MPLM (P), last crew rotation
10/15/09 -- STS-129/Endeavour/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A -- Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A -- MPLM(P)
04/08/10 -- STS-132/Endeavour/ULF4 -- ICC-VLD, MRM1 (contingency)

05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 11/24/08

All ISS systems continue to function nominally, except those noted previously or below. *Flight Day 11 (FD11) of STS-126/ULF-2. ISS crew work cycle today: Wake 8:55am EST; sleep 12:25am; Shuttle crew: 12:55am (both until 8:55am tomorrow). Underway: Week 5 of Increment 18.*

Mission Extension: The IMMT (ISS Mission Management Team) and the Shuttle Program this morning approved an extension of the ULF-2 flight by one day (i.e., undocking on Friday, 11/28) to provide additional time for the WRS (Water Recovery System) and TOCA (Total Organic Carbon Analyzer) troubleshooting activities and increase the chances of returning adequate distillate samples to the ground (or return the UPA if required). Thus, MPLM "Leonardo" closeout & transfer to the Shuttle cargo bay will also slip a day. *[The extension will not interfere with the Progress 31P docking , scheduled for 11/30.]*

Mission ULF-2's EVA-4 is underway, having begun at 1:24pm EST (34 min behind schedule). The spacewalk is being performed by Steve Bowen (EV2) & Shane Kimbrough (EV3). *[EV2 & EV3 began their "campout" last night at ~11:20pm in the U.S. Airlock (A/L) with hatch closure and depressurization of the CL (Crewlock) from 14.7 to 10.2 psi, followed by mask prebreathe at ~11:20pm-12:25am. This morning, following the usual hygiene break/with mask prebreathe for the two spacewalkers at ~8:35am-9:45am after spending the night on 10.2 psi, the A/L hatch was closed again for EVA preps in 10.2 psi, followed by EMU (Extravehicular Mobility Unit) purge and prebreathe in the EMUs, assisted by Chris Ferguson and Sandra Magnus. Afterwards, with CL depressurization and EV2/EV3 egress, EVA-4 began at 1:24pm, with Eric Boe providing IVA (Intravehicular Activity) assist.]*

EVA-4 is expected to last about 6:30h (i.e., until ~7:54pm EST). Spacewalk objectives are --

- for EV2/Bowen:

- Remove MLI (Multi-Layer Insulation) covers 11,10,7,6) on P3 truss,

- At Stbd SARJ (Solar Alpha Rotary Joint), clean & lube under covers 17/18; install TBA (Trundle Bearing Assembly)-3; install cover;
 - EFBM (External Facility Berthing Mechanism) structural latch contingency;
 - Install EFBM covers;
 - Install 2 JEM (Japanese Experiment Module) GPS antennas (prep. for Japanese HTV arrival);
 - Clean up JEM.
- for EV3/Kimbrough:
- Remove P3 MLI (Multi-Layer Insulation) covers 14 & 15;
 - Port SARJ lube (Part 1);
 - Install ETVCG at CP 7 ;
 - Port SARJ, lube (Part 2);
 - Install P3 MLI covers ;
 - Get aheads : Infrared imagery of S1 Radiator & P1 Radiator.

The NOAX (Non-Oxide Adhesive Experimental) caulk applicator from the Shuttle, using Braycote-601 lubricant for the trundle bearings, was approved for use on EVA-4. *[The gun was left in the A/L for use if needed, with no modification to reduce Braycote flow from its nozzle.]*

After the spacewalkers' return on board tonight, post-EVA activities by MS3 Kimbrough, MS2 Bowen & FE-2-18 Magnus & CDR Ferguson in the A/L will consist of --

- Recharging the EMU/spacesuits with water from PWR (Payload Water Reservoir),
- Reconnecting the LTAs (Lower Torso Assemblies) to the EMUs
- Capping the UIA (Umbilical Interface Assembly),
- Initiating battery charging in the A/L BSA (Battery Stowage Assembly),
- Taking photographs of the EMU gloves for downlink and inspection,
- Downlinking EVA photography and the radiator infrared imagery.

Before breakfast, FE-2 Chamitoff & FE-2-18 Sandra Magnus continued their session with the biomed experiment INTEGRATED IMMUNE (Validating Procedures for Monitoring Crew member Immune Function), collecting a liquid saliva sample. *[IMMUNE protocol requires the collection to occur first thing post-sleep, before eating, drinking and brushing teeth, and all samples are stored at ambient temperature. Along with NUTRITION (Nutritional Status Assessment), INTEGRATED IMMUNE samples & analyzes participant's blood, urine, and saliva before, during and after flight for changes related to functions like bone metabolism, oxidative damage and immune function to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects. The saliva is collected in two forms, dry and liquid. The dry samples are collected*

at intervals during the collection day using a specialized book that contains filter paper. The liquid saliva collections require that the crewmember soak a piece of cotton inside their mouth and place it in a salivette bag; there are four of the liquid collections during docked operations.]

Fincke & Chamitoff are continuing troubleshooting activities on the WRS (Water Recovery System), today removing two more vibration isolators from the DA (Distillation Assembly) and installing two additional fasteners for hard mounting the DA on the WRS rack instead. *[After Mike Fincke & Don Pettit removed the first set of isolators yesterday and loaded pre-treated urine into the UPA (Urine Processing Assembly), the UPA ran nominally for 2:58h before shutting down again. Suspect is the rack isolation/dampening supports which probably cause an imbalance to the centrifuge, having never been tested before in zero-gravity (another Lesson Learned?). The crew is now removing additional vibration dampeners from the UPA mounting and will then reattempt UPA processing.]*

Afterwards, the WSTA will again be filled with EDV-pretreated urine (to no more than 65%), and Fincke will start the processing operation. *[For adequate sampling, a minimum of 61 lbs urine distillate is required, which takes at least 24 hrs to collect.]*

For today's troubleshooting of the new TOCA equipment, samples will be required from the WPA (Water Processor Assembly), collected in two bags. *[During the TOCA analysis of waste water samples from the WPA yesterday, the first two replications of the water analysis cycle were completed, but the analysis terminated during the third replication. Subsequent troubleshooting by the crew showed no leak, which made gas bubbles the likely cause. A software modification was uploaded overnight to increase the speed of the liquid loop pump, which is expected to minimize the potential for gas bubbles in the system. Today, Fincke will re-prime the system, TOCA will process a sample, and the CDR will do a second inspection for leaks.]*

Sandra Magnus will also be performing the visual "T+2 Day" microbial (bacterial & fungal) analysis and data recording of the MCDs (Microbial Capture Devices) with the first WPA sample (collected on 11/22).

Completion of routing & installing the PWD (Potable Water Dispenser) standoff hose will be attempted by Greg & Sandy later today, after the EVA-4, since it may involve temporary shutdown of the Lab ITCS LTL (Internal Thermal Control System/ Low Temperature Loop) which is required for Airlock (A/L) operation, to support the necessary disconnecting of its obstructing supply & return QDs (Quick Disconnects). *[The PWD Galley supply hose needs to be routed from the LAB1S7 rack location to the Aft Deck End Cone and from there to the Port Deck*

Standoff hose in the Lab1P4 Z-Panel. The two FEs have worked on removing the obstruction earlier by taking off a flange, then taped hose & flange to the front of the Z Panel on the rack until LTL shutdown allows completing the work.]

Mike Fincke, with Sandy Magnus, will perform a checkout of the new RSP (Respiratory Support Pack), inspecting it for any anomalies. Following successful checkout, the RSP #1002 will be swapped with RSP #1004 (location LAB1S4_D1).

In the FGB, FE-1 Lonchakov unstowed the KUBIK-2 thermostatic container/incubator equipment and pre-packed it for transfer to the MPLM (Multi-Purpose Logistics Module), then handed it over to the Shuttle crew for return to Earth.

Lonchakov conducted the regular status check and data collection on the long-term BIO-5 Rasteniya-1 ("Plants-1") experiment, copying data from its built-in control computer to a PCMCIA memory card for subsequent downlink to the ground via OCA. *[Rasteniya-1 researches growth and development of plants under spaceflight conditions in the LADA-14 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). The payload hardware includes a module (MIS/ Module for the Investigation of Substrates), the MIS control unit (BU), a nitrogen purge unit (BPA) and other accessories. During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. LADA consists of a wall-mounted growth chamber that provides long-term, ready access for crewmember interaction. It provides light and root zone control but relies on the cabin environmental control systems for humidity, gas composition, and temperature control. Cabin air is pulled into the leaf chamber, flows over the plants and vents through the light bank to provide both plant gas exchange and light bank cooling.]*

In the Soyuz TMA-13/17S, docked at the FGB, Yuri ingressed the Descent Module (SA) and performed inspection & troubleshooting of the KhSA Cooler/Dryer, checking its V1 fan for unimpeded spinning.

Afterwards, the FE-1 completed the periodic (about twice a month) replenishing of the Elektron oxygen generator's water supply for electrolysis, filling the KOV EDV container with water collected in CWC (Contingency Water Container) #1076 from the Lab CCAA (Common Cabin Air Assembly) dehumidifier. *[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]*

A two-hour job for Lonchakov today will be the periodic survey/audit of available free stowage space in the FGB, DC1 Docking Compartment and SM PrK/PkhO (Service Module Transfer Tunnel/Transfer Compartment)) for cargo to be delivered

by Progress 31P on 11/30.

Later, the FE-1 has three additional tasks on his schedule:

- Routine maintenance of the SOZh/ECLSS system, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier],*
- Daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur), and
- Periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the passageways PrK (SM Transfer Compartment)–PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1. *[This checkup is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons, and one of the two Russian SKV air conditioners off (SKV-1).]*

In the Kibo JPM (Japanese Pressurized Module), FE-2 Chamitoff removed the AmiA (Antimicrobial Applicator) from the ITCS (Internal Thermal Control System), installed yesterday at the MTL (Moderate Temperature Loop) supply QD. *[AmiA was used to introduce OPA (Ortho-Phthalaldehyde), an antimicrobial agent, into the JPM coolant. The applicator had to remain in the loop for at least 6 hrs. As usual, the MELFI (Minus-Eighty Laboratory Freezer for ISS) Brayton-cycle motor had to be powered down for the AmiA removal (which temporarily interrupts water flow to the MELFI).]*

Afterwards, Gregory accessed the JPM ITCS and collected a coolant sample for analysis on the ground.

Due to the one-day slip of MPLM unberthing, the installation of the spare CPA (Controller Panel Assembly) at the Node-2 nadir CBM (Common Berthing Module) by Greg & Don Pettit, originally scheduled for today, will also be postponed one day.

Chamitoff and Magnus have more time reserved for standard joint “handover” activities, to be continued through the docked period ahead. Today’s handover includes a 15-min familiarization of Sandy with the CMS (Countermeasure System) TVIS treadmill in the SM.

After setting up the G1 camcorder with its VDS MPC (Video Distribution System/

Multi-Purpose Converter) for transmitting external images, Sandy will be supporting the EFBM contingency task of EV2/Steve Bowen at about half way into the EVA-4 with the JEMRMS (JEM Robotic Manipulator System) by the usual activation/deactivation procedures in support of ground controllers at Tsukuba/Japan. *[Involved systems are RLT (RMS Laptop), CCP (Camera Control Panel), RMS JMUs (Joint Motor Units) motors powered from EXT-2, RMS Monitors 1&2, Arm Bus, MDP (Management Data Processor), etc. The MA (Main Arm) will finally be parked at its regular stow position.]*

CDR Fincke will support the EFBM activity by monitoring the external latch #1 retraction from the EFBM BCDU (Berthing Mechanism Control & Display Unit)'s LED monitor and later turning off the G1 camcorder and MPC equipment.

The ISS crew completed their physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2, FE-2-18), TVIS treadmill (FE-1), RED (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Cargo Transfers: MPLM (Multi-Purpose Logistics Module) cargo transfers by Pettit, Boe, Chamitoff, Fincke and Piper (who is also transferring Middeck cargo and will configure MPLM racks for return cargo) are continuing at a brisk pace, remaining slightly ahead of schedule. *[As of this morning, Middeck transfers were 63% complete, MPLM 91%, overall 84%.]*

No CEO photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:57am EST [= epoch]):

Mean altitude -- 354.2 km

Apogee height -- 358.8 km

Perigee height -- 349.6 km

Period -- 91.62 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006641

Solar Beta Angle -- 12.0 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude change in the last 24 hours -- +400 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57376.

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

11/26/08 -- Progress M-66/31P launch
11/28/08 -- STS-126/Endeavour/ULF-2 undocking;
11/30/08 -- STS-126/Endeavour/ULF-2 landing;
11/30/08 -- Progress M-66/31P docking – DC1 Nadir (~7:23am)
12/07/08 -- Progress M-65/30P reentry (after 3 weeks autonomous flight for geophysical experiments)
12/18/08 -- Russian EVA-21
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment
02/14/09 -- STS-119/Endeavour/15A docking
02/24/09 -- STS-119/Endeavour/15A undocking
02/26/09 -- STS-119/Endeavour/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/27/09 -- Soyuz TMA-15/19S launch
Six-person crew on ISS
07/30/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation
10/15/09 -- STS-129/Endeavour/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Endeavour/ULF4 – ICC-VLD, MRM1 (contingency)
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 11/23/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – Flight Day 10 (FD10) of STS-126/ULF-2. ISS crew work cycle today: Wake 8:55am EST; sleep 12:25am; Shuttle crew: 12:55am (both until 8:55am tomorrow). Ahead: Week 5 of Increment 18.*

Mission ULF-2's EVA-3 was completed successfully last night by Heidemarie Stefanyshyn-Piper & Steve Bowen in 6h 57min, accomplishing nearly all of its objectives and some get-aheads.

[During the spacewalk, Piper (EV1) & Bowen (EV2) –

- Cleaned and lubricated the race ring bearing surfaces under Stbd SARJ (Solar Alpha Rotary Joint) covers 1, 2, 3, 11, 12, 13, 14, 15, 16, 19, 20, 21, and 22,*
- Removed & replaced five SARJ TBAs (Trundle Bearing Assemblies -2, -4, -12, -1, -7).*

Additionally, as get-ahead tasks for EVA-4, the spacewalkers removed covers 17 & 18 and TBA-3.

Cleaning and lubing of the race ring bearing surfaces beneath covers 17 & 18, plus replacement of TBA-3 will be completed during tomorrow's EVA-4.

Official start time of the spacewalk was 1:01pm EST, and it ended at 7:58pm. Total EVA duration (PET = Phase Elapsed Time) was 6h 57min. It was the 117th spacewalk for ISS assembly & maintenance and the 89th from the station (65 from Quest, 24 from Pirs, plus 28 from Shuttle) totaling 551h, the third EVA for Expedition 18 and the 17th so far this year (including two Russian Orlan EVAs). It was the 5th spacewalk for Stefanyshyn-Piper (33h 42m tot.) and the second for Bowen (13h 49m tot.). After today's EVA, a total of 155 spacewalkers (119 NASA astronauts, 25 Russians, and 11 astronauts representing Japan-1, Canada-4, France-1, Germany-2 and Sweden-3) have logged 739h 22min outside the station on building, outfitting & servicing. It was the 137th spacewalk involving U.S. astronauts.]

After the spacewalkers' ingress (7:58pm EST), post-EVA activities by MS3 Piper,

MS2 Bowen, FE-2 Chamitoff, CDR Fincke & CDR Ferguson in the A/L and preparations for EVA-4 tomorrow consisted of --

- *Taking photographs of the EMU gloves for downlink and inspection,*
- *Swapping EMU/spacesuits from Kimbrough to Bowen,*
- *Recharging the EMU/spacesuits with water from PWR (Payload Water Reservoir),*
- *Reconnecting the LTAs (Lower Torso Assemblies) to the EMUs,*
- *Initiating METOX (Metal Oxide) canister regeneration for EVA-4,*
- *Capping the UIA (Umbilical Interface Assembly,*
- *Checking out the SAFER units,*
- *Initiating battery charging in the A/L BSA (Battery Stowage Assembly),*
- *Turning the DCS & D2XS cameras around, and*
- *Preparing the A/L Equipment Lock (E-LK).*

In support of EVA-4, Sandra Magnus will set up the photo/TV infrared camera for TRJJ imagery.

CDR Fincke & FE-2-18 Magnus are continuing with WRS (Water Recovery System) activation activities. *[The UPA (Urine Processor Assembly) was activated again but shut down after about 2 hrs due to low centrifuge speed, similar to yesterday's shutdown. Engineering teams met and determined that a possible cause of the low centrifuge speed is a vibration-induced resonance. The on-orbit unit is mounted on vibration isolators. In a late-added task estimated at 2 hrs, Mike & Sandy are performing an on-orbit modification today to remove the vibration isolators and hard-mount the UPA on the rack structure.]*

The WPA (Water Processor Assembly) completed its first on-orbit water processing, using about 40 lbs of waste water (mostly condensate). Magnus collected samples of this first WPA-produced water for archival storage & in-flight chemistry/microbiology analysis with the U.S. WMK (water microbiology kit) and one sample for the newly installed TOCA (Total Organic Carbon Analyzer), then downlinked the results of the latter via USB stick and SSC (Station Support Computer). *[The first two replications of the analysis cycle were completed, but the analysis terminated during the third replication. The problem could have been caused by too much gas being pushed through the system which created bubbles. There is also a chance that an internal water leak is responsible. Another software update may be required.]*

FE-1 Lonchakov conducted his first session with the Russian biomedical MBI-15 "Pilot-M"/NEURO signal response experiment after setting up the workplace and equipment. Afterwards, the Pilot-M & Neurolab-2000M gear was disassembled and stowed away. *[MBI-15 requires a table, ankle restraint system, eyeball electrodes for an EOG (electrooculogram), and two hand controllers (RUO & RUD)]*

for testing piloting skill in “flying” simulations on a laptop (RSK1) under stopwatch control, as well as for studying special features of the psychophysiologic response of cosmonauts to the effects of stress factors in flight.]

FE-2 Chamitoff set up the payload equipment for his fourth session with the 3D-Space (Mental Representation of Spatial Cues During Space Flight) experiment and then performed the protocol, with all three exercises (distance, illusion, handwriting). After all data were stored on PCMCIA memory card, the ESA multipurpose laptop was shut down and the hardware disconnected & stowed away. *[3D-SPACE, a collaboration of ESA and the French space agency CNES (Centre National de la Recherche Scientifique), is designed to identify accurate visual perception & localization of objects in the space environment as prerequisites for spatial orientation & reliable performance of motor tasks in microgravity.*

Humans have mental representations of their surroundings based on sensory information & experience. It is hypothesized that depth & distance perception of objects could be altered in space due to the absence of gravitational reference and ambiguous perspective cues. 3D-SPACE investigates (a) depth perception & the role of perspective cues using geometric illusions, (b) distance perception using both standard psychophysics tests & natural three-dimensional scenes presented on a virtual reality head-mounted display, and (c) the effects of cognitive vs. perceptual-motor changes using handwriting & drawing tests.]

In the COL (Columbus Orbital Laboratory), Gregory installed the ITCS (Internal Thermal Control System) Sampling Adapter to retrieve a sample of its coolant for return to the ground in the Shuttle middeck.

Later today, the FE-2 will hook the AmiA (Antimicrobial Applicator) into the Kibo JPM (Japanese Pressurized Module)'s ITCS, connecting it to the MTL supply QD.

[AmiA introduces OPA (Ortho-Phthalaldehyde), an antimicrobial agent, into the JPM TCS coolant. The applicator must remain installed in the loop for at least 6 hrs.]

Yesterday's routing & installing of the PWD (Potable Water Dispenser) standoff hose by Greg & Sandy was not completed due other hoses obstructing the space required. *[The hose is routed from the LAB1S7 rack location to the Aft Deck End Cone and from there to the Port Deck Standoff. The two FEs removed the obstruction by taking off a flange, then taped hose & flange to the front of the Z Panel on the rack. Specialists will determine the future plan. Temporary shutdown of the LTL (Low Temperature Loop) may help to get the hose installed.]*

Sandra Magnus took the periodic O-OHA (on-orbit hearing assessment) test, a 30-min. NASA environmental health systems examination to assess the efficacy of acoustic countermeasures, using a special MEC (Medical Equipment Computer)

laptop application. It was Sandy's first O-OHA test. *[The O-OHA audiography test involves minimum audibility measurements for each ear over a wide range of frequencies (0.25-10 kHz) and sound pressure levels, with the crewmembers using individual-specific Prophonics earphones, new Bose ANC headsets (delivered on 30P) and the SLM (sound level meter). To conduct the testing, the experimenter is supported by special EarQ software on the MEC, featuring an up/down-arrow-operated slider for each test frequency that the crewmember moves to the lowest sound pressure level at which the tone can still be heard. The baseline test is required not later than about Flight Day 14 for each new Expedition and is then generally performed once per month. Note: There have been temporary hearing deficits documented on some U.S. and Russian crewmembers, all of which recovered to pre-mission levels.]*

FE-2-18 Magnus performed outfitting in the Node -2 by installing a guide ring on the EVA side of the nadir hatch.

In response to a JAXA request, Magnus will also make a second attempt at retracting the structural latch (#1) of the EFBM (Exposed Facility Berthing Mechanism) by activating the BCDU (Berthing Mechanism Control & Display Unit) in the JPM. *[During yesterday's checkout of the Kibo EFBM by Mike & Sandy structural latch #1 failed to retract. The retraction was added as a 20-min contingency task to EVA-4.]*

Preparatory to today's scheduled waste water dump from the Shuttle, FE-2-18 Magnus verified closure of the protective window shutters in the Kibo JPM (Japanese Pressurized Module). Later today, CDR Ferguson will maneuver the ISS/ Shuttle stack into the proper attitude at ~5:46pm EST, and at ~5:46pm the venting (in retrograde direction) will commence, lasting about 50 min. -XVV attitude (Shuttle bottom facing opposite to flight direction for TPS protection) will then be restored with Shuttle thrusters (ORB mode) at ~7:00pm and taken over by CMG Momentum Management. *[This will be the last waste water dump for this mission, even if it is extended by a day.]*

FE-1 Lonchakov performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module), including the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

SOZh checkups by Yuri today also include the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem, gathering

weekly data on total operating time & “On” durations for reporting to TsUP-Moscow.

Lonchakov is to conduct the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS (Russian Segment) hatchways, including the passageways PrK (SM Transfer Compartment)–PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1. *[This checkup is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons, and one of the two Russian SKV air conditioners off (SKV-1).]*

The FE-1 will also shoot situational awareness video of ventilation air ducts in the SM, DC1 Docking Compartment and Soyuz spacecraft, followed by downlinking the footage to TsUP-Moscow.

The ISS crew completed their physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2, FE-2-18), TVIS treadmill (CDR, FE-1), RED (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1). It was the second exercise session for Sandy Magnus, now to become a daily protocol for her.

At ~5:05pm EST, the combined crew is scheduled for three PAO TV downlinks with ABC News (Gina Sunseri), CBS News (Bill Harwood, Peter King) and NBC News (Lester Holt).

At ~8:50pm, the ten crewmembers are scheduled for an in-depth one-hour review of procedures for tomorrow’s 6:30h EVA-4 spacewalk, with egress tomorrow afternoon at ~1:45pm EST.

Bowen (EV2) and Kimbrough (EV3) will begin their “campout” in the “Quest” Airlock (A/L) tonight at ~11:20pm with hatch closure and depressurization of the CL (Crewlock) from 14.7 to 10.2 psi, followed by mask prebreathe until ~12:25m. Sleep time for the ISS crew begins at 12:25am, for the Shuttle crew half an hour later.

EVA-4 Look-ahead: Following the usual hygiene break/with mask prebreathe for Bowen & Kimbrough at ~9:30am-10:40am tomorrow morning after spending the night on 10.2 psi, the A/L hatch will be closed again for EVA preps in 10.2 psi, followed by EMU purge and prebreathe in the EMUs. Afterwards, with CL depressurization and EV1/EV2 egress, EVA-4 nominally begins at ~1:45pm EST. Objectives of the spacewalk are –

- *Remove & later re-install P3 MLI (Multi-Layer Insulation) covers 11, 10, 7, 6, 14, 15,*
- *Clean & lubricate under Stbd SARJ (Solar Alpha Rotary Joint) covers 17/18,*

- *Install TBA-3, re-install covers,*
- *Lubricate Port SARJ,*
- *Install ETVCG camera,*
- *Perform contingency EFBM structural latch #1 retract, and*
- *GPS antenna.*

Possible get-aheads: S1 Radiator, P1 Radiator.

The NOAX (Non-Oxide Adhesive Experimental) caulk applicator from the Shuttle, using Braycote-601 lubricant for the trundle bearings, will be left in the A/L for use during EVA-4 if needed. It will not be modified to reduce Braycote flow from its nozzle

KURS-P Repair Update: After the K2-VKA-01 container of the KURS-P automated rendezvous radar system was installed and connected yesterday in the SM by FE-1 Lonchakov, it was successfully tested by TsUP-Moscow and is running with no issues. *[The passive KURS-P is required for the Progress 31P docking next week (11/30) at the DC1 nadir port, with KURS backup provided by the manual TORU system.]*

Cargo Transfers: MPLM (Multi-Purpose Logistics Module) cargo transfers by Pettit, Boe, Piper, Chamitoff, Magnus and Fincke are continuing at a brisk pace, remaining slightly ahead of schedule. *[As of this morning, Middeck transfers were 56% complete, MPLM 84%, overall 76%.]*

No CEO photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 11:55am EST [= epoch]):

Mean altitude -- 353.8 km

Apogee height -- 358.3 km

Perigee height -- 349.3 km

Period -- 91.62 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006641

Solar Beta Angle -- 15.8 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 0 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57363.

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

11/26/08 -- Progress M-66/31P launch
11/27/08 -- STS-126/Endeavour/ULF-2 undocking; 10:40am – *Under Review*
11/29/08 -- STS-126/Endeavour/ULF-2 landing; ~2:10pm – *Under Review*
11/30/08 -- Progress M-66/31P docking – DC1 Nadir (~7:23am)
12/07/08 -- Progress M-65/30P reentry (after 3 weeks autonomous flight for geophysical experiments)
12/18/08 -- Russian EVA-21
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment
02/14/09 -- STS-119/Endeavour/15A docking
02/24/09 -- STS-119/Endeavour/15A undocking
02/26/09 -- STS-119/Endeavour/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/27/09 -- Soyuz TMA-15/19S launch
Six-person crew on ISS
07/30/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation
10/15/09 -- STS-129/Endeavour/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Endeavour/ULF4 – ICC-VLD, MRM1 (contingency)
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osp/iss_reports/index.htm

ISS On-Orbit Status 11/22/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – Flight Day 9 (FD9) of STS-126/ULF-2. ISS crew work cycle today: Wake 8:55am EST; sleep 12:25am (11/23); Shuttle crew: 12:55am (both until 8:55am tomorrow).*

Mission ULF-2's EVA-3 is underway, having begun at 1:01pm EST (44 min ahead of schedule). EVA-3 is being performed by Heidemarie Stefanyshyn-Piper (EV1) & Steve Bowen (EV2). *[EV1 & EV2 began their "campout" (nachalo desaturatsiy = desaturation start) last night at ~11:20pm in the U.S. Airlock (A/L) with hatch closure and depressurization of the CL (Crewlock) from 14.7 to 10.2 psi, followed by mask prebreathe at ~11:20pm-12:25am. This morning, following the usual hygiene break/with mask prebreathe for the two spacewalkers at ~9:30am-10:40am after spending the night on 10.2 psi, the A/L hatch was closed again for EVA preps in 10.2 psi, followed by EMU (Extravehicular Mobility Unit) purge and prebreathe in the EMUs, assisted by CDR Ferguson. Afterwards, with CL depressurization and EV1/EV2 egress, EVA-3 began at 1:01pm, with MS4 Kimbrough providing IVA (Intravehicular Activity) assist.]*

EVA-3 is expected to last about 7h (i.e., until ~8:01pm). Spacewalk objectives at the Stbd SARJ (Solar Alpha Rotary Joint) are –

For EV1/Piper:

- Clean & lube under covers 15 & 16; install TBA (Trundle Bearing Assembly)-1 plus covers 15 & 16;
- Remove, clean & lube under covers 13, 14, 11, 12, 17, 18; remove, clean & lube under TBAs-1, -7, -12, -3;
- Install TBAs-1, -7, -12, -3; install covers 13, 14, 11, 12, 17, 18.

For EV2/Bowen:

- Remove, clean & lube under covers 21, 22, 1 (do not R&R TBA-6);
- Remove, clean & lube under covers 2, 3, 19, 20; remove, clean & lube under TBA-7,-4;
- Clean TBA-4 DLA (Drive Lock Assembly);

- Install TBAs-7,-4; install covers 2, 3, 19, 20 (do not R&R TBA-5).

A NOAX (Non-Oxide Adhesive Experimental) caulk applicator from the Shuttle, using Braycote-601 lubricant for the trundle bearings, was approved for use on EVA-3 & EVA-4. *[For EVA-3, it was left in the A/L for use if needed. For EVA-4, it will be modified to reduce Braycote flow from its nozzle.]*

After the spacewalkers' return on board tonight, post-EVA activities by MS3 Stefanyshyn-Piper, MS2 Bowen, FE-2 Chamitoff & CDR Ferguson in the A/L will consist of --

- Recharging the EMU/spacesuits with water from PWR (Payload Water Reservoir),
- Reconnecting the LTAs (Lower Torso Assemblies) to the EMUs
- Initiating METOX (Metal Oxide) canister regeneration,
- Capping the UIA (Umbilical Interface Assembly),
- Initiating battery charging in the A/L BSA (Battery Stowage Assembly),
- Taking photographs of the EMU gloves for downlink and inspection.

Before breakfast, FE-2-18 Sandra Magnus completed her first session with the biomed experiment INTEGRATED IMMUNE (Validating Procedures for Monitoring Crew member Immune Function), collecting a wet saliva sample. *[IMMUNE protocol requires the collection to occur first thing post-sleep, before eating, drinking and brushing teeth, and all samples are stored at ambient temperature. Along with NUTRITION (Nutritional Status Assessment), INTEGRATED IMMUNE samples & analyzes participant's blood, urine, and saliva before, during and after flight for changes related to functions like bone metabolism, oxidative damage and immune function to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects. The saliva is collected in two forms, dry and liquid. The dry samples are collected at intervals during the collection day using a specialized book that contains filter paper. The liquid saliva collections require that the crewmember soak a piece of cotton inside their mouth and place it in a salivette bag; there are four of the liquid collections during docked operations.]*

After having successfully deinstalled the K2-VKA-01 container of the KURS-P automated rendezvous radar system in the FGB, FE-1 Lonchakov is currently mounting and connecting the FGB box in the SM (Service Module) in place of its failed counterpart which he has also removed since yesterday. A functions test by TsUP-Moscow over RGS (Russian Groundsite) is scheduled for later today. *[The passive KURS-P is required for the Progress 31P docking next week (11/30) at the DC1 nadir port, with KURS backup provided by the manual TORU system.]*

Subsequent to the KURS installation and test, Lonchakov has three additional tasks

on his schedule:

- Routine maintenance of the SOZh/ECLSS system, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier],*
- Daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur), and
- Periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the passageways PrK (SM Transfer Compartment)–PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1. *[This checkup is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons, and one of the two Russian SKV air conditioners off (SKV-1).]*

During the planned reactivation of the Elektron oxygen generator machine at 32 amps by the ground later today (~4:16pm), Lonchakov will monitor the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating. *[The gas analyzer used on the Elektron during nominal operations for detecting hydrogen (H₂) in the O₂ line (which could cause overheating) is not included in the control algorithm until 10 minutes after Elektron startup.]*

As has become standard operating procedure after deactivation/reactivation of VD-SU monitoring mode, as required for the Elektron power-down/-up, Yuri will also perform a quick function verification of the SUBA Ethernet connection between the OpsLAN (Operations Local Area Network) and the BRI Smart Switch Router in the SM.

CDR Fincke & FE-2-18 Magnus are continuing with WRS (Water Recovery System) activation activities. *[The UPA (Urine Processor Assembly) shut down last night after processing pretreated urine for about 2 hrs, probably due to mechanical interference in the DA (Distillation Assembly) centrifuge (one of three). The centrifuge was restarted in maintenance mode and performed nominally. UPA will be restarted today. Meanwhile, the WPA (Water Processing Assembly) continues to collect condensate water and is ready to begin processing when the quantity of distillate collected reaches the minimum amount required to begin.]*

Afterwards, Magnus will collect samples of the first WPA-produced water for archival storage and in-flight chemistry/microbiology analysis. Using MCDs (microbial capture devices) from the U.S. WMK (water microbiology kit) for treatment/processing (after no more than 6 hours of the collection), Sandy will then process the samples in the MWAK (microbial water analysis kit) for inflight coliform bacteria (*Escherichia coli*) detection.

Chamitoff & Magnus have 2:50h set aside for performing Part 1 of installing the PWD (Potable Water Dispenser) hose, today routing the jumper behind several Lab racks which will have to be rotated away from the wall after disengaging their UAMs (Upper Attach Mechanisms).

Other tasks by the FE-2-18 in support of getting the new Regen-ECLSS (Environment Control & Life Support System) on line on today's schedule include –

- Completing installation of the Galley (ER6/EXPRESS Rack 6) in the Lab by mating umbilicals and setting up its ELC (ER Laptop Computer for later activation by the ground (POIC/Payload Integration & Operation Center),
- Processing samples from the successfully installed TOCA for activation & checkout, and
- Performing leak checks on the WRS-1 & WRS-2 racks.

Gregory & Sandra have another ~4 hrs blocked out for standard joint “handover” activities, to be continued through the docked period ahead.

Mike Fincke is scheduled to feed the butterflies in the CGBA-5/CSI-3 (Commercial Generic Bioprocessing Apparatus/CGBA Science Insert 3) by powering down and decabling the payload, accessing its interior and exposing new food to the larvae in the Butterfly Habitat, then closing up, recabling and reactivating the payload. *[The two world-famous spiders meanwhile have torn down their initially confused three-dimensional webs and have produced traditional symmetrical ones, amazing fascinated watchers and puzzling experts with this surprisingly quick adaptation to zero-G. See more below under Science Update.]*

The ISS crew completed their physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2-18), TVIS treadmill (CDR, FE-1, FE-2), RED (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1). It was the second exercise session for Sandy Magnus, now to become a daily protocol for her.

Cargo Transfers: MPLM (Multi-Purpose Logistics Module) cargo transfers by Pettit, Ferguson, Boe, Kimbrough and Fincke are continuing at a brisk pace, remaining slightly ahead of schedule. *[As of this morning, Middeck transfers were 39% complete, MPLM 77%, overall 67%.]*

EFBM Contingency Task: During yesterday's checkout of the Kibo EFBM (External Facility Berthing Mechanism) by Fincke & Magnus, one of the structural latches (SL#1) failed to retract. The IMMT (ISS Mission Management Team) today approved a JAXA request to add a 20-min contingency task to EVA-4 to retract the latch manually.

Shuttle/ISS Reboost: The planned reboost by the Orbiter was performed successfully yesterday at 12:10pm, raising the stack's mean altitude by 2.2 km.

Weekly Science Update (*Expedition Eighteen -- Week 4*)

3-D SPACE: Planned.

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): Complete.

ANITA (Analyzing Interferometer for Ambient Air): Continuing.

BCAT-3/4 (Binary Colloidal Alloy Test 3/4): No news.

BIO-4: Complete.

CARDIOCOG-2: Complete.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): In progress. For the next CCISS session, Mike will be using a newly refurbished unit that will arrive on ULF-2.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System): Samples returned on 1J.

CSI-3/CGBA-5 (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus 5): "Mike and Sandy – thank you for the superb job of installing the spiders and larvae in their new environment and for the beautiful HD video of CSI-03 installation. Teachers, students, and all of the CGBA team are enjoying it. The two spiders are cohabitating somewhat peacefully so far and we have witnessed some web-building and tearing down of web, but no direct observation of eating. However, we have observed that the output part of the nutrition cycle is working for at least one of the spiders so there must be ingestion going on at some point. Both have been seen drinking from the water source in the cubbies. The butterfly larvae continue to eat voraciously. We can see only five out of six at any one time, but

they tend to crawl everywhere, including inside the food chambers, so it may be that we are looking at a different 'five' in each image. Even the fruit flies have supplied some entertainment with their adaptations to micro-g. Students have begun to access the webpage where images are being posted for comparison to the habitats they have in their classrooms. We've heard from many teachers about the excitement and enthusiasm these experiments have generated already."

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): On 11/5, EuTEF was finally permanently re-activated, after the PLEGPAY memory erase activity. The MIL-BUS error has occurred 3 times this week. Each time the power feeder#1 is cycled and the instruments are brought back on. There was also a problem on 11/19 with a DMS error at COL-CC which prevented commanding that day.-_DEBIE-2: 24-hrs science script ran, started on 11/17 and 11/18, and 11/20. DEBIE-2 is running this week to record any debris impact that may take place in conjunction with the SARJ clean-up activities;-_DOSTEL: On-going science acquisition;- EuTEMP: Currently inactive as planned;-_EVC: Started picture taking on 11/20;- EXPOSE: On-going science acquisition;-_FIPEX: Next script will run after the EVAs are completed;- MEDET: On-going science acquisition; PLEGPAY: Inactive, "Experiment 1" memory has been erased on 10/30. Plasma generation capability has been disabled;- TRIBOLAB: Anomaly with TRIBOLAB Ball Bearing experiment motor, currently being analyzed;

FSL (Fluid Science Laboratory): FSL is nominal.

GEOFLOW: MMA measurements were performed during the docking of ULF2 on 11/17 and successfully downlinked. It is planned to resume the GEOFLOW science runs after 30P undocking, ULF-2 mission and 31P docking.

HDTV System Test DL (JAXA): Complete.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long

Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: Underway for Sandra Magnus.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): In progress.

Marangoni Experiment for ISS in JAXA FPEF (Fluid Physics Experiment Facility): In progress.

Micro-G Clay (JAXA EPO): Complete.

MISSE (Materials ISS Experiment): Ongoing.

Moon Photography from ISS (JAXA EPO): Complete.

MOP (Motion Perception in Zero-G): Three ULF-2 astronauts are participating in this experiment (daily questionnaires)

MSG-SAME (Microgravity Science Glovebox): Complete.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MUSCLE-G (LBP/Low Back Pain): Six ULF2 astronauts are participating in this experiment (daily questionnaires)

NOA-1/-2 (Nitric Oxide Analyzer, ESA): Complete.

NUTRITION w/REPOSITORY: "Greg, thanks for the great work in completing all Nutr/Rep inflight sessions. Your participation is greatly appreciated! All samples will be returning with you, allowing the PI to begin analysis soon after return. Mike, Thanks for the great job completing your FD30 session. Crew notes were very helpful."

PADLES (Passive Dosimeter for Lifescience Experiment in Space): In progress.

PCRF (Protein Crystallization Research Facility) Reconfiguration (JAXA): Complete.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SAMPLE: Complete.

SHERE (Shear History Extensional Rheology Experiment): The 25 new Fluid Modules are now on-orbit with STS-126. They are a new-and-improved design that should be easier to deploy and close than the ones Greg Chamitoff used, and researchers are looking forward to performing a new series of experiments with Mike Fincke.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): “Greg, your only remaining sleep activity will be doffing and stowing the Actiwatch on the Shuttle with the Shuttle crew prior to landing. Mike, thanks for completing the download and initialization activity. Your remaining activities include monthly downloads, 3 weeks of sleep logging and then stowing the Actiwatch. Any additional Sleep logging is above and beyond and greatly appreciated by the PI.”

SOLAR (Solar Monitoring Observatory): SOLAR (USOS) – The Sun visibility window is planned to start on 11/21. Some anomalies are currently being worked for SOLACES and SOVIM instruments. A software patch was successfully uploaded on 11/20 and SOLAR is now running version 4.7 and is in pointing mode;- SOVIM: No science acquisition, non-nominal mode: instrument power consumption was much lower than expected in nominal mode. Trouble-shooting activities were performed on 11/11 and these were not successful. Ground teams are analyzing the data, before next attempts are planned. - SOLSPEC: –Waiting for Sun observation window;- SOLACES: Waiting for Sun observation window.

SOLO (Sodium Loading in Microgravity): Complete.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): Reserve.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (*Waving and Coiling of Arabidopsis Roots at Different g-levels*): Complete.

CEO (*Crew Earth Observations*): “There won't be any CEO inputs until 12/1. We stand down from CEO ops and assist with shuttle imagery tasks during shuttle missions.”

No CEO photo targets uplinked for today.

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 11:13am EST [= epoch]):

Mean altitude -- 353.8 km

Apogee height -- 358.2 km

Perigee height -- 349.4 km

Period -- 91.62 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006509

Solar Beta Angle -- 19.3 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude gain in the last 24 hours -- 2200 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57346.

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

11/26/08 -- Progress M-66/31P launch

11/27/08 -- STS-126/Endeavour/ULF-2 undocking; 10:40am -- *Under Review*

11/29/08 -- STS-126/Endeavour/ULF-2 landing; ~2:10pm -- *Under Review*

11/30/08 -- Progress M-66/31P docking -- DC1 Nadir (~7:23am)

12/07/08 -- Progress M-65/30P reentry (after 3 weeks autonomous flight for geophysical experiments)

12/18/08 -- Russian EVA-21

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Endeavour/15A launch -- S6 truss segment

02/14/09 -- STS-119/Endeavour/15A docking

02/24/09 -- STS-119/Endeavour/15A undocking

02/26/09 -- STS-119/Endeavour/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

07/30/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation
10/15/09 -- STS-129/Endeavour/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Endeavour/ULF4 – ICC-VLD, MRM1 (contingency)
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 11/21/08

All ISS systems continue to function nominally, except those noted previously or below. *Flight Day 8 (FD8) of STS-126/ULF-2. ISS crew work cycle today: Wake 8:55am EST; sleep 12:25am; Shuttle crew: 12:55am (both until 8:55am tomorrow).*

Mission ULF-2's EVA-2 was completed successfully last night by Heidemarie Stefanyshyn-Piper & Shane Kimbrough in 6h 45min, accomplishing all its objectives, with two minor deviations.

[During the spacewalk, Piper (EV1) & Kimbrough (EV3) –

- Relocated two CETA (Crew Equipment Translation Aid) Carts [moved both carts from Stbd side of MT (Mobile Transporter) to Port side with SSRMS support, required prior to S6 installation on Flight 15A],*
- Lubricated the SSRMS LEE A (Latching End Effector A) snares [to prepare for grappling the Japanese HTV (H-II Transfer Vehicle) in Fall 2009],*
- Cleaned Stbd SARJ (Solar Alpha Rotary Joint) Race Ring [the cleaning included successful testing of a procedure involving wet scraping with grease from a wet wipe instead of the straight nozzle grease gun],*
- Removed/replaced TBAs (Trundle Bearing Assemblies) [during install of TBA-11 (#1001) a bolt was inadvertently over-torqued and a TBA insert yielded; TBA-11 was removed, to be returned to Earth for rework and another ("dirty") TBA was installed in its place, possibly to be replaced with a pristine one as a get-ahead). TBA covers 15 & 16 were tied down as planned. Over EVA-1 and EVA-2 a total of five TBAs have been removed and replaced (6, 8, 9, 10, & 11). TBA-2 was removed and left off.]*

Official start time of the spacewalk was 12:58pm EST, and it ended at 7:43pm, terminated somewhat earlier than planned due to increased CO₂ level in Shane

Kimbrough's EMU (~3.2%) which also lost radio comm during return to the Airlock (A/L). Total EVA duration (PET = Phase Elapsed Time) was 6h 45min. It was the 116th spacewalk for ISS assembly & maintenance and the 88th from the station (64 from Quest, 24 from Pirs, plus 28 from Shuttle) totaling 544h 03min, the second

EVA for Expedition 18 and the 16th so far this year (including two Russian Orlan EVAs). It was the 4th spacewalk for Stefanyshyn-Piper (26h 45m tot.) and the first for Kimbrough (6h 45m). After today's EVA, a total of 153 spacewalkers (117 NASA astronauts, 25 Russians, and 11 astronauts representing Japan-1, Canada-4, France-1, Germany-2 and Sweden-3) have logged 732h 25min outside the station on building, outfitting & servicing. It was the 136th spacewalk involving U.S. astronauts.]

After the spacewalkers' ingress (7:43pm EST), post-EVA activities by MS3 Piper, MS4 Kimbrough, FE-2 Chamitoff, CDR Fincke & CDR Ferguson in the A/L and preparations for EVA-3 tomorrow consisted of --

- *Taking photographs of the EMU gloves for downlink and inspection,*
- *Recharging the EMU/spacesuits with water from PWR (Payload Water Reservoir),*
- *Reconnecting the LTAs (Lower Torso Assemblies) to the EMUs*
- *Initiating METOX (Metal Oxide) canister regeneration for EVA-3,*
- *Capping the UIA (Umbilical Interface Assembly),*
- *Initiating battery charging in the A/L BSA (Battery Stowage Assembly),*
and
- *Turning the DCS & D2XS cameras around.*

For FE-1 Lonchakov, besides a high-priority IFM (Inflight Maintenance) task to repair the SM (Service Module) KURS-P (see item below), a second critical activity today are preparations for terminating and disassembling the extensive MATRYOSHKA-R (RBO-3-2) radiation suite in the SM for return to Earth.

FE-2-18 Sandra Magnus completed the temporary installation of the TOCA (Total Organic Carbon Analyzer) in the US Lab, on the frontside of the OGS (Oxygen Generator System) Rack, pos. P1, with CDR Fincke assisted in some procedural steps where torquing of N₂ & H₂O hose fittings was required. *[The ~40-min job involved the installation of the nitrogen & water hoses, priming of the TOCA buffer container, closeout activities after MCC-Houston completed a ground-performed N₂ leak check, and checksum (baseline) analyzer sample processing for a calibration check.]*

Mike Fincke continued the preparation of the WRS UPA (Water Recovery System/ Urine Pretreat Assembly), filling the WSTA (Water Storage Tank Assembly) with pretreated urine from EDV-U container but did not complete the planned processing when the UPA closed down after two hours. *[As troubleshooting is underway, the first sample of processed drinking water is currently expected tomorrow. UPA also triggered a "hazardous failure" yesterday due to an easily remedied stuck check*

valve and later restarted nominally.]

Afterwards, the CDR collected ITCS (Internal Thermal Control System) fluid samples in the Node-2, one from the MTL (Moderate Temperature Loop), a second one from the LTL (Low TL) sample ports after flushing the sampling gear, for return to Earth.

In the Kibo JPM (Japanese Pressurized Module), Magnus supported the checkout of the EFBM (Exposed Facility Berthing Mechanism) by Fincke with the JEMRMS (Robotic Manipulator System). *[Sandy performed final activation of the RMS, with RLT (RMS Laptop), CCP (Camera Control Panel), RMS Monitors, reset JEU (Joint Expedited Undocking) Resolver, MDP (Management Data Processor) mode changed to MA (Main Arm) BRAKE, and Zero position reset for the PTU MA EE (Pan & Tilt Unit) of the MA EE End Effector).]*

Fincke meanwhile set up the G1 video camcorder with MPC (Multipurpose Converter) and powered up the Scopemeter & Current Probe for conducting the EFBM checkout. Afterwards, Magnus prepared the JEMRMS for deactivation by ground commanding, while Mike turned off the G1 camcorder and MPC. *[The checkout involved taking readings of input current to the BEP (Berthing Mechanism Electronics Package) to determine if the current limiter for the EFBM structural latches is within the expected tolerance band. Still waveforms of the readings were documented with the G1 camcorder and DCS-760 camera for downlink.]*

A sample transfer from the newly arrived GLACIER to MELFI (Minus Eighty degree Laboratory Freezer for ISS) scheduled for today was inadvertently executed yesterday in conjunction with the timed procedures review. Effects on JAXA payloads inside MELFI at that time are being assessed, as is the continued proper functioning of GLACIER doors. *[GLACIER (General Laboratory Active Cryogenic ISS Experiment Refrigerator) units are ultra-cold freezers that will store samples as low as -185 degrees C. The GLACIER provides a double middeck locker-sized ER (EXPRESS Rack)-compatible freezer/refrigerator for a variety of experiments that require temperatures ranging from +4 degC (39 degF) to -185 degC (-301 degF). GLACIER is part of the Cold Stowage Fleet of hardware which includes the MELFI and the MERLIN (Microgravity Experiment Research Locker/Incubator).]*

Later today, CDR Fincke is scheduled to do an inspection of the Ku-band power supplies in the Lab (#1005, #1006) that are connected to the two V10 RWS (Robotic Workstation) A31p laptops, checking on cleanliness of their four intake vents and two exhaust fan vents.

Sandy filled out the regular FFQ (Food Frequency Questionnaire), her first, on the

MEC (Medical Equipment Computer). *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software.*

Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health.

Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]

Chamitoff and Magnus will have another 90 min set aside for standard joint “handover” activities, to be continued through the docked period ahead. The handover includes a 15-min familiarization of Sandy with the CMS (Countermeasure System)/Physical Exercise equipment, today focusing on the RED (Resistive Exercise Device) in Node-1, deferred from yesterday.

The ISS crew completed their physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2-18, FE-2), TVIS treadmill (CDR, FE-1), RED (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1). It was the first exercise session for Sandy Magnus, now to become a daily protocol for her.

At ~3:05pm EST, both crews supported the traditional 40-min. news conference conducted with U.S. media at NASA centers from the Node-2 Harmony Module. *[Media clients taped the event for use within their respective media outlets.]*

Afterwards, at ~3:45pm, the ISS and Shuttle crew assembled in the SM for posing for the standard joint crew photograph.

At ~8:50pm, the ten crewmembers are scheduled for an in-depth one-hour review of procedures for tomorrow’s 7-hr EVA-3 spacewalk, with egress tomorrow afternoon at ~1:45pm EST.

Stefanyshyn-Piper (EV1) and Bowen (EV2) will begin their “campout” in the “Quest” Airlock (A/L) tonight at ~11:20pm with hatch closure and depressurization of the CL (Crewlock) from 14.7 to 10.2 psi, followed by mask prebreathe until ~12:25m. Sleep time for the ISS crew begins at 12:25am, for the Shuttle crew half an hour later.

EVA-3 Look-ahead: Following the usual hygiene break/with mask prebreathe for Bowen & Piper at ~9:30am-10:40am tomorrow morning after spending the night on 10.2 psi, the A/L hatch will be closed again for EVA preps in 10.2 psi, followed by EMU purge and prebreathe in the EMUs. Afterwards, with CL depressurization and

EV1/EV2 egress, EVA-3 nominally begins at ~1:45pm EST. Objectives of the spacewalk are continued SARJ (Solar Alpha Rotary Joint) cleaning/scraping and TBA replacements. A NOAX (Non-Oxide Adhesive Experimental) caulk applicator will be requested from the Shuttle Program, using Braycote-601 lubricant for the trundle bearings to make up for the two lost grease guns and to “buy back” some EVA time.

Cargo Transfers: MPLM (Multi-Purpose Logistics Module) cargo transfers by Pettit, Bowen, Ferguson, Boe, Magnus, Kimbrough and Fincke are continuing at a brisk pace, remaining well ahead of schedule. *[As of this morning, Middeck transfers were 33% complete, MPLM 49%, overall 45%.]*

SM KURS-P Failure Update: Activities by FE-1 Lonchakov in the RS (Russian Segment) have been modified in real time due to Moscow’s decision to do a major IFM on the failed KURS-P set #1 in the SM in preparation for the Progress 31P linkup to the DC1 Docking Compartment on 11/30 (~7:23am EST). *[Results of two tests of the system on 11/19 & yesterday failed, with the transmitter of the system (essentially a passive radio/radar repeater/beacon) being suspected as cause. SM KURS set #2 is performing nominally. In an IFM lasting an estimated 10-11 hrs, Yuri Lonchakov is working today and tomorrow to replace the failed block with an identical KURS system from the FGB. RSC Energia hopes to perform a KURS test at ~3-4 pm tomorrow afternoon of Yuri can complete the R&R task by then.]*

Shuttle/ISS Reboost: For the reboost by the Orbiter at 12:10pm, the FE-2-18 verified closure of the protective science window shutters in the Kibo JPM. A delta-V of 3 fps was selected after extensive considerations of predicted debris conjunction events. Post-reboost trajectory predictions show a close approach of Cosmos 2421 Object 32846 of ~1.2 km on Saturday (11/27) at 4:16pm EST.

No CEO photo targets uplinked for today.

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 10:47am EST [= epoch]):

Mean altitude -- 351.7 km

Apogee height -- 354.7 km

Perigee height -- 349.7 km

Period -- 91.57 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0004523

Solar Beta Angle -- 22.6 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude gain in the last 24 hours -- 4 m (EVA-2)

Revolutions since FGB/Zarya launch (Nov. 98) – 57330.

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

11/26/08 -- Progress M-66/31P launch

11/27/08 -- STS-126/Endeavour/ULF-2 undocking; 10:40am – *Under Review*

11/29/08 -- STS-126/Endeavour/ULF-2 landing; ~2:10pm – *Under Review*

11/30/08 -- Progress M-66/31P docking – DC1 Nadir (~7:23am)

12/07/08 -- Progress M-65/30P reentry (after 3 weeks autonomous flight for geophysical experiments)

12/18/08 -- Russian EVA-21

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment

02/14/09 -- STS-119/Endeavour/15A docking

02/24/09 -- STS-119/Endeavour/15A undocking

02/26/09 -- STS-119/Endeavour/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress M-67/32P undocking & deorbit

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

07/30/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation

10/15/09 -- STS-129/Endeavour/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A – MPLM(P)

04/08/10 -- STS-132/Endeavour/ULF4 – ICC-VLD, MRM1 (contingency)

05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 11/20/08

All ISS systems continue to function nominally, except those noted previously or below. *Flight Day 7 (FD7) of STS-126/ULF-2. ISS crew work cycle today: Wake 8:55am EST; sleep 12:25am; Shuttle crew: 12:55am (both until 8:55am tomorrow).*

10 Years since FGB Launch! Happy 10th Anniversary, ISS!

Mission ULF-2's EVA-2 is underway, having begun at 12:58pm EST (47 min ahead of schedule). It is performed by Heidemarie Stefanyshyn-Piper (EV1) & Shane Kimbrough (EV3). EV1 & EV3 began their "campout" (*nachalo desaturatsiy* = desaturation start) last night at ~11:20pm in the U.S. Airlock (A/L) with hatch closure and depressurization of the CL (Crewlock) from 14.7 to 10.2 psi, followed by mask prebreathe at ~11:20pm-12:25am. This morning, following the usual hygiene break/with mask prebreathe for the two spacewalkers at ~9:30am-10:40am after spending the night on 10.2 psi, the A/L hatch was closed again for EVA preps in 10.2 psi, followed by EMU (Extravehicular Mobility Unit) purge and prebreathe in the EMUs, assisted by CDR Ferguson. Afterwards, with CL depressurization and EV1/EV3 egress, EVA-1 began at 12:58pm.

[For the Campout, METOX (Metal Oxide) canisters were installed in the A/L for CO₂ control. EVA-2 is expected to last about 6h 30m, i.e., until ~7:28pm, supported by the SSRMS (Space Station Remote Maneuvering System), operated by FE-2-18 Magnus & MS1 Pettit.

EVA-2 objectives (with nominal start times) are:

- *CETA (Crew Equipment Translation Aid) Carts Relocation -- ~(1:28pm) [move both carts from Stbd side of MT (Mobile Transporter) to Port side with SSRMS support, required prior to S6 installation on Flight 15A],*
- *Lubricating the SSRMS LEE (Latching End Effector) A Snares -- (~3:18pm) [in preparation for grappling the Japanese HTV (H-II Transfer Vehicle)],*
- *Stbd SARJ (Solar Alpha Rotary Joint) Cleaning & TBA (Trundle Bearing Assembly) R&R -- ~(3:18pm) [re-install TBA-11 and Remove/Replace TBAs-*

- 8,- 9 & -12, *plus possible get-aheads*],
- Clean up – (~7:03pm), and
- EVA-2 Ingress – (~7:28pm).]

After the spacewalkers' return on board tonight, post-EVA activities by MS3 Stefanyshyn-Piper, MS4 Kimbrough, FE-2 Chamitoff & CDR Ferguson in the A/L will consist of --

- Recharging the EMU/spacesuits with water from PWR (Payload Water Reservoir),
- Reconnecting the LTAs (Lower Torso Assemblies) to the EMUs
- Initiating METOX (Metal Oxide) canister regeneration,
- Capping the UIA (Umbilical Interface Assembly),
- Initiating battery charging in the A/L BSA (Battery Stowage Assembly),
- Taking photographs of the EMU gloves for downlink and inspection.

Before breakfast, FE-2-18 Sandra Magnus performed her first session with the biomed experiment INTEGRATED IMMUNE (Validating Procedures for Monitoring Crew member Immune Function), collecting one wet saliva sample. *[IMMUNE protocol requires the collection to occur first thing post-sleep, before eating, drinking and brushing teeth, and all samples are stored at ambient temperature. Along with NUTRITION (Nutritional Status Assessment), INTEGRATED IMMUNE samples & analyzes participant's blood, urine, and saliva before, during and after flight for changes related to functions like bone metabolism, oxidative damage and immune function to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects. The saliva is collected in two forms, dry and liquid. The dry samples are collected at intervals during the collection day using a specialized book that contains filter paper. The liquid saliva collections require that the crewmember soak a piece of cotton inside their mouth and place it in a salivette bag; there are four of the liquid collections during docked operations.]*

FE-1 Lonchakov conducted the periodic/long-term inspection of the SM RO (Service Module Working Compartment)'s pressure hull and ring, looking for any moisture, deposits, mold, corrosion and pitting behind panels 130, 134, 135, 138, 139 and also underneath the TVIS treadmill (where deposit was discovered earlier) and the cold plates (where SNT and STR lines are installed). Last time done: 8/14.

[The inspection of the hull surface, which is coated with a primer and dark-green enamel, is done using cleaning napkins to wipe the area in question if required and reporting results to the ground. The hull inspection looks for changed color and cavities; if cavities are found, they are to be measured for depth (with chewing gum) after cleaning. Digital photographs of the shell before and after the removal of deposits were to be made for documentation.]

For tomorrow's planned checkout of the Japanese EFBM (Exposed Facility Berthing Mechanism) in front of the Kibo JPM (Japanese Pressurized Module), FE-2-18 Magnus prepared the Scopemeter and the Current Probe instruments and checked out their operation, including the data record function of the Scopemeter. CDR Fincke meanwhile connected and attached the BCDU (Berthing Mechanism Control & Display Unit) in the JPM.

Afterwards, Sandy Magnus began with the installation of the TOCA (Total Organic Carbon Analyzer) in the US Lab, on the frontside of the OGS (Oxygen Generation System) Rack (pos. P1), tackling the first of three parts. *[The 90-min Part 1 involves the installation of TOCA ORUs (Orbital Replacement Units), with steps such as removing TCO front cover and spare media kit, then installing a USB Drive, a waste water bag, a buffer container, gas liquid separator, EDV mount assembly & seat track brackets, TOCA mounting fixtures and a grounding strap. Part 2 will require two crewmembers for ~15 min, followed by Part 3, by one crewmember, for 15 min.]*

As part of the upcoming WRS (Water Recovery System) activation during the ULF-2 docked period, Mike Fincke, with Sandy Magnus & Greg Chamitoff, prepared for UPA (Urine Pretreat Assembly) initiation by opening the manual valve of the RFTA (Recycle Filter Tank Assembly), then filled the newly installed RFTA and WSTA (Water Storage Tank Assembly) with EDV-pretreated urine and started the processing activity. *[Approximately two EDV-U containers are required to fill an empty RFTA.]*

The FE-1 will complete the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the passageways PrK (SM Transfer Compartment)–PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1. *[This checkup is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons, and one of the two Russian SKV air conditioners off (SKV-1).]*

Yuri is also to take the periodic readings with the Russian AOK GANK-4M Real-Time Harmful Contaminant Gas Analyzer system and calibrated the unit.

Gregory will be conducting another one of the periodic offloadings of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling a CWC (#1054) with the collected water slated for processing. Samples are not required.

Continuing the extended leak checking of the spare BZh Liquid Unit (#056) for the Elektron O₂ generator, Lonchakov charged the unit once again with pressurized N₂

from the BPA Nitrogen Purge Unit (#23) to 1 atm (1 kg/cm²). The last test pressurization to monitor for leakage was on 10/19. *[Objective of the checkout of the BZh, which has been in stowage for almost 2 years, was to check for leakage and good water passage through the feed line inside of the BZh (from ZL1 connector to the buffer tank) and to check the response of the Electronics Unit's micro switches (signaling "Buffer Tank is Empty" & "Buffer Tank is Full". During Elektron operation, the inert gas locked up in the BZh has the purpose to prevent dangerous O₂/H₂ mixing. A leaking BZh cannot be used.]*

MPLM (Multi-Purpose Logistics Module) cargo transfers by Pettit, Bowen, Ferguson, Boe, Magnus and Fincke are continuing at a brisk pace, remaining well ahead of schedule. *[As of this morning, Middeck transfers were 33% complete, MPLM 39%, overall 37%. All MPLM racks have been transferred already. Today's transfers included RFTA components, TOCA ORUs, RAMs (Radiation Area Monitors), GPS antennas & electrical connectors, plus various items brought back to "Leonardo" for return to Earth.]*

After yesterday's maintenance and data retrieval activities on the MATRYOSHKA-R (RBO-3-2) radiation instrumentation in the SM (panel 326), Lonchakov today will turn off the AST Spectrometer.

Afterwards, Yuri is to perform the periodic (monthly) functional closure test of the Vozdukh CO₂ (carbon dioxide) removal system's spare emergency vacuum valves (AVK), in the spare parts kit. *[The AVKs are crucial because they close the Vozdukh's vacuum access lines in the event of a malfunction in the regular vacuum valves (BVK) or a depressurization in the Vozdukh valve panel (BOA). Access to vacuum is required to vent CO₂ during the regeneration of the absorbent cartridges (PP).]*

The FE-1 is also scheduled to collect another set of KAV condensate water samples from a CWC (Contingency Water Container) with US condensate from the Lab CCAA (Common Cabin Air Assembly), after having pumped it over to the usual EDV container, filling two empty drink bags for return on the Shuttle.

For added crew safety during activation of the Regen-ECLLS racks, Mike Fincke is to deploy "ECLSS Keepout Zone Cue Cards". *[In the Lab, one Regen Keepout Zone Cue Card each will be placed at location LAB1P1 (for OGS), LAB1D4 (for WRS-1) and LAB1P4 (for WRS-2).]*

Gregory Chamitoff, looking forward to his return on Endeavour on 11/29 (or 11/30), and Sandy Magnus, who has replaced him ISS FE-2, had another period set aside for standard joint "handover" activities, to be continued through the docked period

ahead. The handover again included a 15-min familiarization of Sandy with the CMS (Countermeasure System)/Physical Exercise equipment, today focusing on the RED (Resistive Exercise Device) in Node-1, as well as a review of sample transfer procedures from the newly arrived GLACIER to MELFI (Minus Eighty degree Laboratory Freezer for ISS). *[GLACIER (General Laboratory Active Cryogenic ISS Experiment Refrigerator) units are ultra-cold freezers that will store samples as low as -185 degrees C. The GLACIER provides a double middeck locker-sized ER (EXPRESS Rack)-compatible freezer/refrigerator for a variety of experiments that require temperatures ranging from +4 degC (39 degF) to -185 degC (-301 degF). GLACIER is part of the Cold Stowage Fleet of hardware which includes the MELFI and the MERLIN (Microgravity Experiment Research Locker/Incubator).]*

In the SM, Lonchakov will conduct the routine maintenance of the SOZh/ECLSS system, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Yuri is also timelined for the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Sandy Magnus spent some time on the MEC (Medical Equipment Computer), formatting and initializing her personal PCMCIA memory card for the TVIS treadmill.

The ISS crew completed their physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS (FE-1, FE-2), RED (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

At ~10:26am, Lonchakov supported a Russian PAO TV downlink with two a messages of greetings & congratulations: (1) to Academician Boris Yevgenevich Paton on his 90th birthday ("*...We know you as a person who applied enormous engineering talent in practical cosmonautics. Developed by you were welding in space and other technologies, as well as different large-scale structures that have been tested and used on Salyut and Mir orbital stations...*"), and (2) to the Russian Federation of Cosmonautics for its 30th Anniversary, with its President, Veteran-Cosmonaut Vladimir Vasilievich Kovalyenko ("*...Founded in 1978, Russia's Federation of Cosmonautics traveled a road of glory and became the largest Russian public space-oriented organization, combining 310 regional and local*

space rocket industry organizations of Russia with approximately 300,000 Federation members working under its umbrella...”).

DC1 KURS Failure: Yesterday, Set 1 of the KURS automated rendezvous & docking system of the DC1 Docking Compartment failed in a test and is unavailable for the Progress 31P docking on 11/30 at the DC1 nadir port. RSC-Energia is working a Go Forward plan to use the FGB KURS unit instead.

WRM Update: An updated WRM (Water Recovery Management) “cue card” was uplinked yesterday for the crew’s reference, updated with the latest water audit.

[The new card (18-0006E) lists 23 CWCs (~722.5 L total) for the four types of water identified on board: technical water (135.2 L, for Elektron electrolysis), potable water (537.4 L, incl. 174.6 L currently off-limit because of Wautersia bacteria), condensate water (10.7 L), waste/EMU dump and other (39.2 L).

Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]

ISS Reboost: A reboost of the ISS by the Shuttle is planned for tomorrow (FD8), at ~12:10pm, with parameters to be determined pending an update on the same-day conjunction (see next item).

Conjunction: The conjunction with the Cosmos satellite, Object 2421, is still being tracked for tomorrow.

STS-126 Mission Highlights:

- Generic face-to-face handover time between Chamitoff & Magnus will be ~12 hrs max; Gregory will remain on the ISS until the day before undocking and will be scheduled as an ISS crewmember.
- Endeavour is being powered by the SSPTS (Station-Shuttle Power Transfer System) from post-docking to just before undocking. During the mated mission when ISS solar arrays are feathered for attitude maneuvers and EVA operations, SSPTS may be powered off to maintain station power margin.
- 30 hrs are required for transfer ops to/from the Shuttle middeck and 105 hours for MPLM. With all the timed activities and rack transfers scheduled, ULF2 will be a highly choreographed transfer mission. The Shuttle crew has been thoroughly trained on the details of the choreography. In addition, each day a transfer message will be uplinked, listing specific items that need to be transferred that day due to operations requiring the items.

No CEO photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 7:49am EST [= epoch]):

Mean altitude -- 351.7 km

Apogee height -- 354.3 km

Perigee height -- 349.1 km

Period -- 91.57 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0003904

Solar Beta Angle -- 25.5 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude gain in the last 24 hours -- 333 m (Shuttle mnvr, EVA-1)

Revolutions since FGB/Zarya launch (Nov. 98) -- 57313.

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

11/26/08 -- Progress M-66/31P launch (nom.)

11/27/08 -- STS-126/Endeavour/ULF-2 undocking; 10:40am -- *Under Review*

11/29/08 -- STS-126/Endeavour/ULF-2 landing; ~2:10pm -- *Under Review*

11/30/08 -- Progress M-66/31P docking (nom.) -- DC1 Nadir

12/07/08 -- Progress M-65/30P reentry (after 3 weeks autonomous flight for geophysical experiments)

12/18/08 -- Russian EVA-21

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Endeavour/15A launch -- S6 truss segment

02/14/09 -- STS-119/Endeavour/15A docking

02/24/09 -- STS-119/Endeavour/15A undocking

02/26/09 -- STS-119/Endeavour/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress M-67/32P undocking & deorbit

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

07/30/09 -- STS-128/Atlantis/17A -- MPLM (P), last crew rotation

10/15/09 -- STS-129/Endeavour/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A -- Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A -- MPLM(P)

04/08/10 -- STS-132/Endeavour/ULF4 -- ICC-VLD, MRM1 (contingency)

05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 11/19/08

All ISS systems continue to function nominally, except those noted previously or below. *Flight Day 6 (FD6) of STS-126/ULF-2. ISS crew work cycle today: Wake 8:55am EST; sleep 12:25am (until 8:55am tomorrow morning, i.e. steady for now).*

Tomorrow: 10th Year Anniversary of ISS!

Mission ULF-2's EVA-1 was completed last night successfully by Heidemarie Stefanyshyn-Piper & Stephen Bowen in 6h 52min, accomplishing all its objectives plus one get-ahead. *[During the spacewalk, Piper (EV1) & Bowen (EV2) –*

- *Transferred the empty NTA (Nitrogen Tank Assembly) from ESP-3 (External Stowage Platform 3) to Shuttle PLB (Payload Bay) & installed it under the LMC (Lightweight MPRESS Carrier),*
- *Transferred the FHRC (Flex Hose Rotary Coupler) from PLB/LMC & installed it on ESP-3 as a prepositioned spare (remaining on ESP-3 until needed),*
- *Removed five covers of the Japanese EFBM (Exposed Facility Berthing Mechanism) for EFBM checkout on FD8,*
- *Removed Stbd SARJ (Solar Alpha Rotary Joint) TBAs (Trundle Bearing Assemblies) #10 & #6 and replaced them with new TBAs,*
- *Removed & brought inside TBA #11, and*
- *Performed partial cleaning and lubrication of the Stbd SARJ Race Ring (the remaining clean & lube tasks for the Stbd SARJ are planned for EVA-2 and EVA-3.*

In addition, the spacewalkers completed the following EVA get-ahead tasks:

- *Removing the SARJ Launch Restraint 4A,*
- *Closing of the Node-2 Zenith CBM (Common Berthing Mechanism) hatch cover, and*
- *Retrieving a large trash bag from Port Tool Box.*

Official start time of the spacewalk was 1:09pm EST, and it ended at 8:01pm. Total EVA duration (PET = Phase Elapsed Time) was 6h 52min. It was the 115th spacewalk for ISS assembly & maintenance and the 87th from the station (63 from Quest, 24 from Pirs, plus 28 from Shuttle) totaling 537h 18min, the first EVA for

Expedition 18 and the 15th so far this year (including two Russian Orlan EVAs). After today's EVA, a total of 151 spacewalkers (115 NASA astronauts, 25 Russians, and 11 astronauts representing Japan-1, Canada-4, France-1, Germany-2 and Sweden-3) have logged a total of 725h 40min outside the station on building, outfitting & servicing. It was the 135th spacewalk involving U.S. astronauts.]

After the spacewalkers' return on board (8:01pm EST), post-EVA activities by MS3 Stefanyshyn-Piper, MS2 Bowen, FE-2 Chamitoff, CDR Fincke & CDR Ferguson in the A/L and preparations for EVA-2 tomorrow consisted of --

- Taking photographs of the EMU gloves for downlink and inspection,
- Transferring the SAFER (Simplified Aid for EVA Rescue) units for subsequent checkout and swapout with a second set,
- Recharging the EMU/spacesuits with water from PWR (Payload Water Reservoir),
- Reconnecting the LTAs (Lower Torso Assemblies) to the EMUs
- Initiating METOX (Metal Oxide) canister regeneration,
- Capping the UIA (Umbilical Interface Assembly),
- Initiating battery charging in the A/L BSA (Battery Stowage Assembly),
- Turning the DCS & D2XS cameras around, and
- Returning the VCA1 (Video Camera Assembly 1) with its drag-thru cable from Node-2 back to the COL (Columbus Orbital Laboratory) for re-installation at its regular endcone/aft side location.

During the EVA, an untethered 30-lbs Crewlock Bag was inadvertently released from a larger ORU (Orbit Replaceable Unit) bag and floated away as the crew was cleaning up grease from a leaking lubrication gun. The lost bag contains two SARJ lubrication guns, a scraper, a scraper debris container, a large trash bag, six wipes, wireties and several tethers. The two spacewalkers shared the other set of SARJ cleaning/lubrication equipment for the remainder of the EVA. Teams are currently assessing any potential impacts to the next EVAs due to loss of the tools.

[Sufficient tools/spares are believed to be available to complete EVAs -2, -3, and -4. EVA-2 can be done with the current tool complement and will include a test to see whether the wet wipes can be used for the initial lube application. The possible use of the Shuttle NOAX (non-oxide adhesive experimental) caulk gun, intended for TPS repair, instead of the lost grease gun is being assessed, including the risk of not having the NOAX caulk gun available for an emergency and whether the caulk gun could be cleaned on orbit. Port SARJ cleaning will be reprioritized ahead of Stbd SARJ cleaning, but there will be no change to the EVA plans unless it is determined that there is insufficient grease to complete them.]

Preparatory to today's scheduled waste water dump from the Shuttle, FE-2-18 Magnus verified closure of the protective window shutters in the Kibo JPM (Japanese Pressurized Module). Later today, CDR Ferguson will maneuver the ISS/

Shuttle stack into the proper attitude at ~5:06pm EST, and at ~5:30pm the venting (in retrograde direction) will commence, lasting about 50 min. –XVV attitude (Shuttle bottom facing opposite to flight direction for TPS protection) will then be restored with Shuttle thrusters (ORB mode) at ~7:42pm and taken over by CMG Momentum Management. *[The kick-back effect of the water dump will impact the parameters to be chosen for the ISS reboost, scheduled for FD8 (11/21).]*

Fincke, Pettit, Chamitoff & Magnus transferred the last three racks from the MPLM (Multi-Purpose Logistics Module) as well as the three ORUs required for the subsequent WRS (Water Recovery System) configuration activities. As of this morning, Middeck transfers are 30% complete, MPLM transfers 23% and overall 24%. 105 transfer hours remain in the timeline. *[With yesterday's successful transfers of five racks, i.e., WRS-1, WRS-2, ER6 (Express Rack 6/Galley), the CIR (Combustion Rack) and the WHC (Waste & Hygiene Compartment/Toilet), MPLM transfers remain ahead of timeline. This allowed accelerating the installation of the Port & Stbd Crew Quarters in the Lab to today as well as hooking up jumpers, configuring the WRS by Mod Kit-3 installations, including the RHS (Reactor Health Sensor) and CR (Catalytic Reactor) ORUs, and transferring one RSR (Resupply Stowage Rack) from the Node-2 to "Leonardo" for return to Earth.]*

FE-1 Lonchakov will work on the RS (Russian Segment) radiation payload suite "Matryoshka-R" (RBO-3-3)/SDTO (Station Development Test Objective) 50448, downloading data and removing dosimeters for return on the Shuttle. *[Yuri will be conducting the periodic time synchronization between the RSS1 laptop and BSPN payload server, after testing functionality by checking data comm between the two computers and synching RSS1 to station time with the RSC-E PingMaster application and ShellForKE payload file transfer program. Data will then be downloaded to RSS1 on a PCMCIA flash card. The FE-1 will remove 32 LULIN-5 dosimeters from the PHANTOM (leaving three in place) and prepack them with 16 containers in the PHANTOM kit for return to Earth on the Shuttle. Matryoshka's AST Spectrometer will be deactivated tomorrow.]*

Sandy Magnus has about one hour to herself for general orientation (station familiarization & acclimatization) as is customary for fresh crewmembers for the first two weeks after starting station residence, if she/he chooses to take it.

Continuing the current round of monthly preventive maintenance of RS ventilation systems, Yuri Lonchakov cleaned the four "Group B" fan screens (VT1, VTK1, VV1RO & VV2RO) in the SM (Service Module).

Yuri will also retrieve a kit with return pouches for the long-term BIO-5 RASTENIYA-1 ("Plants-1") micro-gravity plant growth payload from the Soyuz spacecraft and pack previous used KM LADA Greenhouse Root Modules for return on the Shuttle.

[RASTENIYA-1 researches growth and development of plants under spaceflight conditions in the LADA-14 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). The payload hardware includes a module (MIS/Module for the Investigation of Substrates), the MIS control unit (BU), a nitrogen purge unit (BPA) and other accessories. During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. LADA consists of a wall-mounted growth chamber that provides long-term, ready access for crewmember interaction. It provides light and root zone control but relies on the cabin environmental control systems for humidity, gas composition, and temperature control. Cabin air is pulled into the leaf chamber, flows over the plants and vents through the light bank to provide both plant gas exchange and light bank cooling.]

For FE-2-18 Magnus' upcoming first session with the biomed experiment "Integrated Immune", later today she will break out and set up the equipment needed to support saliva collection. *[Along with NUTRITION (Nutritional Status Assessment), Integrated Immune (Validating Procedures for Monitoring Crew member Immune Function) samples & analyzes participant's blood, urine, and saliva before, during and after flight for changes related to functions like bone metabolism, oxidative damage and immune function to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects. The saliva is collected in two forms, dry and liquid. The dry samples are collected at intervals during the collection day using a specialized book that contains filter paper. The liquid saliva collections require that the crewmember soak a piece of cotton inside their mouth and place it in a salivette bag; there are four of the liquid collections during docked operations. The on-orbit blood samples are collected right before undocking and returned on the Shuttle so that analysis can occur with 48 hours of the sampling. This allows assays that quantify the function of different types of white blood cells and other active components of the immune system. Samples are secured in the MELFI (Minus-Eighty Laboratory Freezer for ISS). Also included are entries in a fluid/medications intact log, and a stress-test questionnaire to be filled out by the subject at begin and end. Urine is collected during a 24-hour period, conventionally divided into two twelve-hour phases: morning-evening and evening-morning.]*

In the SM, Lonchakov will conduct the routine maintenance of the SOZh/ECLSS system, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Yuri is also timed for the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

In addition, the FE-1 will complete the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the passageways PrK (SM Transfer Compartment)–PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1. *[This checkup is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons, and one of the two Russian SKV air conditioners off (SKV-1).]*

At ~1:10pm EST, Yuri supported two Russian PAO TV downlinks, one a message of congratulations for the 70th Anniversary of the Special Machine Building School at N.E. Bauman Moscow State Technical University (MGTU) in Moscow, the other an interview with Mixim Kiselev, host of the Otrazheniye (Reflection) Show on TV which, on 11/22, will dedicate an episode to the development of world cosmonautics.

At ~3:51pm, yesterday's spacewalkers, Steve & Heide, will share three live PAO TV interviews, one with Associated Press (Marcia Dunn), the second with KMSP-TV, Minneapolis (Jeff Passolt) the third with WCVB-TV, Boston (Ed Harding).

The ISS crew completed their physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

At ~8:51pm, the joint crew will conduct an in-depth one-hour review of procedures for tomorrow's EVA-2 spacewalk, with egress scheduled to start tomorrow afternoon at ~1:55pm EST.

Heidemarie Stefanyshyn-Piper (EV1) and Shane Kimbrough (EV3) will begin their "campout" in the "Quest" Airlock (A/L) with hatch closure and depressurization of the CL (Crewlock) from 14.7 to 10.2 psi tonight at ~11:20pm, followed by mask prebreathe until ~12:25m. Sleep time for the ISS crew begins at 12:25am, for the Shuttle crew half an hour later.

Following the usual hygiene break/with mask prebreathe for Kimbrough & Piper at ~9:30am-10:40am tomorrow morning after spending the night on 10.2 psi, the A/L hatch will be closed again for EVA preps in 10.2 psi, followed by EMU purge and prebreathe in the EMUs. Afterwards, with CL depressurization and EV1/EV3

egress, EVA-2 nominally begins at ~1:45pm EST.

ISS Reboost: A reboost of the ISS is planned for FD8 (11/21) at 12:10pm, with an estimated delta-V of 0.91 m/s (3 fps).

Conjunctions: Two TCAs (Times of Closest Approach) are currently being assessed for another conjunction with the Cosmos satellite, Object 2421, both on the same day as the reboost (which will be re-assessed accordingly). As of now, however, the conjunctions are outside the maneuver box, and no action appears necessary.

STS-126 Mission Highlights:

- Focused Orbiter inspection today was not required. The Shuttle TPS (Thermal Protection System)/heatshield has been completely cleared for deorbit and entry.
- Generic face-to-face handover time between Chamitoff & Magnus will be ~12 hrs max; Gregory will remain on the ISS until the day before undocking and will be scheduled as an ISS crewmember.
- Endeavour is being powered by the SSPTS (Station-Shuttle Power Transfer System) from post-docking to just before undocking. During the mated mission when ISS solar arrays are feathered for attitude maneuvers and EVA operations, SSPTS may be powered off to maintain station power margin.
- 30 hrs are required for transfer ops to/from the Shuttle middeck and 105 hours for MPLM. With all the timed activities and rack transfers scheduled, ULF2 will be a highly choreographed transfer mission. The Shuttle crew has been thoroughly trained on the details of the choreography. In addition, each day a transfer message will be uplinked, listing specific items that need to be transferred that day due to operations requiring the items.

No CEO photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 7:23am EST [= epoch]):

Mean altitude -- 351.4 km

Apogee height -- 354.1 km

Perigee height -- 348.6 km

Period -- 91.57 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0004128

Solar Beta Angle -- 28.0 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.73

Mean altitude loss in the last 24 hours -- 56 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57297

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch (nom.)

11/27/08 -- STS-126/Endeavour/ULF-2 undocking; 10:40am – *Under Review*

11/29/08 -- STS-126/Endeavour/ULF-2 landing; ~2:10pm – *Under Review*

05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

07/30/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation

10/15/09 -- STS-129/Endeavour/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A – MPLM(P)

04/08/10 -- STS-132/Endeavour/ULF4 – ICC-VLD, MRM1 (contingency)

05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 11/18/08

All ISS systems continue to function nominally, except those noted previously or below. *Flight Day 5 (FD5) of STS-126/ULF-2. ISS crew work/sleep cycle today: Wake 8:56am EST; sleep 12:26am tomorrow morning (until 8:56am, i.e. steadying out for now).*

Mission ULF-2's EVA-1 began at 1:09pm EST (41 min ahead of schedule), performed by Heidemarie Stefanyshyn-Piper (EV1) & Stephen Bowen (EV2). EV1 & EV2 began their "campout" (*nachalo desaturatsiy* = desaturation start) last night at ~11:20pm in the U.S. Airlock (A/L) with hatch closure and depressurization of the CL (Crewlock) from 14.7 to 10.2 psi, followed by mask prebreathe at ~11:20pm-12:25am. This morning, following the usual hygiene break/with mask prebreathe for the two spacewalkers at ~9:30am-10:40am after spending the night on 10.2 psi, the A/L hatch was closed again for EVA preps in 10.2 psi, followed by EMU purge and prebreathe in the EMUs, assisted by Chamitoff & Ferguson. Afterwards, with CL depressurization and EV1/EV2 egress, EVA-1 began at 1:09pm.

[For the Campout, METOX (Metal Oxide) canisters were installed in the A/L for CO₂ control. EVA-1 is expected to last about 6h 30m, i.e., until ~7:40pm, supported by the SSRMS (Space Station Remote Maneuvering System), operated by FE-2-18 Magnus & MS1 Pettit.

EVA-1 objectives (with nominal times) are:

- *Transfer NTA (Nitrogen Tank Assembly) from ESP-3 (External Stowage Platform 3) to Shuttle PLB (Payload Bay) & install under LMC (Lightweight MPESS Carrier) -- ~2:15 pm*
- *Transfer FHRC (Flex Hose Rotary Coupler) from PLB/LMC & install on ESP-3 -- ~4:00 pm (FHRC is a prepositioned spare remaining on ESP-3 until needed)*
- *Remove 5 covers of Japanese EFBM (Exposed Facility Berthing Mechanism) for EFBM checkout on FD8 -- ~4:26pm)*
- *Clean up starboard SARJ (Solar Alpha Rotary Joint) for subsequent repair activities -- ~4:40 pm*
- *EVA #1 Ingress -- ~7:35pm).]*

After the spacewalkers' return on board, post-EVA activities by MS3 Stefanyshyn-Piper, MS2 Bowen, FE-2 Chamitoff & CDR Ferguson in the A/L will consist of --

- Recharging the EMU/spacesuits with water from PWR (Payload Water Reservoir),
- Reconnecting the LTAs (Lower Torso Assemblies) to the EMUs
- Initiating METOX (Metal Oxide) canister regeneration,
- Capping the UIA (Umbilical Interface Assembly),
- Initiating battery charging in the A/L BSA (Battery Stowage Assembly),
- Taking photographs of the EMU gloves for downlink and inspection, and
- Returning the VCA1 (Video Camera Assembly 1) with its drag-thru cable from Node-2 back to the COL (Columbus Orbital Laboratory) for re-installation at its regular endcone/aft side location.

Before morning inspection and breakfast, FE-1 Lonchakov terminated his third experiment session for the long-term Russian sleep study MBI-12/SONOKARD, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

Later, the FE-1 completed the standard post-delivery maintenance/checkout operations on the new Russian Orlan spacesuit MK-004 (delivered on Progress 30P) begun yesterday, along with its replaceable backpack components (BRTA-2 radio telemetry unit, BK-3M oxygen (O₂) repress bottles, LP-9 LiOH cartridge, etc.). *[Activities today included tests of the Orlan-BSS interface unit telemetry, Orlan communications, Orlan biomed parameters, installation of helmet lights removal & stowage of the LP-9 LiOH cartridge, and configuring suit and BSS for stowage in the DC1 Docking Compartment.]*

Before supporting the spacewalkers for the EVA hygiene break, FE-2 Chamitoff conducted the standard test of the EVA cameras, then assisted with EVA preparations, such as EMU (Extravehicular Mobility Unit) purging.

FE-2-18 Magnus closed the protective window shutters in the Kibo JPM (Japanese Pressurized Module). Later tonight, Sandra will perform final activation of the

JEMRMS (Robotic Manipulator System) and Arm BUS Monitor in the JPM and maneuver its MA (Main Arm) to the EFBM checkout monitor position, then deactivate the BUS Arm Monitor and the RMS.

MPLM Cargo & Transfers: MPLM (Multi-Purpose Logistics Module) “Leonardo” delivered non-time-sensitive and unpowered items. Its “home improvement” cargo includes –

- Three RSRs (Resupply Stowage Racks),
- Six RSPs (Return Stowage Platforms),
- CIR (Combustion Integration Rack),
- ER6 (EXPRESS Rack 6),
- WHC (Waste & Hygiene Compartment) rack,
- CQ1 (Crew Quarters 1) rack
- CQ3 rack,
- WRS-1 (Water Recovery System 1) rack, and
- WRS-2 rack.

The two CQ racks will be transferred from the MPLM to Node-2 and the remaining racks to the U.S. Lab. One RSR will be relocated from Node-2 to “Leonardo” for return. After MPLM hatch opening and ingress last night, cargo transfers began at a brisk pace, getting ahead of timeline quickly with the transfers of the ARED (Advanced Resistive Exercise Device) and three ZSRs (Zero-G Stowage Racks) to the ISS, which were originally planned for today. The transfers and installation of the WRS1 (Water Recovery System 1), WRS2 and EXPRESS (EXpedite PROcessing of Experiments to Space Station) Rack #6 were therefore moved up to today. *[Transfers are being performed by Pettit, Ferguson, Fincke & Magnus. Special handling constraints are in force for the WRS ORUs (Orbit Replaceable Units) of the Regenerable ECLSS (Environment Control & Life Support Systems), which are being installed today in the Lab by Fincke & Pettit at locations D4 (WRS1) & P4 (WRS2). Joining the already installed OGS (Oxygen Generator System) rack, they comprise seven (the first three installed during ULF-2, the other four stowed for later):*

- *DA (Distillation Assembly),*
- *CR (Catalytic Reactor),*
- *RHS (Reactor Health Sensor),*
- *MB (Multifiltration Bed).*
- *PF (Particulate Filter),*
- *GS (Gas Separator), and*
- *OGA (Oxygen Generator Assembly) Water ORU.]*

Yuri Lonchakov had ~90 min set aside for the periodic equipment servicing in the SM (Service Module)’s ASU toilet facility, changing out replaceable parts with new components, e.g., a filter insert (F-V), the pretreat container (E-K), and the E-K’s hose. All old parts were discarded as trash. *[E-K contains five liters of pre-treat*

solution, i.e., a mix of H_2SO_4 (sulfuric acid), CrO_3 (chromium oxide, for oxidation and purple color), and H_2O (water). The pre-treat liquid is mixed with water in a dispenser (DKiV) and used for toilet flushing.]

The FE-1 used CWC (Contingency Water Container) #1069 with Lab CCAA (Common Cabin Air Assembly) condensate in the RS (Russian Segment) for the periodic (about twice a month) replenishing of the Elektron oxygen generator's water supply for electrolysis, filling the KOV thermal loops' EDV container. Once filled, the EDV was connected to the BPK transfer pump for processing. *[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]*

Collected condensate water from the Shuttle was transferred to the ISS by CDR Ferguson in a CWC.

Using the Velocicalc instrument, Gregory Chamitoff will be taking IMV (Intermodular Ventilation) flow measurements in the U.S. Lab at the Fwd Stbd outlet grille.

Lonchakov meanwhile conducts the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the passageways PrK (SM Transfer Compartment)–PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1. *[This checkup is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons, and one of the two Russian SKV air conditioners off (SKV-1).]*

Later, Yuri will collect the periodic readings of potentially harmful atmospheric contaminants in the SM, using the CMS (Countermeasure System), a component of the SKDS GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, today using preprogrammed microchips to measure for o-Xylol (1,2-Dimethylbenzol, C_8H_{10}) and Methyl-Mercaptan (Methanethiol, CH_4S).

The FE-1 is also scheduled for another periodic 20-min. data collection and downlink on the long-term BIO-5 RASTENIYA-1 ("Plants-1") micro-gravity plant growth payload in the LADA/MIS (Module for the Investigation of Substrates) greenhouse. *[RASTENIYA-1 researches growth and development of plants under spaceflight conditions in the LADA-14 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). The payload hardware includes a module (MIS/ Module for the Investigation of Substrates), the MIS control unit (BU), a nitrogen purge unit (BPA) and other accessories. During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary,*

and photo/video recording. LADA consists of a wall-mounted growth chamber that provides long-term, ready access for crewmember interaction. It provides light and root zone control but relies on the cabin environmental control systems for humidity, gas composition, and temperature control. Cabin air is pulled into the leaf chamber, flows over the plants and vents through the light bank to provide both plant gas exchange and light bank cooling.]

In the SM, Lonchakov will be conducting the routine maintenance of the SOZh/ECLSS system, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Yuri is also timelined for the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The ISS crew completed their physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1). *[For load reasons, no exercise is allowed during the 3-hr mounted EVA APFR (Articulated Portable Foot Restraint) ops which started at ~1:00pm.]*

The ISS crew is scheduled for their periodic PMCs (Private Medical Conferences) via S- & Ku-band audio/video, Greg at ~2:30pm, Mike at ~3:00pm, and Yuri at ~4:05pm EST.

Sandy Magnus has ~2.5 hrs to herself for general orientation (station familiarization & acclimatization) as is customary for fresh crewmembers for the first two weeks after starting station residence, if she/he chooses to take it.

After their return aboard ISS, Bowen & Piper, plus EV3/Kimbrough (who will conduct EVA-2 with Piper) will fill out their questionnaires for the MOP (Motion Perception in Zero-G) study which tracks crewmembers’ vestibular adaptation to changes in micro-G, i.e., the SAS/Space Adaptation Syndrome, used also by SFPs (Spaceflight Participants). Shuttle crewmembers Ferguson, Boe, Pettit and Kimbrough meanwhile will be logging their responses to the questions of the MUSCLE-G (LBP/Low Back Pain) experiment.

ISS Crew Sleep Shift Planning: To synchronize the ISS crew’s timeline with STS-

126/ULF-2 docking and subsequent docked activities, Mike's, Yuri's and Greg's wake/sleep cycle has undergone a number of shifts which started on 11/14 and continued until yesterday. The early undock time (currently 10:40am for FD14) drives crew wakeup 2.5 hrs earlier, to 7:00am by FD14. The shift is completed by having set crew sleep 30 min earlier on FD4 and then moving it one hour earlier each day on FD12 and FD13. For the next five days, the wake/sleep shift schedule is as follows (all times EST):

FD5	Wake: 8:56am (11/18) – 12:26am (11/19) Sleep: 12:26am – 8:56am
FD6	Wake: 8:56am (11/19) – 12:26am (11/20) Sleep: 12:26am – 8:56am
FD7	Wake: 8:56am – 12:26am (11/21) Sleep: 12:26am – 8:56am
FD8	Wake: 8:56am – 12:26am (11/22) Sleep: 12:26am – 8:56am
FD9	Wake: 8:56am – 12:26am (11/23) Sleep: 12:26am – 8:56am

STS-126 Mission Highlights:

- Focused Orbiter inspection on FD6 is not required.
- Generic face-to-face handover time between Chamitoff & Magnus will be ~12 hrs max; Gregory will remain on the ISS until the day before undocking and will be scheduled as an ISS crewmember.
- Endeavour is being powered by the SSPTS (Station-Shuttle Power Transfer System) from post-docking to just before undocking. During the mated mission when ISS solar arrays are feathered for attitude maneuvers and EVA operations, SSPTS may be powered off to maintain station power margin.
- 30 hrs are required for transfer ops to/from the Shuttle middeck and 105 hours for MPLM. With all the timed activities and rack transfers scheduled, ULF2 will be a highly choreographed transfer mission. The Shuttle crew has been thoroughly trained on the details of the choreography. In addition, each day a transfer message will be uplinked, listing specific items that need to be transferred that day due to operations requiring the items.

No CEO photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:31am EST [= epoch]):

Mean altitude -- 351.4 km

Apogee height -- 354.3 km

Perigee height -- 348.6 km

Period -- 91.57 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0004232

Solar Beta Angle -- 30.0 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude gain in the last 24 hours -- 120 m (due to docked Shuttle)

Revolutions since FGB/Zarya launch (Nov. 98) -- 57282

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch (nom.)

11/27/08 -- STS-126/Endeavour/ULF-2 undocking; 10:40am – **Under Review**

11/29/08 -- STS-126/Endeavour/ULF-2 landing; ~2:10pm – **Under Review**

11/30/08 -- Progress M-66/31P docking (nom.) – DC1 Nadir

12/07/08 -- Progress M-65/30P reentry (after 3 weeks autonomous flight for geophysical experiments)

12/18/08 -- Russian EVA-21

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment

02/14/09 -- STS-119/Endeavour/15A docking

02/24/09 -- STS-119/Endeavour/15A undocking

02/26/09 -- STS-119/Endeavour/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress M-67/32P undocking & deorbit

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

07/30/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation

10/15/09 -- STS-129/Endeavour/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A – MPLM(P)

04/08/10 -- STS-132/Endeavour/ULF4 – ICC-VLD, MRM1 (contingency)

05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at http://www.hq.nasa.gov/osp/iss_reports/index.htm

ISS On-Orbit Status 11/17/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 4 of Increment 18. Flight Day 4 (FD4) of STS-126/ULF-2. First full day of Sandra Magnus as new crewmember (FE-2) of Expedition 18. ISS crew work cycle today: Wake 9:26am EST; sleep 12:26am (until 8:56am tomorrow morning).*

At ~1:02pm EST (14 min. ahead of schedule), **MPLM “Leonardo” was securely linked to Node-2** after its successful transfer from the Shuttle cargo bay to the nadir berthing port.

Before the MPLM (Multi-Purpose Logistics Module) transfer, CDR Fincke and FE-2 Chamitoff prepared the nadir port vestibule in Node-2 for the berthing, powering up the CBCS (Centerline Berthing Camera System) and gathering equipment needed for the MPLM ingress activities.

FE-2-18 Sandra Magnus closed the protective window shutters in the Kibo JPM (Japanese Pressurized Module).

After the MPLM was grappled in the Endeavour cargo bay by MS1 Don Pettit & MS4 Bob Kimbrough with the SSRMS (Space Station Remote Manipulator) at ~11:30am, the following steps are being executed in the course of the day up to crew ingress late tonight (planned at ~8:30pm EST):

- Unberth MPLM in Shuttle cargo bay;
- Verify Node-2 CBM (Common Berthing Mechanism) premate status;
- MPLM transfer from Shuttle cargo bay to Node-2 nadir port (no crew exercises allowed onboard during SSRMS maneuver from pre-install until after ABOLTS Complete due to loads/dynamics flight rules);
- Node-2 nadir CBM First Stage Capture;
- Node-2 nadir port vestibule safing by CDR Fincke (disconnect jumpers);
- SSRMS switched to Limp mode;
- Node-2 nadir CBM 2nd Stage Capture & ABOLTS (Acquire Bolts) –

- completed: ~1:02pm;
- SSRMS brake applied; SSRMS post-mating ungrapple;
 - Node-2 to MPLM vestibule pressurization & leak check; verification of CBM bolt loading complete; ISA/VAJ (Internal Sampling Adapter/Vacuum Access Jumper) left connected for planned vestibule depress on FD12;
 - MPLM vestibule configured for Ingress (including 30 min. MLI/thermal cover removal, 45 min. jumper install & 15 min. power recovery);
 - Removal of CBM CPAs (Controller Panel Assemblies); activation of MPLM cabin fan & smoke detector;
 - Pressure equalization & IMV airducts installation;
 - Installation of ARS (Air Revitalization System) jumper & vestibule closeout; removal of hatch pip pin; opening of MPLM IMV (Intermodular Ventilation) valves, closing of PPRA's & turning on lights;
 - MPLM Ingress: Relocation of PBA (Portable Breathing Apparatus) & PFE (Portable Fire Extinguisher) from JLP (Japanese Logistics Pressurized Segment) to MPLM for installation.

After MPLM berthing, CDR Fincke disassembled & removed the CBCS in Node-2, making room for subsequent cargo transfers.

FE-1 Lonchakov meanwhile unstowed a new Russian Orlan MK spacesuit (#004) along with its replaceable components (BRTA-2 radio telemetry unit, BK-3M oxygen (O₂) repress bottles, LP-9 LiOH cartridge, etc.) and conducted the first part of the standard post-delivery maintenance/checkout operations on the suit and its backpack. *[Activities today included unpacking, installation of UDSK pressure gauge on Orlan, spacesuit & backup bladder leak check, valve tests, BSS interface unit checkout, and BRTA installation & checkout. More work on MK-004 is scheduled tomorrow.]*

Later today, Yuri will also terminate the “drying out” of the SOKOL pressure suit for Sandy Magnus (which she would wear as a Soyuz passenger in a contingency return) after yesterday’s standard leak checkout.

Scheduled for ~6:15pm, CDR Fincke will have 30 min. for configuring the transfer equipment which allows the Shuttle to supply O₂ to the ISS PBAs (Portable Breathing Apparatus) in support of the subsequent pre-EVA mask prebreathe by EV1 Heide Piper & EV2 Stephen Bowen for denitrogenation. Earlier today, Mike Fincke closed the N₂ (nitrogen) feed valve, used for purging the O₂ supply line from the Shuttle.

Preparatory to tonight’s campout, Gregory Chamitoff uninstalled & removed the temporary IWIS RSU (Internal Wireless Integrated System/Remote Sensor Unit)

accelerometer from the U.S. Airlock (A/L), used last evening for taking docking disturbance data.

FE-2-18 Magnus will be getting some excellent experience with the JEMRMS (Japanese Experiment Module/Robotic Manipulator System) in the Kibo JPM when she is setting up the RMS MA (Main Arm) later today for supporting tomorrow's EVA-1.

[Working with Tsukuba/SSIPC (Space Station Integration & Promotion Center), Magnus has to –

- *Activate the RLT (RMS Laptop),*
- *Start up the JEMRMS DOUG (Dynamic Onboard Ubiquitous Graphics) application to receive & display SRMS/SSRMS/JEMRMS joint angle telemetry from a PCS (Portable Computer System) A31p laptop (if required),*
- *Activate JEMRMS and verify activation completion,*
- *Activate CCP (Camera Control Panel) and RMS Monitors,*
- *Perform Zero Position reset after resetting JEU (Joint Expedited Undocking) Resolver and changing MDP (Management Data Processor) mode to MA BRAKE,*
- *Activate JEMRMS BUS Monitor Start and start the monitor,*
- *Maneuver the external MA to A-1 support position,*
- *Stop JEMRMS BUS Monitor & Deactivate it, and*
- *Power down RMS Monitor and CCP for saving power resources.]*

Chamitoff performed the standard maintenance & checkout on the onboard CSA-CP (Compound Specific Analyzer-Combustion Products) instruments. *[Prime unit currently is CSA-CP #1057 (to be replaced); three backup units are #1060, #1053, #1055. There are now also four new CSA-CPs, delivered on STS-126, wrapped in Mylar. Today's maintenance involved checkout and battery change on one of the two sampling pumps (#1019) and on the four new units which were then to be zero-calibrated and left to the usual de-contamination/degassing of new units.]*

Lonchakov conducted the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the passageways PrK (SM Transfer Compartment)–PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1. *[This checkup is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons, and one of the two Russian SKV air conditioners off (SKV-1).]*

Flight Engineer Magnus had an hour to herself for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residence, if she/he chooses to take it.

Chamitoff, slated for return on Endeavour on 11/29 (or 11/30), and Magnus, who replaced him yesterday as ISS FE-2, have ~2:00h set aside for standard joint “handover” activities, to be continued through the docked period ahead. The handover included a 15-min familiarization of Sandy with the CMS (Countermeasure System)/Physical Exercise equipment, today focused on the CEVIS (Cycle Ergometer with Vibration Isolation).

More ULF-2 cargo transfers from the Shuttle to ISS were handled by Chamitoff, Magnus and Shuttle crewmembers.

Mike Fincke accessed the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) and installed the new CSI-03 (CGBA Science Insert #3) payload, transferred yesterday, with its two weaver spiders and (currently) 4-day old larvae in the spider habitat.

In preparation for his first run with the U. S. SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment, the CDR first downloaded SLEEP data from his Actiwatch to the HRF-1 (Human Research Facility 1) laptop for subsequent downlink and verification by the support scientist, then re-initialized his and Greg’s Actiwatchs for their upcoming individual sessions. *[To monitor their sleep/wake patterns and light exposure, Fincke & Chamitoff will wear a special Actiwatch device which measures the light levels encountered by them as well as their patterns of sleep and activity throughout this run. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

The FE-1 is scheduled to take and download the periodic sensor readings of the Russian “Pille-MKS” (MKS = ISS) radiation dosimetry experiment which has ten sensors placed at various locations in the Russian segment (DC1, SM starboard & port cabin windows, ASU toilet facility, control panel, etc.). *[Nine of the ten dosimeters are read manually.]*

In preparation for tomorrow’s EVA-1, Gregory set up the batteries of the new D2XS cameras for recharge (which takes at least three hours).

Also for the EVA, Mike meanwhile will be adding new tethers to the DCS-760 cameras (making tie wraps unnecessary) and configuring the DCS-760s, one with 28mm lens, the other with flash attachment and 35mm lens, before starting recharging their batteries.

Yuri performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U*

urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]

The FE-1 also completed the regular daily job of IMS (Inventory Management System) “delta file” updating/editing for the weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew performed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

The joint crew conducted an in-depth one-hour review of procedures for the EVA-1 spacewalk, with egress scheduled to start tomorrow afternoon at ~1:51pm EST.

Heidemarie Stefanyshyn-Piper (EV1) and Stephen Bowen (EV2) will begin their “campout” (*nachalo desaturatsiy* = desaturation start) in the A/L with hatch closure and depressurization of the CL (Crewlock) from 14.7 to 10.2 psi at ~11:21pm, followed by mask prebreathe at ~11:21-12:26am. Sleep time for the ISS crew begins at 12:26am. *[For the Campout, METOX (Metal Oxide) canisters were installed in the A/L for CO₂ control.]*

Following the usual hygiene break/with mask prebreathe for Bowen & Piper at ~9:31am-10:41am tomorrow morning after spending the night on 10.2 psi, the A/L hatch will be closed again for EVA preps in 10.2 psi, followed by EMU purge and prebreathe in the EMUs. Afterwards, with CL depressurization and EV1/EV2 egress, EVA-1 nominally begins at ~1:51pm EST.

ISS Crew Sleep Shift Planning: To synchronize the ISS crew’s timeline with STS-126/ULF-2 docking and subsequent docked activities, Mike’s, Yuri’s and Greg’s wake/sleep cycle is undergoing a number of shifts which started on 11/14. The early undock time (10:32am) drives crew wakeup 2.5 hrs earlier, to 7:00am by FD14. The shift is completed by having set crew sleep 30 min earlier on FD4 and then moving it one hour earlier each day on FD12 and FD13. For the next six days, the wake/sleep shift schedule is as follows (all times EST):

FD4	Wake: 9:26am (11/17) –12:26am (11/18) Sleep: 12:26am – 8:56am
FD5	Wake: 8:56am (11/18) – 12:26am (11/19) Sleep: 12:26am – 8:56am
FD6	Wake: 8:56am (11/19) –12:26am (11/20) Sleep: 12:26am – 8:56am

FD7	Wake: 8:56am –12:26am (11/21) Sleep: 12:26am – 8:56am
FD8	Wake: 8:56am –12:26am (11/22) Sleep: 12:26am – 8:56am
FD9	Wake: 8:56am –12:26am (11/23) Sleep: 12:26am – 8:56am

STS-126 Mission Highlights:

- Focused Orbiter inspection on FD6 will not be required.
- Generic face-to-face handover time between Chamitoff & Magnus will be ~12 hrs max; Gregory will remain on the ISS until the day before undocking and will be scheduled as an ISS crewmember.
- Endeavour is being powered by the SSPTS (Station-Shuttle Power Transfer System) from post-docking to just before undocking. During the mated mission when ISS solar arrays are feathered for attitude maneuvers and EVA operations, SSPTS may be powered off to maintain station power margin.
- 30 hrs are required for transfer ops to/from the Shuttle middeck and 105 hours for MPLM. With all the timed activities and rack transfers scheduled, ULF2 will be a highly choreographed transfer mission. The Shuttle crew has been thoroughly trained on the details of the choreography. In addition, each day a transfer message will be uplinked, listing specific items that need to be transferred that day due to operations requiring the items.

No CEO photo targets uplinked for today.

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 6:48am EST [= epoch]):

Mean altitude -- 351.3 km

Apogee height -- 353.6 km

Perigee height -- 349.0 km

Period -- 91.56 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0003378

Solar Beta Angle -- 31.5 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.73

Mean altitude loss in the last 48 hours -- 20 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57265

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

11/20/08 -- ISS 10 Years

11/26/08 -- Progress M-66/31P launch (nom.)

11/27/08 -- STS-126/Endeavour/ULF-2 undocking; 10:40am

11/29/08 -- STS-126/Endeavour/ULF-2 landing; ~2:10pm

11/30/08 -- Progress M-66/31P docking (nom.) – DC1 Nadir

12/07/08 -- Progress M-65/30P reentry (after 3 weeks autonomous flight for geophysical experiments)

12/18/08 -- Russian EVA-21

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Endeavour/15A launch – S6 truss segment

02/14/09 -- STS-119/Endeavour/15A docking

02/24/09 -- STS-119/Endeavour/15A undocking

02/26/09 -- STS-119/Endeavour/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress M-67/32P undocking & deorbit

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

07/30/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation

10/15/09 -- STS-129/Endeavour/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A – MPLM(P)

04/08/10 -- STS-132/Endeavour/ULF4 – ICC-VLD, MRM1 (contingency)

05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 11/16/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – docking day. Ahead: Week 4 of Increment 18. Flight Day 3 (FD3) of STS-126/ULF-2. ISS crew work cycle today: Wake 9:30am EST; sleep 12:56am (until 9:26am tomorrow morning).*

STS-126/Endeavour docked smoothly at the ISS PMA-2 (Pressurized Mating Adapter-2) port at 5:01pm EST, four minutes ahead of timeline, in darkness (orbital sunset ~4:34pm/sunrise ~5:09pm), after successfully completing the RPM (R-Bar Pitch Maneuver) in daylight at ~4:16pm and arriving at +V-Bar (straight in front of ISS) at ~4:30pm (Mike reported that he & Greg could see “no damages whatsoever” on the underbelly TPS through their telephoto lenses). The station now hosts ten occupants again as Mission ULF-2 is underway. *[The combined crew is comprised of ISS-CDR Fincke, FE-1 Lonchakov, FE-2 Chamitoff, STS-CDR Chris Ferguson, PLT Eric Boe, MS1 Donald Pettit, MS2/EV2 Steve Bowen, MS3/EV1 Heidemarie Stefanyshyn-Piper, MS4/EV3 Shane Kimbrough, and MS5/ FE-2-18 Sandra Magnus who replaces Chamitoff as FE-2, as the latter returns on Endeavour as MS-5.]*

Hooks closure to rigidize the Shuttle/ISS linkup was at ((~5:12pm, ~7 min after dock)). After the docking, the station was reoriented as planned to minimize the risk of micrometeoroid/debris impacts upon the Shuttle (-XVV = -x-axis in velocity vector, +z-axis in local vertical). *[Earlier, at ~2:00pm, the ISS maneuvered to docking attitude after attitude control authority was handed over (~1:55pm) from USOS (US Segment) to RS MCS (Russian Segment Motion Control System).]*

After wake-up, FE-2 Chamitoff ended his FD180 (Flight Day 180) session with the NASA/JSC experiment NUTRITION w/Repository, his sixth and last, by collecting a final urine sample upon wakeup for storage in the MELFI (Minus-Eighty Laboratory Freezer for ISS). The sampling kit was then stowed away. *[The current NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes*

measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]

FE-1 Lonchakov performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP-Moscow. Additionally, the FE-1 today checked up on the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem, gathering weekly data on total operating time & "On" durations for reporting to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

Preparatory to the Shuttle arrival, FE-2 Chamitoff verified closure of the Lab & Kibo JPM (Japanese Pressurized Module) science window shutters as protection against thruster plumes. *[The window shutters must remain closed when Shuttle is within 3000 ft/915m of the ISS. They may be opened for no more than 15 minutes for photo documentation if the Shuttle is in Freedrift.]*

Other pre-docking preparations:

- Chamitoff hooked up the UOP DCP (Utility Outlet Panel/Display & Control Panel) power bypass cable at the CUP RWS (Cupola Robotic Work Station) to allow video coverage of the Shuttle's approach and docking with the SSRMS (Space Station Remote Manipulator System) cameras;
- Fincke & Chamitoff readied RPM (R-Bar Pitch Maneuver) photo/video equipment, including camera battery checks, for Orbiter TPS (Thermal Protection System) documentation (Gregory wielded the 400mm-lens D2X camera (replacing the earlier DCS-760), Mike the 800mm-lens D2X for documenting the tile acreage & bottom-side door seals),
- Lonchakov set up & later activated the camera timers upon Orbiter RPM initiation and handled the camcorder (the timers indicated beginning & end of the bottom-side photography window), then also
- Performed final STTS communications configuration checks for the docking (later, upon docking, Yuri switched USOS/RS comm systems to their mated-flight mode),
- Configured proper headset connection for supporting the RPM activity

(which resulted in ~300 pictures of the Orbiter bottom TPS), and

- Verified powerdown of the amateur radio equipment in the SM to prevent RF interference during the proximity & docking ops.

Shortly before the docking, the crew configured the Russian MCS for the automatic “PMA-2 Arrival” mode, an operational sequence used to monitor Orbiter arrival at the PMA-2. *[At “Capture Confirmed”, ISS attitude was immediately set to Freedrift for about 22 min. to allow dampening out relative motions of ISS and Endeavour (with the ODS (Orbiter Docking System) dampers/shock absorbers), then maneuvered to “Mated TEA” (Torque Equilibrium Attitude) to account for the new overall configuration with Endeavour docked.]*

Docking took place at 5:01pm EST. After leak checks of the ODS (Orbiter Docking System) vestibule for about an hour, ISS/STS hatches will be opened (nominally) at ~6:16pm.

After hatch opening, before installation of the ventilation airduct between station and Endeavour, Yuri Lonchakov will be performing the standard collection of air samples with the Russian AK-1M sampler in the SM, FGB, Lab, and then also in the Orbiter.

After the traditional Welcome Ceremony (~6:50pm, nom.), the new arrivals are to receive the mandatory 25-min. Safety Briefing.

FE-2-18 Magnus will transfer her IELK (Individual Equipment Liner Kit) seat liner from the Shuttle to the Soyuz TMA-13/17S crew return vehicle where Yuri Lonchakov installs it for the new FE-2. Greg Chamitoff’s IELK seat liner will be pulled out and temporarily stowed for return to Earth. *[A crewmember is not considered transferred until her/his IELK, AMP (ambulatory medical pack) and ALSP (advanced life support pack) drug kit are transferred. After today’s reconfiguration of the FE-2 IELKs, Sandy has technically become an Expedition 18 member aboard ISS.]*

After the Safety Briefing, Fincke is scheduled to deploy and activate the SSC WRLS (Station Support Computer/ Wireless Router) laptop in Node-2 to joint the Shuttle & Station LANs (Local Area Networks) during the ULF-2 docked period.

Chamitoff relocates the COL VCA1 (Columbus Orbital Laboratory/Video Camera Assembly 1) to Node-2 to monitor transfer activities in the Node-2/MPLM (Multi-Purpose Logistics Module) area.

Greg will also exchange the video tape in the VDS VTR (Video Distribution Subsystem/Video Tape Recorder) which has documented the response of the S1

HRS (Heat Rejection Subsystem) Radiator to the docking disturbances.

First cargo transfers from the Shuttle middeck to the ISS are scheduled for Chris, Donald, Heidemarie, Steve, Sandra & Gregory to begin at ~8:30pm.

Later, Mike Fincke and Shuttle crewmembers Don, Eric & Shane will be working the Robotics arms to hand over the grappled OBSS (Orbiter Boom Sensor System) from the SSRMS (Space Station Remote Manipulator System) to the SRMS (Shuttle RMS) and then “park” the SSRMS in MPLM “Leonardo” viewing position.

Yuri and Sandy will be inspecting new SOKOL pressure suits, conducting the standard leak checks.

Before sleep time, FE-2 Chamitoff has ~45 min reserved for deploying the new Emergency Warning books & C&W (Caution & Warning) cue cards for the ULF-2 docked period in the Lab, Soyuz, SM, A/L (normally located in Node-2), Airlock, and Node-2.

At ~10:30pm, Sandra Magnus is scheduled for her first weekly PMC (Private Medical Conferences) via S- & Ku-band audio/video as ISS crewmember.

ISS Crew Sleep Shift Planning: To synchronize the ISS crew’s timeline with STS-126/ULF-2 docking and subsequent docked activities, Mike’s, Yuri’s and Greg’s wake/sleep cycle is undergoing a number of shifts which started last night (11/14). The early undock time (10:32am) drives crew wakeup 2.5 hrs earlier, to 7:00am by FD14. The shift is completed by moving crew sleep 30 min earlier on FD4 and then one hour earlier each day on FD12 and FD13. For the first seven days, the wake/sleep shift schedule is as follows (all times EST):

FD3	Wake: 9:30am (11/16) –12:56am (11/17) Sleep: 12:56am – 9:26am (11/17)
FD4	Wake: 9:26am –12:26am (11/18) Sleep: 12:26am – 8:56am
FD5	Wake: 8:56am (11/18) – 12:26am (11/19) Sleep: 12:26am – 8:56am
FD6	Wake: 8:56am (11/19) –12:26am (11/20) Sleep: 12:26am – 8:56am
FD7	Wake: 8:56am –12:26am (11/21) Sleep: 12:26am – 8:56am
FD8	Wake: 8:56am –12:26am (11/22) Sleep: 12:26am – 8:56am

FD9	Wake: 8:56am –12:26am (11/23)
	Sleep: 12:26am – 8:56am

STS-126 Mission Highlights:

- MPLM “Leonardo” will be installed on Node-2 on FD4; ingress same day just before Presleep. MPLM transfers start FD5 with four racks, followed on FD6 by 8 racks, including the Galley (/ER6).
- Focused Orbiter inspection is nominally planned for FD6. However, since the installed MPLM will obstruct a small area on the lower starboard wing for Focused inspection, MPLM berthing could be delayed to FD5 if the Debris Assessment Team, in reviewing the RPM imagery on the evening of FD3, identifies an area of concern associated with the starboard wing. Late inspection will be completed in its entirety after the Shuttle undocks on FD14. Endeavour will be undocking with the OBSS (Orbiter Boom Sensor System) on the SRMS (Shuttle Remote Manipulator System) in preparation for that inspection.
- Generic face-to-face handover time between Chamitoff & Magnus will be 12 hrs max; Gregory will remain on the ISS until the day before undocking and will be scheduled as an ISS crewmember.
- Endeavour will be powered by the SSPTS (Station-Shuttle Power Transfer System) from post-docking to just before undocking. During the mated mission when ISS solar arrays are feathered for attitude maneuvers and EVA operations, SSPTS may be powered off to maintain station power margin.
- 30 hrs are required for transfer ops to/from the Shuttle middeck and 105 hours for MPLM. With all the timelined activities and rack transfers scheduled, ULF2 will be a highly choreographed transfer mission. The Shuttle crew has been thoroughly trained on the details of the choreography. In addition, each day a transfer message will be uplinked, listing specific items that need to be transferred that day due to operations requiring the items.

No CEO photo targets uplinked for today.

ISS On-Orbit Status 11/15/08

All ISS systems continue to function nominally, except those noted previously or below.
Saturday – pre-docking preparations day for CDR Fincke, FE-1 Lonchakov & FE-2 Chamitoff.

STS-126/Endeavour (ISS ULF-2) lifted off last night right on time (7:55pm EST) with all systems performing nominally, for ISS rendezvous tomorrow, Sunday (11/16), to dock at ~5:13pm EST. At launch, the ISS was over the Pacific at 46.4 deg S Lat, 161.1 deg W Long. The Orbiter is carrying the seven-member crew of CDR Chris Ferguson, PLT Eric Boe, MS1 Donald Pettit, MS2/EV2 Steve Bowen, MS3/EV1 Heidemarie Stefanyshyn-Piper, MS4/EV3 Shane Kimbrough, and MS5/ Exp-18 FE-2 Sandra Magnus. Magnus will replace ISS Flight Engineer 2 Gregory Chamitoff who returns on 11/29 (nominal) with STS-126. *[STS-126 is the 124th space shuttle flight, the 27th flight to the station, the 22nd flight for Endeavour and the fourth flight in 2008. Endeavour carries about 32,000 pounds of cargo, including supplies and “home improvement” equipment necessary to double the crew size from three to six members in Spring 2009. The new station cargo includes additional sleeping quarters, a second toilet and a resistance exercise device. The shuttle also will deliver a new crew member (Magnus) and bring back another (Chamitoff) after more than five months aboard the station (**see night-launch picture, below**).]*

Wake-up time for the ISS crew today was slipped by 3:30h, from 1:00am to 4:30am EST. Sleep time tonight will start at 10:30pm, to extend to 9:30am tomorrow. See below for a partial overview of the scheduled sleep cycle shifting to bring station activities in line with Shuttle arrival and departure.

To perform a thorough cleaning of the FGB (Functional Cargo Block), FE-1 Lonchakov removed the Russian POTOK-150MK (150 micron) air filter unit of the SOGS air revitalization subsystem from its regular location in the Service Module (SM) and transferred it to the FGB, installed it temporarily on a panel on Velcro and let it run for six hours. Afterwards, Yuri replaced the POTOK pre-filter and returned the assembly to its nominal place in the SM.

FE-2 Chamitoff's first activity this morning was to start on Part 2 of his Flight Day 180 session with the NASA/JSC experiment NUTRITION w/Repository. This was an all-day session, the sixth and last for Greg, of collecting urine samples several times for 24 hrs, to

continue through first void tomorrow morning. *[The NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by supercold MELFI dewars), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

CDR Fincke worked on the THC IMV (Temperature & Humidity Control/Intermodule Ventilation) Assembly in the USOS (US Segment), configuring diffusers in the Lab to optimize air mixing for CO₂ removal and installed a temporary (additional) air duct in Node-2 for increased Shuttle ventilation. *[Until the TeSS (Temporary Sleep Station) is removed, only five of the six diffusers (air intakes) are accessible in the Lab.]*

In further preparation for the ULF-2 spacewalks, Chamitoff worked in the US Airlock (A/L) –

- removing panels as a get-ahead for O₂ setup on FD3,
- installing & connecting an IWIS RSU (Internal Wireless Instrumentation System/ Remote Sensor Unit) accelerometer set for ULF-2 docking data take, running off the SSC-4 laptop, and
- powering up the A/L PCS (Portable Computer System) laptop.

Greg also booted up the Cupola A31p PCS in the Lab.

Lonchakov meanwhile prepared for tomorrow's RPM (R-bar Pitch Maneuver) at Endeavour's arrival by initiating charging for the D2X cameras to be used for the photo session by Fincke and Chamitoff. *[Batteries must be charged for at least three hours. Three batteries will be used for the camera configuration, with a fourth and fifth battery reserved as a backup. The RPM will document the bottom-side mapping of the Orbiter at the arrival of the Shuttle with digital cameras and a video camcorder. During the RPM at ~600 ft from the station, the "shooters" have only ~90 seconds for taking high-resolution digital photographs of all tile areas and door seals on Endeavour, to be downlinked for launch debris assessment. Thus, time available for the shooting will be very limited, requiring great coordination between the two headset-equipped photographers and the Shuttle pilot.]*

Also for the RPM and the subsequent docked phase, Fincke configured the camcorder and installed the BPSM (Battery Powered Speaker Microphone Unit) with its long drag-through cable.

In preparation for ULF-2, Michael Fincke supported the ground in pressurizing & leak-checking the PMA-2 (Pressurized Mating Adapter 2) for ingress, hatch opening and stowage after the Shuttle's arrival. *[PMA-2, at the ISS bow, will be the docking port for Endeavour tomorrow.]*

Gregory worked on the SSC (Station Support Computer) carrying the all-important OSTPV (Onboard Short Term Plan Viewer) to reprogram the OSTPV for showing Shuttle data such as the MET (Mission Elapsed Time) band and the timelines of the upcoming Endeavour crew.

Yuri completed the routine daily servicing of the SM's SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

At ~10:25am, the CDR powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, & power supply) and conducted, at 10:30am, a ham radio exchange with the Newcomers Club in Saitama, Iruma, Sitama, Japan. *["After the first school contact in Japan, many children wanted to get amateur licenses because they want to talk with the astronauts on ISS. In Saitama area, about 30 children got their ham radio licenses. Therefore, we organized the Newcomers Club and used the school contact, and we are already teaching the orbit of a satellite and so on." Questions to Mike were uplinked beforehand. "Is it true that you have a plan to connect the space station to the earth with the carbon nanotube?"; "How did you vote for the presidential election?"; "What do you think to become an astronaut?"; "What is inconvenient to live in zero gravity?"; "Is space food delicious?"; "When do you feel difficulty in space station?"; "Which planet would you like to visit in the future? And why?"; "How do you spend your free time? Do you play games?"; "What is your favorite Japanese word?"; "How long do you think you can live in the space station?"]*

The crew performed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

WRM Update: An updated WRM (Water Recovery Management) "cue card" was uplinked yesterday for the crew's reference, updated with Thursday's (11/13) water audit. *[The new card (18-0006D) lists 23 CWCs (~755.0 L total) for the four types of water identified on board: technical water (135.2 L, for Elektron electrolysis), potable water (573.6 L, incl. 174.6 L currently off-limit because of Wautersia bacteria), condensate water (7.0 L), waste/ EMU dump and other (39.2 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]*

ISS Crew Sleep Shift Planning: To synchronize the ISS crew's timeline with STS-126/ ULF-2 docking and subsequent docked activities, Mike's, Yuri's and Greg's wake/sleep cycle is undergoing a number of shifts which started last night (11/14). The early undock time (10:32am) drives crew wakeup 2.5 hrs earlier, to 7:00am by FD14. The shift is completed by moving crew sleep 30 min earlier on FD4 and then one hour earlier each

day on FD12 and FD13. For the first seven days, the wake/sleep shift schedule is as follows (all times EST):

FD1	Wake: 1:00 am (11/14) – 8:00pm Sleep: 8:00pm (11/14) – 4:30am (11/15)
FD2	Wake: 4:30am (11/15) – 10:30pm Sleep: 10:30pm – 9:30am (11/16)
FD3	Wake: 9:30am –12:56am (11/17) Sleep: 12:56am – 9:26am (11/17)
FD4	Wake: 9:26am –12:26am (11/18) Sleep: 12:26am – 8:56am
FD5	Wake: 8:56am (11/18) – 12:26am (11/19) Sleep: 12:26am – 8:56am
FD6	Wake: 8:56am (11/19) –12:26am (11/20) Sleep: 12:26am – 8:56am
FD7	Wake: 8:56am –12:26am (11/21) Sleep: 12:26am – 8:56am

STS-126 Mission Highlights:

- MPLM “Leonardo” will be installed on Node-2 on FD4; ingress same day just before Presleep. MPLM transfers start FD5 with four racks, followed on FD6 by 8 racks, including the Galley (/ER6).
- Focused Orbiter inspection is nominally planned for FD6. However, since the installed MPLM will obstruct a small area on the lower starboard wing for Focused inspection, MPLM berthing could be delayed to FD5 if the Debris Assessment Team, in reviewing the RPM imagery on the evening of FD3, identifies an area of concern associated with the starboard wing. Late inspection will be completed in its entirety after the Shuttle undocks on FD14. Endeavour will be undocking with the OBSS (Orbiter Boom Sensor System) on the SRMS (Shuttle Remote Manipulator System) in preparation for that inspection.
- Generic face-to-face handover time between Chamitoff & Magnus will be 12 hrs max; Gregory will remain on the ISS until the day before undocking and will be scheduled as an ISS crewmember.
- Endeavour will be powered by the SSPTS (Station-Shuttle Power Transfer System) from post-docking to just before undocking. During the mated mission when ISS solar arrays are feathered for attitude maneuvers and EVA operations, SSPTS may be powered off to maintain station power margin.
- 30 hrs are required for transfer ops to/from the Shuttle middeck and 105 hours for MPLM. With all the timed activities and rack transfers scheduled, ULF2 will be a highly choreographed transfer mission. The Shuttle crew has been thoroughly trained on the details of the choreography. In addition, each day a transfer message will be uplinked, listing specific items that need to be transferred that day due to operations requiring the items.

CEO photo targets uplinked for today were **Heard Island, Australia** (*Heard Island is a*

bleak, uninhabited, and mountainous island located in the Southern Ocean about two-thirds of the way from Madagascar to Antarctica. Its mountains are covered in glaciers and dominated by Mawson Peak, a 9,006 ft high complex volcano which forms part of the Big Ben massif. A long thin spit named "Elephant Spit" extends from the east of the island. ISS pass was in the light of midday with weather satellite imagery trends suggesting improving visibility. Shooting well right of track and trying for detailed oblique views of this challenging target), **Kerguelen Archipelago** (partial clearing, early afternoon, nadir, this glaciated and volcanic archipelago is located in the far South Indian Ocean nearly 2,000 miles southeast of the island of Madagascar. Of primary interest is photography for monitoring of the rarely photographed ice field and glaciers located on the western end of the main island. ISS approach was from the west in early-afternoon illumination with at least partial clearing expected. Trying for a near-nadir mapping pass with the long lens), **Patagonian Glaciers** (ISS had a nadir pass over the less-well photographed Northern Patagonian Ice Field in southern Andes between Chile and Argentina. The pass was in mid-morning with at least partial clearing expected. Using the long lens and try for detailed views of the glacial features, especially the western side, where visible), and **S. Georgia/S. Sandwich** (the South Georgia Island is an arching, mountainous and glaciated island that lies about 860 miles east-southeast of the Falkland Islands. The South Sandwich Islands form a separate island group and are to the southeast. Only partial clearing was expected at the time of the pass, but the crew was to try for mapping pass of the north coast of South Georgia. The pass was in early afternoon light, looking well right of track. Also looking for large icebergs reported in the vicinity).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 4:27m EST [= epoch]):

Mean altitude -- 351.4 km

Apogee height -- 354.0 km

Perigee height -- 348.7 km

Period -- 91.57 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0003921

Solar Beta Angle -- 32.9 deg (magnitude peaking)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 50 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57232

Significant Events Ahead (all dates Eastern Time, some changes possible.):

11/16/08 -- STS-126/Endeavour/ULF-2 docking; ~5:13pm

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch (nom.)

11/27/08 -- STS-126/Endeavour/ULF-2 undocking; 10:40am

11/29/08 -- STS-126/Endeavour/ULF-2 landing; ~2:10pm

11/30/08 -- Progress M-66/31P docking (nom.) -- DC1 Nadir

12/07/08 -- Progress M-65/30P reentry (after 3 weeks autonomous flight for geophysical experiments)
12/18/08 -- Russian EVA-21
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

07/30/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1 (contingency)
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osp/iss_reports/index.htm

STS-126 Launch – 11/14/08 – 7:55pm EST

ISS On-Orbit Status 11/14/08

All ISS systems continue to function nominally, except those noted previously or below.

Progress M-65/30P undocked successfully from the Service Module (SM) aft port on schedule at 11:20am EST. The first separation burn was on time at 11:23am, to be followed by a 30-sec retrograde burn at 2:25pm. 30P will remain in orbit in independent flight, continuing to phase out in front of the ISS (about 40 km per orbit) in order to support Russian non-ISS (geophysical) experiments. A 26-sec posigrade burn is scheduled for 11/17 (12:05pm). After its free flight, the ship will deorbit on 12/6 for destructive reentry over the Pacific Ocean. *[The separation appeared smooth, with no anomalous behavior reported by the crew. The undocking was done under US CMG (Control Moment Gyroscope) Momentum Management control, with Russian thrusters inhibited twice, first during the SM hooks opening activity at 9:40am and again at 11:17am for the undocking.]*

After the undocking, FE-1 Lonchakov switched the SM PrK (Transfer Tunnel)-to-aft port vestibule PEV (Pressure Equalization Valve, KVD) manually to its Closed position, a standard post-undocking procedure.

FE-2 Chamitoff conducted Part 1 of his FD180 session of the NASA/JSC experiment NUTRITION w/Repository, his sixth and last, for blood collection only, for which he had to forego exercising and food intake since yesterday for eight hours. Later today (~5:40pm), the FE-2 will set up the equipment for the 24-hour urine collections which start with the first void early tomorrow morning. Fincke assisted. *[After the CDR performed the phlebotomy, i.e., drawing Greg's blood samples (from an arm vein), the samples were first allowed to coagulate in the Repository for 20-30 minutes, then spun in the HRF RC (Human Research Facility/Refrigerated Centrifuge) and finally placed in MELFI (Minus-Eighty Laboratory Freezer for ISS). No thruster activity was allowed during the blood drawing. The RC was later powered off after a temperature reset to limit wear on the compressor, and cleaned. The NUTRITION project is the most comprehensive in-flight study*

done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by supercold MELFI dewars), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]

Later, the FE-2 completed the PFE (Periodic Fitness Evaluation) protocol, a monthly 1.5-hr. procedure which checks up on blood pressure and electrocardiogram (ECG) during programmed exercise on the CEVIS (Cycle Ergometer with Vibration Isolation) in the US Lab. Readings were taken with the BP/ECG (blood pressure/electrocardiograph) and the HRM (heart rate monitor) watch with its radio transmitter. The CDR assisted as CMO (Crew Medical Officer).

[BP/ECG provides automated noninvasive systolic and diastolic blood pressure measurements while also monitoring and displaying accurate heart rates on a continual basis at rest and during exercise.]

FE-1 Lonchakov set up the equipment for his first session with the Russian experiment MBI-18 DYKHANIE ("Respiration"), then undertook the session, controlled from the RSE-Med laptop and supported by ground specialist tagup.

Yuri then closed down the hardware and stowed it. *[Dykhane-1 uses two body belts (PG-T/thoracic, PG-A/abdominal), a calibrator, resistor, mouthpiece, etc., to study fundamental physiological mechanisms of the external breathing function of crewmembers under long-duration orbital flight conditions. During the experiment, physiological measurements are taken and recorded with a pneumotachogram, a thoracic pneumogram, an abdominal pneumogram, and pressure data in the oral cavity. All experimentally derived plus salient environmental data along with personal data of the subject are recorded on PCMIA card for return to the ground at end of the Expedition. Objectives include determining the dynamics of the relationship between thoracic (pectoral) and abdominal breathing function reserves and their realization potential during spontaneous breathing, the coordinated spontaneous respiratory movements in terms of thoracic and abdominal components of volumetric, time & rate parameters of spontaneous respiratory cycle, identification of the features of humoral-reflex regulation of breathing by dynamics of ventilation sensitivity of thoracic and abdominal components to chemoreceptor stimuli, etc. Overall, the experiment is intended to provide a better understanding of the basic mechanisms of pulmonary respiration/gas exchange gravitational relations of cosmonauts.]*

Chamitoff worked with Fincke on the BCAT-4 (Binary Colloidal Aggregation Test 4) experiment, handing it over to the CDR and passing on to Mike some of his findings of how to go about obtaining good imagery (sharp focus, perfectly square

alignment, excellent stability), then tore down and stored the hardware.

Fincke conducted another one of the periodic offloadings of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling a CWC (Contingency Water Container, #1054) with the collected water slated for processing. Two condensate samples were collected for return on ULF-2. *[Offloading began with 8.84 kg at 8:03am and ended 15 min later with 5.18 kg.]*

Gregory filled out the regular FFQ (Food Frequency Questionnaire), his 20th, on the MEC (Medical Equipment Computer). Mike Fincke's second FFQ session was completed yesterday from the discretionary "job jar" task list. *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

In the U.S. Airlock (A/L), Mike & Greg finished configuration preparations for the ULF-2 EVAs, along with some clean-up items from previous stowage issues. *[The crew removed the remaining charged batteries from the BSA (Battery Stowage Assembly) and conducted a final configuration check on the two EMUs (Extravehicular Mobility Units) and A/L. Since REBA (Rechargeable EVA Battery Assembly) #1004 exhibited a charge error yesterday, REBA #1005, a spare, will be used for ULF-2.]*

The CDR conducted the regular bi-monthly reboots of the OCA Router and File Server SSC (Station Support Computer) laptops.

Mike also replaced the battery of the prime CSA-CP (Compound Specific Analyzer-Combustion Products) unit (#1057). *[The CSA-CP is a passive cabin atmosphere monitor that provides quick response capability during a combustion event (fire). Its collected data are stored on a logger. Mike changed out the battery, then zero-calibrated the instrument (to eliminate drift in the combustion sensors). Following zero calibration, the prime unit's datalogger function was turned on to collect data at the SM Central Post as a spot check. After one hour, the datalogger was deactivated, with the prime CSA-CP remaining on for continuous passive sampling.]*

Mike & Yuri disassembled the equipment used for the recent R&R (Removal & Replacement) activities on the FGB's Komparus A3 system and stored it in the FGB. *["Komparus", which received a full complement of new avionics*

assemblies, is the FGB's communications portal. The Komparus (KIS) onboard radio command & measuring system activates and deactivates the FGB's radio telemetry system, with transmitters, commutators, external antennas, etc. of its two independently operating RTU-A and -B data telemetry subsystems.]

Lonchakov conducted some external reportage photography of the Soyuz TMA-13/17S spacecraft, docked at the FGB nadir port from the DC-1 Docking Compartment's EVA hatch 2 window. *[Using the NIKON D2X camera with wide angle and tele lenses, the FE-1 took digital pictures of the MLI (Multi-Layer Insulation) at various typical areas to assess the condition of the blankets, then copied the images to the RSK1 laptop.]*

The CDR & FE-2 had additional time reserved for hardware preparations and pre-packing for ULF-2. *[Activities included completion of critical portions of the IVA (Intravehicular Activity) Toolbox reconfiguration (clearing out tools from a rack which will be obstructed by cargo assembled for loading into the MPLM (Multi-Purpose Logistics Module), tearing down the Shuttle BOB (Breakout Box) for testing for non-intrusive flow meter ops, and doing some more pre-packing for return to Earth.]*

Yuri completed the routine daily servicing of the SM's SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

Greg had ~2.5 hrs reserved for another VolSci (Voluntary Science) program session with the SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellites) experiment. For today's test run, Chamitoff aimed at finishing a full iteration of algorithm development using two computer/algorithm-controlled satellites propelled by CO₂ gas, five beacons and one beacon tester. *[Today's run (Test Session 15), with ground team support, included the innovative use of "distributed computing" where the satellites perform low level path-following while high level path-determination happens in the crew's laptop, the ability of the crewmember to tune his controller interactively while working in a micro-G environment, and the implementation in hardware of the crewmember's algorithm.]*

The crew performed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2/PFE), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

At ~4:00am EST, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~5:40am, Yuri & Mike linked up with TsUP stowage specialists via S-band to conduct the weekly IMS tagup, discussing inventory & stowage issues, equipment locations and cargo transfers.

At ~9:35am, the FE-1 downlinked a PAO TV message of congratulation to TsUP-Moscow for the 60th birthday of Ivan Leonidovich Derevyanchenko, the General Director of "Conversia XXI" Closed Joint Stock Company (ZAO).

At ~10:00am, the CDR powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, & power supply) and conducted, at 10:05am, a ham radio exchange with three schools as part of International Education Week,- Poolesville High School, Poolesville, MD, Academia Cotopaxi, Quito/Ecuador, and Enloe Magnet High School, Raleigh, NC.

[Questions to Mike were uplinked beforehand. "How is oxygen brought into the ISS? Do you need to bring fresh oxygen or can you recycle the air?"; "What kinds of equipment are you required to work with on a regular basis, and what kind of knowledge or specialties must you have?"; "How do you prepare yourself, both physically and mentally, for the challenges of living in space?"; "If a compass won't work in space, so there is no north-south-east-west, how can you indicate direction?"; "How are scientists working to overcome the effects of radiation on a trip to Mars? Also, do you think that exposure to cosmic rays is a risk that you are comfortable taking?"; "What are the benefits of conducting experiments/studies in space?"; "We learned that in the ISS muscles atrophy and disuse of bones causes osteopenia. Will growing children ever be able to live in space and still grow? We especially wonder about the possibility of children in future colonies on the Moon or Mars."; "What are the differences between performing scientific experiments on earth as opposed to doing them on the space station? Also, what effects will these experiments have on our daily life here on earth?"; "What was the weirdest experiment ever performed on the space station?"; "We watched the ISS video on astronauts eating food and playing with floating spherical liquids. What would happen in a medical emergency on the ISS with spurting blood and other body fluids? How do you handle medical emergencies?"]

At ~5:10pm, the ISS crew will have their regular weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. *[S/G-2 (Space-to-Ground 2) phone patch via SSC (Station Support Computer)].*

Sleep Cycle Shift for ULF-2: Tonight's sleeptime for the crew will be delayed by 3.5 hrs, i.e., from 4:30pm to 8:00pm EST (wakeup tomorrow at 4:30am), beginning

a series of shifts to bring station life in line with STS-126 arrival.

STS-126/ULF-2/Endeavour Countdown Milestones:

The Launch countdown is proceeding nominally. Tanking began at about 11:00am EST.

- Launch Window Opens – 7:50pm
- In-Plane Launch Time – **7:55pm**
- Launch Window Closes – 8:00pm.
- Launch Weather Forecast:
 - Probability of KSC Weather Prohibiting Launch: 30%
 - Probability of KSC Weather Prohibiting Tanking: 0%

STS-126 Mission Highlights: STS-126/ULF-2/Endeavour, the 124th Shuttle mission and the 27th to the station, will be crewed by CDR Chris Ferguson, PLT Eric Boe, MS1 Donald Pettit, MS2/EV2 Steve Bowen, MS3/EV1 Heidemarie Stefanyshyn-Piper, MS4/EV3 Shane Kimbrough, and MS5/ Exp-18 FE-2 Sandra Magnus.

- ISS wake/sleep cycle will be shifted from 1:00am EST to 4:30am on FD2, then to 9:30am on FD3. The early undock time (10:32am) drives crew wakeup 2.5 hrs earlier, to 7:00am by FD14. The shift is completed by moving crew sleep 30 min earlier on FD4, and then one hour earlier each day on FD12 and 13.
- MPLM “Leonardo” will be installed on Node-2 on FD4; ingress same day just before Presleep. MPLM transfers start FD5 with four racks, followed on FD6 by 8 racks, including the Galley (/ER6).
- Focused Orbiter inspection is nominally planned for FD6. However, since the installed MPLM will obstruct a small area on the lower starboard wing for Focused inspection, MPLM berthing could be delayed to FD5 if the Debris Assessment Team, in reviewing the RPM imagery on the evening of FD3, identifies an area of concern associated with the starboard wing. Late inspection will be completed in its entirety after the Shuttle undocks on FD14. Endeavour will be undocking with the OBSS (Orbiter Boom Sensor System) on the SRMS (Shuttle Remote Manipulator System) in preparation for that inspection.
- Generic face-to-face handover time between Chamitoff & Magnus will be 12 hrs max; Gregory will remain on the ISS until the day before undocking and will be scheduled as an ISS crewmember.
- Endeavour will be powered by the SSPTS (Station-Shuttle Power Transfer System) from post-docking to just before undocking. During the mated mission when ISS solar arrays are feathered for attitude maneuvers and EVA operations, SSPTS may be powered off to maintain station power margin.
- 30 hrs are required for transfer ops to/from the Shuttle middeck and 105 hours for MPLM. With all the timelined activities and rack transfers

scheduled, ULF2 will be a highly choreographed transfer mission. The Shuttle crew has been thoroughly trained on the details of the choreography. In addition, each day a transfer message will be uplinked, listing specific items that need to be transferred that day due to operations requiring the items.

CEO photo targets uplinked for today were **Antarctic Ice Pack**, **S. Indian Ocean** (*the crew had a late morning pass over an area that weather satellite trends suggest at least partial clearing of the vicinity of the Antarctic Ice Pack. Looking well right of track for icepack, iceberg, and possible shoreline features*), **Kerguelen Archipelago** (*this glaciated and volcanic archipelago is located in the far south Indian Ocean nearly 2,000 miles SE of the island of Madagascar. Of primary interest is photography for monitoring of the rarely photographed ice field and glaciers located on the western end of the main island. ISS approach was from the W in mid-afternoon illumination and at least partial clearing was expected. Trying for a near-nadir mapping pass with the long lens, and then staying ready for the next target just seconds ahead*), **Heard Island** (*Heard Island is a bleak, uninhabited, and mountainous island located in the Southern Ocean; about two-thirds of the way from Madagascar to Antarctica. Its mountains are covered in glaciers and dominated by Mawson Peak, a 9,006 ft high complex volcano which forms part of the Big Ben massif. A long thin spit named "Elephant Spit" extends from the east of the island. ISS pass was in early afternoon light with weather satellite imagery suggesting partial clearing from the W. Looking well right of track and trying for oblique context views of this challenging target*), **Aurora Borealis** (*CREW REQUEST: Several passes during the day. Solar activity remains anomalously low and likewise Auroral displays will minimal. The crew was to look for displays obliquely left of track above the horizon*), and **Patagonian Glaciers** (*partial clearing, midday, nadir. Best pass of the day for lighting of this target area was at nadir over the southernmost portion of the Southern Patagonian Ice Field. Greg & Mike should have had midday illumination with at least partial clearing expected. CEO database already has numerous, excellent views of most of the beautiful, large glacier on the eastern flank of the Andes. This time the crew was to try for detailed views of the smaller, less-well photographed ones on the western flank*).

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:24am EST [= epoch]):

Mean altitude -- 351.4 km

Apogee height -- 353.9 km

Perigee height -- 348.9 km

Period -- 91.57 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0003737
Solar Beta Angle -- 32.8 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.72
Mean altitude loss in the last 48 hours -- 53 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 57219

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

11/14/08 -- STS-126/Endeavour/ULF-2 launch – MPLM Leonardo, LMC, PSSC;
(7:55:34pm EST)
11/16/08 -- STS-126/Endeavour/ULF-2 docking; ~5:13pm
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch (nom.)
11/27/08 -- STS-126/Endeavour/ULF-2 undocking; 10:40am
11/29/08 -- STS-126/Endeavour/ULF-2 landing; ~2:10pm
11/30/08 -- Progress M-66/31P docking (nom.) – DC1 Nadir
12/07/08 -- Progress M-65/30P reentry (after 3 weeks autonomous flight for
geophysical experiments)
12/18/08 -- Russian EVA-21
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

07/30/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1 (contingency)
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 11/13/08

All ISS systems continue to function nominally, except those noted previously or below. *L-1 for STS-126 (see below).*

Before breakfast and exercise, FE-2 Chamitoff performed his third PHS (Periodic Health Status) w/Blood Labs examination, using the U.S. PCBA (Portable Clinical Blood Analyzer). The second part of PHS, Subjective Clinical Evaluation, was performed later in the day. CDR Fincke assisted with the blood draw as CMO (Crew Medical Officer). All data were then logged on the MEC (Medical Equipment Computer) and the hardware stowed. *[The PHS exam, with PCBA analysis and clinical evaluation, is guided by special software (IFEP, In-Flight Examination Program) on the MEC laptop. While PCBA analyzes total blood composition, the blood's hematocrit is particularly measured by the Russian MO-10 protocol.]*

FE-1 Lonchakov conducted the periodic data collection and downlink on the long-term BIO-5 RASTENIYA-1 ("Plants-1") micro-gravity plant growth payload in the LADA/MIS (Module for the Investigation of Substrates) greenhouse. He also dried the substrate, took documentary photography and discussed the experiment with a ground specialist. *[RASTENIYA-1 researches growth and development of plants under spaceflight conditions in the LADA-14 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). The payload hardware includes a module (MIS/ Module for the Investigation of Substrates), the MIS control unit (BU), a nitrogen purge unit (BPA) and other accessories. During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. LADA consists of a wall-mounted growth chamber that provides long-term, ready access for crewmember interaction. It provides light and root zone control but relies on the cabin environmental control systems for humidity, gas composition, and temperature control. Cabin air is pulled into the leaf chamber, flows over the plants and vents through the light bank to provide both plant gas exchange and light bank cooling.]*

In final preparations for tomorrow's undocking of the Progress TM-65/30P cargo ship from the SM (Service Module) aft port (at 11:20am EST), Yuri Lonchakov dismantled and removed electronic equipment from the ship, specifically the US-21 matching unit, the cargo ship's LKT local temperature sensor commutator (TA251MB) of the BITS2-12 and its PZU-1M ROM (read-only memory) unit.

[When a Progress is undocked and jettisoned, the valuable electronics are retained, to be recycled on a future vehicle.]

After yesterday's installation of the StM Docking Mechanism between Progress and the SM, Mike & Yuri had another hour reserved today for transferring more discarded cargo to 30P and stowing it according to detailed plan in the logistics spacecraft-turned-trash can, then reported the completed stowage operation to the ground. *[StM is the "classic" probe-and-cone type, consisting of an active docking assembly (ASA) with a probe (SSh), which fits into the cone (SK) on the passive docking assembly (PSA) for initial soft dock and subsequent retraction to hard dock. The ASA is mounted on the Progress' cargo module (GrO), while the PSA sits on the docking ports of the SM, FGB and DC1.]*

At ~10:15am EST, Yuri & Mike activated the 30P, disassembled the air duct in the hatchway to the SM, removed the threaded quick-disconnect (QD) screw clamps of the SM docking & internal transfer system (SSVP), which has rigidized the mating surfaces, closed hatches and initiated the standard one-hour leak check of the connecting vestibule (AO) to verify hermeticity.

Mike Fincke successfully installed an IWIS (Internal Wireless Instrumentation System) accelerometer RSU (Remote Sensor Unit) in the U.S. Airlock (A/L). The 25 ft cable will be routed on 11/15 to the A/L installation site. *[IWIS gathers data on structural dynamics in micro-G that cannot be obtained on the ground, for reducing conservatism in dynamic math models of ISS structure and forcing functions,. This would possibly allow relaxation of operational constraints that limit activities that cause structural loads (activities such as: crew-exercise, vehicle dockings, re-boost) and extension ISS life (15 years) through more accurate fatigue calculations. IWIS consists of a suite of software on the A31p SSC (Station Support Computer) laptops and four major hardware components: Strain Gauges, Accelerometers, Remote Sensor Unit (RSU), and Network Control Unit (NCU). Sensors are four 4 tri-axial accelerometers and eight strain gauges (only in Node-1). Each accelerometer needs one RSU and can be relocated if needed for better measurements. The NCU, which is also movable provides RF (radio-frequency) interface between IWIS software and RSUs, as well as time synchronization for all RSU clocks in the network prior to data collection.]*

In the COL (Columbus Orbital Laboratory) at location COL1O2, the CDR prepared for the upcoming ZSR (Zero-G Stowage Rack) relocation during the ULF-2 docked

period by installing a Pivot Pin Bracket, a K-BAR (Knee-Brace Assembly Replacement) capture mechanism and an ISPR (International Standard Payload Rack) Bonding Strap.

In the Kibo JLP (Japanese Logistics Pressurized Segment), at loc. P2, Fincke replaced the bottom Pivot Fitting with an ARIS (Active Rack Isolation System) Bottom Pivot Fitting from JPM (Japanese Pressurized Module), loc. F2.

The FE-1 completed the periodic collection of air samples in the SM & FGB using the AK-1M sampler kit, recording date, time & location. Kits and pump were then restowed.

In the A/L, Mike Fincke & Greg Chamitoff continued the EVA preparations, today –

- De-gassing three PWRs (Payload Water Reservoirs, #1024, 1025, 1026) to be used for the spacewalks (*“De-gassing” = removing air bubbles from the PWR water that will be used to refill the EMU water tanks, by centripetal force, i.e., swinging the water bags to produce temporary “artificial gravity”*),
- Checking out three PGTs (Pistol Grip Tools, #1001, 1002, 1008) along with their batteries,
- Installing two METOX (Metal Oxide) CO₂ absorption canisters (#0016 in EMU 3003, #0019 in EMU 3018),
- Installing batteries on two helmet light/EMU TV assemblies, and
- Installing two REBAs (Rechargeable EVA Battery Assemblies) in EMUs 3003 & 3018.

The FE-2 removed the recorded video tape of the last SHERE (Shear History Extensional Rheology Experiment) run (9/30) from the MSG (Microgravity Science Glovebox) video drawer.

Gregory also completed the visual “T+2 Day” microbial (bacterial & fungal) analysis of the Week 3 potable water samples, collected on 11/11 from the SRV-K hot tap and two CWC (Contingency Water Containers) specimens and processed on board with the MCDs (Microbial Capture Devices) and coliform detection bags.

Mike meanwhile conducted the monthly 30-min PEP (Fire Detection & Suppression/Portable Emergency Provisions) safety inspection/audit in the ISS modules. *[The IMS-supported inspection involves verification that PFEs (Portable Fire Extinguishers), PBAs (Portable Breathing Apparatus) and EHTKs (Extension Hose/Tee Kits) are free of damage to ensure their functionality, and to track shelf life/life cycles on the hardware.* FE-2 Chamitoff conducted the monthly 30-min PEP (Fire Detection & Suppression/Portable Emergency Provisions) safety inspection/audit in the ISS modules. *[The IMS-supported inspection involves verification that PFEs*

(Portable Fire Extinguishers), PBAs (Portable Breathing Apparatus), and EHTKs (Extension Hose/Tee Kits) are free of damage to ensure their functionality, and to track shelf life/life cycles on the hardware. QDMA (Quick-Don Mask Assembly) harness inspection was not required today.]

FE-2 Chamitoff performed the regular 30-day inspection of the new AED (Automated External Defibrillator) in the CHeCS (Crew Health Care Systems) rack.

[The AED is a portable electronic device that automatically diagnoses the potentially life threatening cardiac arrhythmias of ventricular fibrillation and ventricular tachycardia in a patient. It then can treat them through defibrillation, i.e., the application of electrical therapy which stops the arrhythmia, allowing the heart to re-establish an effective rhythm. AEDs are generally either held by trained personnel who will attend events or are public access units which can be found in places including corporate and government offices, shopping centers, airports, restaurants, casinos, hotels, sports stadiums, schools and universities, community centers, fitness centers, health clubs and any other location where people may congregate.]

For his return to Earth, Chamitoff prepared for gathering his personal exercise equipment, to be closed out after his last session on each device, and the gear to be used by his replacement, FE-2 Sandy Magnus. *[The equipment includes such items as HRM (Heart Rate Monitor) transmitter, HRM watch, HRM resupply kit, HRM chest strap, TVIS PCMCIA memory card, TVIS harness, and CEVIS ergometer shoes.]*

Fincke & Chamitoff had ~2:15 hrs reserved for more hardware pre-packing for return on STS-126.

In the RS (Russian Segment), the Elektron electrolysis machine, inactive for a while due the ongoing BITS2-12 onboard telemetry measurement system maintenance, was reactivated by the ground at ~11:55am EST at 32 amps, supported by Lonchakov by monitoring the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating.

[The gas analyzer used on the Elektron during nominal operations for detecting hydrogen (H₂) in the O₂ line (which could cause overheating) is not included in the control algorithm until 10 minutes after Elektron startup.]

Fincke completed the weekly 10-min. CWC (Contingency Water Container) inventory as part of on-going WRM (Water Recovery & Management) assessment of onboard water supplies. Updated “cue cards” based on the crew’s water calldowns are sent up every other week. *[The new card (18-0006C) lists 23 CWCs (~771.1 L total) for the four types of water identified on board: technical*

water (151.3 L, for Elektron electrolysis), potable water (573.6 L, incl. 174.6 L currently off-limit because of Wautersia bacteria), condensate water (7.0 L), waste/ EMU dump and other (39.2 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]

FE-2 Chamitoff again had a one-hour period to himself for the regular crew departure preparations, working on the standard end-of-increment cleanup preparatory to his return to Earth later this month. *[It is usual for crewmembers to be granted reduced workdays for making their departure preparations, as their return date approaches.]*

Greg completed the routine daily servicing of the SM's SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

The FE-2 also conducted another checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the passageways SM PrK (Transfer Compartment)–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, and FGB GA–Node-1.

Later, Gregory completed a run with the MedOps experiment WinSCAT (Spaceflight Cognitive Assessment Tool for Windows), his fifth onboard session, by logging in on the MEC laptop and performing the psychological evaluation exercise on the laptop-based WinSCAT application. *[WinSCAT is a monthly time-constrained questionnaire test of cognitive abilities, routinely performed by astronauts aboard the ISS every 30 days before or after the PHS (periodic health status) test or on special CDR's, crewmembers or flight surgeons request. The test uses cognitive subtests that measure sustained concentration, verbal working memory, attention, short-term memory, spatial processing, and math skills. The five cognitive subtests are Coding Memory - Learning, Continuous Processing Task (CPT), Match to Sample, Mathematics, and Coding Delayed Recall. These WinSCAT subtests are the same as those used during NASA's long-duration bed rest studies.]*

Yuri performed the daily IMS (Inventory Management System) maintenance, updating/editing the standard IMS "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Chamitoff set up NASA's NUTRITION w/Repository experiment hardware for his

sixth and last session, starting tomorrow with the standard blood draw (phlebotomy), for which Greg has to start fasting 8 hrs before, i.e., tonight, with only water consumption allowed. *[The NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by supercold MELFI dewars), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

The crew conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

STS-126/ULF-2/Endeavour L-0 (11/14) Launch Countdown Milestones:

- Tanking Weather Briefing – 10:00am EST
- Earliest Tanking Operations – 10:30am
- MMT on console – 4:30pm
- Launch Window Opens – 7:50pm
- In-Plane Launch Time – 7:55pm
- Launch Window Closes – 8:00pm.
- Launch Weather Forecast:
 - Probability of KSC Weather Prohibiting Launch: 30%
 - Probability of KSC Weather Prohibiting Tanking: 0%

STS-126 Mission Highlights: STS-126/ULF-2/Endeavour, the 124th Shuttle mission (the 27th to the station), will be crewed by CDR Chris Ferguson, PLT Eric Boe, MS1 Donald Pettit, MS2/EV2 Steve Bowen, MS3/EV1 Heidemarie Stefanyshyn-Piper, MS4/EV3 Shane Kimbrough, and MS5/ Exp-18 FE-2 Sandra Magnus.

- ISS wake/sleep cycle will be shifted from 1:00am EST to 4:30am on FD2, then to 9:30am on FD3. The early undock time (10:32am) drives crew wakeup 2.5 hrs earlier, to 7:00am by FD14. The shift is completed by moving crew sleep 30 min earlier on FD4, and then one hour earlier each day on FD12 and 13.
- MPLM “Leonardo” will be installed on Node-2 on FD4; ingress same day just before Presleep. MPLM transfers start FD5 with four racks, followed on FD6 by 8 racks, including the Galley (ER6).
- Focused Orbiter inspection is nominally planned for FD6. However, since the installed MPLM will obstruct a small area on the lower starboard wing for Focused inspection, MPLM berthing could be delayed to FD5 if the Debris Assessment Team, in reviewing the RPM imagery on the evening of FD3,

identifies an area of concern associated with the starboard wing. Late inspection will be completed in its entirety after the Shuttle undocks on FD14. Endeavour will be undocking with the OBSS (Orbiter Boom Sensor System) on the SRMS (Shuttle Remote Manipulator System) in preparation for that inspection.

- Generic face-to-face handover time between Chamitoff & Magnus will be 12 hrs max; Gregory will remain on the ISS until the day before undocking and will be scheduled as an ISS crewmember.
- Endeavour will be powered by the SSPTS (Station-Shuttle Power Transfer System) from post-docking to just before undocking. During the mated mission when ISS solar arrays are feathered for attitude maneuvers and EVA operations, SSPTS may be powered off to maintain station power margin.
- 30 hrs are required for transfer ops to/from the Shuttle middeck and 105 hours for MPLM. With all the timelined activities and rack transfers scheduled, ULF2 will be a highly choreographed transfer mission. The Shuttle crew has been thoroughly trained on the details of the choreography. In addition, each day a transfer message will be uplinked, listing specific items that need to be transferred that day due to operations requiring the items.

CEO photo targets uplinked for today were **Sydney, Australia** (*CREW REQUEST: The target is Australia's largest city [estimated population 4.28 million] and the state capital of New South Wales. It is also a major seaport located on the southeast coast. ISS pass was in late afternoon sun with fair weather expected. As ISS approached the coast from the SW, the crew was to shoot left of track*), **S. Georgia/S. Sandwich** (*the South Georgia Island is an arching, mountainous and glaciated island that lies about 860 miles ESE of the Falkland Islands. The South Sandwich Islands form a separate island group and are to the SE. Only partial clearing was expected at the time of the pass, but Mike & Greg were to try for a mapping pass of the north coast of South Georgia. ISS pass was just after midday, looking well right of track. Looking also for large icebergs reported in the vicinity*), **Lake Eyre, Australia** (*this large, mostly dry lakebed is a landmark from space in South Australia. It is the lowest point of a basin that drains an area about one-seventh of the continent. This makes it a good indicator of long-term rainfall trends in east-central Australia. As ISS approached the area from the NW in early morning light, the crew was to look well right of track for the lakebed with perhaps a darker flow of water from the north. Using the short lens for context views and trying to acquire most or all of the lakebed in a single frame. Then getting ready for the next target* Canberra in just over three minutes), **Canberra, Australia** (*the capital city of Australia is situated inland in the mountains and hills of southeastern Australia. ISS had a fair weather pass in mid-morning light as it approached from the NW. Using the long lens settings and looking just left of track for a detailed mapping of the*

urban area).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 7:58am EST [= epoch]):

Mean altitude -- 351.5 km

Apogee height -- 354.0 km

Perigee height -- 349.0 km

Period -- 91.57 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0003707

Solar Beta Angle -- 32.1 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 61 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57203

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

11/14/08 -- STS-126/Endeavour/ULF-2 launch – MPLM Leonardo, LMC, PSSC;
(7:55:34pm EST)

11/14/08 -- Progress M-65/30P undocking – 11:20am EST (phys. sep.)

11/16/08 -- STS-126/Endeavour/ULF-2 docking; ~5:13pm

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch (nom.)

11/27/08 -- STS-126/Endeavour/ULF-2 undocking; 10:40am

11/29/08 -- STS-126/Endeavour/ULF-2 landing; ~2:10pm

11/30/08 -- Progress M-66/31P docking (nom.) – DC1 Nadir

12/07/08 -- Progress M-65/30P reentry (after 3 weeks autonomous flight for geophysical experiments)

12/18/08 -- Russian EVA-21

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking

02/26/09 -- STS-119/Discovery/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress M-67/32P undocking & deorbit

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/27/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

07/30/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation

10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A – MPLM(P)

04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1 (contingency)

05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at

http://www.hq.nasa.gov/osp/iss_reports/index.htm

ISS On-Orbit Status 11/12/08

All ISS systems continue to function nominally, except those noted previously or below.

Major activities for CDR Fincke & FE-2 Chamitoff today were EVA preparations for the ULF-2 spacewalks. Working in the U.S. "Quest" Airlock, Mike & Greg –

- Terminated the recharging of the REBA (Rechargeable EVA Battery Assemblies), HL (Helmet Light), PGT (Pistol Grip Tool), and EMU (Extravehicular Mobility Unit) batteries in the BSA (Battery Stowage Assembly), most of which will be used for EVA-1,
- Initiated the second recharge (of two) on the REBA, HL and EMU batteries,
- Set up EMUs #3018 & #3003 with their SCUs (Service & Cooling Umbilicals) and initiated the standard 1hr scrubbing process on the spacesuits' cooling water loops, filtering ionic and particulate matter (via a 3-micron filter),
- Conducted the regular checkout for the two spacesuits, and
- Terminated the scrubbing, shutting down the suit fans and oxygen (to limit run time), disassembled the EMU water processing kit and stowed the equipment.

Afterwards, Fincke & Chamitoff reviewed uplinked summaries of EVA tasks, EVA systems and DOUG (Dynamic Onboard Ubiquitous Graphics) files for ULF-2. A 30-min tagup with STS-126 crewmembers on the ground followed for reviewing the EVA tasks.

[Four EVAs are planned during the mission. MS2 (Bowen), MS3 (Piper), & MS4 (Kimbrough) will rotate all EVAs. General EVA tasks are:

- **EVA-1** (FD5) – NTA (Nitrogen Tank Assembly) transfer to Shuttle PLB, FHRC (Flex Hose Rotary Coupler) transfer to ESP-3, EFBM Cover Removal, Stbd SARJ (Solar Array Rotary Joint) Cleaning/TBA (Trundle Bearing Assembly) R&R.
- **EVA-2** (FD7) – CETA Cart Relocation, LEE A Lubrication, Stbd SARJ Cleaning/TBA R&R.

- **EVA-3** (FD9) – SARJ cleaning/TBA R&R.
- **EVA-4** (FD11) – Port SARJ lubing, EFBM cover install, ETVCG Install, JLP GPS Antenna Install, JEM Handrails/WIFs Install, IR and Digital Imagery of S1/P1 Radiators.]

Fincke completed the routine daily servicing of the SM's SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

Mike also conducted the periodic checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the passageways SM PrK (Service Module Transfer Compartment)–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, and FGB GA–Node-1.

Lonchakov performed the daily IMS (Inventory Management System) maintenance, updating/editing the standard IMS “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Yuri also collected the periodic readings of potentially harmful atmospheric contaminants in the SM, using the CMS (Countermeasure System), a component of the SKDS GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, today using preprogrammed microchips to measure for o-Xylol (1,2-Dimethylbenzol, C_8H_{10}) and Methyl-Mercaptan (Methanethiol, CH_4S).

Continuing preparations for Progress M-65/30P undocking on 11/14 (Friday), Lonchakov & Fincke installed the StM Docking Mechanism between Progress and the SM aft end. *[StM is the "classic" probe-and-cone type, consisting of an active docking assembly (ASA) with a probe (SSh), which fits into the cone (SK) on the passive docking assembly (PSA) for initial soft dock and subsequent retraction to hard dock. The ASA is mounted on the Progress' cargo module (GrO), while the PSA sits on the docking ports of the SM, FGB and DC1.]*

The FE-1 had another 4 hrs reserved for loading trash and other disposal cargo onto 30P.

In preparation for STS-126/ULF-2 arrival and the MPLM (Multi-Purpose Logistics Module) “Leonardo” berthing with the SSRMS (Space Station Remote Manipulator

System), Chamitoff re-installed the CBCS (Centerline Berthing Camera System) at the Node-2 Nadir hatch, remated the camera cable connection and photo-documented the setup. *[CBCS had been installed on 10/22 but was temporarily removed on 10/27 to make room for the EarthKAM (EK) payload for a week of student photo ops. Leonardo will be transferred from the Shuttle cargo bay with the SSRMS on FD4 and berthed at the Node-2 Nadir Port CBM (Common Berthing Mechanism), followed immediately by activation and initial crew ingress.]*

Gregory broke out and set up the equipment for tomorrow's scheduled U.S. PHS (Periodic Health Status) w/Blood Labs exam, a clinical evaluation of Chamitoff as subject, with Mike Fincke assisting as CMO (Crew Medical Officer) for the blood sampling part. *[Today's task included an electronic function test and control analysis of the blood lab equipment, viz., the PCBA (Portable Clinical Blood Analyzer), which was then temporarily stowed.]*

The FE-2 also had an hour for freeing space and relocating/consolidating cargo stowage to make room in the COL (Columbus Orbital Laboratory), JLP (Japanese Logistics Pressurized Segment), and Node-2 as required, for new racks coming up with ULF-2. Moves were to be logged in the IMS.

Afterwards, Greg worked on more hardware prepacking for return on ULF-2, going by revised uplinked Prepack Lists as reference.

The FE-2 again had a one-hour period to himself for the regular crew departure preparations, working on the standard end-of-increment cleanup preparatory to his return to Earth later this month. *[It is usual for crewmembers to be granted reduced workdays for making their departure preparations, as their return date approaches.]*

The station residents conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

At ~9:15am EST, Fincke & Chamitoff participated in a live 10-min. PAO interview with The Pittsburgh Tribune-Review (Mike Cronin).

At ~5:45pm, Gregory is scheduled for his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop).

New jobs added to the voluntary U.S. "job jar" task list for Fincke & Chamitoff are –

- the periodic PEP (Fire Detection & Suppression/Portable Emergency

Provisions) inspection, and

- tearing down and testing the Shuttle BOB (Breakout Box) for non-intrusive flow meter operations.

STS-126/ULF-2/Endeavour L-2 Status: The L-2 Day meeting of the MMT (Mission Management Team) this morning gave a "GO" for proceeding with the STS-126 launch countdown. No significant issues are being worked and there will not be an L-1 Day MMT meeting.

- *L-0 (11/14) Launch Countdown Milestones:*
 - *Tanking Weather Briefing – 10:00am EST*
 - *Earliest Tanking Operations – 10:30am*
 - *MMT on console – 4:30pm*
 - *Launch Window Opens – 7:50pm*
 - *In-Plane Launch Time – 7:55pm*
 - *Launch Window Closes – 8:00pm.*
- *Launch Weather Forecast:*
 - *Probability of KSC Weather Prohibiting Launch: 40%*
 - *Probability of KSC Weather Prohibiting Tanking: 0%*
 - *Primary Concerns: Showers within 20 NM of the SLF (Shuttle Landing Facility), cumulus clouds*

STS-126 Mission Highlights: STS-126/ULF2/Endeavour, the 124th Shuttle mission (the 27th to the station), will be crewed by CDR Chris Ferguson, PLT Eric Boe, MS1 Donald Pettit, MS2/EV2 Steve Bowen, MS3/EV1 Heidemarie Stefanyshyn-Piper, MS4/EV3 Shane Kimbrough, and MS5/ Exp-18 FE-2 Sandra Magnus.

- ISS wake/sleep cycle will be shifted from 1:00am EST to 4:30am on FD2, then to 9:30am on FD3. The early undock time (10:32am) drives crew wakeup 2.5 hrs earlier, to 7:00am by FD14. The shift is completed by moving crew sleep 30 min earlier on FD4, and then one hour earlier each day on FD12 and 13.
- MPLM "Leonardo" will be installed on Node-2 on FD4; ingress same day just before Presleep. MPLM transfers start FD5 with four racks, followed on FD6 by 8 racks, including the Galley (ER6).
- Focused Orbiter inspection is nominally planned for FD6. However, since the installed MPLM will obstruct a small area on the lower starboard wing for Focused inspection, MPLM berthing could be delayed to FD5 if the Debris Assessment Team, in reviewing the RPM imagery on the evening of FD3, identifies an area of concern associated with the starboard wing. Late inspection will be completed in its entirety after the Shuttle undocks on FD14. Endeavour will be undocking with the OBSS (Orbiter Boom Sensor System) on the SRMS (Shuttle Remote Manipulator System) in preparation

for that inspection.

- Generic face-to-face handover time between Chamitoff & Magnus will be 12 hrs max; Gregory will remain on the ISS until the day before undocking and will be scheduled as an ISS crewmember.
- Endeavour will be powered by the SSPTS (Station-Shuttle Power Transfer System) from post-docking to just before undocking. During the mated mission when ISS solar arrays are feathered for attitude maneuvers and EVA operations, SSPTS may be powered off to maintain station power margin.
- 30 hrs are required for transfer ops to/from the Shuttle middeck and 105 hours for MPLM. With all the timelined activities and rack transfers scheduled, ULF2 will be a highly choreographed transfer mission. The Shuttle crew has been thoroughly trained on the details of the choreography. In addition, each day a transfer message will be uplinked, listing specific items that need to be transferred that day due to operations requiring the items.

No CEO photo targets uplinked for today (due to yesterday's holiday).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 7:47am EST [= epoch]):

Mean altitude -- 351.5 km

Apogee height -- 354.1 km

Perigee height -- 349.0 km

Period -- 91.57 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0003768

Solar Beta Angle -- 30.8 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 60 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57187

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

11/14/08 -- STS-126/Endeavour/ULF-2 launch – MPLM Leonardo, LMC, PSSC; (7:55pm EST)

11/14/08 -- Progress M-65/30P undocking

11/16/08 -- STS-126/Endeavour/ULF-2 docking; ~4:56pm

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch (nom.)

11/27/08 -- STS-126/Endeavour/ULF-2 undocking; 10:32am

11/29/08 -- STS-126/Endeavour/ULF-2 landing; ~2:01 pm
11/30/08 -- Progress M-66/31P docking (nom.) – DC1 Nadir
12/18/08 -- Russian EVA-21
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

07/30/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1 (contingency)
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 11/11/08

All ISS systems continue to function nominally, except those noted previously or below. *Veterans Day Holiday.*

Before breakfast & first exercise, CDR Fincke, FE-1 Lonchakov and FE-2 Chamitoff completed a full session with the Russian crew health monitoring program's medical assessment MO-9/Biochemical Urinalysis. Afterwards, the FE-1 closed out and stowed the Urolux hardware. *[MO-9 is conducted every 30 days (and also before and after EVAs) and is one of five nominal Russian medical tests adopted by NASA for U.S. crewmembers for IMG PHS (Integrated Medical Group/Periodic Health Status) evaluation as part of the "PHS/Without Blood Labs" exam. The analysis uses the sophisticated in-vitro diagnostic apparatus Urolux developed originally for the Mir program. Afterwards, the data are entered in the MEC (Medical Equipment Computer)'s special IFEP software (In-Flight Examination Program).]*

The CDR collected failed lighting system BBAs (Baseplate Ballast Assemblies) from the Kibo JLP (Japanese Logistics Pressurized Segment, loc. 1PA2) and JPM (Japanese Pressurized Module, loc. 1OF2), and stowed them for return on STS-126/ULF-2.

In JLP, Fincke deinstalled a soft dummy panel at loc. 1P1 for temporary stowage, then removed a hard dummy panel from loc. 1F1 and installed it at 1P1, replacing it at 1F1 with the soft panel and tightening its four fasteners. After the swap, Mike also was to check on available stowage space at the 1P1, A1 & S1 rack areas for ULF-2 cargo.

Later, Mike conducted the CTB (Cargo Transfer Bag) T1/T2 contents audit carried yesterday on the voluntary "job jar" task list, retrieving cables to be retained aboard prior to CTB T2's disposal on ULF-2 and verifying availability of BDS (Backup Drive System) hardware for setting up the Robotics BDS in the JPM after ULF-2 departure.

Also in preparation for the ULF-2 docked period, the CDR & FE-2 –

- Worked another ~3 hrs on hardware repacking for return to Earth,
- Spent ~30 min. in the US Airlock checking out two SAFER (Simplified Aid for EVA Rescue) units (#1004 & #1007) for the ULF-2 spacewalks, and
- Readied two sets of retention nets for installation in the JLP (intended to protect shell heaters in the empty rack bays by enclosing stowed cargo against the JLP Hard Dummy Panels during ULF2).

FE-1 Lonchakov had 4 hrs reserved for loading trash and other disposal cargo onto Progress 30P.

FE-2 Chamitoff conducted “Exp-18 Week 3” sampling of potable water for chemical and microbial analysis from the SVO-ZV tap and the SRV-K Warm tap, the latter after preliminary heating of the water (three heating cycles) and flushing.

[Gregory collected two 450 mL samples (for postflight microbial analysis), one 225 mL sample (for inflight microbial analysis) and two 750 mL samples (for postflight chemical analysis) from each of three ports (SRV-K hot, SRV-K warm, SVO-ZV) for return on STS-126/ULF2. The flush water, collected in three small waste water bags, was then reclaimed for technical use. For the in-flight chemistry/microbiology analysis, Greg used MCDs (microbial capture devices) from the U.S. WMK (water microbiology kit) for treatment/processing after no more than 6 hours of the collection (done ~12:25pm EST). Sample analysis included subsequent processing of water samples in the MWAK (microbial water analysis kit) for inflight coliform bacteria (Escherichia coli) detection (done ~12:45pm). Results of the on-board processing will be available after a two-day incubation period, in case of the MWAK after 4-6 days of incubation.]

CDR Fincke worked on the WDS (Water Distribution System) in the US Lab, tearing it down to make room for the upcoming installation of new ECLSS (Environment Control & Life Support Systems) racks arriving on ULF-2.

For the purpose of testing the main TORU (Teleoperator Control System) receiver on the mated Progress M-65/30P, CDR Fincke & FE-1 Lonchakov worked with ground specialists via VHF on DO15 (Daily Orbit 15, VHF coverage 11:38-11:47am) on the standard vehicle-to-vehicle TORU checkout between the Service Module (SM) and the Progress 30P cargo ship docked at the SM aft port. TORU was activated on 11:10am. Progress thrusters (DPO) were inhibited and not involved.

[Crew activities focused on TORU activation, inputting commands via the RUO Rotational Hand Controller and close-out ops. TORU lets an SM-based crewmember perform the approach and docking of automated Progress vehicles in case of failure of the automated KURS system. Receiving a video image of the approaching ISS, as seen from a Progress-mounted docking television camera (“Klest”), on a color monitor (“Simvol-Ts”, i.e. “symbol center”) which also displays

an overlay of rendezvous data from the onboard digital computer, the crewmember steers the Progress to mechanical contact by means of two hand controllers, one for rotation (RUO), the other for translation (RUD), on adjustable armrests. The controller-generated commands are transmitted from the SM's TORU control panel to the Progress via VHF radio. In addition to the Simvol-Ts color monitor, range, range rate (approach velocity) and relative angular position data are displayed on the "Klest-M" video monitor (VKU) which starts picking up signals from Progress when it is still approximately 7 km away. TORU is monitored in real time from TsUP over Russian ground sites (RGS) and via Ku-band from Houston, but its control cannot be taken over from the ground. Progress M-66/31P and all subsequent vehicles which carry more advanced avionics equipment, will require new TORU procedures.]

In the SM, Yuri performed the routine daily servicing of the SOZh system (ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

The FE-1 also conducted the daily IMS (Inventory Management System) maintenance, updating/editing the standard IMS "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Gregory again had a one-hour period to himself for the regular crew departure preparations, working on the standard end-of-increment cleanup preparatory to his return to Earth later this month. *[It is usual for crewmembers to be granted reduced workdays for making their departure preparations, as their return date approaches.]*

The FE-2 also completed another one of the periodic inspections of the RED (Resistive Exercise Device) canister cords and accessories, currently done every two weeks.

The crew had their periodic PMCs (Private Medical Conferences) via S- & Ku-band audio/video, Greg at ~10:30am, Mike at ~11:15am, and Yuri at ~ 12:35pm EST.

The station residents conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

At ~2:30pm EST, Yuri Lonchakov headed the crew in supporting a live PAO TV downlink with messages of greetings for two events: (1) the Russian Youth Aerospace Association "Soyuz", celebrating its 20th Anniversary on 11/14 at MSTU (N.E. Bauman Moscow State Technical University), and (2) RTTV channel "Russia Today" which will have an extensive coverage of the 10th Anniversary of the first ISS module launch and will air the ISS interview on 11/20. [*"...Congratulations on the 20th Anniversary of the Russian Youth Aerospace "Soyuz" Association! We are very pleased to take part in this festivity. We salute our young people – future cosmonauts, designers, engineers. Guys, remember, you are the ones who will have to conquer the space, explore planets, and lead the way to the stars....".* (Note: Seven new cosmonaut candidates currently in training are Soyuz Association graduates).]

CEO photo targets uplinked for today were **Lakes, Bolivian Andes** (*climates of the central Andes change rapidly from wet tropical to arid subtropical. Lakes reflect these climates exactly: Lake Titicaca in the north is a permanent freshwater lake; Lake Poopo is brackish and sometimes dries up completely during El Niño events; and Salar Uyuni is almost always dry, its salt floor appearing bright white from low Earth orbit, the crew's prime visual cue [salar is a dry lake with a salt bed].*

Between El Niño events [as now] Uyuni floods over part of its surface to a few feet in depth and Lake Poopo usually expands [a trend opposite to the heavy rains and floods of the Pacific coastline during El Niño events]; general views were requested looking right of track to document the present water levels of Salar Uyuni and Lake Poopo; during the ice ages of the recent geologic past, the entire Uyuni–Poopo basin was repeatedly turned into a single permanent lake as the atmospheric circulation settled into a different equilibrium state. The last permanent lake [17,000 years ago] was as large as Lake Michigan, and the weight of its water is known to have depressed the land surface at the north end by 20–40 m. Future requests for photography will focus on shoreline details of the ancient lakes).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:55am EST [= epoch]):

Mean altitude -- 351.6 km

Apogee height -- 354.1 km

Perigee height -- 349.1 km

Period -- 91.57 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0003679

Solar Beta Angle -- 29.0 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 90 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57172

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

11/14/08 -- STS-126/Endeavour/ULF-2 launch – MPLM Leonardo, LMC, PSSC;
(7:55pm EST)

11/14/08 -- Progress M-65/30P undocking

11/16/08 -- STS-126/Endeavour/ULF-2 docking; ~4:56pm

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch (nom.)

11/27/08 -- STS-126/Endeavour/ULF-2 undocking; 10:32am

11/29/08 -- STS-126/Endeavour/ULF-2 landing; ~2:01 pm

11/30/08 -- Progress M-66/31P docking (nom.) – DC1 Nadir

12/18/08 -- Russian EVA-21

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking

02/26/09 -- STS-119/Discovery/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress M-67/32P undocking & deorbit

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/25/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

07/30/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation

10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A – MPLM(P)

04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1 (contingency)

05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 11/10/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 3 of Increment 18.*

CDR Fincke ended his FD30 (Flight Day 30) session with the NASA/JSC experiment NUTRITION w/Repository, his second, by collecting a final urine sample upon wakeup for storage in the MELFI (Minus-Eighty Laboratory Freezer for ISS). The sampling kit was then stowed away. Mike's next activity with this experiment will be the FD60 session. *[The current NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

The CDR, FE-1 Lonchakov & FE-2 Chamitoff began their workday before breakfast with the periodic session of the Russian biomedical routine assessment PZeh-MO-7/Calf Volume Measurement. *[Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference points, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures.]*

Fincke worked on the SM ASU (Service Module Toilet System), performing the monthly 30-min. maintenance/servicing of the facility by changing out replaceable ASU parts with new components, i.e., the urine receptacle (MP) and a filter insert (F-V). The old parts were discarded as trash.

Afterwards, Mike closed out the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) payload by removing the CSI-02 (CGBA Science Insert #2) hardware from it for return to Earth. The CDR also accessed CGBA-4, retrieving the CSI-01

stowage bag and packing the SHERE FM (Shear History Extensional Rheology Experiment Fluid Module) stowage tray for return on ULF-2.

Lonchakov conducted a 3-hr. task of servicing the RASTENIYA-1 (Plants-1) MIS LADA payload, moistening the substrate and discussing the experiment with a ground specialist. *[Rasteniya-1 researches growth and development of plants under spaceflight conditions in the LADA-14 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). The payload hardware includes a module (MIS/Module for the Investigation of Substrates), the MIS control unit (BU), a nitrogen purge unit (BPA) and other accessories. During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. LADA consists of a wall-mounted growth chamber that provides long-term, ready access for crewmember interaction. It provides light and root zone control but relies on the cabin environmental control systems for humidity, gas composition, and temperature control. Cabin air is pulled into the leaf chamber, flows over the plants and vents through the light bank to provide both plant gas exchange and light bank cooling.]*

In ESA's COL (Columbus Orbital Laboratory), Chamitoff removed the ERNObox payload from its location (at COL102) and re-installed it at a different location (COL Port Cone aft/module side). *[The ERNO (Entwicklungsring Nord) box contains various radiation devices, including LEON-2 CPU (Central Processing Unit) developed by ATMEL/France and ESA, new memory devices, large SRAM (Static Random Access Memory)-based FPGAs (Field-Programmable Gate Arrays), and MEMS (Microelectromechanical Systems) sensors. The radiation-hardened LEON-2 microprocessor chip is the first implementation of a LEON CPU-core in silicon, with SPARC compliance. SPARC (Scalable Processor Architecture), invented by Sun Microsystems Inc., is an open set of technical specifications that any person or company can license and use to develop microprocessors and other semiconductor devices based on published industry standards.]*

Afterwards, Gregory worked on the COL ventilation system, inspecting and cleaning the RGS (Return Grid Sensor Housing) on the PD Panel, module side.

Lonchakov used CWCs (Contingency Water Containers) #1069 & #1030 in the RS (Russian Segment) for the periodic (about twice a month) replenishing of the Elektron oxygen generator's water supply for electrolysis, filling the KOV thermal loops' EDV container. Once filled, the EDV was connected to the BPK transfer pump for processing. *[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they*

could cause Elektron shutdown.]

Yuri had another 3 hrs. reserved for a BITS2-12 (onboard telemetry measurement system) related job, deinstalling five electronic components from the PTsB Central Processor Subsystem (Monoblock TA968MA) which Sergey Volkov had removed & stowed on 9/24, then moving the box to the Lab for return on ULF-2. The activity was supported by ground specialist tagup. *[The removed components were stowed as spares except one of them (TA734 BPL 2A) which was returned to the excessed PTsB container. BITS is the primary telemetry downlink path for both FGB and SM parameters, designed to collect, record and transmit measurement data to the ground concerning the operation of all RS onboard systems, science hardware, and data concerning the crew's health status. BITS also processes and relays to the ground the digital data arrays formed by various science hardware and the BVS (Onboard Computer System). The TA968MA is the primary device that forms the BITS operating modes.]*

Mike Fincke undertook the periodic relocation of the TEPC (Tissue Equivalent Proportional Counter) detector assembly, the primary radiation measurement tool in the ISS, from the SM (Panel 338) to Node-2 (loc. PD3/2) and connected it to the UOP3 power outlet panel. *[TEPC had been relocated to the SM by Chamitoff on 9/30, after having been in the Kibo JPM (JEM Pressurized Module) from 8/24.]*

After reviewing 400 & 800mm-lens training imagery taken on 11/6 for the STS-126/ULF-2 Endeavour RPM (R-bar Pitch Maneuver) on 11/16, Fincke & Chamitoff tagged up with ground specialists to discuss the ground-analyzed photo/video imagery. *[The RPM drill prepares crewmembers for the bottom-side mapping of the Orbiter at the arrival of the Shuttle. During the RPM at ~600 ft from the station, the "shooters" have only ~90 seconds for taking high-resolution digital photographs of all tile areas and door seals on Endeavour, to be downlinked for launch debris assessment. Thus, time available for the shooting will be very limited, requiring great coordination between the two headset-equipped photographers and the Shuttle pilot.]*

Greg & Mike had about 4 hrs. between them for more hardware prepacking for ULF-2, using revised uplinked Prepack Lists as reference.

The CDR also spent about an hour loading disposal cargo & trash onto Progress M-65/30P.

Lonchakov meanwhile completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking & servicing the ASU toilet facilities, replacing the KTO & KBO solid waste containers, replacing of EDV-SV*

waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available. Tests of IP-1 air flow sensors, smoke detectors, time & synchronization etc. are also performed daily via SPP (Automated Onboard Sequencer) control.]

Working from his discretionary “as time permits” task list, Yuri also performed the regular daily job of IMS (Inventory Management System) “delta file” updating/editing for the weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

In the US Airlock (A/L), Fincke terminated the discharge of EMU (Extravehicular Mobility Unit) battery #2073 in BC4 (Battery Charger 4). In preparation for the STS-126 spacewalks, Mike then initiated recharge procedures on REBA (Rechargeable EVA Battery Assemblies), HL (Helmet Light), PGT (Pistol Grip Tool), and EMU (Extravehicular Mobility Unit) batteries in BC1/2/3/4 of the BSA (Battery Stowage Assembly). *[This is the first of two recharges required to prepare all EVA batteries for ULF-2. Today’s activity was also to confirm whether BC1 is still producing any sounds different from BCs 2-4 during power-up and charging. No unusual noise was heard, and BC1 was also used for charging.]*

Greg Chamitoff had a one-hour period to himself for the regular crew departure preparations, working on the standard end-of-increment cleanup preparatory to his return to Earth on 11/29. *[It is usual for crewmembers to be granted reduced workdays for making their departure preparations, as their return date approaches.]*

The station residents conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

At ~2:55am EST, CDR Fincke powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, & power supply) and conducted, at 3:00am, a ham radio exchange with Anderson's Creek Primary School, Warrandyte, Victoria, Australia. *[Anderson's Creek Primary School is situated 30 km NE of Melbourne and has over 340 students. It is nestled in a tranquil natural environment. The school is surrounded by native vegetation that invites parrots, galahs and the sound of laughing kookaburras. Its architectural design encourages cooperative teaching and is very much a community based school which places great importance on the partnership between parents and teachers. There is a strong emphasis on the use of information technology in the classrooms. Warrandyte is a small township of around 14,000 people, situated on the Yarra River and surrounded by beautiful State Parks. The town is known for its painters and potters. Gold mining played an important role in the establishment of*

Warrandyte. The very first payable gold for Victoria was discovered here in 1851, at Anderson's Creek, which runs behind the school. This is why the school logo is a poppet head. Questions to Mike were uplinked beforehand. "What is your latest discovery?"; "Do your five senses work as well in space?"; "Is everything slower, or faster, in space?"; "Is your speech affected in space?"; "How many people are with you? Do you get on each others nerves?"; "What happens if you need to wear glasses in space?"; "Would a thermometer work in space?"; "How does a space ship move in space when there are no particles to push against?"; "When you exercise, do you lose the same amount of fat as you would on earth?"; "What time zone do you use? Is there special space time?"; "Have you been hit by a meteor? What happens if you are?"]

At ~2:35pm, Mike Fincke had a CDE (Crew Discretionary Conference) via Ku-band/video and S-band/audio.

Progress Propellant Purge: Preparatory to the Progress 30P departure on 11/14, TsUP-Moscow conducted the standard propellant line purge on the TM-65 cargo spacecraft's fuel (12:48pm) and oxidizer lines (2:21pm). For the events, ISS attitude control authority was handed over to RS thrusters at 12:30pm, to be returned to US Momentum Management at ~2:55pm. For the thruster firings, Gregory verified closure of the protective window shutters in the Lab and JPM.

Lighting Maintenance: Over the weekend, the crew restored function to GLAs (General Luminaire Assemblies) in the A/L and JLP (JEM Logistics Pressurized Segment). [A BBA (Baseplate Ballast Assembly) was relocated from the Lab (loc.10S6) to replace a failed BBA in the A/L (loc.10A1). Since there are no spare BBAs on orbit, additional BBAs will be scavenged from MPLM (Multi-Purpose Logistics Module) Leonardo on ULF-2. Three LHAs (Lamp Housing Assemblies) that had been removed from ATV "Jules Verne" were used to replace three failed LHAs in the JLP.]

No CEO photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:30am EST [= epoch]):

Mean altitude -- 351.7 km

Apogee height -- 354.1 km

Perigee height -- 349.3 km

Period -- 91.57 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0003585

Solar Beta Angle -- 26.7 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 105 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57156

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

11/14/08 -- STS-126/Endeavour/ULF-2 launch – MPLM Leonardo, LMC, PSSC;
(7:55pm EST)

11/14/08 -- Progress M-65/30P undocking

11/16/08 -- STS-126/Endeavour/ULF-2 docking; ~4:56pm

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch (nom.)

11/27/08 -- STS-126/Endeavour/ULF-2 undocking; 10:32am

11/29/08 -- STS-126/Endeavour/ULF-2 landing; ~2:01 pm

11/30/08 -- Progress M-66/31P docking (nom.) – DC1 Nadir

12/18/08 -- Russian EVA-21

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking

02/26/09 -- STS-119/Discovery/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress M-67/32P undocking & deorbit

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/25/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

07/30/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation

10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A – MPLM(P)

04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1 (contingency)

05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 11/09/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – rest day for CDR Fincke, FE-1 Lonchakov, FE-2 Chamitoff. Ahead: Week 3 of Increment 18.*

After wakeup (1:00am EST), FE-2 Chamitoff again downloaded the accumulated data of the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment from his Actiwatch to the HRF-1 (Human Research Facility 1) laptop as part of his final week-long session with SLEEP. *[To monitor the crewmember's sleep/wake patterns and light exposure, Greg wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition and uses the payload software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list. This is Week 3 of 3 for the FE-2.]*

CDR Fincke's first activity this morning was to start on his Flight Day 30 session with the NASA/JSC experiment NUTRITION w/Repository. This was an all-day session, the second for Mike, of collecting urine samples several times for 24 hrs, to continue through first void tomorrow morning. *[After performing phlebotomy with the help of FE-2 Chamitoff, i.e., drawing blood samples (from an arm vein), the samples were first allowed to coagulate in the Repository for 20-30 minutes, then spun in the HRF RC (Human Research Facility/Refrigerated Centrifuge) and finally placed in MELFI (Minus-Eighty Laboratory Freezer for ISS). No thruster activity was allowed during the blood drawing. The RC was later powered off after a temperature reset to limit wear on the compressor, and cleaned. The NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by*

supercold MELFI dewars), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]

For FE-1 Lonchakov it was time again for recharging the Motorola Iridium-9505A satellite phone brought up on Soyuz 17S, a monthly routine job and his second time. *[After retrieving it from its location in the TMA-13/17S Descent Module (BO), Yuri initiated the recharge of its lithium-ion battery, monitoring the process every 10-15 minutes as it took place. Upon completion at ~10:15am EST, the phone was returned inside its SSSP Iridium kit and stowed back in the BO's operational data files (ODF) container. The satphone accompanies returning ISS crews on Soyuz reentry & landing for contingency communications with SAR (Search-and-Rescue) personnel after touchdown (e.g., after an "undershoot" ballistic reentry, as happened during the recent 15S return). The Russian-developed procedure for the monthly recharging has been approved jointly by safety officials. During the procedure, the phone is left in its fire-protective fluoroplastic bag with open flap. The Iridium 9505A satphone uses the Iridium constellation of low-Earth orbit satellites to relay the landed Soyuz capsule's GPS (Global Positioning System) coordinates to helicopter-borne recovery crews. The older Iridium-9505 phones were first put onboard Soyuz in August 2003. The newer 9505A phone, currently in use, delivers 30 hours of standby time and three hours of talk, up from 20 and two hours, respectively, on the older units.]*

Yuri also performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP-Moscow. Additionally, the FE-1 today checked up on the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem, gathering weekly data on total operating time & "On" durations for reporting to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

The crew had their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop), Yuri at ~4:45am EST, Greg at ~10:50am, Mike at ~2:30pm.

The station residents conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Working off the Russian discretionary "if time permits" task list, Lonchakov performed a session of the DZZ-2 "Diatomeya" ocean observations program, using the NIKON-F5 DCS still camera and the HDV (high-definition) video camcorder from SM window 8 for ~20 min to record water areas with highly pronounced color contrast blooms, including coral reef lagoons, optically irregular cloud patterns along the flight path. *[Target zones today in the Atlantic & Indian Ocean were the geographic location over the underwater Mid-Atlantic Ridge and the area SW of Australia, in the Pacific Ocean the areas SW of Mexico to the coast of Chile, and S of Hawaii to the Chile coast.]*

Also off the work suggestions list, the FE-1 conducted another session for Russia's Environmental Safety Agency (EKON), making observations and taking KPT-3 aerial photography of environmental conditions on earth using the Nikon D2X with the SIGMA 300-800mm telephoto lens.

A new US "job jar" task list item for Mike & Greg called for checking for crystals in samples 8, 9, and 10 of the BCAT-4 (Binodal Colloidal Aggregation Test - 4: Polydispersion) experiment and photographing them if found, followed by homogenizing sample 3. *[BCAT-4-Poly uses the micro-G environment and a colloid-polymer mixture as a test bed to study how particles in a homogenous mixture become ordered to form crystals, without the masking effects of gravitational sedimentation. It is hoped that observations of samples will provide insight about how the particle interactions, polydispersity and sedimentation affect phase changes, as well as questions about the relative packing fractions, and which crystallization phase is manifested. The samples are being photographed using the EarthKAM camera; one sample (#3) is being photographed for a 6 day period. The remaining three samples will be photographed if crystals form.]*

Also off the voluntary task list, Fincke & Chamitoff were to conduct an audit of two CTBs (Cargo Transfer Bags) for hardware required for the upcoming setup operations of the JEM Robotics BDS (Backup Drive System).

No CEO photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:10am EST [= epoch]):

Mean altitude -- 351.8 km

Apogee height -- 354.2 km

Perigee height -- 349.3 km

Period -- 91.57 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0003657
Solar Beta Angle -- 24.0 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.72
Mean altitude loss in the last 48 hours -- 74 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 57140

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

11/14/08 -- STS-126/Endeavour/ULF-2 launch – MPLM Leonardo, LMC, PSSC;
(7:55pm EST)
11/14/08 -- Progress M-65/30P undocking
11/16/08 -- STS-126/Endeavour/ULF-2 docking; ~4:56pm
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch (nom.)
11/27/08 -- STS-126/Endeavour/ULF-2 undocking; 10:32am
11/29/08 -- STS-126/Endeavour/ULF-2 landing; ~2:01 pm
11/30/08 -- Progress M-66/31P docking (nom.) – DC1 Nadir
12/18/08 -- Russian EVA-21
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

07/30/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1 (contingency)
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 11/08/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – light-duty day for CDR Fincke, FE-1 Lonchakov & FE-2 Chamitoff.*

After wakeup (1:00am EST), FE-2 Chamitoff again downloaded the accumulated data of the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment from his Actiwatch to the HRF-1 (Human Research Facility 1) laptop as part of his final week-long session with SLEEP. *[To monitor the crewmember's sleep/wake patterns and light exposure, Greg wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition and uses the payload software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list. This is Week 3 of 3 for the FE-2.]*

Yuri Lonchakov performed the periodic maintenance of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #2 of the regenerable dual-channel filtration system. The process will be terminated at ~4:00pm EDT. Bed #1 regeneration was performed yesterday (see note on False Fire Warning below). *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently (last time: 9/29 & 9/30).]*

The crew performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the SM (Service Module) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises.*

Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]

As part of the house cleaning, Yuri Lonchakov conducted regular maintenance inspection & cleaning on fan screens in the FGB (TsV2) and DC-1 (V3).

In the FGB (*Funktsionalnyi-Grusovoi Blok*, Functional Cargo Block), Lonchakov and CDR Fincke closed out the extensive IFM (Inflight Maintenance) on the "Komparus" Command Measurement System (KIS), running final tests and cleaning up by stowing equipment & removed components in the FGB. *[Komparus maintains the FGB internal clock, stores time-tagged program commands for sequenced execution, activates & deactivates the dual-redundant radio telemetry system, measures FGB relative motion, and receives and routes USOS (US Orbital Segment) commands to be sent to the Node MDMs (Multiplexer/Demultiplexers).]*

Mike Fincke set up the NUTRITION with Repository hardware for his second session (FD30), starting tomorrow with blood draw and urine collections. The protocol requires Mike to begin the usual 8-hr fast tonight by 7:00pm EST, i.e., no food or drink, but water consumption is highly encouraged to ensure proper hydration. *[Mike's 24-hour urine collect starts with the first void of the day tomorrow morning and continues through the first void Monday morning. The NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by supercold MELFI dewars), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

At ~9:05am the crewmembers conducted their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-Houston and TsUP-Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

For today's VolSci (Voluntary Weekend Science) program, FE-2 Chamitoff, with CDR Fincke assisting, had ~4 hrs on his timelines for another exciting range of tests of the SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellites) experiment which today used three satellites and five beacons. *[Today's run (Test Session 15), with ground team support, included the innovative use of "distributed computing" where the satellites perform low level path-following while high level path-determination happens in the crew's laptop, the*

ability of the crewmember to interactively tune his controller while testing in a micro-G environment, and the implementation in hardware of the crewmember's algorithm.]

Gregory completed the routine daily servicing of the SM's SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

The crew conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Working off the Russian discretionary "time permitting" task list, Lonchakov performed a session of the GFI-8 "Uragan" (hurricane) earth-imaging program, using the NIKON D2X digital camera to take 800mm-lens telephotos. *[Uplinked target zones were Darwin Island (one of the Galapagos Archipelago islands) and Patagonian Glaciers.]*

Also off the work suggestions list, the FE-1 conducted another session for Russia's Environmental Safety Agency (EKON), making observations and taking KPT-3 aerial photography of environmental conditions on earth using the Nikon D2X with the SIGMA 300-800mm telephoto lens.

A third task item from the Russian discretionary job list for Yuri was the regular service of the Russian BIO-5 Rasteniya-1 ("Plants-1") experiment, collecting initial data in the dry substrate for ~12 hrs, copying the data to a PCMCIA memory card for subsequent downlink via BSR-TM and OCA channels, plus filling the KDV water canister. *[Rasteniya-1 researches growth and development of plants under spaceflight conditions in the LADA-14 "greenhouse" from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). The payload hardware includes a module (MIS/ Module for the Investigation of Substrates), a MIS control unit (BU), a nitrogen purge unit (BPA) and other accessories. During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording.]*

SSRMS Walk-off: Yesterday, Robotics ground controllers released the SSRMS (Space Station Remote Manipulator System) from PDGF (Power & Data Grapple Fixture)-4 on the MBS (Mobile Base System) railcart and "walked" it the onto the

Node-2 PDGF. System performance was nominal. This completed the ULF-2 setup activities, and the double-grappled SSRMS is now in position for Flight ULF-2 docked operations, with its cameras stowed to protect them from thruster contamination during docking.

False Fire Event: Also yesterday, a (false) fire warning was enunciated in the SM associated with the on-going RS (Russian Segment) BITS2-12 Onboard Telemetry Measurement System testing of the BD1 (Database 1) mass memory unit. At test start, VD-SU (Data Output-Control System) mode was deactivated in an effort to prevent any erroneous messages from the BD1 when activated. At this time the BMP Micropurification Unit channel 1, being “baked out” for regeneration, had a temperature of 56 degC. Per software coding, when the temperature is more than 50 degC while VD-SU is off, a BMP-1 fire hazard warning is triggered. The crew was immediately informed of the false alarm via RGS (Russian Groundsite).

Weekly Science Update (*Expedition Eighteen -- Week 2*)

3-D SPACE: Planned.

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): Complete.

ANITA (Analyzing Interferometer for Ambient Air): Continuing.

BCAT-3/4 (Binary Colloidal Alloy Test 3/4): BCAT-4 operations were initiated on 11/1. Samples 8, 9, and 10 were homogenized for long-term crystal observations. Sample 3 was homogenized and the images are being analyzed on the ground at Harvard University. “So far, sample 3 image quality has been fantastic! In addition, Thank You for taking initiative to collect GNC vector data to help us understand the microgravity forces imposed on the BCAT module.”

BIO-4: Complete.

CARDIOCOG-2: Complete.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): In progress. For the next CCISS session, Mike will be using a newly refurbished unit that will arrive on ULF-2.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System): Samples returned on 1J.

CSI-2/CGBA-5 (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus 5): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): Due to safety concerns identified for the PLEGPAY instrument when operated in Plasma Discharge mode, the entire EuTEF platform had to be put in survival mode on 9/1. Since then, the EuTEF power feeder#1 is de-activated and no science acquisition is possible. Request has been approved at IMMT for intermittent activation for 3 of the 9 EUTEF payloads. This only mitigated the science loss for the EXPOSE, DOSTEL and MEDET instruments. The situation implies significant loss of science return for all EUTEF payloads. On 10/30, the ground commanding activity to erase the software instructions of the so-called "Experiment 1" (Plasma Generation) from the memory of PLEGPAY was performed nominally. A full memory dump of PLEGPAY instrument was performed and the ground teams analyzed the outcome of the memory deletion. The EuTEF platform was permanently activated on 11/5.-- DEBIE-2: 24-hrs science script ran starting on 11/5;-- DOSTEL: On-going science acquisition;-- EuTEMP: Currently inactive as planned;-- EVC: Currently no picture taking;-- EXPOSE: On-going science acquisition;-- FIPEX: Science script started on 11/6;-- MEDET: On-going science acquisition; -- PLEGPAY: Inactive, "Experiment 1" memory has been erased on 10/30. Plasma generation capability has been disabled;-- TRIBOLAB: In thermal stabilization mode, Ball Bearing #4 experiment planned to be started on 11/6.

FSL (Fluid Science Laboratory): FSL is nominal.

GEOFLOW: The EC (Experiment Container) has been successfully installed back into the FSL (Fluid Science Laboratory) drawer. ESA is planning to resume the GEOFLOW science runs after ULF-2 mission and 30P undocking & 31P docking.

HDTV System Test DL (JAXA): Complete.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): In progress.

Marangoni Experiment for ISS in JAXA FPEF (Fluid Physics Experiment Facility):
In progress.

Micro-G Clay (JAXA EPO): Complete.

MISSE (Materials ISS Experiment): Ongoing.

Moon Photography from ISS (JAXA EPO): Complete.

MOP (Motion Perception in Zero-G): Planned for STS-126.

MSG-SAME (Microgravity Science Glovebox): Complete.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MUSCLE-G (LBP/Low Back Pain): Complete.

NOA-1/-2 (Nitric Oxide Analyzer, ESA): Complete.

NUTRITION w/REPOSITORY: "Mike, thanks for the great catch on the RC spin settings during your FD15 session. The PI really appreciated your attentiveness and awesome communication! Your next session will be your FD30."

PADLES (Passive Dosimeter for Lifescience Experiment in Space): In progress.

PCRF (Protein Crystallization Research Facility) Reconfiguration (JAXA):
Complete.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems):
Ongoing.

SAMPLE: Complete.

SHERE (Shear History Extensional Rheology Experiment): Complete.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): In progress

SOLAR (Solar Monitoring Observatory): The present Sun visibility window has started on 10/27, but due to high ISS yaw angle, SOLAR only started to track the Sun on 10/29 early morning. On 11/03, 3 Criss-Cross measurements have been successfully performed. On 11/04 a problem with the telemetry caused a sun tracking interruption. Some anomalies are currently being worked for SOLACES and SOVIM instruments. The current Sun observation window is planned to end on 11/09.-- SOVIM: no science acquisition, non-nominal mode: instrument power consumption was much lower than expected in nominal mode. For the time being it is powered off as the ground teams are working out a recovery plan, to be performed after the current Sun observation window.-- SOLSPEC: daily science acquisition - nominal;-- SOLACES: problem of synchronization of the instrument microcontrollers, some work-around procedures are being implemented since the start of the Sun observation window.

SOLO (Sodium Loading in Microgravity): Complete.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite):
Reserve.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels):
Complete.

CEO (Crew Earth Observations): Through 11/5 the ground has received a total of 2,074 frames of CEO images for review and cataloging. "Thanks for your excellent response to our target requests. Photos with times corresponding to our CEO

target request times are reviewed first and since our last report included: Cairo, Egypt (35 frames in a dual camera session – target confirmed – under review – sorry about the clouds); Wetumpka Impact Crater, Alabama (5 frames under review); Caracas, Venezuela, (29 frames under review); Central Arizona-Phoenix (32 frames – target confirmed – under review); Amazon River Delta (35 frames – target confirmed – more clouds than we had hoped); South Tibesti Megafans (52 frames – under review); Vredefort Impact Crater, South Africa (15 frames – target confirmed– soft focus – under review); South Georgia Island – 15 frames – target confirmed – and icebergs too); Patagonian Glaciers (17 frames – target not acquired); Arkenu (28 frames – target not acquired); Antarctic Ice Pack (20 frames – target confirmed – bergs and landmass too); Luquillo Forest (42 frames – target confirmed – under review). Glad to hear you are pumped, so are we! We are now holding off on our long-lens requests until we hear that the focus issues you described are resolved to your satisfaction. Your excellent imagery of the Arkenu impacts, from the first attempt, will be published on NASA/GSFC's Earth Observatory website this weekend. Great work!"

CEO photo targets uplinked for today were **Bosumtwi Impact Crater** (*this well-marked impact crater is located about 150 km west of the south end of Lake Volta in south central Ghana. It is a very young impact [just over a million years old], about 10.5 km in diameter, and almost completely filled by a lake. There are only a few images of this crater in the CEO database because the area is usually cloud and/or haze covered. On this partly cloudy, mid-morning pass, as ISS approached the coast from the NW, Mike & Greg were to find Lake Volta and look just right of track*), **Kerguelen Archipelago** (*this glaciated and volcanic archipelago is located in the far south Indian Ocean nearly 2,000 miles southeast of the island of Madagascar. Primary interest for monitoring is shots of the rarely photographed ice field and glaciers located on the western end of the main island. ISS approach was from the W in mid-afternoon illumination and at least partial clearing was expected. Trying for a nadir mapping pass with the 180mm lens*), **Heard Island, Australia** (*Heard Island is a bleak, uninhabited, and mountainous island located in the Southern Ocean; about two-thirds of the way from Madagascar to Antarctica. Its mountains are covered in glaciers and dominated by Mawson Peak, a 9,006 ft high complex volcano which forms part of the Big Ben massif. A long thin spit named "Elephant Spit" extends from the east of the island. ISS pass was in mid-afternoon light with weather satellite imagery suggesting partial clearing from the W. Looking well right of track and trying for oblique context views of this challenging target*), and **S. Georgia/S. Sandwich** (*the South Georgia Island is an arching, mountainous, and glaciated island that lies about 860 miles ESE of the Falkland Islands. The South Sandwich Islands form a separate island group and are to the SE. Only partial clearing was expected at the time of the ISS pass, but the crew was to try for a mapping pass of the north coast of South Georgia. The pass was in early afternoon, looking well right of track and looking also for large icebergs reported in*

the vicinity).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 4:54am EST [= epoch]):

Mean altitude -- 351.9 km

Apogee height -- 354.2 km

Perigee height -- 349.5 km

Period -- 91.58 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.000352

Solar Beta Angle -- 21.0 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 48 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57122

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

11/14/08 -- STS-126/Endeavour/ULF-2 launch – MPLM Leonardo, LMC, PSSC;
(7:55pm EST)

11/14/08 -- Progress M-65/30P undocking

11/16/08 -- STS-126/Endeavour/ULF-2 docking; ~4:56pm

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch (nom.)

11/27/08 -- STS-126/Endeavour/ULF-2 undocking; 10:32am

11/29/08 -- STS-126/Endeavour/ULF-2 landing; ~2:01 pm

11/30/08 -- Progress M-66/31P docking (nom.) – DC1 Nadir

12/18/08 -- Russian EVA-21

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking

02/26/09 -- STS-119/Discovery/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress M-67/32P undocking & deorbit

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/25/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

07/30/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1 (contingency)
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 11/07/08

All ISS systems continue to function nominally, except those noted previously or below.

After wakeup, FE-2 Chamitoff again downloaded the accumulated data of the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment from his Actiwatchs to the HRF-1 (Human Research Facility 1) laptop as part of his final week-long session with SLEEP. *[To monitor the crewmember's sleep/wake patterns and light exposure, Greg wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition and uses the payload software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list. This is Week 3 of 3 for the FE-2.]*

FE-1 Lonchakov performed the periodic maintenance of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The process will be terminated at ~4:15pm EST and Bed #2 regeneration performed tomorrow. (Last time done: 10/18-19). *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently (last time: 9/29 & 9/30).]*

In the FGB (*Funktsionalnyi-Grusovoi Blok*, Functional Cargo Block), Lonchakov and CDR Fincke again spent several hours on the extensive IFM (Inflight Maintenance) on the "Komparus" Command Measurement System (KIS), removing and replacing boxes with electronic components & their cabling of the KIS system which acts as the communications portal of the Khrunichev-built FGB, receiving & forwarding ground commands addressed to onboard systems when the FGB is in view of a ground station, and serving other central functions. *[Today, Yuri & Mike retrieved*

new spare parts from behind stowage panels in the FGB, then removed & replaced three electronics containers (KR-MPA Radio Engineering box, KS1-MPA Main Control box #1, KD-MPA Integrator box), following up with closeout ops. Returning and stowing cargo items and tools are scheduled tomorrow. Background: Komparus maintains the FGB internal clock, stores time-tagged program commands for sequenced execution, activates & deactivates the dual-redundant radio telemetry system, measures FGB relative motion, and receives and routes USOS (US Orbital Segment) commands to be sent to the Node MDMs (Multiplexer/Demultiplexers).]

As has become standard operating procedure after deactivation/reactivation of the BITS2-12 onboard measurement telemetry system and VD-SU monitoring mode, Yuri performed a quick function verification of the relatively new SUBA Ethernet connection between the OpsLAN (Operations Local Area Network) and the BRI Smart Switch Router in the SM. *[The routine task uses the RSS1 laptop for a comm check with the RSC-E PingMaster application and for downloading BRI log files.]*

Afterwards, the FE-1 switched the Vozdukh CO₂ removal system from automatic mode to manual control.

Continuing the current round of the monthly preventive maintenance of RS (Russian segment) ventilation systems, FE-2 Chamitoff performed a 1h15m inspection and cleaning of Group A ventilator fans and grilles in the SM (Service Module).

Gregory also filled out the regular FFQ (Food Frequency Questionnaire), his 19th, on the MEC (Medical Equipment Computer). Mike Fincke's second FFQ session remains on the discretionary "job jar" task list. *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

In the COL (Columbus Orbital Laboratory), the FE-2 disconnected and removed the AmiA (Antimicrobial Applicator) module from the TCS (Thermal Control System) loop, an exacting 1-hr job, which he had installed yesterday. *[Running since yesterday, AmiA has introduced OPA (Ortho-phthalaldehyde), an antimicrobial agent, into the COL TCS coolant at the 1F3 Z-Panel. Prior to installation, Greg had*

purged the applicator to vacuum and conducted a leak check. AmiA was stowed for return, and a small amount of fluid was be drained from the module with a TCS Coolant Sampling Adapter into an ITCS Sample Port Flush Bag.]

Fincke & Chamitoff again worked in the US Airlock (A/L), clearing it of non-EVA related items, continued EVA tool configuration procedures and started EMU (Extravehicular Mobility Unit) battery maintenance charging on battery #2073 in BC (Battery Charger) 4. *[Discharge/recharge of the 16V-batteries takes about 12-15 hours. The full maintenance discharge, done manually in the early days of ISS ops, is handled automatically by an SSC (Station Support Computer) laptop equipped with a special DOS application which will terminate the process on 11/10.]*

Afterwards, Mike took a video camera into the A/L for filming a "tour" of its interior to be used for an early preparation of the STS-126 crew for their ULF-2 spacewalks, emphasizing EVA Tool & EMU Configurations, generic layout of METOX (Metal Oxide) canisters & batteries in the MO2 Bag, the mesh bag labeled "ULF2 EMU B/U (Pp)", and other view deemed important by the CDR.

The FE-2 performed the regular bi-weekly reboot of the SSC OCA Comm Router laptop.

The crew conducted their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Fincke completed the routine daily servicing of the SM's SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

As an addition to his voluntary task list for today, Yuri Lonchakov got the regular daily job of IMS (Inventory Management System) "delta file" updating/editing for the weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Greg had another 60-min reserved for hardware prepacking for STS-126/ULF-2, using as reference a revised uplinked Prepack List which reflects crew calldowns from the 11/3 ground specialist tagup.

At ~2:10am EST, CDR Fincke powered up the SM's amateur radio equipment

(Kenwood VHF transceiver with manual frequency selection, headset, & power supply) and conducted, at 2:15am, a ham radio exchange with the Dibrugarh University, Dibrugarh, India. *[Dibrugarh University, the easternmost University of India, was set up in 1965 under the provisions of the Dibrugarh University Act, 1965 enacted by the Assam Legislative Assembly. It is a teaching-cum-affiliating University with limited residential facilities. The University is situated at Rajabheta at a distance of about five kilometers to the south of the premier town of the Dibrugarh in the eastern part of Assam as well as India. Dibrugarh, a commercially and industrially advanced town in the entire north-eastern region, also enjoys a unique place in the fields of Art, Literature and Culture. The district of Dibrugarh is well known for its vast treasure of minerals (including oil and natural gas and coal), a flora and fauna and largest concentration of tea plantations. The diverse tribes with their distinct dialects, customs, traditions and culture form a polychromatic ethnic mosaic which makes this area a veritable paradise for the study of Anthropology and Sociology, beside Art and Culture. Questions to Mike were uplinked beforehand. "How do you feel in zero gravity?"; "Which part of the Earth and space do you find most beautiful?"; "Have you seen the mighty Brahmaputra?"; "How do you manage yourself out there? Are there any facilities for your entertainment?"; "How long do you sleep?"; "What is the mission behind your space tour?"; "How does it feel while escaping the gravity?"; "Have you found anything which could be beneficial to the world as a whole?"; "What kind of changes do you expect on your return to Earth?"; "How was your experience while voting for the presidential election?"]*

At ~4:15am, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~2:45pm, the ISS crew will have their regular weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. *[S/G-2 (Space-to-Ground 2) phone patch via SSC (Station Support Computer)]*.

New voluntary tasks added to the US "job jar" job list for Fincke are (a) documentary photography of panel and strap installations in the Kibo JPM (JEM Pressurized Module), (b) replacement of rack pivot fittings in JLP (JEM Logistics Pressurized Segment) and JPM, and (c) preparation of retention nets in Kibo for stowing ULF-2 delivered cargo items.

WRM Update: An updated WRM (Water Recovery Management) "cue card" was uplinked overnight for the crew's reference, updated with yesterday's water audit.

[The new card (18-0006B) lists 23 CWCs (~792.5 L total) for the four types of water identified on board: technical water (151.3 L, for Elektron electrolysis), potable water (573.6 L, incl. 174.6 L currently off-limit because of Wautersia

bacteria), condensate water (28.4 L), waste/EMU dump and other (39.2 L).

Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]

VolSci Look-ahead: For this weekend's VolSci (Voluntary Science) program, Mike & Greg were asked to consider additional BCAT (Binary Colloidal Alloy Test)-4 operations, including crystal checks on some samples (8, 9, 10), taking photos of any crystals found, and then homogenizing and photographing sample 1 which would have photos taken automatically once an hour for three days using the EarthKAM system.

CEO photo targets uplinked for today were **Kerguelen Archipelago** (*this glaciated and volcanic archipelago is located in the far south Indian Ocean nearly 2,000 miles southeast of the island of Madagascar. Primary interest for monitoring is shots of the rarely photographed ice field and glaciers located on the western end of the main island. ISS approach was from the W in mid-afternoon illumination and at least partial clearing was expected. Using the long lens settings for a detailed, mapping pass looking just left of track*), **Beni River dynamics, Bolivia** (*the Beni River breaks out of the Andes Mountains about 100 miles north-northeast of the capital city of La Paz to become the major drainage feature of northern Bolivia. It is a very dynamic meandering stream with numerous oxbow lakes and meander scars visible in its floodplain. The Beni's seasonal changes in course, along with the rapid evolution of its channels and meanders, makes it an ideal candidate for studying, understanding, and illustrating these erosional processes. On this mid-morning pass with just a few clouds expected, the crew had nadir views of a key segment of the river. Their approach was from the NW and the Beni flows generally northward. Using the long lens settings for a detailed mapping strip*), and **Patagonian Glaciers** (*best pass of the day for lighting of this target area was at nadir over the southernmost portion of the Southern Patagonian Ice Field. The crew should have had mid-afternoon light with an expected partial clearing. CEO already has numerous, excellent views of most of the beautiful, large glacier on the eastern flank of the Andes. This time Mike & Greg were to try for detailed views of the smaller, less-well photographed ones on the western flank*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:53am EST [= epoch]):

Mean altitude -- 351.9 km

Apogee height -- 354.3 km

Perigee height -- 349.5 km

Period -- 91.58 min.

Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0003549
Solar Beta Angle -- 17.6 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.72
Mean altitude loss in the last 48 hours -- 53 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 57109

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

11/14/08 -- STS-126/Endeavour/ULF-2 launch – MPLM Leonardo, LMC, PSSC;
(7:55pm EST)

ISS On-Orbit Status 11/06/08

All ISS systems continue to function nominally, except those noted previously or below. *Uplink to crew from MCC-H Flight Control: "Excellent job on the SSRMS Ops and Komparus repair. You guys make it look easy!" (Which it isn't).*

After wakeup, FE-2 Chamitoff again downloaded the accumulated data of the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment from his Actiwatch to the HRF-1 (Human Research Facility 1) laptop as part of his final week-long session with SLEEP. *[To monitor the crewmember's sleep/wake patterns and light exposure, Greg wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition and uses the payload software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list. This is Week 3 of 3 for the FE-2.]*

In the FGB (Functional Cargo Block), FE-1 Lonchakov, in part assisted by CDR Fincke, continued the extensive IFM (Inflight Maintenance) work on the "Komparus" Command Measurement System (KIS), removing and replacing boxes with electronic components & their cabling of the system which acts as the communications portal of the Khrunichev-built FGB, receiving & forwarding ground commands addressed to onboard systems when the FGB is in view of a ground station, and serving other central functions. *[Komparus maintains the FGB internal clock, stores time-tagged program commands for sequenced execution, activates & deactivates the dual-redundant radio telemetry system, measures FGB relative motion, and receives and routes USOS (US Orbital Segment) commands to be sent to the Node MDMs (Multiplexer/Demultiplexers).]*

In the COL (Columbus Orbital Laboratory), FE-2 Chamitoff successfully installed an AmiA (Antimicrobial Applicator) module in the TCS (Thermal Control System) loop, an exacting 2-hr job. *[Running for a minimum of six hours, AmiA is introducing*

OPA (Ortho-phthalaldehyde), an antimicrobial agent, into the COL TCS coolant at the 1F3 Z-Panel. Prior to installation, Greg purged the applicator to vacuum and conducted a leak check. Later, AmiA will be removed and stowed for return, and a small amount of fluid will; be drained from AmiA with a TCS Coolant Sampling Adapter.]

CDR Fincke meanwhile verified the stowage location of an empty OGS PWR (Oxygen Generation System/Payload Water Reservoir, #2003) to be used for ULF-2 activities. *[The PWR was disconnected and stowed away several weeks ago.]*

Afterwards, Fincke completed the weekly 10-min. CWC (Contingency Water Container) inventory as part of on-going WRM (Water Recovery & Management) assessment of onboard water supplies. Updated "cue cards" based on the crew's water calldowns are sent up every other week. *[The new card (18-0006A), to be updated with today's data, lists 25 CWCs (~794.5 L total) for the four types of water identified on board: technical water (153.3 L, for Elektron electrolysis), potable water (573.6 L, incl. 174.6 L currently off-limit because of Wautersia bacteria), condensate water (28.4 L), waste/EMU dump and other (39.2 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]*

Mike also spent some time on locating and verifying availability of rack pivot pins required during the ULF-2 docked period for MPLM (Multi-Purpose Logistics Module) transfer operations.

In the SM (Service Module), FE-1 Lonchakov serviced the new Russian BIO-5 Rasteniya-1 ("Plants-1") experiment by upgrading its MIS-LADA control unit (BU), i. e., uninstalling its old software and loading it with a new program version.

[Rasteniya-1 researches growth and development of plants under spaceflight conditions in the LADA-14 "greenhouse" from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). The payload hardware includes a module (MIS/Module for the Investigation of Substrates), the MIS control unit (BU), a nitrogen purge unit (BPA) and other accessories. During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording.]

In preparation for another RPM (R-bar Pitch Maneuver) training session, Mike Fincke gathered and powered down the four D2Xs digital cameras, as required for the regular "blank image" checkout which he performed some time later (after a minimum of 30 mins.) by taking blank images, storing them on a PCMCIA (Portable Computer Memory Card International Adapter) flash memory card and later downlinking them to MCC-Houston for analysis. *[Blank images are used to identify*

“dead” pixels for each camera.]

Afterwards, Mike & Greg performed their third standard 30-min Shuttle RPM skill training, using the D2X digital still cameras with 400 & 800mm lenses to take in-cabin target imagery using a Shuttle cutout. Afterwards, the obtained OBT (onboard training) images were downlinked to the ground for analysis (~12:25pm EST). *[The RPM drill prepares crewmembers for the bottom-side mapping of the Orbiter at the arrival of the Shuttle (STS-124/1J) on 6/2. During the RPM at ~600 ft from the station, the “shooters” have only ~90 seconds for taking high-resolution digital photographs of all tile areas and door seals on Discovery, to be downlinked for launch debris assessment. Thus, time available for the shooting will be very limited, requiring great coordination between the two headset-equipped photographers and the Shuttle pilot.]*

Working in the US Airlock, Chamitoff & Fincke configured EVA tools, set up the CL (Crewlock) and readied the large ORU (Orbit Replaceable Unit) bag and staging bags in preparation for the three ULF-2 mission EVAs. *[Overheard from Mike while reviewing EVA tools: “This looks like something you might fight a vampire with,” referring to a loop pin puller.]*

The FE-2 completed the once-a-month reboot of all active US PCS (Portable Computer System) laptops, along with recording their batteries’ state of charge for the ground.

Gregory had another 50-min reserved for hardware prepacking for STS-126/ULF-2, using as reference a revised uplinked Prepack List which reflects crew calldowns from the 11/3 ground specialist tagup.

The crew performed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Chamitoff completed the routine daily servicing of the SM’s SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

As an addition to his voluntary “job jar” task list for today, Greg also was assigned the regular daily job of IMS (Inventory Management System) “delta file” updating/editing for the regular weekly automated export/import to its three databases on the

ground (Houston, Moscow, Baikonur).

A second discretionary task list item was for Mike Fincke to fill out his second FFQ (Food Frequency Questionnaire) on the MEC (Medical Equipment Computer).

[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]

MT Translation: In preparation for ULF-2, the MT (Mobile Transporter), carrying the MCAS (Mobile Base System [MBS] Capture Attach System) with the ESP-3 (External Stowage Platform 3), was successfully trundled on the truss from WS (Work Site) 7 to WS 5 via ground commanding. For the translation, the RS thrusters were disabled from 8:40am – 11:50am due to loads constraints. Later, new mass properties, accounting for the MT dislocation, were uplinked.

TsVM Restart with Context: As a follow-on after the recent BITS2-12 Onboard Telemetry Measurement System repair & checkout, TsUP-Moscow has begun restarting the Russian TsVM Central Computer in the SM with context (i.e., with a new uplinked RSS communication program). The complex recovery of the BVS onboard computer system's control involves a large number of subsystems that need to be activated, reset, inhibited or updated. The Elektron oxygen generator remains off until later tonight, but represses with O₂ from Progress 30P tankage are being conducted as required.

CEO photo targets uplinked for today were **South Tibesti Megafans** (*ISS had a clear, mid-morning pass over this target located in northwestern Chad south of the Tibesti Mountains. Relict channels of an extensive megafan river system occupy a large area, probably dating from the last wet period in the Sahara Desert [~10, 000 years ago]. These channel networks appear to be good analogs for river-like lines on Mars. Overlapping images just left of track were requested. The relict stream beds are located on the light-toned flats below the dark volcanic slopes of the Tibesti Mountains*), **Vredefort Impact Crater** (*this large, ancient impact located in northern South Africa is about 300km in diameter and over 2 billion years old. On this fair-weather pass, in late-morning light, ISS approached the impact from the NW, and Mike & Greg were asked to shoot near nadir, using the long lens settings for mapping the arching ridge features marking the rim of the impact*), **Kerguelen** (*this glaciated and volcanic archipelago is*

*located in the far south Indian Ocean nearly 2,000 miles southeast of the island of Madagascar. Of primary interest is photography for monitoring of the rarely photographed ice field and glaciers located on the western end of the main island. The station's approach was from the W in mid-afternoon illumination and at least partial clearing was expected. Using the long lens settings for a detailed, near-nadir mapping pass), **S. Georgia/S. Sandwich** (the South Georgia Island is an arching, mountainous and glaciated island that lies about 860 miles east-southeast of the Falkland Islands. The South Sandwich Islands form a separate island group and are to the SE. Only partial clearing was expected at the time of the overpass, but Mike & Greg were to try for detailed views of the glaciers on the north coast of South Georgia), and **Coral reefs, American Samoa** (although much of this target area is to the right of track, the crew appeared to have an excellent late morning pass with only a few clouds. It should have provided nadir views of the islands of Western Samoa and Apia. Using the long lens settings and try to map in detail the beautiful fringing reef structures of these South Pacific islands).*

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:30am EST [= epoch]):

Mean altitude -- 352.0 km

Apogee height -- 354.3 km

Perigee height -- 349.7 km

Period -- 91.58 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.000344

Solar Beta Angle -- 14.0 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 48 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57093

Significant Events Ahead (all dates Eastern Time, some changes possible.):

11/14/08 -- STS-126/Endeavour/ULF-2 launch – MPLM Leonardo, LMC, PSSC;
7:55pm EST

11/14/08 -- Progress M-65/30P undocking

11/16/08 -- STS-126/Endeavour/ULF-2 docking; ~4:56pm

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch (nom.)

11/27/08 -- STS-126/Endeavour/ULF-2 undocking; 10:32am

11/29/08 -- STS-126/Endeavour/ULF-2 landing; ~2:01 pm

11/30/08 -- Progress M-66/31P docking (nom.)
12/18/08 -- Russian EVA-21
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

07/30/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1 (contingency)
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 11/05/08

All ISS systems continue to function nominally, except those noted previously or below.

After wakeup, FE-2 Chamitoff again downloaded the accumulated data of the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment from his Actiwatchs to the HRF-1 (Human Research Facility 1) laptop as part of his final week-long session with SLEEP. *[To monitor the crewmember's sleep/wake patterns and light exposure, Greg wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition and uses the payload software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list. This is Week 3 of 3 for the FE-2.]*

In the FGB (Functional Cargo Block), FE-1 Lonchakov continued the extensive IFM (Inflight Maintenance) work on the "Komparus" Command Measurement System (KIS), removing and replacing electronic components of the system which acts as the communications portal of the Khrunichev-built FGB, receiving & forwarding ground commands addressed to onboard systems when the FGB is in view of a ground station, and serving other central functions. *[Komparus maintains the FGB internal clock, stores time-tagged program commands for sequenced execution, activates & deactivates the dual-redundant radio telemetry system, measures FGB relative motion, and receives and routes USOS (US Orbital Segment) commands to be sent to the Node MDMs (Multiplexer/Demultiplexers).]*

FE-2 Chamitoff prepared for camera viewing of today's ESP-3 (External Stowage Platform 3) relocation with the SSRMS (Space Station Remote Manipulator System) by working in the Kibo JEM (Japanese Experiment Module) to set up and activate the JEMRMS PTU (Robotic Manipulator System/Pan & Tilt Unit) of the Elbow camera, reset the JEU (Joint Expedited Undocking) resolvers and power on the

EXT2 video camera.

After booting up the CUP RWS (Cupola Robotic Workstation) A31p laptop in the US Lab and starting the DOUG (Dynamic Onboard Ubiquitous Graphics) application to support the Robotics activities, the FE-2 & CDR used the SSRMS to relocate the ESP-3 from its permanent location on the zenith side of the P3 truss element to the MCAS (Mobile Base System [MBS] Common Attachment System) at WS5 (Worksite 5) on the truss for ULF2. *[On EVA-1 during the Shuttle-docked operations, the spacewalkers will transfer the NTA (Nitrogen Tank Assembly) on the ESP-3 to the Endeavour for return and stow the FHRC (Flex Hose Rotary Coupler), arriving on STS-126, on the ESP-3. Today's relocation consisted of grappling ESP-3 with the SSRMS, demating the UMA (Umbilical Mechanism Assembly), deploying the CLA (Capture Latch Assembly) with the CAS (Common Attach System) in Normal State, and mating the ESP-3. Afterwards, the CUP laptop was powered down, as were the JEMRMS systems, with the Elbow camera reconfigured in stowed position.]*

Yuri Lonchakov conducted monthly maintenance on the deactivated Russian IK0501 GA (Gas Analyzer) of the SOGS Pressure Control & Atmospheric Monitoring System by replacing its CO₂ filter assembly (BF) with a new unit from FGB stowage (done last: 9/25), then reactivating the unit. The old filter was discarded.

Using a vacuum cleaner with soft brush attachment, the FE-1 performed the periodic cleaning of the side panel fan grilles of the Russian LIV Video Complex voltage converter (UN941) behind SM (Service Module) panel 426.

With the RS (Russian Segment) Elektron-VM oxygen (O₂) generator powered down, Yuri purged its BZh Liquid Unit with nitrogen (N₂) at 0.65 kg/cm² via its KE3 & VN3 valves, a periodic safety measure.

Chamitoff completed the routine daily servicing of the SM's SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

Greg also conducted the periodic checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the passageways SM PrK (Service Module Transfer Compartment)–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, and FGB GA–

Node-1.

The regular daily IMS (Inventory Management System) maintenance task was added today to Yuri's discretionary "time permitting" job list, i.e., updating/editing the IMS standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The FE-2 had another hour reserved for hardware prepacking for STS-126/ULF2, using as reference a revised uplinked Prepack List which reflects crew calldowns from the 11/3 ground specialist tagup.

The crew performed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

At ~3:30pm EST, FE-2 Chamitoff's schedule calls for a teleconference via Ku-band with his replacement, Astronaut Sandy Magnus, due to arrive on ULF2 to be the new FE-2 for Expedition 18. *[Purpose of the 30-min tagup: to pass on Lessons Learned to the upcoming Increment crew, i.e., to begin the handover process prior to the arrival on orbit through Videocons and Data Exchanges between the current crew and the upcoming crew. These tagups normally start toward the end of the first month on orbit.]*

Acoustic Survey Issue: Yesterday's periodic acoustic measurement protocol was not completed nominally due to an issue with data recovery. Steps at resolving the recovery snag are underway, and CDR Fincke was asked to redo the measurement for one of the three static dosimeters, first setting it up early this morning, then recording its data and stowing it tonight, at least 12 hrs after the setup.

CEO photo targets uplinked for today were **Arkenu 1 and Arkenu 2 Impact Craters** (*Arkenu 1 & 2 are a rarely exposed double impact structure created by a 500 m diameter pair of asteroids. Located in the desert of southeastern Libya, Arkenu 1 is 6.8 km in diameter and Arkenu 2 is 10 km. Both have been dated as less than 140 million years old. ISS approach was from the NW under clear skies at mid-morning. First, looking ahead near nadir, Mike & Greg were to try to spot the large dark features of Arkenu and Auenat, and then look for the tiny, faint impacts just right of track. They recently acquired CEO's best-ever images with the 400mm lens settings on 10/21. This time, they were to try for them using the 800mm*), **Antarctic Ice Pack** (*as part of the ISS program's participation in the International Polar Year [IPY], CEO is attempting to monitor conditions of Antarctic Ice Pack, usually situated well right of track near the southernmost portion of the ISS orbit*

track. Weather satellite imagery loops today suggested the possibility of at least partial clearing in this area of the Southern Ocean. Mike & Greg had mid-afternoon light, to look for pack ice features well right of track towards the Antarctic coast), and Luquillo Forest, Puerto Rico (fair, mid-morning, just right of track, this Long Term Ecological Research Site [LTER] is located near the northeastern corner of the island of Puerto Rico. ISS pass was in mid-morning; hopefully with a minimum of cloud formations. As the station approached the Virgin Islands from the NW, Mike & Greg were to look for this forest site just right of track using the long lens settings for detail).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:01am EST [= epoch]):

Mean altitude -- 352.0 km

Apogee height -- 354.3 km

Perigee height -- 349.8 km

Period -- 91.58 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0003356

Solar Beta Angle -- 10.1 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 53 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57077

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

11/14/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC; 7:55pm EST

11/16/08 -- STS-126/Endeavour/ULF2 docking; ~4:56pm

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/27/08 -- STS-126/Endeavour/ULF2 undocking; 10:32am

11/29/08 -- STS-126/Endeavour/ULF2 landing; ~2:01 pm

11/30/08 -- Progress M-66/31P docking

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking

02/26/09 -- STS-119/Discovery/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

07/30/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1 (contingency)
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 11/04/08

All ISS systems continue to function nominally, except those noted previously or below.

Upon wakeup, CDR Fincke started the next part (3rd of 5) of the periodic acoustic measurement protocol by recording post-sleep data of the crew-worn acoustic dosimeters, later deploying the dosimeters statically (Part 4), one at the SM (Service Module) Central Post, one in Node-2 and the third in an empty rack bay in the COL (Columbus Orbital Laboratory) which is being considered as a future temporary sleep station. Later, at ~2:00pm EST, Fincke recorded the data taken by the three static dosimeters during the day (Part 5), and then stowed the dosimeters. *[Acoustic data must be taken twice per Increment, each time for the duration of the 16-hour crew workday.]*

Before morning inspection and breakfast, FE-1 Lonchakov terminated his second experiment session for the long-term Russian sleep study MBI-12/SONOKARD, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

FE-2 Chamitoff started his day by downloading the accumulated data of the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment from his Actiwatchs to the HRF-1 (Human Research Facility 1) laptop as part of his final week-long session with SLEEP. *[To monitor the crewmember's sleep/wake patterns and light exposure, Greg wears a special Actiwatch device which*

measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition and uses the payload software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list. This is Week 3 of 3 for the FE-2.]

In the SM, Lonchakov serviced the new Russian BIO-5 Rasteniya-1 ("Plants-1") experiment, copying initial data to a PCMCIA memory card for subsequent downlink via BSR-TM and OCA channels, plus filling the KDV water canister. *[Rasteniya-1 researches growth and development of plants under spaceflight conditions in the LADA-14 "greenhouse" from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). The payload hardware includes a module (MIS/Module for the Investigation of Substrates), a MIS control unit (BU), a nitrogen purge unit (BPA) and other accessories. During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording.]*

Chamitoff continued the new (monthly) round of periodic preventive maintenance of ventilation systems in the RS (Russian Segment), working in the FGB cleaning the ventilation screens of panels 201, 301 & 401.

Also in the FGB, the FE-1 made preparations for the subsequent R&R (removal and replacement) of Kompas components scheduled for the next few days (11/4-11/8), today first tagging up with ground specialists via S-band to discuss the activities, then setting up the work area and switching protective caps on a power outlet (148A). *["Kompas" is the FGB's communications portal. The Kompas (KIS) onboard radio command & measuring system activates and deactivates the FGB's radio telemetry system, with transmitters, commutators, external antennas, etc. of its two independently operating RTU-A and -B data telemetry subsystems.]*

In support of JAXA/Tsukuba operations in the Kibo module (uplinking new databases & downlinking log files after database test runs), Gregory connected a JEMRMS (JEM Robotic Manipulator System) power cable to a UOP (Utility Outlet Panel), then powered up and checked the JEMRMS BUC (Backup Controller). After the ground commanding was done, the FE-2 turned off the BUC and disconnected the power cable.

In preparation for tomorrow's scheduled ESP-3 (External Stowage Platform 3) relocation from the zenith side of the P3 truss element to the MCAS (Mobile Base System [MBS] Common Attachment System), Mike Fincke and Greg Chamitoff conducted the usual one-hour review of DOUG (Dynamic Onboard Ubiquitous

Graphics) software. *[The EBCS (External Berthing Camera System), which will be required for the ESP-3 relocation, was properly checked out by the ground on 9/8, with support by Volkov & Chamitoff.]*

In the Kibo JLP (JEM Logistics Pressurized Module), Greg replaced a damaged PBA (Portable Breathing Assembly) mask (with a broken comm piece) with a new PHA QDMA (Prebreathe Hose Assembly/Quick-Don Mask Assembly) from the spares kit. *[A new QDM will be transferred on ULF2 FD4 from the Endeavour to the PHA spares kit prior to the EVA Prebreathe.]*

Mike Fincke had ~1:45h set aside to work on the RED (Resistive Exercise Device), adjusting its spiral pulleys in order to increase canister loading and installing two external splines, including one found. Afterwards, the CDR performed the usual load re-calibration of the canisters. *[The calibration allows accurate execution of exercise protocol objectives. Upon receipt of the results of the calibration data, ground specialists review the data and, assuming favorable engineering analysis, give the crew a GO for their RED exercise session. Calibration of the load settings of the pulley cans is performed with an on-orbit calibration kit with a special calibration tool and steel handles. Downlink from Mike after the successful calibration: "Cheers!"]*

Mike & Greg had another 3:20h reserved for hardware prepacking for the STS-126/ULF2, using as reference a revised uplinked Prepack List which reflects crew calldowns from yesterday's tagup.

The CDR also conducted the routine daily servicing of the SOZh (ECLSS) system in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers, replacement of EDV-SV waste water and EDV-U urine containers and performing US condensate processing (transfer from CWC to EDV containers) if condensate is available.]*

Later, the FE-2 performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew had their periodic PMCs (Private Medical Conferences) via S- & Ku-band audio/video, Greg at ~10:10am, Mike at ~10:50am, and Yuri at ~ 11:40am EST.

FE-1 Lonchakov again had an hour to himself for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for

the first two weeks after starting station residence, if she/he chooses to take it.

The crew performed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

At 10:30am EST, Gregory supported the periodic VHF-1 emergency communications check over NASA's VHF (Very High Frequency) stations, today with the Dryden (10:33am) and White Sands (10:36am) VHF sites, talking with Houston/Capcom, MSFC/PAYCOM (Payload Operation & Integration Center Communicator), Moscow/GLAVNI (TsUP Capcom), EUROCOM/Munich and JCOM/Tsukuba in the normal fashion via VHF radio from a handheld microphone and any of the USOS ATUs (Audio Terminal Units). *[Purpose of the test is to verify signal reception and link integrity, improve crew proficiency, and ensure minimum required link margin during emergency (no TDRS) and special events (such as a Soyuz relocation).]*

At ~5:10am, CDR Fincke powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, & power supply) and conducted, at 5:15am, a ham radio exchange with St. Thomas' Primary School, Brisbane, Queensland, Australia. Several displays were planned for the school library on the school's ARISS (Amateur Radio in ISS) project, with information on the NASA space program, Amateur Radio and ARISS. They also have a link to the school ARISS Project web site, NASA and the current location of the ISS, plus an interactive section where children can listen to past ARISS school contacts.

Questions were uplinked to Mike beforehand. *["How did the space station get into space and how does it stay there?"; "What is it like eating and sleeping in space?"; "Do you have night and day in the space station?"; "Where does the space station get its power from?"; "Besides humans, are there any living things on the space station?"; "Is there any danger of being hit by a meteoroid when on a space walk and what protection do you have?"; "What do you do if some one gets sick or injured in space?"; "With astronauts on the space station from so many countries, what time zone does it work in?"; "Do you get to speak to your family from the space station?"; "How long is it safe to live in the space station before it starts to affect your health?"; "How do you have enough oxygen to breath on the space station?"; "What do you miss the most about earth?"]*

At ~1:05pm, the crew downlinked two TV addresses with Russian/English greetings, one on the 90th Anniversary of the N. E. Zhukovski Central Aerohydrodynamic Institute (TsAGI) in the city of Zhukovski, the other to the personnel of the Russian Ministry of Internal Affairs and participants of the Day of Militia ceremony on 11/10. *[TsAGI, founded on December 1, 1918, by Professor*

Nikolai Egorovich Zhukovski, a pioneer of national aviation, today maintains ties with over 50 leading aerospace companies and research centers in the US, Europe and Asia in the areas of theoretical and experimental aviation research. Zhukovski, the "Father of Russian Aviation" is known for the saying "Rather than using the strength of their muscles, humans will fly using the power of their minds".]

At ~3:00pm, the E18 crew is scheduled for a teleconference with the crew of the STS-126 mission, via S/G-2 for audio and Ku-Band for video.

CEO photo targets uplinked for today were **South Tibesti Megafans** (ISS had a clear, mid-morning pass over this target located in northwestern Chad south of the Tibesti Mountains. Relict channels of an extensive megafan river system occupy a large area, probably dating from the last wet period in the Sahara Desert [~10,000 years ago]. These channel networks appear to be good analogs for river-like lines on Mars. Overlapping images at nadir along the ground track were requested. The relict stream beds are located on the light-toned flats south of dark volcanic slopes of the Tibesti Mountains), **Vredefort Impact Crater** (this large, ancient impact located in northern South Africa is about 300km in diameter and over 2 billion years old. On this fair-weather pass near midday, Mike & Greg approached the impact from the NW. Looking just right of track and using the long lens settings for a mapping of the visible rim features of the impact), **Georgia/S. Sandwich** (the South Georgia Island is an arching, mountainous and glaciated island that lies about 860 miles east-southeast of the Falkland Islands. The South Sandwich Islands form a separate island group to the SE. Weather was marginal [partly cloudy at best], but Mike & Greg were to try for detailed views of the glaciers on the north coast of South Georgia. The pass was in the best light near midday), and **Patagonian Glaciers** (the Northern Patagonian Ice Field is the northernmost of two large remaining ice fields of South America, located in the Andes Mountains of southern Chile. It is also the world's largest ice field so far from the poles. Looking just left of track on this partly cloudy pass near midday. Mike & Greg were to try for detailed views of the glacier features, particularly on the western and northern margins).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 7:35am EST [= epoch]):

Mean altitude -- 352.1 km

Apogee height -- 354.3 km

Perigee height -- 349.9 km

Period -- 91.58 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0003272

Solar Beta Angle -- 6.1 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.72
Mean altitude loss in the last 48 hours -- 56 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 57061

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

11/05/08 -- ESP-3 relocation
11/14/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC; 7:55pm EST
11/16/08 -- STS-126/Endeavour/ULF2 docking; ~4:56pm
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/27/08 -- STS-126/Endeavour/ULF2 undocking; 10:32am
11/29/08 -- STS-126/Endeavour/ULF2 landing; ~2:01 pm
11/30/08 -- Progress M-66/31P docking
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch

Six-person crew on ISS

07/30/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1 (contingency)
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 11/03/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 2 of Increment 18. >>Today 51 years ago (1957), Soviet Chief Designer Sergei Pavlovich Korolev launched the first living passenger into orbit – the little canine “proto-cosmonaut” Laika (“Barker”) with Sputnik-2 on an R7 “Semyorka”.*<<

With yesterday's time change, crew work begins now at 1:00am EST and ends at 4:30pm, with the one-hour lunch break at about 7:00am.

FE-2 Chamitoff started his day with his third week-long session with the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment, using the payload software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop. *[To monitor the crewmember's sleep/wake patterns and light exposure, Greg wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary “job jar” task list. This is Week 3 of 3 for the FE-2.]*

Before breakfast, CDR Fincke began Part 1 (of 5) of the periodic acoustic measurement protocol by deploying crew-worn acoustic dosimeters, to be carried by all crewmembers for 24 hours (with a microphone on the shirt collar). (Last time done: 9/8-9/9). *[Tonight, after about 15 hours of measurements, dosimeter data will be downloaded and the hardware power-cycled for another data take starting tonight after 8.5-hr. sleep. At that point, the crew will deploy the dosimeters statically in the station for the duration of the day, record measurements tomorrow noon and stow the instruments. Acoustic data must be taken twice per Increment, each time for the duration of the 16-hour crew workday.]*

Most of Fincke's & Chamitoff's time today was assigned to hardware prepacking for the 15-day Shuttle mission ULF2, preceded by a prepack conference with ground

specialists via S-band at ~8:05am EST, and an OBT (On-board Training) review of the STS-126/ULF2 docked timeline, followed by a discussion with MCC-H specialists via teleconference. Some highlights follow:

- *STS-126/ULF2/Endeavour, the 124th Shuttle mission (the 27th to the station), will be crewed by CDR Chris Ferguson, PLT Eric Boe, MS1 Donald Pettit, MS2/EV2 Steve Bowen, MS3/EV1 Heidemarie Stefanyshyn-Piper, MS4/EV3 Shane Kimbrough, and MS5/ Exp-18 FE-2 Sandra Magnus.*
- *ISS wake/sleep cycle will be shifted from 1:00am EST to 4:30am on FD2, then to 9:30am on FD3. The early undock time (10:32am) drives crew wakeup 2.5 hrs earlier, to 7:00am by FD14. The shift is completed by moving crew sleep 30 min earlier on FD4, and then one hour earlier each day on FD12 and 13.*
- *MPLM "Leonardo" will be installed on Node-2 on FD4; ingress same day just before Presleep. MPLM transfers start FD5 with four racks, followed by 8 racks, including the Galley (ER6), on FD6.*
- *Focused Orbiter inspection is nominally planned for FD6. However, since the installed MPLM will obstruct a small area on the lower starboard wing for Focused inspection, MPLM berthing could be delayed to FD5 if the Debris Assessment Team, in reviewing the RPM imagery on the evening of FD3, identifies an area of concern associated with the starboard wing. Late inspection will be completed in its entirety after the Shuttle undocks on FD14. Endeavour will be undocking with the OBSS (Orbiter Boom Sensor System) on the SRMS (Shuttle Remote Manipulator System) in preparation for that inspection.*
- *Four EVAs are planned during the mission. MS2, MS3, and MS4 will rotate all EVAs. General EVA tasks are:*
 - ***EVA-1** – NTA (Nitrogen Tank Assembly) transfer to Shuttle PLB, FHRC (Flex Hose Rotary Coupler) transfer to ESP-3, EFBM Cover Removal, Stbd SARJ (Solar Array Rotary Joint) Cleaning/TBA (Trundle Bearing Assembly) R&R.*
 - ***EVA-2** – CETA Cart Relocation, LEE A Lubrication, Stbd SARJ Cleaning/TBA R&R.*
 - ***EVA-3** – SARJ cleaning/TBA R&R.*
 - ***EVA-4** – Port SARJ lubing, EFBM cover install, ETVCG Install, JLP GPS Antenna Install, JEM Handrails/WIFs Install, IR and Digital Imagery of S1/P1 Radiators.*
- *Generic face-to-face handover time between Chamitoff & Magnus will be 12 hrs max; Gregory will remain on the ISS until the day before undocking and will be scheduled as an ISS crewmember.*
- *Endeavour will be powered by the SSPTS (Station-Shuttle Power Transfer System) from post-docking to just before undocking. During the mated mission when ISS solar arrays are feathered for attitude maneuvers and*

EVA operations, SSPTS may be powered off to maintain station power margin.

- *30 hrs are required for transfer ops to/from the Shuttle middeck and 105 hours for MPLM. With all the timelined activities and rack transfers scheduled, ULF2 will be a highly choreographed transfer mission. The Shuttle crew has been thoroughly trained on the details of the choreography. In addition, each day a transfer message will be uplinked, listing specific items that need to be transferred that day due to operations requiring the items.*

FE-1 Lonchakov started a new round of the periodic (monthly) preventive maintenance of RS (Russian Segment) ventilation systems in the DC1 (Docking Compartment) by cleaning the PF1 & PF2 dust collectors in its air duct system and the protective mesh screens of the V1 & V2 ventilator fans. Later, Yuri moved to the FGB (Funktsionalnyi-Grusovoi Blok) to clean the vent grills of the three SOTR (thermal control system) gas-liquid heat exchangers (GZhT-1, -2, -3).

Mike Fincke terminated IWIS (Internal Wireless Instrumentation System) software commanding and prepared for the “deep sleep” recovery of the IWIS RSU (Internal Wireless Integrated System/Remote Sensor Unit) system (listed yesterday as a discretionary entry on the “job jar” task list). *[The hardware will remain powered on for tomorrow’s (11/4) dedicated thruster firing. IWIS RSUs collect structural dynamics data on the ISS structure during specific “disturbance” events such as thruster firings, docking/undocking, etc.]*

Yuri Lonchakov conducted the regular status check and data collection on the BIO-5 Rasteniya-2 (“Plants-2”) experiment which researches growth and development of plants (peas) under spaceflight conditions in the LADA-13 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}).

Performing regular service on the MATRYOSHKA-R (RBO-3-2) radiation instrumentation in the SM (panel 326), Yuri Lonchakov conducted a health check on the ASTR Spectrometer and prepared it for a new round of experiment activities, downlinking all remaining data from the ALC-954 PCMCIA (Portable Computer Memory Card International Adapter) memory card via the RSK1 laptop and replacing it in the AST with a new card (ALC-955). The Spectrometer was then activated, after a functional check. *[RBO-3-2 is using the ESA/RSC-Energia experiment ALTCRISS (ALC/Alteino Long Term monitoring of Cosmic Rays on the ISS) with its Spectrometer (AST) and ALC equipment, which is periodically moved around and now located again in the SM.]*

In the JAXA JPM (JEM Pressurized Module), Chamitoff retrieved two OIWIFs (On-orbit Install Worksite Interfaces) from a standoff. With Mike Fincke, he also

unpacked and readied a JEM cargo bag containing four cables for the PROX-GPS antenna, required for HTV (H-II Transfer Vehicle) operations. *[The PROX system, mostly located in the ICS (Inter-orbit Communication System) Rack, consists of a PROX antenna, a PROX-GPS (Global Positioning System) antenna, PROX comm equipment and an HCP (Hardware Command Panel) in the JPM, except for the antenna. When the HTV approaches the ISS, the PROX antenna, which contains GPS receivers, will initiate communications with the HTV. The ISS orbital location and speed are immediately relayed to the HTV through the PROX. At the same time, data from the HTV are relayed to the ISS. In addition, the antenna relays commands sent from the ground to the HTV.]*

FE-1 Lonchakov again had an hour to himself for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residence, if she/he chooses to take it.

At ~4:20pm EST, just before sleep time, Yuri will set up the Russian MBI-12 SONOKARD (Sonocard) payload and start his second experiment session, using a sports shirt from the SONOKARD kit with a special device in the pocket for testing a new method for acquiring physiological data without using direct contact on the skin. Measurements are recorded on a data card for return to Earth.

[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]

The CDR completed the regular monthly TVIS maintenance, inspecting the condition of harnesses, belt slats, corner bracket ropes, IRBAs (Isolation Restorative Bungee Assemblies) and gyroscope wire ropes for any damage or defects, lubricating as required plus recording time & date values. *[Mike's downlinked report: "TVIS is looking great! All wire ropes and cords looking great and pass my inspection."]*

The crew performed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

At ~4:00am EST, Mike Fincke powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, & power supply) and conducted, at 4:05am, a ham radio exchange with IES Trassierra,

Córdoba, Spain, a Secondary Education School with 900 students located between a developing area and an area of low social-economical status. Its project "Sailing through Space" will help students to broaden their knowledge in the field of space and also will be a very important tool to motivate them to study. The project is going to last two years and it will include a wide variety of activities such as observing the sky from Cordoba, visiting the workshop that the Observatory of Granada brought to the school and making trips to the observatory situated in Toledo. Questions were uplinked to Mike beforehand. [*"What kind of food do you eat? Do you have a special diet?"; "Are you in contact with your family?"; "How long have you been in the ISS?"; "What do you miss the most?"; "How long does it take to go to the space?"; "What is your favourite thing up there?"; "Have you ever felt frightened?"; "What is the weight of your spacesuit?"; "What is your mission onboard?"; "How do you have a shower?"*].]

No CEO (Crew Earth Observation) targets uplinked today.

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:44am EST [= epoch]):

Mean altitude -- 352.1 km

Apogee height -- 354.3 km

Perigee height -- 350.0 km

Period -- 91.58 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0003213

Solar Beta Angle -- 1.9 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 70 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 57046

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

11/14/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC; 7:55pm EST

11/16/08 -- STS-126/Endeavour/ULF2 docking; ~4:56pm

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/27/08 -- STS-126/Endeavour/ULF2 undocking; 10:32am

11/29/08 -- STS-126/Endeavour/ULF2 landing ; ~2:01 pm

11/30/08 -- Progress M-66/31P docking

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch 02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 11/02/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – rest day for CDR Fincke, FE-1 Lonchakov, FE-2 Chamitoff. Ahead: Week 2 of Increment 18. We are now on Standard Time again.*

FE-1 Lonchakov performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP-Moscow. Additionally, the FE-1 today checked up on the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem, gathering weekly data on total operating time & "On" durations for reporting to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

FE-2 Chamitoff performed the standard sensor calibration on the CSA-O₂ (Compound Specific Analyzer-Oxygen) units #1043 & #1059, delivered on 1J, using a new calibration adapter (#1001), brought up by 30P.

Working on the MATRYOSHKA-R (RBO-3-2) radiation instrumentation in the SM (panel 326), Lonchakov turned off the AST Spectrometer, taking radiation measurements since 10/17, then removed the PCMCIA (Portable Computer Memory Card International Adapter) ALC-954 memory card and checked number and size of its data files. Card 954 was then stowed in a kit, with the AST Spectrometer remaining deactivated.

The CDR & FE-1 had their weekly PFCs (Private Family Conferences) via S-band/ audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop), Yuri at ~9:30am EST, Mike at ~3:40pm.

Working from the US voluntary "job jar" task list, Mike & Greg completed "deep

sleep” recovery of the IWIS RSU (Internal Wireless Integrated System/Remote Sensor Unit) system. *[IWIS RSUs collect structural dynamics data on the ISS structure during specific “disturbance” events such as thruster firings, docking/undocking, etc.]*

The crew executed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

No CEO (Crew Earth Observation) targets uplinked today.

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

11/14/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC; 7:55pm;

11/16/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/29/08 -- STS-126/Endeavour/ULF2 landing (~2:00 pm EST est.)

11/30/08 -- Progress M-66/31P docking

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

ISS On-Orbit Status 11/01/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – light-duty day for CDR Fincke, FE-1 Lonchakov & FE-2 Chamitoff.*

As part of the crew's regular morning inspection tour, FE-1 Lonchakov conducted the routine checkup of DC1 (Docking Compartment) circuit breakers and fuses. *[The monthly checkup in the "Pirs" module looks at AZS circuit breakers on the BVP Amp Switch Panel (they should all be On) and the LEDs (light-emitting diodes) of 14 fuses in fuse panels BPP-30 & BPP-36.]*

The crew performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the SM (Service Module) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

As part of the house cleaning, Yuri conducted regular maintenance inspection & cleaning on fan screens in the FGB (TsV2), DC-1 (V3) and SM (VPkhO, VPrK, FS5, FS6 & FS9). The FE-1 also cleaned the pre-filter in the Russian POTOK-150MK (150 micron) air purification subsystem.

CDR Fincke completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Lonchakov performed routine maintenance on the Russian SRVK condensate water

processor by removing & replacing its BRPK-2 (Condensate Separation & Pumping Unit)'s separator.

At ~10:15am EDT the crewmembers conducted their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-Houston and TsUP-Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

After the ground shut down the EarthKAM (EK/Earth Knowledge Acquired by Middle School Students) experiment, Gregory Chamitoff moved some of its equipment back to the US Lab (from Node-2) to support the BCAT (Binary Colloidal Alloy Test) experiment run. *[Greg's diligence in working through some Firewire-software issues was greatly appreciated in an uplink message. The EK run has netted over 1100 images.]*

The FE-2 also set up and restarted BCAT-4 operations at the Avionics Racks 2 (LAB1D1) and 3 (LAB1D2), after the recent considerable troubleshooting to get the payload running. *[The camera image was set up on Sample 3, after which Greg, with gloves on, homogenized samples 8, 9, 10, then 3 last. Immediately following the homogenization of Sample 3, the FE-2 took a few photos of the sample. Controlled by EarthKAM software, the camera is now automatically photographing Sample 3 once every hour for the next 6 days.]*

For today's VolSci (Voluntary Weekend Science) program, Mike Fincke & Greg Chamitoff had 3 hrs on their timelines for another exciting range of tests of the SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellites) experiment which include satellite spiral maneuvers for synthetic imaging mission, fuel balancing, docking using path planning, advanced path follower algorithms, failure detection and recovery using simulated failures in communications. *[Today's run (Test Session 14B) used two satellites and, if time permitted, also executed Test Session 14A with three satellites.]*

The crew completed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Later, Mike transferred the exercise data files to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working off the Russian discretionary "time permitting" task list, Lonchakov performed routine service on the Matryoshka-R radiation payload via its Lulin-5 electronics box, checking and adjusting date/time, taking readings and entering time tag.

Also off the work suggestions list, the FE-1 conducted another session for Russia's Environmental Safety Agency (EKON), making observations and taking KPT-3 aerial photography of environmental conditions on earth using the Nikon D2X with the SIGMA 300-800mm telephoto lens.

A third task item from the Russian discretionary job list for Yuri was a session of the GFI-8 "Uragan" (hurricane) earth-imaging program, using the NIKON D2X digital camera to take telephotos. *[Uplinked target zones were the Andes (general views from both side of flight track, discretionary snapshots for educational purposes), the Amazon jungle (looking for cut-down forest in Amazon basin), the Galapagos archipelago (ocean wave pattern near small islands in the northern part of the archipelago), South Andes (large glaciers flowing into fiords and lakes, focusing on the contact between glacier with water surface) and Ugra National Park (forest vegetation in the steppe, the northernmost island of the Galapagos archipelago, and Darwin Island).]*

A voluntary task item for CDR Fincke today was to fill out his first FFQ (Food Frequency Questionnaire) on the MEC. *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

Weekly Science Update (Expedition Eighteen -- Week 1)

3-D SPACE: In progress.

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): Complete.

ANITA (Analyzing Interferometer for Ambient Air): Continuing.

BCAT-3/4 (Binary Colloidal Alloy Test 3/4): After the 10/23 EarthKAM troubleshooting, BCAT-4 is looking forward to continuing homogenization and photography of sample 3. The homogenization of samples 8, 9 and 10 remains on

the task list if not completed along with the sample 3 operations.

BIO-4: After 16S landing, the BASE-B/-C and XENOPUS biological samples have been very quickly retrieved and handed-over to science teams. Meanwhile, KUBIK incubators telemetry data have been downlinked and are being analyzed by PD (Payload Developer) team.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): “Thanks Mike, for working through the CBPD errors and getting it to work. For the next CCISS session, you will be using a newly refurbished unit that will arrive on ULF2. Also, thanks for the great video and call downs. It really helps us troubleshoot issues and ensures the PI gets the best data possible.”

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System): Samples returned on 1J.

CSI-2/CGBA-5 (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus 5): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): Due to safety concerns identified for the PLEGPAY instrument when operated in Plasma Discharge mode, the entire EuTEF platform had to be put in survival mode on 9/1. Since then, the EuTEF power feeder#1 is de-activated and no science acquisition is possible. Request has been approved at IMMT for intermittent activation for 3 of the 9 EUTEF payloads. EuTEF platform power feeder#1 has been re-activated for 8-hrs periods on 10/17, 10/19, 10/21, 10/24, 10/26 and 10/29. This only mitigates the science loss for the EXPOSE, DOSTEL and MEDET instruments. The situation implies

significant loss of science return for all EUTEF payloads. On 10/30, the ground commanding activity to erase the software instructions of the so-called “Experiment 1” (Plasma Generation) from the memory of PLEGPAY was performed nominally. A full memory dump of PLEGPAY instrument has also been performed and ground teams are now analyzing the outcome of the memory deletion. Once this activity is done the rest of the EUTEF instruments will be able to resume normal operations-- DEBIE-2: Inactive;-- DOSTEL: Inactive, part of proposed intermittent activation;-- EuTEMP: Inactive;-- EVC: Inactive;-- EXPOSE: Inactive, part of proposed intermittent activation;-- FIPEX: Inactive; -- MEDET: Inactive, part of proposed intermittent activation; -- PLEGPAY: Inactive, “Experiment 1” memory has been erased on 10/30;-- TRIBOLAB: Inactive.

FSL (Fluid Science Laboratory): FSL is nominal.

GEOFLOW: The EC (Experiment Container) has been successfully installed back into the FSL (Fluid Science Laboratory) drawer. It is planned to resume the GEOFLOW science runs after ULF2 mission and 31P undocking and 32P docking.

HDTV System Test DL (JAXA): Complete.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): In progress.

Marangoni Experiment for ISS in JAXA FPEF (Fluid Physics Experiment Facility):

A part of the FPEF clean-up (preparation for the clean up) of Marangoni EXP was completed on 10/28. Once the FPEF clean-up is completed, Marangoni will resume operations.

Micro-G Clay (JAXA EPO): Complete.

MISSE (Materials ISS Experiment): Ongoing.

Moon Photography from ISS (JAXA EPO): Complete.

MOP (Motion Perception in Zero-G): Daily MOP questionnaires completed by the Space Flight Participant. Downloaded on 16S.

MSG-SAME (Microgravity Science Glovebox): Complete.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MUSCLE-G (LBP/Low Back Pain): Daily MUSCLE questionnaires completed by the Space Flight Participant. Downloaded on 16S.

NOA-1/-2 (Nitric Oxide Analyzer, ESA): Complete.

NUTRITION w/REPOSITORY: In progress.

PADLES (Passive Dosimeter for Lifescience Experiment in Space): In progress.

PCRF (Protein Crystallization Research Facility) Reconfiguration (JAXA): Complete.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SAMPLE: Complete.

SHERE (Shear History Extensional Rheology Experiment): Complete.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): "Greg, you are currently scheduled to complete another week of Sleep logging next week. This will make up for the week that was lost during the SSC reload."

SOLAR (Solar Monitoring Observatory): The present Sun visibility window has started on 10/27, but due to ISS yaw angle, SOLAR only started to track the Sun on 10/29 early morning. Some anomalies are currently being worked for SOLACES and SOVIM instruments:-- SOVIM: no science acquisition, non-nominal mode: instrument power consumption is zero, for the time being it is powered off as the ground teams are working out a recovery plan-- SOLSPEC: daily science acquisition - nominal;-- SOLACES: problem of synchronization of the instrument

microcontrollers, some work-around procedures are being implemented since the start of the Sun observation window. On 10/29, some problem with file naming of the Command Sequence scripts have led to a delay of several hours to start the science acquisition.

SOLO (Sodium Loading in Microgravity): Complete.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): Reserve.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): The four remaining ECs (Experiment Containers) have been removed by Greg from the BIOLAB Rotor B on 10/29.

CEO (Crew Earth Observations): Through 10/30 the ground has received a total of 1,118 frames of CEO images for review and cataloging (the first 6 days of Increment 18). Photos with times corresponding to CEO target request times are being reviewed first and since the last report included: Santa Barbara Coast, California (acquisition confirmed – 28 frames under review); Yellowstone NP, Wyoming (acquisition confirmed – 24 frames under review); Santa Barbara Coast, California – 53 frames under review); Lake Nasser-Toshka Lakes, Egypt (acquisition confirmed – 23 frames under review); Lake Chad, Africa (21 frames - excellent imagery acquired for continued monitoring); Niwot Ridge Tundra, Colorado (acquisition confirmed – 21 frames under review); Mt Kilimanjaro, Tanzania (17 frames - target not acquired – to be re-tried); Madrean Sky Islands, NW Mexico (acquisition confirmed – 34 frames under review); Khartoum, Sudan (acquisition confirmed – 38 frames under review); and Red River Basin, TX (acquisition confirmed – 43 frames under review). “You are off to an incredible start with sharp, well-composed imagery and lots of it! More feedback will come as we complete our reviews. Thanks for your patience as we transition from Increment 17 to 18.”

CEO photo targets uplinked for today were **North African Dust Storm** (*Dynamic Event: North African Dust Storm - As ISS approached the Libyan coast, Mike & Greg were to look left of track, toward the eastern Mediterranean and eastern Egypt. The approach of a strong cold front should have created a large dust plume. Requested were panoramic views of the plume along the north coast of*

Egypt), **B.P. Structure** (the B.P. Structure is the first impact crater crossed today. It is small so it is a very challenging target. The crater is 2 km in diameter [similar in diameter to Meteor Crater in Arizona] and its age has been dated at less than 120 million years. The crater should have been close to under track. Mapping pass was requested), **Oasis Impact Crater** (Oasis impact crater is larger than B.P. [18 km in diameter] and probably a little easier to recognize. The age has been dated as less than 120 million years. Mapping pass along the orbit track was requested), and **Amazon River Delta** (Dynamic Event: Amazon River Delta. ISS had a nadir pass over the mouths of the Amazon River. CEO researchers want to continue their long-term image documentation of this dynamic delta. The delta is 210 miles wide and the sediment discharge extends hundreds of miles out into the Atlantic Ocean. Documenting the individual islands in the delta along with the extent of the sediment plume).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

Significant Events Ahead (all dates Eastern Time, some changes possible.):

11/02/08 -- **Daylight Saving Time (DST) ends**
 11/14/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC; 7:55pm;
 11/16/08 -- STS-126/Endeavour/ULF2 docking
 11/20/08 -- **ISS 10 Years**
 11/25/08 -- Progress M-65/30P undocking & deorbit
 11/26/08 -- Progress M-66/31P launch
 11/29/08 -- STS-126/Endeavour/ULF2 landing (~2:00 pm EST est.)
 11/30/08 -- Progress M-66/31P docking
 02/09/09 -- Progress M-66/31P undocking & deorbit
 02/10/09 -- Progress M-67/32P launch
 02/12/09 -- Progress M-67/32P docking
 02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
 02/14/09 -- STS-119/Discovery/15A docking
 02/24/09 -- STS-119/Discovery/15A undocking
 02/26/09 -- STS-119/Discovery/15A landing (nominal)
 03/25/09 -- Soyuz TMA-14/18S launch
 03/27/09 -- Soyuz TMA-14/18S docking (DC1)
 04/05/09 -- Soyuz TMA-13/17S undocking
 04/07/09 -- Progress M-67/32P undocking & deorbit
 05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 05/25/09 -- Soyuz TMA-15/19S launch
 05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
 07/30/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation

10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 10/31/08

All ISS systems continue to function nominally, except those noted previously or below. *HAPPY HALLOWEEN!*

Before breakfast and exercise, CDR Fincke broke out and set up the equipment for today's U.S. PHS (Periodic Health Status) w/o Blood Labs exam, a clinical evaluation of Mike & Yuri Lonchakov, their first, with Gregory Chamitoff assisting as CMO (Crew Medical Officer). For the PHS (Periodic Health Status) w/o Blood Labs examination, the crew used the U.S. PCBA (Portable Clinical Blood Analyzer).

[The second part of PHS, Subjective Clinical Evaluation, was performed later in the day. All data were then logged on the MEC (Medical Equipment Computer) and the hardware stowed. The PHS exam, with PCBA analysis and clinical evaluation, is guided by special software (IFEP, In-Flight Examination Program) on the MEC laptop. While PCBA analyzes total blood composition, the blood's hematocrit is particularly measured by the Russian MO-10 protocol.]

The FE-2 conducted another one of the periodic offloadings of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling a CWC (Contingency Water Container, #1062) with the collected water slated for processing. No samples were required.

CDR Fincke worked on the CDRA (Carbon Dioxide Removal Assembly), removing and replacing two CSVs (CDRA Selector Valves, #105 & #106), then closing out the worksite after the ground checkout of the valves. Afterwards, Mike bypassed the temperature sensor A of the CDRA Bed #201 using ISS pin kit jumpers.

[The two replaced valves would periodically fail to reach their final position when commanded, shutting down the CDRA. The ground teams successfully checked out the new valves and began a 24-hour CDRA verification run.]

In the Service Module (SM), FE-1 Lonchakov removed the Lada-13 greenhouse from the Russian BIO-5 Rasteniya-1 ("Plants-1") experiment, installed a BKGA gas

analyzer control unit, hooked up and activated the MIS control unit, loaded new software, put in new MIS hardware and ran a hardware test in Auto mode, terminating it after ~5 hrs. *[Rasteniya-1 researches growth and development of plants under spaceflight conditions in the Lada-13 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. Lada consists of a wall-mounted growth chamber that provides long-term, ready access for crewmember interaction. It provides light and root zone control but relies on the cabin environmental control systems for humidity, gas composition, and temperature control. Cabin air is pulled into the leaf chamber, flows over the plants and vents through the light bank to provide both plant gas exchange and light bank cooling. Lada was launched to the ISS in September 2002.]*

In Node-2, FE-2 Chamitoff changed out a diffuser plate on the THC (Temperature & Humidity Control) system, taking acoustic measurements before and after the diffuser plate replacement to document the cause of the current high noise level and its mitigation.

Gregory performed another standard sensor calibration on the CSA-O₂ (Compound Specific Analyzer-Oxygen) units #1043 & #1059, delivered on 1J, using a new calibration adapter (#1001), brought up by 30P.

The CDR performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The daily IMS (Inventory Management System) maintenance was conducted today by Yuri, updating/editing the standard IMS "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The FE-2 conducted the regular bi-monthly reboots of the OCA Router and File Server SSC (Station Support Computer) laptops.

In preparation for the arrival & docking of the Japanese HTV (H-II Transfer Vehicle) later this year, the HTV Control Center (HTV-CC) in Tsukuba has conducted a weekly-long series of command and telemetry tests. *[HTV-CC successfully tested both the A- and B-string of the BSP (Baseband Signal Processor). Range & Range Rate function was also successfully confirmed as the ISS made several passes*

over a ground site in Tanegashima, Japan. During these overflights, the ground station sent a simulated HTV telemetry stream to ISS, and HTV commands were routed from the JAXA SSIPC (Space Station Integrated Promotion Center) through ISS and back to the ground site. The Heartbeat FDIR (Fault Detection, Isolation, & Recovery) test was also a success, and concluded the PROX System Checkout #1.]

Fincke & Chamitoff continued to prepare for the STS-126/ULF2 mission by prepacking hardware for return in the MPLM (Multi-Purpose Logistics Module).

The CDR reconfigured the IFM (In-Flight Maintenance) tool box drawers by installing the new drawers into the toolbox location, preparing a common crew tool kit, removing and stowing tools from the old toolbox drawers, and stowing the old empty drawers for return on ULF2.

Chamitoff filled out the regular FFQ (Food Frequency Questionnaire), his 18th, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

Before starting their exercise sessions on the TVIS treadmill, Mike & Yuri set up the video equipment for filming their subsequent workout on the treadmill for biomechanical evaluation of their performance and assessment of the hardware status by ground engineers. Afterwards, the camera gear was torn down and stowed.

The crew completed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Later, Greg transferred the exercise data files to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~4:50am EDT, Yuri & Mike linked up with TsUP stowage specialists via S-band to conduct the weekly IMS tagup, discussing inventory & stowage issues,

equipment locations and cargo transfers.

At ~6:30am, Gregory had his weekly PFC (Private Family Conferences) via S-band/ audio and Ku-band/MS- NetMeeting application (which displays the uplinked ground video on an SSC laptop).

At ~9:06am, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

FE-1 Lonchakov had an hour to himself for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residence, if she/he chooses to take it.

CEO (Crew Earth Observations) photo targets uplinked for today were **Cairo, Egypt** (*the population of Cairo is about 6.8 million people [2006]. Cairo's metropolitan area has about 17.8 million people. This target is located on the banks of the Nile River in northern Egypt, immediately south of where the Nile splits into its two branches. The grayness of the city contrasts nicely with the green of the Nile delta. Looking a little right of the track and documenting land use and city boundaries*), **Wetumpka Impact Crater** (*Wetumpka was confirmed as an impact crater [shocked quartz was found in cores] in 1998. The crater is 7.6 km in diameter and is estimated to be about 83 million years old. This was a challenging target for Mike & Greg because the crater itself is a little difficult to spot due to vegetation and soil cover. The crater is located east of downtown Wetumpka, Alabama. Wetumpka is also located to the northeast of Montgomery, Alabama and to the southwest of Atlanta, Georgia. Mapping pass along the track*), **Caracas, Venezuela** (*the Venezuelan capital city is situated in a narrow valley, just inland from the Caribbean Sea coast south of a forested mountain range. Trying for detailed near-nadir views of the city. As always with this city, there were probably partly cloudy conditions*), and **Central-Arizona Phoenix** (*the Central-Arizona Phoenix site is part of the Long Term Ecological Research [LTER] suite of sites. The main objective for these sites is to document the land cover/land use change on a seasonal basis. Looking for land cover or land use boundaries and documenting with overlapping frames*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

Significant Events Ahead (*all dates Eastern Time, some changes possible*):

11/02/08 -- Progress 30P reboost; *Daylight Saving Time (DST) ends*

11/14/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC; 7:55pm;

11/16/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/29/08 -- STS-126/Endeavour/ULF2 landing (~2:00 pm EST est.)
11/30/08 -- Progress M-66/31P docking
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 10/30/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Fincke set up the camcorder equipment for taking video of FE-2 Chamitoff performing his first session of the general U.S. MedOps PFE (Periodic Fitness Evaluation) program on the CEVIS (Cycle Ergometer with Vibration Isolation), filmed via VTR (Video Tape Recorder). *[The footage was downlinked afterwards for biomechanical evaluation of the exercising crewmember and assessment of the on-orbit setup of equipment during data collection and hardware status.]*

The FE-2 then completed the PFE protocol, a monthly 1.5-hr. procedure which checks up on blood pressure and electrocardiogram (ECG) during programmed exercise on the CEVIS (Cycle Ergometer with Vibration Isolation) in the Lab. Readings were taken with the BP/ECG (blood pressure/electrocardiograph) and the HRM (heart rate monitor) watch with its radio transmitter. Fincke, who had completed the session yesterday, assisted as CMO (Crew Medical Officer). The video equipment was later stowed and MCC-Houston informed that the video could be downlinked. *[BP/ECG provides automated noninvasive systolic and diastolic blood pressure measurements while also monitoring and displaying accurate heart rates on a continual basis at rest and during exercise.]*

The SSRMS (Space Station Remote Manipulator System) was maneuvered by Robotics ground controllers as part of the ongoing ULF2 pre-launch checkout. *[The SSRMS Tip LEE (Latching End Effector) released the MBS PDGF-1 (Mobile Base System/Power & Data Grapple Fixture) and maneuvered to the ESP3 (External Stowage Platform #3) park position. The SSRMS is now in position to start the ESP3 relocation operations next Wednesday. Today's operations also included diagnostic checks on the SSRMS joints and LEE B. Systems performance was nominal, and the activity was completed ahead of schedule. ESP3 relocation to the MCAS (MBS Common Attach System) is scheduled for next Wednesday.]*

All three crewmembers performed the standard Emergency Egress Drill. *[This is a standard training exercise conducted to familiarize the crew with the location of emergency equipment (including hatches and passageways), focusing particularly on the passage along the emergency evacuation route.]*

The HTV (H-II Transfer Vehicle) PROX system checkout continued today with the HTV-CC (Control Center) successfully performing the Range & Range Rate checkout. At the end of the test the BSP (Baseband Signal Processor) was switched back to the A side in preparation for the Heartbeat FDIR (Fault Detection, Isolation, & Recovery) test tomorrow.

Mike Fincke & Greg Chamitoff continued to prepack hardware for return in the MPLM (Multi-Purpose Logistics Module).

Mike & Gregory also successfully completed their RPM (R-Bar Pitch Maneuver) Skills Training by photographing CEO (Crew Earth Observation) targets.

The crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exercise device (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Mike transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Yuri completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Lonchakov also handled the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

11/02/08 -- Progress 30P reboost; *Daylight Saving Time (DST) ends*

11/14/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC; 7:55pm;

11/16/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch
11/29/08 -- STS-126/Endeavour/ULF2 landing (~2:00 pm EST est.)
11/30/08 -- Progress M-66/31P docking
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osp/iss_reports/index.htm

ISS On-Orbit Status 10/29/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Fincke set up the camcorder equipment for taking video of Chamitoff and himself performing their first session of the general U.S. MedOps PFE (Periodic Fitness Evaluation) program on the CEVIS (Cycle Ergometer with Vibration Isolation), filmed via VTR (Video Tape Recorder). *[The footage was downlinked afterwards for biomechanical evaluation of the exercising crewmember and assessment of the on-orbit setup of equipment during data collection and hardware status.]*

The CDR & FE-2 then completed the PFE protocol, a monthly 1.5-hr. procedure which checks up on blood pressure and electrocardiogram (ECG) during programmed exercise on the CEVIS (Cycle Ergometer with Vibration Isolation) in the Lab. Readings were taken with the BP/ECG (blood pressure/electrocardiograph) and the HRM (heart rate monitor) watch with its radio transmitter, with Chamitoff first assisting as CMO (Crew Medical Officer), then being assisted by Fincke in his turn. The video equipment was later stowed and MCC-Houston informed that the video could be downlinked. *[BP/ECG provides automated noninvasive systolic and diastolic blood pressure measurements while also monitoring and displaying accurate heart rates on a continual basis at rest and during exercise.]*

FE-1 Lonchakov had ~4.5h to perform periodic replacement maintenance on the Russian thermal control system's heating loop #2 (SOTR KOB-2), removing two units (BS) containing electric pumps (ENA) of the replaceable pump panel 4SPN2 and exchanging them with spares from stowage. Afterwards, Yuri also tested the 4SPN2 pump panel to ascertain its functionality. Today's maintenance leaves one remaining spare on board. Finally, the KOB-2 was turned on by Russian ground control. *[The two BS units of 4SPN2 were exchanged the last time on 8/22. Each of the two SOTR KOB loops has two redundant pump panels with two redundant*

pumps each. While in the early years of Mir and ISS the pumps were integral to the SPN panels, the current design allows them to be replaced without requiring an entire new SPN block.]

Gregory Chamitoff continued his support of the EarthKAM (Earth Knowledge Acquired by Middle Schools) program, today swapping the 60mm lens with a 180mm lens for the students. *[There are 65 schools and 4,768 students participating in this week's session. EarthKAM allows middle school students to program a digital camera onboard the ISS to photograph a variety of geographical targets for study in the classroom.]*

Mike & Greg continued to prepare for the STS-126/ULF-2 mission by prepacking hardware for return in the MPLM (Multi-Purpose Logistics Module).

CDR Fincke reconfigured the toolbox facility in Node-1, installing new drawers and rearranging old drawers. *[Mike prepared a common crew tool kit for use in Node-2, Columbus, Kibo JPM (JEM Pressurized Module) and the MPLM coming up with ULF-2, added a few tools to the ISS Leak Kit, removed/stowed tools from old drawers, and stowed old empty drawers for return on ULF-2.]*

FE-2 Chamitoff replaced the PS1 & PS2 dust filters in the FGB with new spares.

Lonchakov collected the periodic readings of potentially harmful atmospheric contaminants in the SM (Service Module), using the CMS (Countermeasure System), a component of the SKDS GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, today using preprogrammed microchips to measure for o-Xylol (1,2-Dimethylbenzol, C_8H_{10}), Methyl-Mercaptan (Methanethiol, CH_4S), and Sulphur Dioxide (SO_2).

The crew reported that the aft Airlock GLA (General Luminaire Assembly) was dim. Troubleshooting was performed on the light and power removed to protect subsequent failure of the Baseplate Ballast Assembly (BBA). Engineering is recommending replacing the Lamp Housing Assembly (LHA).

The SSRMS (Space Station Remote Manipulator System) was successfully repositioned today in preparation for the ESP-3 (External Stowage Platform 3) relocation. The PDGF-3 (Power & Data Grapple Fixture #3) was released and the arm was maneuvered and grappled PDGF-4. A base change was performed from PDGF-3 to PDGF-4. The Tip LEE (Latching End Effector) on PDGF-1 will be released tomorrow and the arm will be maneuvered to the ESP-3 park position. Additionally, the demate microswitch on the MBS (Mobile Base System) redundant string was confirmed healthy today. *[This microswitch failed to indicate demate during the MSS MCAS (Mobile Service System Common Attach System) checkout*

on 10/7.]

Yuri Lonchakov had an hour to himself for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residence, if she/he chooses to take it.

The crew executed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

[Maximum speed for TVIS in motorized mode is not to exceed 16.1 km/h. Fincke removed his SPDs (Subject Positioning Devices) which were required for the first seven exercise sessions for him for safety.]

After a successful second day of the HTV PROX (H-II Transfer Vehicle/Prox System) Checkout, HTVCC (HTV Control Center) today sent the first commands to the HTV simulator at the PROX ground site via ISS.

The CDR completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Greg handled the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

- 11/02/08 -- Progress 30P reboost; *Daylight Saving Time (DST) ends*
- 11/14/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
- 11/16/08 -- STS-126/Endeavour/ULF2 docking
- 11/20/08 -- **ISS 10 Years**
- 11/25/08 -- Progress M-65/30P undocking & deorbit
- 11/26/08 -- Progress M-66/31P launch
- 11/29/08 -- STS-126/Endeavour/ULF2 landing (~2:00 pm EST est.)
- 11/30/08 -- Progress M-66/31P docking
- 02/09/09 -- Progress M-66/31P undocking & deorbit
- 02/10/09 -- Progress M-67/32P launch
- 02/12/09 -- Progress M-67/32P docking
- 02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
- 02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM (P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 10/28/08

All ISS systems continue to function nominally, except those noted previously or below.

Yuri Lonchakov set up the hardware for the Russian MBI-21 PNEVMOKARD experiment and conducted the session, his first, which does not allow moving or talking during data recording. Kononenko will have his fifth session tomorrow. The experiment is controlled from the RSE-med A31p laptop, equipped with new software, and uses the TENZOPLUS sphygmomanometer to measure arterial blood pressure. *[PNEVMOKARD (Pneumocard) attempts to obtain new scientific information to refine the understanding about the mechanisms used by the cardiorespiratory system and the whole body organism to spaceflight conditions. By recording (on PCMCIA cards) the crewmember's electrocardiogram, impedance cardiogram, low-frequency phonocardiogram (seismocardiogram), pneumotachogram (using nose temperature sensors), and finger photoplethysmogram, the experiment supports integrated studies of (1) the cardiovascular system and its adaptation mechanisms in various phases of a long-duration mission, (2) the synchronization of heart activity and breathing factors, as well as the cardiorespiratory system control processes based on the variability rate of physiological parameters, and (3) the interconnection between the cardiorespiratory system during a long-duration mission and the tolerance of orthostatic & physical activities at the beginning of readaptation for predicting possible reactions of the crewmembers organism during the their return to ground.]*

The ISS crew continued to prepare for the STS-126/ULF2 mission by prepacking hardware for return in the MPLM (Multi-Purpose Logistics Module) Leonardo.

FE-1 Lonchakov changed out the SRVK-2M multi-filtration unit and the Gas-Liquid Mixture Filter. Yuri also inspected the Sediment Trap Insert. *[The SRVK-2M converts collected condensate into drinking water and dispenses the reclaimed potable water].*

CDR Fincke downloaded heart rate and blood pressure measurements from the CCISS (Cardiovascular & Cerebrovascular Control On Return from ISS) that had been collected passively over the past 24 hours using the Holter Monitor and Actiwatch. *[CCISS provides data to support the study of the effects of long-duration spaceflight on crew members' heart functions and their blood vessels that supply the brain. This experiment is collaborative with the Canadian Space Agency.]*

As standard procedure for newly arrived station residents, Lonchakov filled out the questionnaire for the standard Russian biomedical Braslet-M/Anketa ("bracelet/questionnaire") test procedure. *[If desired, the crewmembers may evaluate a number of "bracelet" cuffs for their usefulness in suppressing the adverse effects of micro-G for the "newcomer" aboard the station during the acute phase of adaptation to weightlessness, if there are such indications. The "bracelets" are compression cuffs attached to a belt and worn on the upper thighs over the coveralls, intended as countermeasures against the initial micro-G effects of blood filling (vascularity) in the upper torso (heaviness and blood pulsation in the head), facial puffiness, nasal stuffiness, painful eye movement, and vestibular disorders (dizziness, nausea, vomiting). They create artificial blood accumulation in the upper thirds of the thighs, causing some of the circulating blood volume to relocate from the upper body to the lower extremities, thereby (hopefully) correcting the adverse hemodynamic effect of micro-G and thus improving the crewmember's working capability. The actual compression cuff in the Braslet units is a combination of alternating multi-layer tensile and non-tensile elements, whose distension by body movements creates elastic forces that produce the necessary pressure on the body surface. The questionnaire lists bracelet types, days worn, cuff tension used, wearing method (on body or over clothing), thigh cuff positioning, etc.]*

HTV (IH-II Transfer Vehicle (HTV) Prox System Checkout: The JAXA (Japan Aerospace Exploration Agency (JAXA) Prox system checkout continued today with another checkout on the Range and Range Rate measurement function using the PROX link over a the Tanegashima Space Center Ground Station (TNSC GS) in Japan. HTV ground support reported that they got good range data today from both sets of tests.

MSS (Mobile Servicing System) Operations: Today robotics ground controllers translated the MT (Mobile Transporter) from worksite (WS) 4 to WS6, and then on to WS7. The translation to WS6 was nominal and power & data redundancy was confirmed at Worksite 6. This fulfilled a portion of the ULF2 pre-launch checkout. The translation to WS7 was interrupted when the "+Y" worksite sensor at WS7 did not trip as expected. This was a recurrence of an anomaly which occurred when the MT translated to WS7 back on 2/1/08. The ground team recovered and completed the translation with manual commanding. Despite the resulting delay, there were no thermal issues and today's ops were completed on schedule.

Reboost: Tonight, the ISS is scheduled to perform a reboost using the 30P Rendezvous & Docking thrusters. This 0.55 m/s delta-V burn was to set up phasing for the STS-126/ULF2 and 31P launches. The reboost is scheduled for 9:13pm EDT.

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

11/02/08 -- Progress 30P reboost; *Daylight Saving Time (DST) ends*
11/15/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/17/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit (*UNDER REVIEW*)
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
12/01/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.) (*UNDER REVIEW*)
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 10/27/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 1 of Increment 18. Quote of the Day:* By Michael "Spanky" Fincke while performing TVIS assembly kit pre-pack for ULF-2 return:
"This CTB (Cargo Transport Bag) is like a piñata; stuff just goes everywhere..."

CDR Fincke, FE-1 Lonchakov & FE-2 Chamitoff began their workday before breakfast with the periodic session of the Russian biomedical routine assessments PZEH-MO-7/Calf Volume Measurement & PZEH-MO-8/Body Mass Measurement, using the IM mass measurement device which Yuri broke down afterwards for stowage. *[Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference points, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures. For determining body mass in zero-G, where things are weightless but not massless, the Russian IM "scales" measure the inertial forces that arise during the oscillatory motion of a mass driven by two helical metering springs with known spring constants. By measuring the time period of each oscillation of the unknown mass (the crewmember) and comparing it to the period of a known mass, the crewmember's mass is calculated by the computer and displayed.]*

Gregory worked in the Kibo JPM (JEM Pressurized Module) to power on the HTV PROX (H-II Transfer Vehicle/ Proximity Communication System) preparatory to its first checkout. *[Throughout the week, the HTV control center in Tsukuba will be sending commands and viewing telemetry in order to checkout various parts of the system when ISS overflies a ground site in Tanegashima, Japan. During these overflights, the ground station will send a simulated HTV telemetry stream to ISS and HTV commands will be routed from SSIPC through ISS and back to the ground site. The checkout will not involve any crew use of the HCP (Hardware Command Panel), but the crew will perform an HCP checkout sometime in December after the PROX functionality has been confirmed. PROX consists of an PROX antenna, a*

PROX-GPS antenna, PROX comm equipment and an HCP. With the exception of the PROX antenna, the PROX-GPS antenna and the HCP, the PROX is also installed in the JPM. When the HTV approaches the ISS, the PROX antenna, which contains GPS receivers, will initiate communications with the HTV. The ISS orbital location and speed are immediately relayed to the HTV through the PROX. At the same time, data from the HTV are relayed to the ISS. In addition, the antenna relays commands sent from the ground to the HTV.]

Mike Fincke conducted his first on-orbit session with the CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS) experiment, with Chamitoff acting as operator, by setting up and donning the Holter Monitor, donning the CBPD (Continuous Blood Pressure Device), performing the Baro Study, doffing the CBPD, and starting the 24-hr passive heart rate data collection. Data are recorded on a PCMCIA memory card, with the HRF (Human Research Facility) rack laptop for control. Data download and equipment stowage is scheduled tomorrow after the 24-hr period. *[CCISS studies the effects of long-duration spaceflight on crewmembers' heart functions and their blood vessels that supply the brain (= "cerebrovascular"). Learning more about the changes in cardiovascular & cerebrovascular systems in zero-G could lead to specific countermeasures that might better protect future space travelers. For the Baro study of CCIS, heart rate and blood pressure are being recorded for resting and timed breathing for 5 min, with no caffeine or food (water is acceptable) allowed two hours before the start of the Baro Study and no exercise prior to the Baro Study.]*

Yuri Lonchakov performed major periodic replacements on the SM (Service Module)'s ASU toilet facility, changing out replaceable parts with new components, such as a sensor unit (A8A-9060), two receptacles (PR & MP), four hoses, a T-connector, an elbow fitting, an indicator, a filter insert (F-V), and the pretreat container (E-K) with its hose. All old parts were discarded as trash. *[E-K contains five liters of pre-treat solution, i.e., a mix of H_2SO_4 (sulfuric acid), CrO_3 (chromium oxide, for oxidation and purple color), and H_2O (water). The pre-treat liquid is mixed with water in a dispenser (DKiV) and used for toilet flushing.]*

Chamitoff disconnected the thermal control MTL (Moderate Temperature Loop) supply jumper which he attached yesterday in the US Lab to an ITCS (Internal Thermal Control System) Z-panel (LAB1S3) for filling with coolant. *[The activity is in preparation for the installation of the WRS-2 (Water Recovery System 2) of the new Regenerative ECLSS in the CHeCS rack during STS-126/ULF2. All coolant lines need to be filled prior to mating them to their respective racks.]*

Greg also printed out a new cue card for the RPM (R-Bar Pitch Maneuver) operations using the 400mm lens. A tagup with ground specialist was held at

~1:50pm EDT to discuss photography details for the maneuver.

Between the two of them, Mike & Greg had ~5 hrs set aside for more cargo prepacking for STS-126/ULF-2.

Yuri performed the routine task of taking two photos of the internal part of the FGB nadir port's SSVP-StM docking cone, used for the Soyuz TMA-13/17S linkup on 10/14. These images are used to refine current understanding of docking conditions. The pictures were then transferred to OCA for subsequent downlinking. *[The objective is to take photo imagery of the scratch or scuff mark left by the head of the active docking probe on the internal surface of the passive drogue (docking cone) ring, now rotated out of the passageway. As other crewmembers before him, the FE-1 used the Nikon D1X digital still camera to take two pictures each with the hatch closed down.]*

In the JAXA JLP (JEM Logistics Pressurized Module), Mike Fincke removed a failed GLA LHA (General Luminaire Assembly/Light Housing Assembly) and two failed LHA BBAs (Baseband Assemblies), then connected the vacuum cleaner to a UOP (Utility Outlet Panel, J4) in the JPM.

The FE-2 completed another one of the periodic inspections of the RED (Resistive Exercise Device) canister cords and accessories, currently done every two weeks.

The crew executed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1). *[Maximum speed for TVIS in motorized mode is not to exceed 16.1 km/h. SPDs (Subject Positioning Devices) are required for the first seven exercise sessions for the CDR and FE-1 for safety.]*

Afterwards, Greg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Lonchakov performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The daily IMS (Inventory Management System) maintenance was conducted today also by Yuri, updating/editing the standard IMS "delta file" including stowage

locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

After temporarily removing the CBCS (Centerline Berthing Camera System) in the Node-2, Gregory set up the EarthKAM (EK) payload for a week of student photo ops. *[The first part of the setup required “borrowing” a Ku-Band Power Supply from the US Lab for use in Node-2. To minimize the impact to the setup activities for BCAT, use of a different DCS-760 camera was recommended. This will be the first session since last April, so there are many students eagerly awaiting the chance to put the camera to work. This will be the 29th time for EarthKAM aboard the ISS and the first time on Increment 18. EK is using a DCS 760 electronic still camera with 50mm (f/1.4) lens at the Node-2 window, powered by 16Vdc from a 28 Vdc adapter, taking pictures by remote operation from the ground, without crew interaction. Numerous schools are participating in this EarthKAM session. EarthKAM is an education program that enables thousands of students to photograph and examine Earth from the unique perspective of space, integrating the excitement of ISS with middle-school education. The student requests are uplinked in a camera control file to an A31p SSC (Station Support Computer) laptop which then activates the camera at specified times and receives the digital images from the camera’s storage card on its hard drive, for subsequent downlink via OPS LAN.]*

On ER-2 (EXPRESS Rack 2), Chamitoff removed & replaced the GN2 (gaseous nitrogen) umbilical at the LAB1O1 UIP (Utility Interface Panel). *[A looped GN2 umbilical was flown on mission ULF 1.1. It was built for the ARIS-EXPRESS Kit but was flown on loan for temporary use on the OGS (Oxygen Generation System) rack. The OGS rack no longer requires continued use of the umbilical and so it was removed for installation on ER-2 to replace an older configuration of the umbilical which was being used on the Rack. The ARIS (Active Rack Isolation System) kit baseline calls-out the use of the looped GN2 umbilical.]*

FE-1 Lonchakov had an hour to himself for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residence, if she/he chooses to take it.

At ~2:20pm, the crewmembers convened for their standard bi-weekly teleconference with the JSC Astronaut Office (Steve Lindsey), via S-band S/G-2 audio & phone patch.

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this “Gateway” website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the

Earth from space, with 324,812 from the ISS alone).

Current Time Differences: EDT/Moscow – 7 hrs; CDT/Moscow – 8 hrs (until 11/2).

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

10/29/08 -- Progress 30P reboost
11/02/08 -- *Daylight Saving Time (DST) ends*
11/14/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/16/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/29/08 -- STS-126/Endeavour/ULF2 landing
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 10/26/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – rest day for CDR Fincke, FE-1 Lonchakov, FE-2 Chamitoff. Ahead: Week 1 of Increment 18,-- and Spanky & crew are off to a fine start.*

CDR Fincke ended his FD15 (Flight Day 15) session with the NASA/JSC experiment NUTRITION w/Repository, his first, by collecting a final urine sample upon wakeup for storage in the MELFI (Minus-Eighty Laboratory Freezer for ISS), Dewar 1/Tray B.. The sampling kit was then stowed away. Mike's next activity with this experiment will be the FD30 session. *[The current NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R +30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

The new crew performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the SM (Service Module) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

As part of the house cleaning, Yuri conducted regular maintenance inspection & cleaning on fan screens in the FGB (TsV2), DC-1 (V3) and SM (VPkhO, VPrK, FS5, FS6 & FS9).

FE-1 Lonchakov also performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP-Moscow. Additionally, the FE-1 today checked up on the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem, gathering weekly data on total operating time & "On" durations for reporting to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The three station residents had their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop), Yuri at ~8:45am, Greg at ~10:05am, Mike at 1:30pm.

The crew executed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

[Maximum speed for TVIS in motorized mode is not to exceed 16.1 km/h. SPDs (Subject Positioning Devices) are required for the first seven exercise sessions for the CDR and FE-1 for safety.]

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

Significant Events Ahead (all dates Eastern Time, some changes possible.):

10/26/08 -- Daylight Saving Time ended in Europe & Russia

10/29/08 -- Progress 30P reboost

11/02/08 -- Daylight Saving Time (DST) ends

11/15/08 -- STS-126/Endeavour/ULF2 launch -- MPLM Leonardo, LMC

11/17/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit (*UNDER REVIEW*)

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

12/01/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.) (*UNDER REVIEW*)

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 10/25/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – light-duty day for CDR Fincke, FE-1 Lonchakov & FE-2 Chamitoff.*

The crew's work/sleep cycle is back on the regular schedule: wake-up – 2:00am EDT, sleeptime – 5:30pm.

First activity this morning for CDR Fincke was to start on his Flight Day 15 session with the NASA/JSC experiment NUTRITION w/Repository. This was an all-day session, the first for Mike, of collecting urine samples several times for 24 hrs, to continue through first void tomorrow morning. *[After performing phlebotomy with the help of FE-2 Chamitoff, i.e., drawing blood samples (from an arm vein), the samples were first allowed to coagulate in the Repository for 20-30 minutes, then spun in the HRF RC (Human Research Facility/Refrigerated Centrifuge) and finally placed in MELFI (Minus-Eighty Laboratory Freezer for ISS). No thruster activity was allowed during the blood drawing. The RC was later powered off after a temperature reset to limit wear on the compressor, and cleaned. The NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by supercold MELFI dewars), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

At ~10:00am EDT the crewmembers conducted their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-Houston and TsUP-Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

Gregory filled out the regular FFQ (Food Frequency Questionnaire), his 17th, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

Mike Fincke, joined later by Greg Chamitoff, conducted his first VolSci (Voluntary Science) program, an EPO (Education Payload Operations) session with “Buzz Lightyear”, i.e., shooting a video of the Buzz Lightyear doll demonstrating aspects of working and living in the space environment by showing how micro-G affects familiar objects and activities.

Yuri Lonchakov performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The E18 crew executed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1). *[Maximum speed for TVIS in motorized mode is not to exceed 16.1 km/h. SPDs (Subject Positioning Devices) are required for the first seven exercise sessions for the CDR and FE-1 for safety.]*

Afterwards, Greg transferred the exercise data file to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Weekly Science Update (*Expedition Seventeen/Eighteen -- Week 27*)

3-D SPACE: In progress.

ALTCRISS (*Alteino Long Term monitoring of Cosmic Rays on the ISS*): Close-out activities for Inc 17-ALTCRISS were performed on 10/14. Passive dosimeters and

memory cards were returned on 16S.

ANITA (Analyzing Interferometer for Ambient Air): Continuing.

BCAT-3/4 (Binary Colloidal Alloy Test 3/4): After the 10/23 EarthKAM troubleshooting, BCAT-4 is looking forward to continuing homogenization and photography of sample 3. The homogenization of samples 8, 9 and 10 remains on the task list if not completed along with the sample 3 operations.

BIO-4: With 17S, a package of 3 Biology experiments were launched (i.e. ROALD, XENOPUS, BASE-B/-C) using the KUBIK incubators. On 10/14, KUBIK 1 & 2 were activated and temperatures were set: +21deg C for KUBIK-1 (to support XENOPUS) and +37deg C for KUBIK-2 (to support ROALD). XENOPUS experiment containers were installed upon transfer from Soyuz and activated on 10/14/11:20am EDT. ROALD experiment containers were installed, and the centrifuge was activated around 10/14/11:33am. The ROALD experiment is controlled by an automated timeline which commands the different fixation points in time. Containers with fixed samples are then transferred to MELFI. The first insertion into MELFI was performed around 10/14/2:40pm, and the second insertion was performed some hours later around 10/14/4:15pm. The next day, the third transfer was also performed as planned and samples were inserted into MELFI around 10/15/2:16pm. The fourth and final transfer for ROALD has been nominally performed on 10/16 at around 2: 06pm. For the XENOPUS experiment, the crew performs a daily ventilation of the KUBIK. The containers for the BASE-B/-C experiment were kept in Soyuz to allow for stable temperature conditions. The experiment started on 10/18, with KUBIK-3 setup on 10/17. The experiment was installed in KUBIK-3 20min later than expected, but this has no science impact. Only one BioKit could be packed on the undocking day and the other had to be packed the day before so BASE-B/-C rearrangements were made and this was sent up via radiogram. On 10/22 the first BASE-B/-C BioKit was transferred into the Soyuz for return. Transfer of second BioKit for BASE-B/-C and closeout and transfer of XENOPUS for 16S return.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): "Mike, you are currently scheduled to complete your first CCISS two- day activity next week."

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System):
Samples returned on 1J.

CSI-2/CGBA-5 (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus 5): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): Due to safety concerns identified for the PLEGPAY instrument (when operated in Plasma Discharge mode), the entire EuTEF platform was put in survival mode on 9/1 at around 11:00am EDT (just prior to 29P undocking). Since then, the EuTEF power feeder#1 has been deactivated and no science acquisition is possible. Request has been approved for intermittent activation for 3 of the 9 EUTEF payloads. EuTEF platform power feeder#1 has been re-activated for 8-hrs periods on 10/17, 10/19 and 10/21. Planned re-activation on 10/23 was skipped because of 16S undocking. This intermittent re-activation protocol will continue every other day until safety issues are solved with the PLEGPAY instrument. This only mitigates the science loss for the EXPOSE, DOSTEL and MEDET instruments. The situation implies significant loss of science return for all EUTEF payloads. The activity to delete Experiment 1 from the memory of PLEGPAY was planned for 10/22 but was cancelled and is now planned for 10/24. Once this activity is done the rest of the EuTEF instruments will be able to resume normal operations.-- DEBIE-2: Inactive;-- DOSTEL: Inactive, part of proposed intermittent activation;-- EuTEMP: Inactive;-- EVC: Inactive;-- EXPOSE: Inactive, part of proposed intermittent activation;-- FIPEX: Inactive; -- MEDET: Inactive, part of proposed intermittent activation; -- PLEGPAY: Inactive;-- TRIBOLAB: Inactive.

FSL (Fluid Science Laboratory): FSL is nominal.

GEOFLOW: In progress.

HDTV System Test DL (JAXA): JAXA tried to downlink the missed images but failed. So, a tape was added which was on the return manifest for ULF-2.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: “Thanks for your participation in Integrated Immune. The information you gave during the 17S session helped the ground teams to better organize the session and determine exact on-orbit hardware availability. We look forward to future sessions.”

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): In progress.

Marangoni Experiment for ISS (JAXA Fluid Physics Experiment Facility): The Marangoni Experiment has been completed, with the exception of the HDD (Hard Disk Drive) exchange. The PI team decided not to conduct the experiment further, because of the lack of the silicon oil buffer. Although the liquid bridge occurred, the PI is very satisfied with the results.

Micro-G Clay (JAXA EPO): Complete.

MISSE (Materials ISS Experiment): Ongoing.

Moon Photography from ISS (JAXA EPO): Complete.

MOP (Motion Perception in Zero-G): Daily MOP questionnaires completed by the Space Flight Participant. Downloaded on 16S.

MSG-SAME (Microgravity Science Glovebox): Complete.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 “Pirs”.

MULTIGEN-1: Completed.

MUSCLE-G (LBP/Low Back Pain): Daily MUSCLE questionnaires completed by the Space Flight Participant. Downloaded on 16S.

NOA-1/-2 (Nitric Oxide Analyzer, ESA): NOA return items have been pre-packed for 16S return.

NUTRITION w/REPOSITORY: In progress.

PADLES (Passive Dosimeter for Lifescience Experiment in Space): In progress.

PCRF (Protein Crystallization Research Facility) Reconfiguration (JAXA):
Complete.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems):
Ongoing.

SAMPLE: Complete.

SHERE (Shear History Extensional Rheology Experiment): Complete.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): “Greg, you have completed all your Increment 17 Sleep Activities. For Increment 18, you will have: one more Actiwatch download/initialization session, one more week of Sleep logging to make up for the lost week, and then doffing the Actiwatch on the Shuttle. Mike, thanks for donning the Actiwatch and completing the download and initialization activity. Your remaining activities for Increment 18 include: Monthly downloading of the Actiwatches, 3 weeks of Sleep logging, and doffing the Actiwatch before leaving. Additional Sleep logging is above and beyond and greatly appreciated by the PI.”

SOLAR (Solar Monitoring Observatory): The last Sun visibility window ended on 10/04. The instruments operated nominally, with the exception of SOLACES which encountered a synchronization problem for its two micro-controllers units. Next Sun observation window is planned to start on 10/28.-- SOVIM: waiting for the Sun;-- SOLSPEC: waiting for the Sun;-- SOLACES: waiting for the Sun.

SOLO (Sodium Loading in Microgravity): The low sodium diet (i.e. session#2) was ended in the evening of 10/13. The impact on science interpretation of second body mass measurement performed on 10/14 after crew had breakfast and midday meal is under analysis.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite):
Reserve.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (*Waving and Coiling of Arabidopsis Roots at Different g-levels*): Completed.

CEO (*Crew Earth Observations*): Through 10/23 the ground has received a total of 10,302 frames of CEO images for review and cataloging (almost 1,600 frames in the last week alone). Photos with times corresponding to our CEO target request times are reviewed first and since our last report included: Two Hearted River Forest Reserve, MI (target not acquired due to clouds but excellent context views of the Sudbury and Wanapitei Impact site were acquired coincidentally); Sakura-jima Volcano, Japan (31 frames under review); Mount Unzen (31 frames under review); N Mariana Islands & Guam (8 frames - under review); Arkeno Impacts (27 frames - several best-ever frames acquired); Coweeta Forest, North Carolina (34 frames - under review); Tigris-Euphrates Delta (42 frames - target confirmed, still under review); Lake Nasser, Toshka Lakes, Egypt (28 frames - target confirmed, still under review); Santa Barbara Coast (43 frames – target acquired – under review); Volcan Colima (27 frames under review); and East Haruj Megafans (46 frames under review). “Your response this week to our target requests has been just tremendous! Thanks for your enthusiasm and excellent imagery. More feedback will come as we complete our reviews. Your beautifully detailed image of desert erosional features in central Libya will be published on NASA/GSFC’s Earth Observatory website this weekend. Your image acquired in August provides an excellent illustration of the complex history of erosional processes by both air and water that have formed the modern Libyan landscape.”

CEO (*Crew Earth Observations*) photo targets uplinked for today were **Aral Sea** (*DYNAMIC EVENT: The dramatic retreat and disappearance of the Aral Sea has been documented in Astronaut photography for decades now. ISS had a nadir pass in late morning light under clear skies. Just after the station tracked over the northern edge of the Caspian Sea, Greg & Mike were to try for oblique contextual views of the Aral region followed by nadir views of the individual remaining pools of this once large water body*), and **Madrean Sky Islands** (*this target is located in the northern reaches of Mexico’s Sierra Madre Occidental which boast some of the richest biodiversity anywhere in North America. The “Sky Islands” are a veritable archipelago of cool, moist, higher-altitude pine-oak forested mountain ranges that dot the hot deserts of southern Arizona New Mexico northwestern Mexico. These climatological islands, situated in remote and rugged areas, are being heavily modified by logging. This fair-weather pass, just after midday, was well to the northeast of most of the target area and should have been well suited for broad contextual views to be used in the future for pinpointing specific features to photograph. After crossing the upper Grand Canyon, Greg & Mike were to look*

right of track).

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

10/26/08 – *Daylight Saving Time ends in Europe and Russia*
10/29/08 -- Progress 30P reboost
11/02/08 -- *Daylight Saving Time (DST) ends in US*
11/15/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/17/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit (*UNDER REVIEW*)
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
12/01/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.) (*UNDER REVIEW*)

ISS On-Orbit Status 10/24/08

All ISS systems continue to function nominally, except those noted previously or below. Full rest day for the Inc-18 crew of CDR Michael Fincke, FE-1 Yuri Lonchakov and FE-2 Gregory Chamitoff.

Yest posadka! (*We have Landing!*) Welcome back home, Sergey Volkov, Oleg Kononenko, and Richard Garriott! After 199 days in space (197 docked to ISS), Soyuz TMA-12/16S, carrying two-thirds of the Expedition 17 crew plus the US SFP (10 days in space), **landed successfully** last night at ~11:37pm EDT in the steppes of Kazakhstan, with the crew in excellent condition. *The crew was transported to Kustenai, Kazakhstan via helicopter and departed for Star City, where they were received by a large gathering of guests, including Roskosmos Head Perminov (see JvP photo, below).]*

The crew's work/sleep cycle is shifting towards more regular times: Wake-up – 9:00am EDT (from 11:45pm last night), sleeptime – 5:30pm.

CDR Fincke set up the Kenwood amateur radio equipment and conducted a ham radio pass at ~1:10pm EDT with Scuola Media Statale Donato Forlani, Conversano, Italy

Due to the shortened work day, the crew completed an abbreviated physical workout program on the TVIS treadmill (FE-1), and RED resistive exercise device (CDR, FE-2). For their first seven runs on the TVIS, Mike & Yuri are using SPDs (Subject Positioning Devices) for safety.

Afterwards, Greg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

The CDR set up NASA's NUTRITION/Repository experiment hardware for his first session of urine & blood sampling scheduled tomorrow. For the phlebotomy (blood sample draw), Mike has to start fasting 8 hrs before, i.e., tonight, with only water consumption allowed. *[The Clinical Nutritional Assessment profile currently required on all U.S. Astronauts, collects blood and urine samples preflight and postflight. NUTRITION expands this protocol by also capturing inflight samples and an additional postflight sample. Furthermore, additional measurements are included for samples from all sessions, including additional markers of bone metabolism, vitamin status, and hormone and oxidative stressor tests. The results will be used to better understand the impact of countermeasures (exercise and pharmaceuticals) on nutritional status and nutrient requirements. The Clinical Nutritional Assessment profile (MR016L), first started on two Mir crewmembers and then on all ISS US crews, nominally consists of two pre-flight and one post-flight analysis of nutritional status, as well as an in-flight assessment of dietary intake using the FFQ (Food Frequency Questionnaire). The current NUTRITION project expands MR016L testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI/Minus Eighty Degree Celsius Laboratory Freezer for ISS), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

Lonchakov performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Currently carried open on Greg Chamitoff's "job jar" task list are four jobs, at his discretion:

- FSL-VMU (Fluid Science Laboratory/Video Management Unit) troubleshooting (requires 2 hrs advance notice to COL-CC/Oberpfaffenhofen),
- BLB-INC-ECS (Biolab Incubator Experiment Containers) exchange (requires 2 hrs advance notice to COL-CC/Oberpfaffenhofen),
- BCAT-4 (Binary Colloid Alloy Test 4) sample homogenizing
- MSG (Microgravity Science Glovebox) Glove Ring search and separation into old/expired & new units.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

11/02/08 -- Progress 30P reboost; *Daylight Saving Time (DST) ends*
11/14/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/16/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit (*UNDER REVIEW*)
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking

ISS On-Orbit Status 10/23/08

All ISS systems continue to function nominally, except those noted previously or below. *Day 10 of joint E17/18 operations. **Last day in space for CDR Volkov, FE-1 Kononenko, SFP Garriott.***

The crew's work/sleep cycle remains shifted for the Soyuz undocking: Wake-up – 8:00am EDT (from 10:00pm last night), sleeptime – 11:45pm.

For the biomed experiment INTEGRATED IMMUNE (Validating Procedures for Monitoring Crew member Immune Function), CDR-18 Fincke and FE-2 Chamitoff performed their Blood Collection and final Liquid Saliva collection, assisting each other for the blood draws. The Saliva Return Pouches and Blood Sleeves were then stored at ambient temperature on the Soyuz for return to ground. *[IMMUNE protocol requires the collection to occur first thing post-sleep, before eating, drinking and brushing teeth, and all samples are stored at ambient temperature. Along with NUTRITION (Nutritional Status Assessment), INTEGRATED IMMUNE samples & analyzes participant's blood, urine, and saliva before, during and after flight for changes related to functions like bone metabolism, oxidative damage and immune function to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects.]*

The FE-2 retrieved and stowed the four passive FMK (Formaldehyde Monitoring Kit) sampling assemblies deployed by him on 10/21 in the Lab (at P3, below CEVIS) and Service Module (SM, at the most forward handrail, on panel 307), to catch any atmospheric formaldehyde on a collector substrate for subsequent analysis on the ground. *[Two monitors each are usually attached side by side, preferably in an orientation with their faces perpendicular to the direction of air flow.]*

In preparation for the Soyuz departure tonight, Gregory also ensured proper closure of the protective window shutters in the Lab and Kibo module and powered down the SM Kenwood ham radio equipment, to prevent RF interference with the Soyuz

radio comm.

Oleg Kononenko & Yuri Lonchakov closed out and transferred the last Russian biotech payloads for return on TMA-12. *[Specifically: BIO-4 (Xenopus & BBC) BTKh-6, BIO-12/ REGENERATION, BTKh-29 (ZHENSHEN-2/Ginseng-2), BTKh-10/ KONYUGATSIYA, TKhN-9 (KRISTALLIZATOR/Crystallizer), BTKh-1,-2, & -4 (GLICOPROTEID/Glycoprotein, MIMETIK-K, KAF, VAKTSINA-K/Vaccine), and BTKh-14/BIOEMULSION.]*

Mike Fincke performed some troubleshooting for EarthKAM, after ground testing indicated that the EKAM Flight Software (FSW) does not download camera images when image processing within the camera takes longer than ~2.5-seconds.

With Soyuz TMA-12 no longer available as contingency CRV (crew return vehicle) for the coming Increment, Lonchakov transferred its three Emergency Procedures ODF (DAS EhP) books to the new CRV, TMA-13, docked at the FGB nadir port.

After several hours of final cargo transfers, CDR Volkov updated the IMS (Inventory Management System) with the transfer data.

In the JAXA Kibo JPM (JEM Pressurized Module), Gregory turned off the Argon gas supply from the CGSE (Common Gas Support Equipment) Upper GBUs (Gas Bottle Units).

Fincke collected the Actiwatch device of the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) study from VC-15 Garriott for temporary stowage. After downloading the data from his own Actiwatch to the HRF-1 (Human Research Facility 1) laptop for subsequent downlink, Chamitoff also stowed his, Mike's and the FE-1's devices and turned off the SLEEP software. *[To monitor his sleep/wake patterns and light exposure, crewmembers don the special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout this run. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

Preparations for the undocking will begin at about 3:00pm, with Volkov de-installing a lighting fixture (SD1-5M) from the Soyuz Orbital Module, for later reuse.

The CDR then enters the 16S Descent Module and performs the standard pre-undocking communications check, as Lonchakov in the SM configured the STTS comm system for undocking.

With the returning crewmembers all ingressed in the Soyuz spacecraft, Sergey & Oleg are to activate the spacecraft (~3:55pm), followed by closing the Soyuz and

DC1 hatches, assisted by Mike Fincke and Greg Chamitoff. The departing Soyuz crew then starts the standard one-hour leak check on the Soyuz-to-DC1 vestibule.

The return to Earth of the TMA-13 spacecraft tonight will proceed along the following general event sequence (all times EDT):

- ISS attitude control handover to RS --- 6:20pm;
- ISS in free drift for DC-1 hooks open --- 6:40pm;
- ISS in free drift for undocking --- 8:12:30pm;
- Hooks Open command --- 8:13:30pm; automatic undocking from DC-1 on DO15;
- **Separation springs action** (delta-V ~0.12 m/sec) --- 8:16:30pm;
- Manual separation burn (15 sec, ~0.54 m/sec) --- 8:19:30pm;
- ISS attitude control handover to US --- 9:55pm;
- Deorbit Burn start (delta-V 115.2 m/sec) --- 10:45:24pm;
- Deorbit Burn complete --- 10:49:44pm
- **Tri-Module separation** (140 km) --- 11:10:34pm;
- Atmospheric entry (102 km, with ~170 m/sec) --- 11:13:32pm;
- Max G-load (34 km alt) --- 11:20:09pm;
- Parachute deploy command (10.7 km alt) --- 11:22:04pm;
- **16S Landing** (DO1) --- 11:37pm EDT; 6:37am Moscow DMT (10/24); 9:37am local Kazakhstan (10/24);
- Local Sunset --- 7:18am (10/24), 6:18pm local.

[Note: Kazakhstan time = GMT+6h; EDT+10h. Moscow DMT = EDT+7h.]

Prior to starting their sleep period at ~11:45pm, the remaining ISS crewmembers are to complete a number of post-undocking tasks:

- Downlinking the TV footage of the spacecraft departure to the ground,
- Disassembling the TV equipment which covered the spacecraft departure and returning its component to their regular places,
- Turning off the KUBIK-1 & -3 thermostatic containers,
- Performing the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM,
- Conducting the daily IMS (Inventory Management System) updating/editing,
- Completing the periodic checkout/verification of IP-1 airflow sensors in the various RS hatchways, and
- Initializing the SLEEP Actiwatch for Greg Chamitoff from the HRF-1 laptop,

The E18 crew also completes an adjusted physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR-18, FE-1-18), and RED resistive exercise device (FE-2).

Afterwards, Greg transfers the exercise data file to the MEC (Medical Equipment

Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

CEO (Crew Earth Observations) photo targets uplinked for today were **East Haruj Megafans** (*ancient, now defunct rivers [sourced in the Tibesti Mountains to the south of the site when the Sahara Desert was much wetter] have laid down vast spreads of sediment as a series of large fans hundreds of km long and wide. As rivers shifted position they produced networks of criss-crossing stream channels covering the entire surface of megafans. Earth's megafans may be the best analog for widespread "intercrater plains" on Mars. This analog is being applied for the first time in ongoing research*), and **Georgia Coastal Ecosystems** (*the study area is a barrier island and marsh complex located on the central Georgia coast in the vicinity of Sapelo Island, located between Savannah and Jacksonville), and Sevilleta Wildlife Area, New Mexico (the Sevilleta Wildlife Area is primarily situated near either side of the Rio Grande River in central New Mexico. Detailed mapping views along the ISS track were requested.*

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

11/02/08 -- **Daylight Saving Time (DST) ends**
11/14/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/16/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit (*UNDER REVIEW*)
11/26/08 -- Progress M-66/31P launch
11/29/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.) (*UNDER REVIEW*)
11/30/08 -- Progress M-66/31P docking
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 10/22/08

All ISS systems continue to function nominally, except those noted previously or below. *Day 9 of joint E17/18 operations (last full day for Volkov, Kononenko, Garriott).*

Day/night cycle: Wake-up – 1:00am, followed by **short sleep period from 9:00am-1:00pm**, for second sleeptime at 10:00pm tonight (until 8:00am tomorrow morning).

FE-2 Chamitoff and CDR-18 Fincke conducted their second standard 30-min Shuttle RPM (R-bar Pitch Maneuver) skill training, using the NIKON D2Xs digital still camera with 400 & 800mm (by teleconverter) lenses at SM (Service Module) windows 6 & 8 (facing in flight direction) to take CEO (Crew Earth Observations) target imagery with manual focusing. The practice run involved mapping of ground features with images having 40-50% overlap and about 20 images in each sequence. Afterwards, the obtained OBT (onboard training) images were downlinked by Gregory to the ground for analysis (~3:55am). *[The RPM drill prepares crewmembers for the bottom-side mapping of the Orbiter at the arrival of the Shuttle (STS-126/Endeavour/ULF2 on 11/16. During the RPM at ~600 ft from the station, the “shooters” have only ~90 seconds for taking high-resolution digital photographs of all tile areas and door seals on Discovery, to be downlinked for launch debris assessment. Thus, time available for the shooting will be very limited, requiring great coordination between the two headset-equipped photographers and the Shuttle pilot.]*

Floating in the Soyuz TMA-12/16S Orbital Module (BO), CDR Volkov dismantled and removed the LKT local temperature sensor commutator (TA251MB) of the BITS2-12 onboard telemetry system, along with its PZU-1M ROM (read-only memory) unit, now no longer required since the BO is to be jettisoned before 16S reentry. *[The electronics was stowed on ISS for reuse in a future Progress vehicle.]*

FE-1 Kononenko terminated the charging of the TTM-2 and “Kelvin-Video” batteries and checked out the equipment for another run of the Russian KPT-2 science

payload BAR-RM. Afterwards, data gathering started using the RSE-1 laptop, with downlinking via BSR-TM channel. *[Objective of the payload is to experiment with ISS leak detection based on environmental data anomalies (temperature, humidity, and ultrasound emissions) at leak locations. The payload uses a remote infrared thermometer (Kelvin-Video), a thermohygrometer (Iva-6A), a heat-loss anemometer/thermometer (TTM-2), an ultrasound analyzer (AU-01), and a leak detector (UT2-03) to determine physical background signs of loss of ISS pressure integrity which could be indicative of leaks in the working compartments of the station. Measurements are taken in specific zones (13 in SM PkhO and 4 in DC1), both with lights & fans turned on and off.]*

FE-1-18 Lonchakov conducted an observation & operations checkout on the KPT-3 aerial photography equipment for Russia's Environmental Safety Agency (EKON), which uses the NIKON D2X camera to document environmental conditions in Russia.

Kononenko later used the Russian IPD-NH₃ Draeger tubes, on a cartridge belt with a pump, to check the cabin air for NH₃ (ammonia, from possible urine spillage), followed by the periodic air sampling with the AK-1M adsorber around the SM work table. The samplers were stowed in the Soyuz 16S Descent Module for analysis on the ground.

Major science activities in the RS (Russian Segment) by Oleg Kononenko & Yuri Lonchakov today concerned the biotechnical/biomedical payloads BIO-12/ REGENERATION with its two PLANARIA containers, BTKh-31 (ANTIGEN), KUBIK-3 (set On to +6 degC), BTKh-8 (BIOTREK), which the Flight Engineers transferred from the SM to the Soyuz for return to Earth, and ESA's BIO-4 (ventilating the BIO-4 sample in the thermostatic container KUBIK-1).

VC-15 Richard Garriott, assisted in part by Russian crewmembers, worked on his daily onboard program which today included –

- SLEEP Actiwatch logging;
- Phone tagup with consultant team at TsUP via VHF-1;
- SSTV (Slow-Scan TV) ham session (City of Shchelkovo)
- PCG (Protein Crystal Growth) photography;
- PCG transfer to Soyuz;
- Video blogs;
- Earth photography; and
- Copying data & image files to HDD (Hard Disk Drive) for return.

In preparation for STS-126/ULF-2 arrival and the MPLM (Multi-Purpose Logistics Module) Leonardo docking with the SSRMS (Space Station Remote Manipulator

System), Chamitoff & Fincke installed the CBCS (Centerline Berthing Camera System) at the Node-2 Nadir hatch, powered it up and checked it out. Afterwards, the CBCS electronics cables were disconnected to avoid hatch “dragthroughs”.
[Should there be any changes to the CBCS configuration between now and ULF-2, another CBCS checkout may be required. Leonardo will be transferred from the Shuttle cargo bay with the SSRMS and berthed at the Node-2 Nadir Port CBM (Common Berthing Mechanism).]

In addition, Gregory performed a checkout of the nadir CBM (Common Berthing Mechanism) in Node-2.

Also for ULF-2, Greg & Mike worked ~2:35h in the US Airlock, preparing EVA (Extravehicular Activity) tools for the planned four spacewalks, including configuring the gear, CL (Crewlock) bags, the Large ORU (Orbit Replaceable Unit) bag, the Staging Bag, and Grease Guns for the SARJ (Solar Array Rotary Joint) repair activities. (See below for More on this).

FE-1-18 Lonchakov took the periodic readings of potentially harmful atmospheric contaminants in the SM, using the CMS (Countermeasure System), a component of the SKDS GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, today using preprogrammed microchips to measure for Isopropanol (“rubbing alcohol”, C_3H_8O), Methanol (“wood alcohol”, CH_3OH) and Toluene (methylbenzene, C_7H_8).

Additionally, Yuri performed the periodic checkout/verification of IP-1 airflow sensors in the various RS (Russian Segment) hatchways, including the passageways SM PrK (Transfer Compartment) – RO (SM Working Compartment), PkhO (SM Transfer Tunnel) – RO, PkhO – DC1, PkhO – FGB PGO, FGB PGO – FGB GA, and FGB GA–Node-1.

CDR-18 Fincke meanwhile conducted the periodic atmospheric sampling in the center of the Lab, SM and COL (Columbus Orbital Laboratory) with the U.S. GSCs (Grab Sample Containers), except for #1041.

Kononenko completed the periodic collection of air samples, including checking for Freon, in the SM & FGB using the AK-1M adsorber, recording date, time & location. Kits and pouches were then stowed for return to Earth

The FE-1 also used the standard ECOSFERA equipment, set up yesterday, to conduct microbial air sampling runs for the MedOps SZM-MO-21 experiment, with the POTOK Air Purification System temporarily powered down, taking samples from cabin surfaces along with samples from crewmembers for sanitation and disease studies. The sample tubes were then stowed in the Kriogem-03 refrigerator for

return on TMA-11. *[The equipment, consisting of an air sampler set, a charger and power supply unit, provides samples to help determine microbial contamination of the ISS atmosphere, specifically the total bacterial and fungal microflora counts and microflora composition according to morphologic criteria of microorganism colonies.]*

After the short sleep period, Yuri will conduct the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM.
[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

Oleg is to take care of the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Volkov & Kononenko have their regular pre-descent PMCs (Private Medical Conferences), Oleg at 3:10pm EDT, Sergey at 3:40pm.

Sergey and Oleg will be finishing up packing and stowing return cargo on 16S, and Mike & Greg have additional time reserved for continuing pre-packing for ULF-2.

The crew executes their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR-18, FE-2), TVIS treadmill (CDR/2.5h, FE-1/2.5h), and RED resistive exercise device (FE-1-18, FE-2) and VELO bike with bungee cord load trainer (FE-1-18).

Later, The FE-2 transfers the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~1:30pm EDT, Gregory sets up the G1 video camcorder with MPC (Multipurpose Converter) and IPU (Image Processing Unit), and at ~1:40pm the combined ISS crews conducted their traditional **Change-of-Command** ceremony, as Expedition 17 crewmembers Sergey Volkov & Oleg Kononenko turn ISS operations over to the Expedition 18 crew of Michael Fincke, Yuri Lonchakov and Gregory Chamitoff. With this, stewardship of the space station is officially transferred to the new crew.

[As part of the Change-of-Command ceremony, the Russian crewmembers signed two copies of the formal Russian handover protocol document certifying RS handover/acceptance. The first copy remains on ISS, the second copy will be

returned to the ground on Soyuz TMA-12.]

EVA/EMU Preparations: Mike Fincke & Greg Chamitoff were lauded by MCC-H spacewalk specialists for “a great job getting the suits ready for ULF2 despite the difficulties in locating some of the parts. We appreciate your patience in helping us get the airlock sorted out and ready for EVA.” Today’s job for Mike & Greg: inspecting the large EVA trash bag, prepping and modifying the trigger throw on the SARJ (Solar Array Rotary Joint) grease guns and starting tool configuration for EVA 1. Today’s timeline has 2hr 35min reserved for tool config, plus there are 2 more hours scheduled on 11/6 to complete the ULF2 preparations/EVA tool configuring.

16S Return to Earth: The return to Earth of the TMA-12 spacecraft is planned to proceed along the following approximate event sequence (all times EDT):

- ISS attitude control handover to RS --- 6:20pm;
- ISS in free drift for DC-1 hooks open --- 6:40pm;
- ISS in free drift for undocking --- 8:12pm;
- Hooks Open command --- 8:13:30pm; automatic undocking from DC-1 on DO15;
- Separation springs action (delta-V ~0.12 m/sec) --- 8:16pm;
- Manual separation burn (15 sec, ~0.54 m/sec) --- 8:19pm;
- ISS attitude control handover to US --- 9:55pm;
- Deorbit Burn start (delta-V 115.2 m/sec) --- 10:45:19pm;
- Deorbit Burn complete --- 10:49:41pm
- Tri-Module separation (140 km) --- 11:10:31pm;
- Atmospheric entry (102 km, with ~170 m/sec) --- 11:13:29pm;
- Max G-load (34 km alt) --- 11:20:12pm;
- Parachute deploy command (10.7 km alt) --- 11:22:04pm;
- 16S Landing (DO1) --- 11:37pm EDT; 6:37am Moscow DMT (10/24); 9:37am local Kazakhstan (10/24);
- Local Sunset --- 7:18am (10/24), 6:18pm local.

[Note: Kazakhstan time = GMT+6h; EDT+10h. Moscow DMT = EDT+7h.]

What the Soyuz TMA-12 crew will experience during their reentry/descent tomorrow (10/23):

For the reentry, Volkov, Kononenko and Garriott will wear the Russian Kentavr anti-G suit. *[The Kentavr garment is a protective anti-g suit ensemble to facilitate the return of a long-duration crewmember into the Earth gravity. Consisting of shorts, gaiters, underpants, jersey and socks, it acts as countermeasure for circulatory disturbance, prevents crewmember from overloading during descent and increases orthostatic tolerance during post-flight adaptation. Russian crewmembers are also advised to ingest fluid-electrolyte additives, viz., three sodium chloride tablets*

during breakfast and after the midday meal, each time with 300 ml of fluid, and two pills during the meal aboard Soyuz before deorbit.]

Before descent:

Special attention will be paid to the need for careful donning of the medical belt with sensors and securing tight contact between sensors and body.

During preparation for descent, before atmosphere reentry, crewmembers settle down comfortably in the Kazbek couches, fasten the belts, securing tight contact between body and the seat liner in the couch.

During de-orbit:

Dust particles starting to sink in the Descent Module (SA) cabin is the first indication of atmosphere reentry and beginning of G-load effect. From that time on, special attention is required as the loads increase rapidly.

Under G-load effect during atmosphere reentry the crew expects the following experience:

Sensation of G-load pressure on the body, burden in the body, labored breathing and speech. These are normal sensations, and the advice is to "take them coolly". In case of the feeling of a lump in the throat, this is no cause to "be nervous". This is frequent and should not be fought. Best is to "try not to swallow and talk at this moment". Crew should check vision and, if any disturbances occur, create additional tension of abdominal pressure and leg muscles (strain abdomen by pulling in), in addition to the Kentavr anti-G suit.

During deployment of pilot parachute (0.62 & 4.5 square meters), drogue chute (16 sq.m.) and main (518 sq.m.) chutes the impact accelerations will be perceived as a "strong snatch". No reason to become concerned about this but one should be prepared that during the parachutes deployment and change ("rehook") of prime parachute to symmetrical suspension, swinging and spinning motion of the SA occurs, which involves vestibular (middle ear) irritations.

It is important to tighten restrain system to fasten pelvis and pectoral arch. Vestibular irritation can occur in the form of different referred sensations such as vertigo, hyperhidrosis, postural illusions, general discomfort and nausea. To prevent vestibular irritation the crew should "limit head movement and eyes movement", as well as fix their sight on motionless objects.

Just before the landing (softened by six small rocket engines behind the heat shield):

Crew will be prepared for the vehicle impact with the ground, with their bodies fixed along the surface of the seat liner in advance. "Special attention should be paid to arm fixation to avoid the elbow and hand squat" (instruction). Landing speed: ~9.9

m/sec.

After landing:

Crew should not get up quickly from their seats to leave the SA. They were advised to stay in the couch for several minutes and only then stand up. In doing that, they should limit head and eyes movement and avoid excessive motions, proceeding slowly. They and their body should not take up earth gravity in the upright position too quickly.

CEO (Crew Earth Observations) photo targets uplinked for today were **Tigris-Euphrates Delta** (*ISS pass for this target is in early afternoon light with clear skies expected. As the station tracked southeastward down the Tigris-Euphrates valley, Greg & Mike were to look right of track for the delta region as they approached the NW end of the Persian Gulf. Trying for short-lens, contextual views of the area for a baseline, seasonal documentation of the state of the river and its environment*), **Lake Nasser, Toshka Lakes, Egypt** (*on this early afternoon pass with clear skies Greg & Mike had a nadir pass over the northeastern part of the CEO target area. Using the long lens settings for detailed views of northern Lake Nasser and the Aswan dam area*), **Santa Barbara Coast, California** (*this target is a Long Term Ecological Research [LTER] site centered near Santa Barbara, CA. On this early afternoon pass, clear skies were expected over the land areas as Greg & Mike approached from the NW. Using the long lens settings and looking just right of track for a detailed mapping of the Santa Inez Mountains from Lompoc in the west to just north of Ventura to the east*), and **Volcan Colima** (*less than 6 minutes after the ISS encounter with the Santa Barbara Coast target, as the station continued down the W coast of Mexico, Greg & Mike had a nadir pass over this active volcano. Actually comprised of two eruptive centers, Nevado de Colima and Volcan de Colima, this target is challenging because of diurnal cloud formation near the summits. If clouds permitted, the crew was to try for detailed views of this volcanic complex, including the cones and surrounding volcanic deposits*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

Week 27 Scheduled Main Activities:

- *Thu. (10/23):* SLEEP, IMMUNE, FMK stow, Pld xfers, Hatches closure, Soyuz undock & land; IP-1.
- *Fri. (10/24):* Ham pass, NUTRITION s/u, COL FSL VMU troubleshoot, BLB incubator ECS xchange, BCAT-4.
- *Sat. (10/25):* NUTRITION, Ham pass, WPC, FFQ, VolSci EPO, SAMS PCMCIA check, Node-1 cleanup.

- *Sun. (10/26):* NUTRITION, Station cleaning, PFCs.

ISS Orbit (as of this morning, 9:03am EDT [= epoch]):

Mean altitude -- 352.0 km

Apogee height -- 354.3 km

Perigee height -- 349.7 km

Period -- 91.58 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0003369

Solar Beta Angle -- -50.7 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 70 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56857

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

10/23/08 -- Soyuz TMA-12/16S undock (DC1 nadir, 8:16pm) & land (11:37pm) =

10/24 -- 9:37am Kazakhstan)

11/02/08 -- Progress 30P reboost; *Daylight Saving Time (DST) ends*

11/15/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/17/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit (*UNDER REVIEW*)

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

12/01/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.) (*UNDER REVIEW*)

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking

02/26/09 -- STS-119/Discovery/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress M-67/32P undocking & deorbit

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/25/09 -- Soyuz TMA-15/19S launch

05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**

07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation

10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 10/21/08

All ISS systems continue to function nominally, except those noted previously or below. *Day 8 of joint E17/18 operations.*

Day/night cycle: Wake-up – 1:00am EDT, sleeptime – 4:30pm.

Aboard the station, the E17/18 crew rotation/handover activities continued nominally, today for the last day. *[Kononenko and Lonchakov had ~1.5h between them for dedicated FE/FE handover activities, focusing today on Rodnik urine transfer and EDV water sampling, as listed in the relevant Handover (RPS) Book section 10 (SOZh). In addition, there are “generic” handovers where crewmembers are scheduled together to complete various designated standard tasks.]*

For the biomed experiment INTEGRATED IMMUNE (Validating Procedures for Monitoring Crew member Immune Function), CDR Fincke, FE-2 Chamitoff and SFP Garriott collected their third liquid, later the first dry saliva sample before breakfast. The dry saliva collection continued throughout the day today with collections occurring at five different time points. All samples were stored at ambient temperature. Gregory took three more dry samples during the day. *[IMMUNE protocol requires the collection to occur first thing post-sleep, before eating, drinking and brushing teeth, and all samples are stored at ambient temperature. Along with NUTRITION (Nutritional Status Assessment), INTEGRATED IMMUNE samples & analyzes participant’s blood, urine, and saliva before, during and after flight for changes related to functions like bone metabolism, oxidative damage and immune function to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects. The saliva is collected in two forms, dry and liquid. The dry samples are collected at intervals during the collection day using a specialized book that contains filter paper. The liquid saliva collections require that the crewmember soak a piece of cotton inside their mouth and place it in a salivette bag; there are four of the liquid collections during docked operations.]*

Upon wakeup, FE-1-18 Yuri Lonchakov terminated his first SONOKARD experiment session for the long-term Russian sleep study MBI-12, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

Fincke & Chamitoff performed the regular inspection and checkout of the HMS RSP (Health Maintenance System/Respiratory Support Pack).

Mike & Greg also had about half an hour reserved to work on the CMRS (Crew Medical Restraint System), stowed in the CHeCS (Crew Health Care Systems) rack, performing the periodic checkout and inspection of the system for upcoming standard CMO (Crew Medical Officer) proficiency training. *[The crewmembers inspected the CMRS for cracks in the board and/or metal fastener exposed on top of CMRS (found some time ago on the ground units), either of which could provide a high-voltage defibrillation ground path from the patient to ISS structure. The board-like CMRS allows strapping down a patient on the board with a harness for medical attention by the CMO who is also provided with restraints around the device. The device can be secured to the ISS structure within two minutes to provide a patient restraint surface for performing emergency medical procedures, such as during ACLS (Advanced Cardiac Life Support). It can also be used to transport a patient between the station and the Orbiter middeck. It isolates the crew and equipment electrically during defibrillations and pacing electrical discharges, accommodates the patient in the supine zero-G positions, provides cervical spine stabilization and, for a three-person crew, can also restrain two CMOs during their delivery of medical care.]*

FE-1 Kononenko & FE-1-18 Lonchakov conducted the MO-22 Sanitary-Epidemiological Status check, part of the Russian MedOps program done usually before Soyuz departures. *[To monitor for microflora, Oleg & Yuri collected samples from surface areas of interior panels and hardware at various places in the Service Module (SM), and the FGB, also from each other, using cotton swabs and special test tubes which were then stowed in 16S for return to the ground.]*

The CDR conducted an overview of the CEVIS cycle ergometer with Yuri Lonchakov to help him with the CEVIS equipment. *[This was originally supposed to happen over the weekend, but it was dropped because of conflicting activities.]*

Fincke took pictures of the S1 Radiator from the Soyuz 16S “Blister” window and SM window 13 using the 80-400mm lens. From each window, Mike shot photos at four different settings.

Yuri & Oleg also gathered water samples in the Russian Segment (RS) from the Service Module (SM) SVO-ZV Water Supply System, specifically from EDV containers filled from the ATV “Jules Verne”. All samples were prepared for return on TMA-12.

Also for return on Soyuz, Kononenko removed the SPD differential pressure indicator/dosimeter assemblies of the Matryoshka-R radiation monitoring payload and transferred them to the DM. *[Matryoshka automatically takes radiation measurements in the SM and DC-1 docking compartment for studies of on-orbit radiation and long-term dose accumulation, using six SPD dosimeters deployed throughout the RS as well as in a spherical body-simulating Matryoshka-R phantom.]*

In the JAXA Kibo JPM (JEM Pressurized Module), Chamitoff activated the JEMRMS (Japanese Experiment Module/Robotic Manipulator System), then conducted Checkout 1 on its Main Arm in space. The maneuvers were observed by the SSRMS (Space Station Remote Manipulator System) video cameras. *[After powering up the RLT (RMS Laptop), CCP (Camera Control Panel) and RMS Monitors, and adjusting settings including updating the DOUG (Dynamic Onboard Ubiquitous Graphics) laptop application with real-time data, RMS function was checked out for dynamic response, region check function, Arm Bus communication, Monitor split screen performance and RMS function. Afterwards, data were to be prepared for downlink, the Arm Bus Monitor turned off, MDP (Management Data Processor) set to Standby and all systems deactivated. Background: The externally mounted JEMRMS is composed of two arms: the 10-m-long MA (Main Arm) and a 2-m-long small fine arm (the latter to be delivered on a future mission). Both arms have six independent joints, to provide dexterity very similar to the human arm. The internal robotic control workstation, known as JEMRMS Console, is used for manipulating the RMS. Remote television cameras are mounted on both arms, enabling the crew to control the arms from inside the JPM.]*

In preparation for their return to gravity in two days, Volkov & Kononenko undertook the second session of their fifth and final training session of the Russian MO-5 MedOps protocol of cardiovascular evaluation in the below-the-waist reduced-pressure device (ODNT, US: LBNP) on the Russian VELO ergometer, assisting each other as CMO (Crew Medical Officer). The activity was then closed out. *[The one-hour assessment, supported by ground specialist tagup (VHF) and*

telemetry monitoring from Russian ground sites (at 6:11am EDT), uses the Gamma-1 ECG equipment with biomed harness, skin electrodes and a blood pressure and rheoplethysmograph cuff wired to the cycle ergometer's instrumentation panels. The Chibis ODNT provides gravity-simulating stress to the body's cardiovascular/circulatory system for evaluation of Malenchenko's orthostatic tolerance (e.g., the Gauer-Henry reflex) after several months in zero-G. The preparatory training generally consists of first imbibing 150-200 milliliters of water or juice, followed by two cycles of a sequence of progressive regimes of reduced ("negative") pressure, set at -20, -25, -30, and -35 mmHg for five min. each, then -25, -30, and -35 mmHg (Torr) for 10 min. each plus 30mmHg for 5 min. while shifting from foot to foot at 10-12 steps per minute, while wearing a sphygmomanometer to measure blood pressure. The body's circulatory system interprets the pressure differential between upper and lower body as a gravity-like force pulling the blood (and other liquids) down. Chibis data and biomed cardiovascular readings are recorded. The Chibis suit (not to be confused with the Russian "Penguin" suit for spring-loaded body compression, or the "Kentavr" anti-g suit worn during reentry) is similar to the U.S. LBNP facility (not a suit) used for the first time on Skylab in 1973/74, although it appears to accomplish its purpose more quickly.]

Working together as part of the handover program, Yuri & Oleg transferred liquid waste (urine) from EDV-U containers to the Progress 30P Rodnik BV tankage.

Gregory performed the periodic deployment of four passive FMK (Formaldehyde Monitoring Kit) sampling assemblies in the Lab (at P3, below CEVIS) and SM (at the most forward handrail, on panel 307) for two days, to catch any atmospheric formaldehyde on a collector substrate for subsequent analysis on the ground.

[Two monitors each are usually attached side by side, preferably in an orientation with their faces perpendicular to the direction of air flow.]

CDR Fincke was scheduled for cleaning the Node-1 Smoke Detector #2.

In preparation for the installation of the Regenerative ECLSS (Environmental Control & Life Support System) racks during the ULF-2 flight, Fincke also filled the MTL supply jumpers. *[The jumpers are required to be filled prior to mating them to their respective racks.]*

Major science activities in the RS (Russian Segment) by Sergey Volkov today concerned the biomedical experiment BIO-2/BIORISK kit, which the CDR transferred from the SM to the Soyuz for return to Earth, and BIO-4, ventilating the BIO-4 sample in the thermostatic container KUBIK-1. *[The four BIO-4 experiments, developed by scientists from Germany, Belgium, Switzerland, Italy and France, include research in bacterial physiology, immune cell function and*

developmental biology. Two experiments (BBB/BASE B & BBC/BASE C) study how bacteria cope and adapt in the spaceflight environment, being exposed to parameters such as microgravity, cosmic radiation, space electromagnetism and vibrations. Xenopus studies the development of cane toad tadpoles (Xenopus laevis) in spaceflight. The fourth experiment is ROALD looks at the "ROle of Apoptosis in Lymphocyte Depression". BBB, BBC & SEN will return on Soyuz TMA-12/16S.]

VC-15 Richard Garriott, assisted in part by Russian crewmembers, worked on his daily onboard program which today included –

- SLEEP Actiwatch logging;
- Phone tagup with consultant team at TsUP via VHF-1;
- SSTV (Slow-Scan TV) ham session (City of Shchelkovo)
- 2 ham radio sessions (Malaysia, Austin, TX);
- PRK Visual Acuity evaluation;
- MUSCLE-G (LBP/Low Back Pain) questionnaire;
- Video blogs;
- Earth photography; and
- Copying data & image files to HDD (Hard Disk Drive) for return.

Garriott, Chamitoff, Fincke, Volkov and Kononenko had their regular PMCs (Private Medical Conferences), via S-band/audio & Ku-band/video, Richard at ~5:45am EDT, Greg at ~10:30am, Mike at ~11:50am, Sergey at ~12:40pm, Oleg at ~1:00pm.

Sergey conducted the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the DC1-to-Soyuz tunnel, and the FGB-to-Soyuz and FGB-to-Node passageway. *[This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently six persons, and one of the two Russian SKV air conditioners still off (SKV-1), having run out of service life.]*

At ~12:20pm, Volkov & Lonchakov prepared two copies of the formal Russian handover protocol document certifying RS handover/acceptance as part of the standard Change-of-Command procedures scheduled tomorrow. *[Two copies of the ISS RS Handover Protocol were printed out for signature by Volkov, Kononenko and Lonchakov. The first copy remains on ISS, the second copy will be returned to the ground on Soyuz TMA-12.]*

CDR Volkov had another 2:25h set aside for packing return equipment for stowage on Soyuz 16S.

About 4:50hrs worth of pre-packing of return cargo was also completed by Mike Fincke for STS-126/ULF-2.\

Sergey performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Lonchakov took care of the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

At ~9:30am EDT, the crew downlinked a 20-min. PAO video message of greetings to the 16th International Space Olympiad for Schoolchildren in Korolev. *[The International Space Olympiad for Schoolchildren is conducted annually by the City of Korolev’s Council of Education jointly with RSC-Energia. This time around it’s the XVI Olympiad that is taking place from 10/15-26 in Korolev, dedicated to the 70th Anniversary of the City of Korolev and to the 45th Anniversary of Valentina N. Tereshkova’s flight to space. High school students from Korolev, Moscow Region, USA, and the UK are among the participants of the International Space Olympiad. The best of delegates will come to TsUP to see the ISS crew during a comm session.]*

For his (initial) use of the TVIS treadmill, Mike Fincke installed SPD (Subject Positioning Device) top assemblies for safety, required for his first seven TVIS uses.

The E17/18 crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-1-18, FE-2), TVIS treadmill (CDR-18), and VELO bike with bungee cord load trainer (CDR, FE-1-18). Sergey’s & Oleg’s exercise regimen today was accounted for by their Chibis/ODNT training activity.

Afterwards, Oleg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

In preparation for a microbial air sampling session scheduled tomorrow, Kononenko unstowed and set up the MedOps SZM-MO-21 ECOSFERA equipment, initiating charging on the Ecosphere power pack (BP) and activating the KRIOGEM-03 refrigerator for the samples. *[The equipment, consisting of an air sampler set, a charger, power supply unit, and incubation tray for Petri dishes, determines microbial contamination of the ISS atmosphere, specifically the total bacterial and*

fungus microflora counts and microflora composition according to morphologic criteria of microorganism colonies.]

Lonchakov set up the TTM-2 and "Kelvin-Video" batteries for charging for another operational run of the Russian KPT-2 science payload BAR-RM. Charging will be terminated tomorrow (10/22), with data gathering starting afterwards using the RSE-1 laptop, with downlinking via BSR-TM channel. *[Objective of the payload is to experiment with ISS leak detection based on environmental data anomalies (temperature, humidity, and ultrasound emissions) at leak locations. The payload uses a remote infrared thermometer (Kelvin-Video), a thermohygrometer (Iva-6A), a heat-loss anemometer/thermometer (TTM-2), an ultrasound analyzer (AU-01), and a leak detector (UT2-03) to determine physical background signs of loss of ISS pressure integrity which could be indicative of leaks in the working compartments of the station. Measurements are taken in specific zones (13 in SM PkhO and 4 in DC1), both with lights & fans turned on and off.]*

CEO (Crew Earth Observations) photo targets uplinked for today were **Mount Unzen** (*Mount Unzen volcano is located east of the city of Nagasaki. This volcano has been active during the last 10,000 years and is responsible for some pretty spectacular pyroclastic flows [fast moving currents of hot gas and rock which travel away from the volcano at speed generally greater than 80km/h]. The latest robust activity occurred from 1990-1995 when a lava dome formed at the summit and the resulting pyroclastic flows [temperatures in pf's can reach about 1,000 degrees C] were responsible for fatalities*), **Sakura-jima Volcano** (*Sakura-jima is one of Japan's most active volcanoes. It is located in a part of Kagoshima bay. In 1914 the lava from an eruption created new land that connected the former island to the Osumi Peninsula*), **N Mariana Islands & Guam** (*the Northern Mariana Islands consists of 15 islands. ISS orbital track took the station near the southern islands of Saipan, Tinian and Rota. There are few images of these islands due to the sleep schedule of ISS crews and weather. Lows clouds were probably around but it was hoped that Greg still was able to capture some of the islands. Of particular interest are the fringing coral reefs surrounding the islands*), and **Arkeno 1 and Arkeno 2 Impact Craters** (*Arkeno 1 and 2 are a rarely exposed double impact structure created by a 500 m diameter pair of asteroids. Located in southeastern part of the Libyan Desert, Arkeno 1 is 6.8 km in diameter and Arkeno 2 is 10 km. Both have been dated as less than 140 million years old. Detailed images of the structures of both craters were requested*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

Week 27 Scheduled Main Activities:

- *Wed. (10/22):* RPM skill trng2, BITS-LKT removal, IPD-NH3/GSC/CMS sampling, BIO-12 xfer, CBCS install, BTKh-31/-8 xfers, KPT-3 ops, MO-21, BIO-4, Change of Command, IP-1, PMCs.
- *Thu. (10/23):* SLEEP, IMMUNE, FMK stow, Pld xfers, Hatches closure, Soyuz undock & land; IP-1.
- *Fri. (10/24):* Ham pass, NUTRITION s/u, COL FSL VMU troubleshoot, BLB incubator ECS xchange, BCAT-4.
- *Sat. (10/25):* NUTRITION, Ham pass, WPC, FFQ, VolSci EPO, SAMS PCMCIA check, Node-1 cleanup.
- *Sun. (10/26):* NUTRITION, Station cleaning, PFCs.

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

10/23/08 -- Soyuz TMA-12/16S undock (DC1 nadir, 8:16pm) & land (11:37pm) = 10/24 -- 9:37am Kazakhstan)

11/02/08 -- Progress 30P reboost; *Daylight Saving Time (DST) ends*

11/14/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/16/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit (*UNDER REVIEW*)

11/26/08 -- Progress M-66/31P launch

11/29/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.)

11/30/08 -- Progress M-66/31P docking

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking

02/26/09 -- STS-119/Discovery/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress M-67/32P undocking & deorbit

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/25/09 -- Soyuz TMA-15/19S launch

05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**

07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation

10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A – MPLM(P)

04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1

05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at

ISS On-Orbit Status 10/20/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 27 of Increment 17. Day 7 of joint E17/18 operations.*

Crew wake-up – 1:00am EDT; sleeptime – 4:30pm.

Aboard the station, the E17/18 crew rotation/handover activities continued nominally. *[Kononenko and Lonchakov had ~30 min. between them for dedicated FE/FE handover activities, focusing today on SVO water supply system sampling, as listed in the relevant Handover (RPS) Book section 10. In addition, there are “generic” handovers where crewmembers are scheduled together to complete various designated standard tasks.]*

CDR-18 Michael Fincke performed Rack outfitting in the JPM, installing a HCP/GPS (Hardware Command Panel/Global Positioning System) cable & cable guard, routing it in front of the ICS/PROX (Inter-orbit Communication System/Proximity Communication System) Rack, and installing the cable from the ICS Rack to the JPM hatch for connection to the Lab RWS (Robotics Workstation). *[The ICS is Japan's unique system for uplinking & downlinking data, images, and voice data between Kibo and the Mission Control Room at TKCS (Tsukuba Space Center). The ICS Rack houses the ICS-PM (Pressurized Module) subsystem that enables data communications between Kibo and TKSC through the Japanese DRTS (Data Relay Test Satellite) known as Kodama. In addition, the ICS Rack includes the PROX that will be used for the HTV (H-II Transfer Vehicle) rendezvous and berthing. PROX consists of a PROX antenna, a PROX-GPS antenna, PROX comm equipment and an HCP. With the exception of the PROX antenna, the PROX-GPS antenna and the HCP, the PROX is also installed in the JPM. When the HTV approaches the ISS, the PROX antenna, which contains GPS receivers, will initiate communications with the HTV. The ISS orbital location and speed are immediately relayed to the HTV through the PROX. At the same time, data from the HTV are relayed to the ISS. In addition, the antenna relays commands sent from the ground*

to the HTV.]

FE-1 Kononenko conducted another session with the Russian biomedical MBI-15 "Pilot-M"/NEURO signal response experiment after setting up the workplace and equipment, with Volkov, who had conducted MBI-15 yesterday, assisting. Afterwards, the Pilot-M & Neurolab-2000M gear was closed down and stowed. *[MBI-15 requires a table, ankle restraint system, eyeball electrodes for an EOG (electrooculogram), and two hand controllers (RUO & RUD) for testing piloting skill in "flying" simulations on a laptop (RSK1) under stopwatch control, as well as for studying special features of the psychophysiologic response of cosmonauts to the effects of stress factors in flight.]*

Kononenko took and downloaded the periodic sensor readings of the Russian "Pille-MKS" (MKS = ISS) radiation dosimetry experiment which has ten sensors placed at various locations in the Russian segment (DC1, SM starboard & port cabin windows, ASU toilet facility, control panel, etc.), then re-deployed the sensors. The memory card was stowed for return to Earth. *[Nine of the ten dosimeters are read manually.]*

Sergey Volkov, Oleg Kononenko and SFP Richard Garriott spent three hours in the TMA-12 Descent Module (SA) to conduct the Soyuz descent drill, a standard training exercise for every crew returning on a Soyuz. The exercise, which strictly forbids any command activation (except for switching the InPU display), was supported by a tagup and discussions with ground instructor at TsUP/Moscow via S-band. *[The session includes a review of the pertinent ODFs (operational data files), specifically the books on Soyuz Ascent & Descent Procedures, Emergency Descents, and Off-Nominal Situations, crew responsibilities when executing the flight program, visual crew recognition of SUS (Entry Control System) failures, spacesuit procedures, etc., with special emphasis on operations with the Neptune-ME cockpit console. The training uses a Descent Simulator application on the RSK1 laptop. During the actual descent, Volkov, as Soyuz CDR, will occupy the middle couch, with Garriott in the right seat and Kononenko in the Descent Module's left Kazbek couch. Pending the final State Commission decision at about 3.5h before undocking, 16S return is expected for 10/23 (next Thursday), with undocking at 8:15pm EDT and landing near Arkalyk/Kazakhstan at ~11:36pm (9:36am Kazakhstan time on 10/24). See below for details.]*

After the JEM RMS (Robotic Manipulator System) checkout Part 4 on 10/19, Greg Chamitoff started up the POC DOUG (Portable Onboard Computers/Dynamic Onboard Ubiquitous Graphics) application for a ~30 min. procedures review of tomorrow's RMS checkout Part 1. *[Checkout #1 is a test of the JEMRMS Region Check Function, by "flying" the arm in Manual mode and Joint Auto mode. In addition, Greg will perform a dynamic response test by moving designated joints in*

Joint Auto Mode.]

The FE-2 also worked with CDR-18 Mike Fincke in the US Airlock, resizing an EMU (Extravehicular Mobility Unit) and making other preparations for the ULF-2 spacewalks. *[One EMU was resized for MS-2 Steve Bowen for nominal use on ULF-2. Other activities involved pre-gathering and partitioning of EMU components for contingency use on ULF-2 or emergency undock transfer.]*

Greg and Mike had another 70 min. reserved on their timelines for pre-packing ULF-2 return cargo.

Yuri performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Lonchakov also completed the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

CDR Volkov performed the last one of the daily visual status checks on the running DAKON-M hardware in the second session of the Russian experiment TEKh-15/ IZGIB (“Bend”), tagging up with the ground, downlinking data, closing down operations and de-installing the equipment. *[The activity required visual control of hardware operations three times a day and report to the ground. The first IZGIB session, for checkout, was conducted on 9/23. IZGIB has the objective to help update mathematical models of the ISS gravitation environment, using accelerometers of the Russian SBI Onboard Measurement System, the GIVUS high-accuracy angular rate vector gyrometer of the SUDN Motion Control & Navigation System and other accelerometers for unattended measurement of micro-accelerations at science hardware accommodation locations - (1) in operation of onboard equipment having rotating parts (gyrodynes, fans), (2) when establishing and keeping various ISS attitude modes, and (3) when performing crew egresses into space and physical exercises.]*

Yuri Lonchakov collected the periodic water samples from the Russian water supply system (SVO-ZV) for return on Soyuz 16S and analysis on the ground.

As another handover activity, Sergey & Yuri performed the periodic (monthly) functional closure test of the Vozdukh CO₂ (carbon dioxide) removal system’s spare

emergency vacuum valves (AVK), in the spare parts kit. See CDRA item, below. *[The AVKs are crucial because they close the Vozdukh's vacuum access lines in the event of a malfunction in the regular vacuum valves (BVK) or a depressurization in the Vozdukh valve panel (BOA). Access to vacuum is required to vent CO₂ during the regeneration of the absorbent cartridges (PP).*

FE-1 Kononenko completed another routine radiation data monitoring & logging session for flow & dose power data with the MATRYOSHKA-R radiation payload and its LULIN-5 electronics box. The memory cards were prepared for return on 16S.

For Volkov & Kononenko, it was time to complete the first 1.5-hr. part of their final training session in the "Chibis" ODNT suit as standard preparation of cosmonauts for returning into gravity (the second part is scheduled for tomorrow). *[The below-the-waist reduced-pressure device ODNT (US: LBNP) in the "Chibis" garment provides gravity-simulating stress to the body's cardiovascular/circulatory system for reestablishing the body's orthostatic tolerance (e.g., the Gauer-Henry reflex) after the six-month stay in zero-G. Sergey's & Oleg's ODNT protocol today consisted of first imbibing 150-200 milliliters of water or juice, followed by a sequence of progressive regimes of reduced ("negative") pressure, set at -15, -25, -35 and -40 mmHg for five minutes each, then at -20, -30, and -40 mmHg, 10 minutes in each mode, and at -30 mmHg for 5 min, while shifting from foot to foot at 10-12 steps per minute. The body's circulatory system interprets the pressure differential between upper and lower body as a gravity-like force pulling the blood (and other liquids) down.]*

Lonchakov conducted the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the DC1-to-Soyuz tunnel, and the FGB-to-Soyuz and FGB-to-Node passageway. *[This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently six persons, and one of the two Russian SKV air conditioners still off (SKV-1), having run out of service life.]*

Major science activities in the RS (Russian Segment) by Yuri Lonchakov today focused BIO-4, ventilating the BIO-4 sample in KUBIK-1. *[The four BIO-4 experiments, developed by scientists from Germany, Belgium, Switzerland, Italy and France, include research in bacterial physiology, immune cell function and developmental biology. Two experiments (BBB/BASE B & BBC/BASE C) study how bacteria cope and adapt in the spaceflight environment, being exposed to parameters such as microgravity, cosmic radiation, space electromagnetism and vibrations. Xenopus studies the development of cane toad tadpoles (Xenopus laevis) in spaceflight. The fourth experiment is ROALD looks at the "ROle of*

Apoptosis in Lymphocyte Depression". BBB, BBC & SEN will return on Soyuz TMA-12/16S.]

VC-15 Richard Garriott, assisted in part by Russian crewmembers, worked on his daily onboard program which today included –

- SLEEP Actiwatch logging;
- Soyuz descent training with Volkov & Kononenko;
- Ham radio session (Pinehurst School);
- Internet/NetMeeting conference with Challenger Center;
- Symbolic (commemorative) activity;
- PRK Visual Acuity evaluation;
- MUSCLE-G (LBP/Low Back Pain) questionnaire;
- MOP-G (Motion Perception; vestibular adaptation to changes in micro-G);
- Video blogs;
- Earth photography; and
- Copying data & image files to HDD (Hard Disk Drive) for return.

In the US Lab, Greg Chamitoff de-installed the UOP DCP (Utility Outlet Panel/ Display & Control Panel) bypass power cable to the VTR (Video Tape Recorder) at the Lab & Cupola RWS (Robotics Work Stations), now no longer required for a while.

As part of handovers, FE-1-18 Lonchakov was checked out on the CEVIS cycle ergometer and its maintenance (for example, the CEVIS Contingency Controller has no data uploading or saving capability.)

The E17/18 crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), RED resistive exercise device (FE-2, CDR-18) and VELO bike with bungee cord load trainer (FE-1-18). Sergey's & Oleg's exercise regimen today was accounted for by their Chibis/ODNT training activity.

Afterwards, Mike transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

In preparation for the following PAO TV event, the FE-2 set up and activated the VDS MPC (Video Distribution System/Multi-Purpose Converter) with its four downlinks for transmitting G1 camcorder imagery. Later (~12:00pm), the MPC was powered off again.

At 1:20pm EDT, all crewmembers, including SFP Garriott, gathered in the US

segment for the “traditional” live televised SFP/Joint Crew News conference, with US media gathered at NASA Centers (~20 min.).

At ~4:10pm, just before sleep time, Yuri Lonchakov will set up the Russian MBI-12 SONOKARD (Sonocard) payload and start his first experiment session, using a sports shirt from the SONOKARD kit with a special device in the pocket for testing a new method for acquiring physiological data without using direct contact on the skin. Measurements are recorded on a data card for return to Earth.

[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember’s physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]

BRP-M Failure: After some steam or smoke was observed coming from the Russian SRV-K (Condensate Water Processor) hot water tap in the SM and the BRP-M (Water Distribution & Heating Unit) body exhibited elevated temperature, the crew deactivated the system and closed all related valves, then replaced the BRP-M with an on-board spare.

CEO (Crew Earth Observations) photo targets uplinked for today were **Mount Unzen** (*Mount Unzen volcano is located east of the city of Nagasaki. This volcano has been active during the last 10,000 years and is responsible for some pretty spectacular pyroclastic flows [fast moving currents of hot gas and rock which travel away from the volcano at speed generally greater than 80km/h]. The latest robust activity occurred from 1990-1995 when a lava dome formed at the summit and the resulting pyroclastic flows [temperatures in pf’s can reach about 1,000 degrees C] were responsible for fatalities*), **Sakura-jima Volcano** (*Sakura-jima is one of Japan’s most active volcanoes. It is located in a part of Kagoshima bay. In 1914 the lava from an eruption created new land that connected the former island to the Osumi Peninsula*), **N Mariana Islands & Guam** (*the Northern Mariana Islands consists of 15 islands. ISS orbital track took the station near the southern islands of Saipan, Tinian and Rota. There are few images of these islands due to the sleep schedule of ISS crews and weather. Lows clouds were probably around but it was hoped that Greg still was able to capture some of the islands. Of particular interest are the fringing coral reefs surrounding the islands*), and **Arkenu 1 and Arkenu 2 Impact Craters** (*Arkenu 1 and 2 are a rarely exposed double impact structure created by a 500 m diameter pair of asteroids. Located in southeastern part of the Libyan Desert, Arkenu 1 is 6.8 km in diameter and Arkenu 2 is 10 km. Both have been dated as less than 140 million years old. Detailed images of the structures of both craters were requested*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

Week 27 Scheduled Main Activities:

- *Tue. (10/21):* MO-22, MBI-12, RSP checkout, CMRS checkout, JEMRMS checkout, SVO EDV sampling, ODNT/LBNPO closeouts, RBO-3-1, PAO; Rodnik xfer, PMCs, PFE (FE-2), BIO-2, MO-21, KPT-1 chg., FMK deploy.
- *Wed. (10/22):* RPM skill trng2, BITS-LKT removal, IPD-NH3/GSC/CMS sampling, BIO-12 xfer, CBCS install, BTKh-31/-8 xfers, KPT-3 ops, MO-21, BIO-4, Change of Command, IP-1, PMCs.
- *Thu. (10/23):* SLEEP, IMMUNE, FMK stow, Pld xfers, Hatches closure, Soyuz undock & land; IP-1.
- *Fri. (10/24):* Ham pass, NUTRITION s/u, COL FSL VMU troubleshoot, BLB incubator ECS xchange, BCAT-4.
- *Sat. (10/25):* NUTRITION, Ham pass, WPC, FFQ, VolSci EPO, SAMS PCMCIA check, Node-1 cleanup.
- *Sun. (10/26):* NUTRITION, Station cleaning, PFCs.

ISS Orbit (as of this morning, 8:19am EDT [= epoch]):

Mean altitude -- 352.1 km

Apogee height -- 354.4 km

Perigee height -- 349.8 km

Period -- 91.58 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0003359

Solar Beta Angle -- -57.0 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 40 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56825

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

10/23/08 -- Soyuz TMA-12/16S undock (DC1 nadir, 8:16pm) & land (11:37pm) =

10/24 -- 9:37am Kazakhstan)

11/02/08 -- Progress 30P reboost; *Daylight Saving Time (DST) ends*

11/14/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/16/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit (*UNDER REVIEW*)

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

12/01/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.) (*UNDER*

REVIEW)

02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osp/iss_reports/index.htm

Date: Sunday, October 19, 2008 12:15:41 PM
Attachments:

ISS On-Orbit Status 10/19/08

All ISS systems continue to function nominally, except those noted previously or below. *Day 6 of joint E17/18 operations. Sunday – not a rest day for CDR Volkov, FE-1 Kononenko, FE-2 Chamitoff, CDR-18 Fincke, FE-1-18 Lonchakov & SFP Garriott. Ahead: Week 27 (last) of Increment 17.*

The crew's work/sleep cycle remains at the one-hour earlier wake-up time of 1:00am EDT; sleeptime tonight – 4:30pm.

Aboard the station, the E17/18 crew rotation/handover activities continued nominally. *[Volkov, Kononenko, Fincke and Lonchakov had ~5:00 hrs between them for dedicated CDR/CDR & FE/FE handover activities, focusing today on Payloads, Crew data support, Medical equipment, RSE Installation & hookup to ZVENO-B units, Elektron BZh pressurization, as listed in the relevant Handover (RPS) Book sections 10, 19, 20, 21. In addition, there are "generic" handovers where crewmembers are scheduled together to complete various designated standard tasks.]*

After wakeup, FE-2 Chamitoff & SFP (Space Flight Participant) Garriott downloaded the daily SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data from their Actiwatches to the HRF-1 (Human Research Facility 1) laptop. Richard is participating in the SLEEP experiment for NASA. *[To monitor the crewmember's sleep/wake patterns and light exposure, crewmembers wear a special Actiwatch device which measures the light levels encountered by them as well as their patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

Before breakfast (and brushing teeth), Chamitoff and Fincke started their second session with the biomed experiment INTEGRATED IMMUNE (Validating Procedures for Monitoring Crew member Immune Function), collecting one wet saliva sample. SFP Garriott is also participating in this medical test. *[IMMUNE protocol requires the collection to occur first thing post-sleep, before eating, drinking*

and brushing teeth, and all samples are stored at ambient temperature. Along with NUTRITION (Nutritional Status Assessment), INTEGRATED IMMUNE samples & analyzes participant's blood, urine, and saliva before, during and after flight for changes related to functions like bone metabolism, oxidative damage and immune function to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects. The saliva is collected in two forms, dry and liquid. The dry samples are collected at intervals during the collection day using a specialized book that contains filter paper. The liquid saliva collections require that the crewmember soak a piece of cotton inside their mouth and place it in a salivette bag; there are four of the liquid collections during docked operations.]

FE-1-18 Yuri Lonchakov performed the periodic maintenance of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #2 of the regenerable dual-channel filtration system. The process will be terminated at ~4:00pm EDT. Bed #1 regeneration was performed yesterday. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently (last time: 9/29 & 9/30).]*

CDR Volkov conducted the (currently daily) visual status check on the running DAKON-M hardware in the second session of the Russian experiment TEKh-15/ IZGIB ("Bend"), tagging up with the ground, downlinking data and restarting the data taking afterwards. *[The activity runs till 10/20, requiring visual control of hardware operations three times a day and report to the ground. The first IZGIB session, for checkout, was conducted on 9/23. IZGIB has the objective to help update mathematical models of the ISS gravitation environment, using accelerometers of the Russian SBI Onboard Measurement System, the GIVUS high-accuracy angular rate vector gyrometer of the SUDN Motion Control & Navigation System and other accelerometers for unattended measurement of micro-accelerations at science hardware accommodation locations - (1) in operation of onboard equipment having rotating parts (gyrodynes, fans), (2) when establishing and keeping various ISS attitude modes, and (3) when performing crew egresses into space and physical exercises.]*

Major science activities in the RS (Russian Segment) by Yuri Lonchakov today focused on work with the microbiological payload BIO-4 (ventilating the BIO-4 sample in KUBIK-1). *[The four BIO-4 experiments, developed by scientists from Germany, Belgium, Switzerland, Italy and France, include research in bacterial physiology, immune cell function and developmental biology. Two experiments (BBB/BASE B & BBC/BASE C) study how bacteria cope and adapt in the spaceflight environment, being exposed to parameters such as microgravity, cosmic*

radiation, space electromagnetism and vibrations. Xenopus studies the development of cane toad tadpoles (Xenopus laevis) in spaceflight. The fourth experiment is ROALD looks at the "ROle of Apoptosis in Lymphocyte Depression". BBB, BBC & SEN will return on Soyuz TMA-12/16S.]

CDR Volkov conducted another session each with the Russian biomedical MBI-15 "Pilot-M"/NEURO signal response experiment after setting up the workplace and equipment, with FE-1 Kononenko assisting the CDR. Afterwards, the Pilot-M & Neurolab-2000M gear remained configured for Oleg's session tomorrow. *[MBI-15 requires a table, ankle restraint system, eyeball electrodes for an EOG (electrooculogram), and two hand controllers (RUO & RUD) for testing piloting skill in "flying" simulations on a laptop (RSK1) under stopwatch control, as well as for studying special features of the psychophysiologic response of cosmonauts to the effects of stress factors in flight.]*

In the JAXA Kibo/JPM (JEM Pressurized Module), Greg Chamitoff & Mike Fincke activated the RLT (Robotics Laptop Terminal) of the JEMRMS (JEM Robotic Manipulator System), then reviewed and checked the DOUG (Dynamic Onboard Ubiquitous Graphics) files and conducted the RMS C/O-4 (Checkout #4). *[For C/O-4, Greg was to "fly" the JEMRMS MA (Main Arm) around the EFU13 (Exposed Facility Unit 13) on the JLP (JEM Logistics Pressurized Section) module to capture target images using the television camera on the MA EE (End Effector) for calibration purposes. This was to be followed by so-called "inching" operations, as a crew-in-the-loop demonstration to verify how small a command the crewmember can input using the hand controllers in Manual Mode (this inching operation is expected to be used on Flight 2J/A and subsequent flights if the RLT (Ready-to-Latch) judgment for a P/L (payload) berthing is not OK and the operator is requested to get the P/L closer to an EFU. Background: The externally mounted JEMRMS is composed of two arms: the 10-m-long MA (Main Arm) and a 2-m-long small fine arm (the latter to be delivered on a future mission). Both arms have six independent joints, to provide dexterity very similar to the human arm. The internal robotic control workstation, known as JEMRMS Console, is used for manipulating the RMS. Remote television cameras are mounted on both arms, enabling the crew to control the arms from inside the JPM.]*

Oleg Kononenko completed the routine daily servicing of the SOZh system (ECLSS/ Environment Control & Life Support System) in the SM, including the periodic checkup on the Russian POTOK-150MK(150 micron) air filter unit of the SOGS air revitalization subsystem, gathering weekly data on total operating time & "On" durations for reporting to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The daily IMS (Inventory Management System) maintenance was conducted today by Sergey Volkov, updating/editing the standard IMS “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

As part of checking out the JAXA SCOF (Solution Crystallization Observation Facility) in the Kibo JPM (JEM Pressurized Module), CDR-18 Fincke retrieved the Reference Cell cartridge from the SCOF and removed the MMA TAA (Microgravity Measurement Apparatus/Tri-Axial Accelerometer) the from the cell. *[Similar to the operation and functionality of the US IWIS (Internal Wireless Instrumentation System), MMA is a network of wireless units distributed throughout the Japanese module. Each unit connects to an external TAA.]*

After the FE-2 broke out the standard auditory test equipment, Mike Fincke, Oleg Kononenko, Sergey Volkov, Yuri Lonchakov and Greg Chamitoff each took the periodic O-OHA (on-orbit hearing assessment) test, a 30-min. NASA environmental health systems examination to assess the efficacy of acoustic countermeasures, using a special MEC (Medical Equipment Computer) laptop application. It was Greg’s fourth O-OHA session, the fifth for Sergey & Oleg and the first for Mike & Yuri. *[The O-OHA audiography test involves minimum audibility measurements for each ear over a wide range of frequencies (0.25-10 kHz) and sound pressure levels, with the crewmembers using individual-specific Prophonics earphones, new Bose ANC headsets (delivered on 30P) and the SLM (sound level meter). To conduct the testing, the experimenter is supported by special EarQ software on the MEC, featuring an up/down-arrow-operated slider for each test frequency that the crewmember moves to the lowest sound pressure level at which the tone can still be heard. The baseline test is required not later than about Flight Day 14 for each new Expedition and is then generally performed once per month. Note: There have been temporary hearing deficits documented on some U.S. and Russian crewmembers, all of which recovered to pre-mission levels.]*

Greg performed troubleshooting on the laptop which supports the BCAT-4. If successful, the FE-2 was to activate the payload for his VolSci (Voluntary Weekend Science) program, setting up the camera image on Sample 3, homogenizing and taking some manual photos of the Sample until alignment and focus are satisfactory. EarthKAM was then to take over with automated photos of Sample 3 every hour for six days. *[If problems persist with getting the BCAT-4 system to operate, Greg was to homogenize samples 8, 9 and 10 for 10 minutes each, then gently re-stow the BCAT-4 SGSM (Slow Growth Sample Module).]*

Chamitoff also checked the Node-2 nadir hatch for sufficient clearance for the planned setup of new EarthKAM operations the week of 10/27, allowing enough

space for positioning the camera at the window and provide access to its aiming and focusing.

The FE-2 & CDR-18 also conducted the regular pre-launch checkout of the RWS (Robotics Workstations), first the Lab RWS, then the Cupola RWS, including testing the DCP (Display & Control Panel) and RHC (Rotational Hand Controller) switches for the subsequent SSRMS (Space Station Remote Manipulator System) ops.

After calibrating the RWS RHC & THC (Translational Hand Controller), the two crewmembers then took the SSRMS on its planned 1-hr. checkout maneuver, grappling the PDGF-1 (Power & Data Grapple Fixture 1) on the MBS (Mobile Base System).

Lonchakov & Volkov configured the Russian RSE2 laptop and installed cabling to connect it to the two new ZVENO-B ("Link-B") modems behind SM panel 437, and then exercised the system by uploading new antivirus software and running a scan on RSE1.

Continuing the extended leak checking of the spare BZh Liquid Unit (#056) for the Elektron O₂ generator, Oleg & Yuri charged the unit once again with pressurized N₂ from the BPA Nitrogen Purge Unit (#23) to 1 atm (1 kg/cm²). The last test pressurization to monitor for leakage was on 9/29. *[Objective of the checkout of the BZh, which has been in stowage for almost 2 years, was to check for leakage and good water passage through the feed line inside of the BZh (from ZL1 connector to the buffer tank) and to check the response of the Electronics Unit's micro switches (signaling "Buffer Tank is Empty" & "Buffer Tank is Full". During Elektron operation, the inert gas locked up in the BZh has the purpose to prevent dangerous O₂/H₂ mixing. A leaking BZh cannot be used.]*

As part of handover activities, CDR-18 Fincke used the vacuum cleaner plus other tools to perform the periodic USOS hatch seal inspection (Node-1 Forward, Aft & Starboard, Lab Aft & Forward, Node-2 Aft, Starboard & Port, Airlock, Columbus, Kibo JPM Zenith & Starboard, Kibo JLP Nadir) in support of ACS (Atmospheric Control System) maintenance.

Oleg Kononenko completed the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the DC1-to-Soyuz tunnel, and the FGB-to-Soyuz and FGB-to-Node passageway. *[This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently six persons, and one of the two Russian SKV air conditioners still off (SKV-1), having run out of service life.]*

Fincke & Lonchakov had their standard PMCs (Private Medical Conferences), via S-band/audio & Ku-band/video, Mike at ~10:15pm EDT, Yuri at ~1:35pm.

Chamitoff & Fincke have their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS- NetMeeting application (which displays the uplinked ground video on an SSC laptop) scheduled today, Greg at ~12:45pm, Mike at ~3:10pm.

VC-15 Richard Garriott, assisted in part by Russian crewmembers, worked on his daily onboard program which today included –

- INTEGRATED IMMUNE (Validating Procedures for Monitoring Crew member Immune Function, collecting wet saliva sample before breakfast);
- SLEEP Actiwatch logging;
- Tagup with advisors (AT) at TsUP via VHF-1;
- TV/phone downlink (“call mother”);
- Ham radio session (Austin, TX for Challenger Center);
- PRK Visual Acuity evaluation;
- MUSCLE-G (LBP/Low Back Pain) questionnaire;
- MOP-G (Motion Perception; vestibular adaptation to changes in micro-G);
- Video blogs (e.g., Bacteria, Electrostatic Charge, Action & Reaction Sports, Gyroscopes, Rotational inertia, Energy exchange, How & Why liquids merge & mix, Physiological Factors, Family)
- Earth photography (Europe, Central Asia, Himalayas, night shots, Central America, Space Station movie, Life Onboard);
- Copying data & image files to HDD (Hard Disk Drive) for return.

The E17/18 crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR-18, FE-2), TVIS treadmill (CDR/2.5h, FE-1/2.5h), and RED resistive exercise device (FE-1-18, FE-2).

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

Week 27 Scheduled Main Activities:

- *Mon. (10/20):* MBI-15, JPM outfit, PILLE-MKS, Descent OBT, JEMRMS s/u, TEKh-15, Vozdukh AVK c/o, RBO-3-1, IP-1, BIO-4, PAO, MBI-12.
- *Tue. (10/21):* MO-22, MBI-12, RSP checkout, CMRS checkout, JEMRMS checkout, SVO EDV sampling, ODNT/LBNPO closeouts, RBO-3-1, PAO; Rodnik xfer, PMCs, PFE (FE-2), BIO-2, MO-21, KPT-1 chg., FMK deploy.

- *Wed. (10/22):* RPM skill trng2, BITS-LKT removal, IPD-NH3/GSC/CMS sampling, BIO-12 xfer, CBCS install, BTKh-31/-8 xfers, KPT-3 ops, MO-21, BIO-4, Change of Command, IP-1, PMCs.
- *Thu. (10/23):* SLEEP, IMMUNE, FMK stow, Pld xfers, Hatches closure, Soyuz undock & land; IP-1.
- *Fri. (10/24):* Ham pass, NUTRITION s/u, COL FSL VMU troubleshoot, BLB incubator ECS xchange, BCAT-4.
- *Sat. (10/25):* NUTRITION, Ham pass, WPC, FFQ, VoISci EPO, SAMS PCMCIA check, Node-1 cleanup.
- *Sun. (10/26):* NUTRITION, Station cleaning, PFCs.

ISS Orbit (as of this morning, 7:52am EDT [= epoch]):

Mean altitude -- 352.1 km

Apogee height -- 354.4 km

Perigee height -- 349.9 km

Period -- 91.58 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.000333

Solar Beta Angle -- -59.2 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 58 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56809

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

10/23/08 -- Soyuz TMA-12/16S undock (DC1 nadir, 8:15pm) & land (11:36pm) =

10/24 -- 9:36am Kazakhstan)

11/02/08 -- Progress 30P reboost; *Daylight Saving Time (DST) ends*

11/15/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/17/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit – (*UNDER REVIEW*)

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

12/01/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.) – (*UNDER REVIEW*)

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking

02/26/09 -- STS-119/Discovery/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 10/18/08

All ISS systems continue to function nominally, except those noted previously or below. *Day 5 of joint E17/18 operations. Saturday – but not a rest for CDR Volkov, FE-1 Kononenko, FE-2 Chamitoff, CDR-18 Fincke, FE-1-18 Lonchakov & SFP Garriott.*

The crew's work/sleep cycle remains at the one-hour earlier wake-up time of 1:00am EDT; sleeptime tonight – 4:30pm.

Aboard the station, the E17/18 crew rotation/handover activities continued nominally. *[Volkov, Kononenko, Fincke and Lonchakov had ~3:30 hrs between them for dedicated CDR/CDR & FE/FE handover activities, focusing today on SOZh/ ECLSS (BMP, GANK, CMS Analyzer), SOTR (Thermal Control System), EPS (Electrical Power System), Internal Lights, BVS (Onboard Computer System), as listed in the relevant Handover (RPS) Book sections 10, 12, 13, 17, 18. In addition, there are "generic" handovers where crewmembers are scheduled together to complete various designated standard tasks.]*

CDR Volkov, with Yuri Lonchakov observing, performed the periodic maintenance of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The process will be terminated at ~3:30pm EDT and Bed #2 regeneration performed tomorrow. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently (last time: 9/29 & 9/30).]*

Sergey Volkov also conducted the (currently daily) visual status check on the running DAKON-M hardware in the second session of the Russian experiment TEKh-15/IZGIB ("Bend"), tagging up with the ground, downlinking data and restarting the data taking afterwards. *[The activity runs till 10/20, requiring visual control of hardware operations three times a day and report to the ground. The first*

IZGIB session, for checkout, was conducted on 9/23. IZGIB has the objective to help update mathematical models of the ISS gravitation environment, using accelerometers of the Russian SBI Onboard Measurement System, the GIVUS high-accuracy angular rate vector gyrometer of the SUDN Motion Control & Navigation System and other accelerometers for unattended measurement of micro-accelerations at science hardware accommodation locations - (1) in operation of onboard equipment having rotating parts (gyrodynes, fans), (2) when establishing and keeping various ISS attitude modes, and (3) when performing crew egresses into space and physical exercises.]

Major science activities in the RS (Russian Segment) by Yuri Lonchakov today focused on work with the biotechnological experiments

- BTKh-14/BIOEMULSION (activation of mixing mode Day 3, closeout ops with Bioreactor #5 and transfer to KRIOGEM-3M, with photography) and
- BIO-4 (installation of Base C and SEN/Xenopus units in KUBIK 3, and ventilating the BIO-4 sample in KUBIK-1). *[The four BIO-4 experiments, developed by scientists from Germany, Belgium, Switzerland, Italy and France, include research in bacterial physiology, immune cell function and developmental biology. Two experiments (BBB/BASE B & BBC/BASE C) study how bacteria cope and adapt in the spaceflight environment, being exposed to parameters such as microgravity, cosmic radiation, space electromagnetism and vibrations. Xenopus studies the development of cane toad tadpoles (Xenopus laevis) in spaceflight. The fourth experiment is ROALD looks at the "ROle of Apoptosis in Lymphocyte Depression". BBB, BBC & SEN will return on Soyuz TMA-12/16S.]*

In support of the Russian KPT-12/EXPERT experiment, Kononenko collected surface samples from inside and around the SM PrK (Transfer Compartment) Tunnel.

The FE-1 also removed yellow tags from equipment that was certified since launch, involving the two ZVENO-B ("Link-B") units installed last August behind SM (Service Module) panel 437. *[Yellow tags, more formally called "uncertified dual ops tags", are used to identify items not certified for ISS Operations (certification and/or paperwork not complete prior to launch); items which have IP (International Partner) segment-specific certification (can be used in one IP segment but should not be used in another IP segment); items that could pose a safety hazard; and items that are broken or expired. Blank yellow tags are flown so hardware can be tagged on-orbit as necessary.]*

Working in JAXA's Kibo JPM (JEM Pressurized Module), Chamitoff powered up the PCS (Portable Computer System) laptop and performed a checkout of the external forward TV camera to verify its function and controllability for the upcoming

JEMRMS (Robotic Manipulator System) checkout.

On the JPM's IPU VRU (Image Processing Unit/Video Recording Unit), the FE-2 removed & replaced a number of recording disks (#1035, #1036, #1037, #1038, #1039).

Additionally, Gregory had ~1hr. for cleaning up payload items in Kibo, i.e., consolidating LSE (Laboratory Support Equipment) and FPEF (Fluid Physics Experiment Facility) tools in their CTBs (Cargo Transfer Bags) and relocating the CTBs for return to the ground on ULF-2.

Also in the Japanese segment, CDR-18 Fincke took documentary photography for subsequent downlink to Tsukuba from an SSC (Station Support Computer). *[The shots were to show the clearance between the ZSR (Zero-G Stowage Rack) and JLP (JEM Pressurized Logistics Segment) shell and N-Brace, plus the Saibo Rack CO₂ umbilical connection and the manual valve GCO₂ vent.]*

In the Soyuz TMA-13 spacecraft, Yuri Lonchakov performed troubleshooting on the V1 fan of the ventilation system in the Descent Module, supported by ground monitoring on DO4 (Daily Orbit 4).

In preparation for tomorrow's SSRMS (Space Station Remote Manipulator System) operations, i.e., maneuvering to and grapple MBS PDGF-1 (Mobile Base System/Power & Data Grapple Fixture 1), Greg Chamitoff set up the Robotics video camera connection by hooking up the UOP DCP (Utility Outlet Panel/Display & Control Panel) power bypass cable for both the Lab & Cupola RWS (Robotics Workstations), followed by a 30-min. review of newly uplinked POC DOUG (Portable Onboard Computers/Dynamic Onboard Ubiquitous Graphics) software for the SSRMS activities.

Afterwards, Gregory cleaned out Node-2 of stowage items to make room for setting up and checking out the CBCS (Centerline Berthing Camera System) preparatory to the docking of MPLM (Multi-Purpose Logistics Module) "Leonardo" on ULF-2.

Kononenko & Lonchakov conducted an inspection and checkout of PU SOA (Air Scrubbing System Control Panel) cables behind SM panel 425. *[Panel 425 covers the flexible metal H₂ hoses from Elektron between the RPD pressure differential regulator (equalization unit) and the ZLVK-2 hydrogen vent valve toward the BMP micropurification unit inlet valve.]*

Yuri Lonchakov performed the monthly radiation data checkup for accumulated flux & dose rate data with the Matryoshka-R radiation payload (RBO-3-2) and its LULIN-

5 electronics box, replacing its data storage card with a new one.

Chamitoff worked on the BCAT-4 experiment which on 10/10 had encountered a problem with the SSC-12 laptop running the automated picture-taking EarthKAM software. *[Setting up to continue BCAT-4 operations tomorrow, Greg replaced the SSC-12 with another laptop (SSCs-4 & 6 being also not good), then turned on the laptop and camera, and took some Sample 3 photos in order to make sure that the system is working properly.]*

The FE-2 also repaired a failed PCS (Portable Computer System) laptop in the US Airlock by transferring its hard disk drive (vers. R11) to another laptop shell, later reporting that the PC was working OK again.

Greg filled out the regular FFQ (Food Frequency Questionnaire), his 16th, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

Mike Fincke performed the monthly CEVIS (cycle ergometer) maintenance, and Yuri Lonchakov got checked out on TVIS treadmill IFM (Inflight Maintenance) procedures.

Sergey Volkov conducted the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the DC1-to-Soyuz tunnel, and the FGB-to-Soyuz and FGB-to-Node passageway. *[This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently six persons, and one of the two Russian SKV air conditioners still off (SKV-1), having run out of service life.]*

Oleg & Yuri took readings with the Russian AOK GANK-4M Real-Time Harmful Contaminant Gas Analyzer system and calibrated the unit.

Servicing the US OGS (Oxygen Generation System), Mike Fincke & Greg Chamitoff removed the WDS (Water Delivery System) to provide access to the OGS for the regular O₂ purge of the H₂ sensor, after demating the O₂ outlet QD (Quick Disconnect). The WDS was then re-installed on the OGS rack front.

VC-15 Richard Garriott, assisted in part by Russian crewmembers, worked on his daily onboard program which today included –

- SLEEP Actiwatch logging;
- Tagup with consultants (AT) at TsUP via VHF-1;
- Ham radio session (Austin, TX for Challenger Center);
- PRK Visual Acuity evaluation;
- MUSCLE-G (LBP/Low Back Pain) questionnaire;
- MOP-G (Motion Perception; vestibular adaptation to changes in micro-G);
- Video blogs (e.g., Earth Science Challenges 1-6, Time in Space, Tabula Rasa, DEV Team & players, commercial Seiko questionnaire, et al.);
- Earth photography (mid-US, Seattle, Southern Canada); and
- Copying data & image files to HDD (Hard Disk Drive) for return.

Richard and the three Russian crewmembers had two hours set aside for scheduled commemorative (Russian: “symbolic”) activities, a standard tradition for visiting guests and departing expedition crewmembers. *[The crew members signed and stamped a book by Y. V. Kondratiuk (“Conquering Interplanetary Space”), pennants of TsAGI (Central Aerohydrodynamic Institute), the Communard Association and the Chemical Engineering Design Office (with A.M. Isaiev’s portrait), Russian post philatelic items (envelopes), and envelopes for the 16S crew commemorative kit.]*

Garriott, Fincke & Lonchakov had their standard PMCs (Private Medical Conferences), via S-band/audio & Ku-band/video, Richard at ~4:30am EDT, Mike at ~1:05pm, Yuri at ~1:20pm.

Gregory & Michael had again time set aside on their schedule for pre-packing hardware to be returned on STS-126/ULF-2.

The E17 crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR/2.5h, FE-1/2.5h), and RED resistive exercise device (FE-2). Also, CDR-18 Fincke performed his second onboard exercise on the RED for one hour.

Afterwards, Greg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Weekly Science Update (*Expedition Seventeen -- Week 26*)

3-D SPACE: In progress.

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): Close-out activities for Inc 17-ALTCRISS were performed on 10/14.

ANITA (Analyzing Interferometer for Ambient Air): Continuing.

BCAT-3/4 (Binary Colloidal Alloy Test 3/4): “Greg. thank you for all your work to attempt to get a functional laptop and for requesting to try BCAT-4 again.”

BIO-4: With 17S, a package of 3 Biology experiments were launched (i.e. ROALD, XENOPUS, BASE-B/-C) using the KUBIK incubators. On 10/14, KUBIK 1 & 2 were activated and temperatures were set: +21deg C for KUBIK-1 (to support XENOPUS) and +37deg C for KUBIK-2 (to support ROALD). XENOPUS experiment containers were installed upon transfer from Soyuz and activated on 10/14/11:20am EDT. ROALD experiment containers were installed, and the centrifuge was activated around 10/14/11:33am. The ROALD experiment is controlled by an automated timeline which commands the different fixation points in time. Containers with fixed samples are then transferred to MELFI. The first insertion into MELFI was performed around 10/14/2:40pm, and the second insertion was performed some hours later around 10/14/4:15pm. The next day, the third transfer was also performed as planned and samples were inserted into MELFI around 10/15/2:16pm. The fourth and final transfer for ROALD was planned for 10/16/2:00pm (pending confirmation).

For the XENOPUS experiment, the crew performs a daily ventilation of the KUBIK. The containers for the BASE-B/-C experiment were kept in Soyuz to allow for stable temperature conditions. The experiment will start on GMT292, with KUBIK-3 setup on GMT291.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System):
Samples returned on 1J.

CSI-2/CGBA-5 (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus 5): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): Due to safety concerns identified for the PLEGPAY instrument (when operated in Plasma Discharge mode), the entire EuTEF platform was put in survival mode on 9/1 at around 11:00am EDT (just prior to 29P undocking). Since then, the EuTEF power feeder#1 has been deactivated and no science acquisition is possible. Request has been approved for intermittent activation for 3 of the 9 EUTEF payloads. EuTEF platform power feeder #1 has been re-activated for 8-hrs periods on 10/10, 10/12, and 10/15 (10/14 was skipped because of 17S docking). This activation protocol will continue every other day until safety issues are solved with the PLEGPAY instrument. This only mitigates the science loss for the EXPOSE, DOSTEL and MEDET instruments. The situation implies significant loss of science return for all EUTEF payloads.

FSL (Fluid Science Laboratory): FSL is nominal.

GEOFLOW: In progress.

HDTV System Test DL (JAXA): JAXA tried to downlink the missed images but failed. So, a tape was added which was on the return manifest for ULF-2.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): In progress.

Marangoni Experiment for ISS (JAXA Fluid Physics Experiment Facility): The

Marangoni Experiment has been completed, with the exception of the HDD (Hard Disk Drive) exchange. The PI team decided not to conduct the experiment further, because of the lack of the silicon oil buffer. Although the liquid bridge occurred, the PI is very satisfied with the results.

Micro-G Clay (JAXA EPO): Complete.

MISSE (Materials ISS Experiment): Ongoing.

Moon Photography from ISS (JAXA EPO): Complete.

MOP (Motion Perception in Zero-G): Daily MOP questionnaires are filled in by the SFP (Space Flight Participant).

MSG-SAME (Microgravity Science Glovebox): Complete.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MUSCLE-G (LBP/Low Back Pain): Daily MUSCLE questionnaires are filled in by the SFP.

NOA-1/-2 (Nitric Oxide Analyzer, ESA): NOA return items have been pre-packed for 16S return.

NUTRITION w/REPOSITORY: In progress.

PADLES (Passive Dosimeter for Lifescience Experiment in Space): In progress.

PCRF (Protein Crystallization Research Facility) Reconfiguration (JAXA): Complete.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SAMPLE: Complete.

SHERE (Shear History Extensional Rheology Experiment): Complete.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): “Greg, thanks for completing your Sleep logging this week. The Sleep PI is receiving your data, and we will work to correct the Sleep Log File save path with a service pack update and try to schedule another week to make up for the week that was deleted. We are currently working on scheduling a download 3 and initialize 2 activity after undocking on 10/23 for the Actiwatch data.”

SOLAR (Solar Monitoring Observatory): The last Sun visibility window ended on 10/4. The instruments operated nominally, with the exception of SOLACES which encountered a synchronization problem for its two micro-controllers units.

SOLO (Sodium Loading in Microgravity): Currently in idle mode, as no sun visibility. Performed only troubleshooting for SOLACES on problem of synchronization for its two micro-controllers units

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): Reserve.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): Completed.

CEO (Crew Earth Observations): Through 10/16 the ground has received a total of 8,491 frames of CEO images for review and cataloging. Photos with times corresponding to the uplinked CEO target request times are reviewed first and since the last report included: Hurricane Norbert, Eastern Pacific (excellent imagery but received only yesterday). “Greg, your excellent, sun glint-enhanced view of Coronado Island in Mexico’s Gulf of California will be published on NASA/GSFC’s Earth Observatory website this weekend. Your image nicely documents the topographic features of this uninhabited island and hints of its diverse marine environment. Nice catch!”

CEO (Crew Earth Observations) photo targets uplinked for today were Meili Glacier, China (*Meili Mt. with its glacier rises above 22,000 feet and is the center of a diversity hotspot for plants and endangered animals [snow leopard, clouded leopard, Asiatic black bear, and red panda]. The snow-covered mountain ranges run parallel separated by major rivers in semiarid gorges. Meili Mt. lies on the second major range right of track*), and Two Hearted River Forest Reserve, Upper

Peninsula, MI (*this Reserve will be managed by the Nature Conservancy for sustainable forestry. Imagery for longer term monitoring was requested. Looking just right of track, a short way inland from the shore of Lake Superior*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

Week 26 Scheduled Main Activities:

- *Sun. (10/19):* ISS-18 expmts.; VC15 Prgm.; Handovers ISS-18; BMP ch.2 regen.; JEMRMS DOUG review ; JEMRMS activities/checkout ; MBI-15 NEURO; O-OHA assess.; IP-1 check; Elektron BZh check.

ISS Orbit (as of this morning, 7:26am EDT [= epoch]):

Mean altitude -- 352.2 km

Apogee height -- 354.5 km

Perigee height -- 349.9 km

Period -- 91.58 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0003346

Solar Beta Angle -- -60.6 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 30 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56793

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

10/23/08 -- Soyuz TMA-12/16S undock (DC1 nadir, 8:15pm) & land (11:36pm) =

10/24 -- 9:36am Kazakhstan)

11/02/08 -- Progress 30P reboost; *Daylight Saving Time (DST) ends*

11/15/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/17/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit – (*UNDER REVIEW*)

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

12/01/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.) – (*UNDER REVIEW*)

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking

02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 10/17/08

All ISS systems continue to function nominally, except those noted previously or below. *Day 4 of joint E17/18 operations.*

The crew's work/sleep cycle remains at the one-hour earlier wake-up time of 1:00am EDT; sleeptime tonight – 4:30pm.

Aboard the station, the E17/18 crew rotation/handover activities continued nominally. *[Volkov, Kononenko, Fincke and Lonchakov had ~4:45 hrs between them for dedicated CDR/CDR & FE/FE handover activities, focusing today on SOZh/ECLSS (CMS Analyzer), TORU, EVA, IVA & EVA Tools, Hatches, Windows, STA Kits, Progress & Progress Transfers status, as listed in the relevant Handover (RPS) Book sections 14, 15, 16, 23. In addition, there are "generic" handovers where crewmembers are scheduled together to complete various designated standard tasks.]*

After wakeup and before breakfast, FE-2 Chamitoff & SFP (Space Flight Participant) Garriott downloaded the daily SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data from their Actiwatchs to the HRF-1 (Human Research Facility 1) laptop. Richard is participating in the SLEEP experiment for NASA. *[To monitor the crewmember's sleep/wake patterns and light exposure, crewmembers wear a special Actiwatch device which measures the light levels encountered by them as well as their patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

CDR Volkov performed the (currently daily) visual status check on the running DAKON-M hardware in the second session of the Russian experiment TEKh-15/ IZGIB ("Bend"), tagging up with the ground, downlinking data and restarting the data taking afterwards. *[The activity runs till 10/19, requiring visual control of hardware operations three times a day and report to the ground. The first IZGIB*

session, for checkout, was conducted on 9/23. IZGIB has the objective to help update mathematical models of the ISS gravitation environment, using accelerometers of the Russian SBI Onboard Measurement System, the GIVUS high-accuracy angular rate vector gyrometer of the SUDN Motion Control & Navigation System and other accelerometers for unattended measurement of micro-accelerations at science hardware accommodation locations - (1) in operation of onboard equipment having rotating parts (gyrodynes, fans), (2) when establishing and keeping various ISS attitude modes, and (3) when performing crew egresses into space and physical exercises.]

Volkov & Kononenko had 2 hrs set aside to perform the periodic Russian SPOPT (Fire Detection & Suppression System) maintenance, today in the FGB, by dismantling its IDZ-2 smoke detectors, cleaning their ionizing needles and then reinstalling the sensors. *[Part of the job is to inspect surrounding areas behind panels and to clean those surfaces with microbial growth wipes.]*

Major science activities in the RS (Russian Segment) by Yuri Lonchakov today focused on work with the thermostat-controlled coolers KUBIK-2 (preparing & copying data from it) and KUBIK-3 (installing the KUB incubator) plus the biotechnological experiments BIOEMULSION (activation of mixing mode Day 2) and BIO-4 (ventilation in KUBIK-1).

Sergey & Oleg conducted their fourth preliminary training session with the Russian "Chibis" LBNP suit (lower body negative pressure; Russian: ODNT), ramping up to get them ready for returning to gravity on 10/23. Assisting each other in turn as CMO (Crew Medical Officer), the subjects were supported in their two one-hour sessions by ground specialist tagup via VHF at 5:35am (DO4) & 7:10am EDT (DO5). *[The assessment uses the Gamma-1 ECG equipment with biomed harness, skin electrodes and a blood pressure and rheoplethysmograph cuff wired to the cycle ergometer's instrumentation panels. The Chibis ODNT provides gravity-simulating stress to the body's cardiovascular/circulatory system for evaluation of Volkov's and Kononenko's orthostatic tolerance (e.g., the Gauer-Henry reflex) after several months in zero-G. The preparatory training generally consists of first imbibing 150-200 milliliters of water or juice, followed by two cycles of a sequence of progressive regimes of reduced ("negative") pressure, set today at -25, -30, -35 and -40 mm Hg (Torr) for five min. each while shifting from foot to foot at 10-12 steps per minute, wearing a sphygmomanometer to measure blood pressure. The body's circulatory system interprets the pressure differential between upper and lower body as a gravity-like force pulling the blood (and other liquids) down. Chibis data and biomed cardiovascular readings are recorded. The Chibis suit (not to be confused with the Russian "Penguin" suit for spring-loaded body compression, or the "Kentavr" anti-g suit worn during reentry) is similar to the U.S. LBNP facility (not a suit) used for the first time on Skylab in 1973/74, although it appears to accomplish*

its purpose more quickly.]

FE-1-18 Lonchakov worked in the Soyuz TMA-13/17S Descent Module, dismantling the two "Klest" (KL-152) TV cameras and their light units for return to the ground on 16S for reuse, temporarily stowing them in the SM (Service Module).

Oleg Kononenko conducted the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the DC1-to-Soyuz tunnel, and the FGB-to-Soyuz and FGB-to-Node passageway. *[This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently six persons, and one of the two Russian SKV air conditioners still off (SKV-1), having run out of service life.]*

With the JAXA Marangoni Surface experimentation in the FPEF (Fluid Physics Experiment Facility) having ended, FE-2 Chamitoff spent 10 min. in the Kibo JPM (JEM Pressurized Module) to turn off the MMA (Microgravity Measurement Apparatus) and its laptop (MLT), then powered down the MMA's NCU/RSU (Network Control Unit/Remote Sensor Unit) set from the Ryutai rack's UDC (Utility DC-to-DC Converter). *[SSIPC (Space Station Integration & Promotion Center) at Tsukuba/Japan has been conducting the Marangoni convection research basically only during crew sleep (for quiescence). The first series of the Marangoni experiment is now complete, and researchers uplinked their thanks to the crew, saying that they "were excited by the results".]*

In the US Lab, Gregory reconfigured the ITCS (Internal Thermal Control System) LAB1O4 RFCA (Rack Flow Control Assembly) from LTL (Low Temperature Loop) to MTL (Moderate Temperature Loop) operation, as required for upcoming EXPR-6 activities.

Kononenko & Lonchakov, as part of the handover program (RPS), collected the periodic readings of potentially harmful atmospheric contaminants in the SM (Service Module), using the CMS (Countermeasure System), a component of the SKDS GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, today using preprogrammed microchips to measure for o-Xylol (1,2-Dimethylbenzol, C_8H_{10}), Methyl-Mercaptan (Methanethiol, CH_4S), and Sulphur Dioxide (SO_2).

The FE-2 took measurements for the regular atmospheric status check for $ppCO_2$ (Carbon Dioxide partial pressure) in the Lab, SM at panel 449 and COL (Columbus Orbital Laboratory) plus battery ticks, using the hand-held CDMK (CO_2 Monitoring Kit, #1002). The unit was then deactivated and returned to its stowage location (LAB1S2). *[Purpose of the 5-min activity is to trend with MCA (Major Constituents*

Analyzer), i.e., to correlate the hand-held readings with MCA measurements. The results are usually logged in the OSTPV (Onboard Short Term Plan Viewer) and are immediately available to the ground.]

Working on the MATRYOSHKA-R (RBO-3-2) radiation instrumentation in the SM (panel 326), Yuri activated the AST Spectrometer for taking radiation measurements and storing the data on an inserted PCMCIA (Portable Computer Memory Card International Adapter) memory card (ALC-954). *[RBO-3-2 is using the ESA/RSC-Energia experiment ALTCRISS (ALC/Alteino Long Term monitoring of Cosmic Rays on the ISS) with its Spectrometer (AST) and ALC equipment, which is periodically moved around and now located again in the SM.]*

VC-15 Richard Garriott, assisted in part by Russian crewmembers, worked on his daily onboard program which today included –

- SLEEP Actiwatch logging;
- INTEGRATED IMMUNE (Validating Procedures for Monitoring Crew member Immune Function, collecting wet saliva sample before breakfast);
- Telephone talk to AT thru TsUP/Moscow via USB1;
- Tagup with consultants at TsUP via VHF-1;
- SSTV (Slow-Scan TV) ham radio session with Star City (Shchelkovo) via RSK2 laptop and MAREX-NA ISS SpaceCam1;
- 3 Ham radio sessions (Budbrooke Primary School, Warwick, England plus 2 with Austin, TX for VC-15 program & Challenger Center);
- DHL-G experiment for commercial German firm DHL (demo of Law of Preservation of Energy in micro-G using motion of two objects), along with still & video documentation);
- PRK Visual Acuity evaluation;
- MUSCLE-G (LBP/Low Back Pain) questionnaire;
- MOP-G (Motion Perception; vestibular adaptation to changes in micro-G);
- Video blogs (e.g., Family & Family Jewelry, Magnetism, Fluid Behavior, Conservation of Momentum, Ice Melting, et al.);
- Earth photography (Eastern US, Southern CA, mid-US); and
- Copying data & image files to HDD (Hard Disk Drive) for return.

E18 crewmembers Lonchakov & Fincke had several time segments reserved to familiarize themselves with physical exercise and the workout equipment (RED, TVIS treadmill maintenance, TVIS memory card formatting).

Volkov performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Sergey also conducted the daily IMS (Inventory Management System) maintenance, updating/editing the standard IMS "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Fincke & Lonchakov had their standard PMCs (Private Medical Conferences), via S-band/audio & Ku-band/video, Mike at ~10:10am EDT, Yuri at ~12:55pm.

Gregory & Michael had again time (~2.5 hrs) set aside on their schedule for pre-packing hardware to be returned on STS-126/ULF-2.

The E17 crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), and RED resistive exercise device (FE-2). Volkov & Kononenko had part of their exercise regimen accounted for by their fourth Chibis session, and CDR-18 Fincke performed his first onboard exercise on the RED for one hour.

Afterwards, Greg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~3:15am EDT, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~9:30am, Chamitoff held a teleconference with Astronaut Sandra Magnus, the new FE-2 coming up on STS-126/ULF-2 to replace him.

At ~2:10pm, the ISS crew is scheduled for their regular weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. *[S/G-2 (Space-to-Ground 2) phone patch via SSC].*

At ~3:45pm, the FE-2 is also scheduled for a CDE (Crew Discretionary Event) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop).

WRM Update: An updated WRM (Water Recovery Management) "cue card" was uplinked overnight for the crew's reference, updated with yesterday's water audit.

[The new card (17-1016D) lists 27 CWCs (~929.4 L total) for the four types of water identified on board: technical water (241.2 L, for Elektron electrolysis),

potable water (627.6 L, incl. 174.6 L currently on hold), condensate water (21.4 L), waste/EMU dump and other (39.20 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]

Conjunctions: Two conjunctions with orbital debris continue to be closely monitored by MCC-H specialists, both for tomorrow, Saturday (10/18): Object #33326 (from a Chinese CZ-2C rocket) with a TCA (Time of Closest Approach) at 9:55am EDT and a predicted overall miss distance (R) of 10.23 km, and Object #87985 (unknown) with TCA of 4:44pm and R = 86.5km (to be dropped). If a DAM (Debris Avoidance Maneuver) becomes advisable for #33326, it would best be performed tomorrow morning at 7:48am. If it is performed, Soyuz 16S landing time would occur approximately 2 min. later than currently planned, and the currently-planned reboost on 10/29 would be cancelled.

CEO (Crew Earth Observations) photo targets uplinked for today were **Japan Islands** (due to the current crew sleep shifting Greg had a nice opportunity to not only see Japan but to acquire a panoramic view from the northern islands to the south), **West Hawk Impact Crater** (looking right from track, West Hawk crater is a circular lake. This 4.5 km-diameter crater was formed 350 million years ago, and despite several episodes of glacial erosion in the last 2 million years, is still evident in the landscape. Greg may have had patchy clouds in the area), and **Hurricane Omar, Atlantic Ocean** (Greg should have been able to see Hurricane Omar south and right of ISS track. Omar is forecasted to have wind speeds of 110 kt, making it a minimal Category 3 storm. Trying to capture as much of the hurricane in a single frame as possible).

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

Week 26 Scheduled Main Activities:

- **Sat. (10/18):** ISS-18 expmts.; VC15 Prgm.; BMP ch.1 regen.; GANK sampling; IP-1 check; FFQ; Handovers ISS-18; Symbolic Activity; OGS deact.; DOUG review for JEMRMS checkout.
- **Sun. (10/19):** ISS-18 expmts.; VC15 Prgm.; Handovers ISS-18; BMP ch.2 regen.; JEMRMS DOUG review ; JEMRMS activities/checkout ; MBI-15 NEURO; O-OHA assess.; IP-1 check; Elektron BZh check.

ISS Orbit (as of this morning, 8:34am EDT [= epoch]):

Mean altitude -- 352.2 km

Apogee height -- 354.6 km

Perigee height -- 349.8 km
Period -- 91.58 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0003546
Solar Beta Angle -- -61.1 deg (magnitude peaking)
Orbits per 24-hr. day -- 15.72
Mean altitude loss in the last 48 hours -- 70 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 56778

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

10/23/08 -- Soyuz TMA-12/16S undock (DC1 nadir, 8:15pm) & land (11:36pm) =
10/24 -- 9:36am Kazakhstan)
11/02/08 -- Progress 30P reboost; *Daylight Saving Time (DST) ends*
11/14/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/16/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
12/01/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.) – *UNDER
REVIEW*
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at

http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 10/16/08

All ISS systems continue to function nominally, except those noted previously or below. *Day 3 of joint E17/18 operations.*

The crew's work/sleep cycle returned to the one-hour earlier wake-up time of 1:00am EDT; sleeptime tonight remains at 4:30pm.

Aboard ISS, the E17/18 crew rotation/handover activities continued nominally. *[Volkov, Kononenko, Fincke and Lonchakov had ~4 hrs between them for dedicated CDR/CDR & FE/FE handover activities, focusing today on Video, Audio, Prox Ops systems, Communications System, STTS (Telephone/Telegraph), ECLSS, Iridium-9505A (Motorola) satphone, recommendations on working with Radiograms, ODFs (Operations Data Files) & the IMS (Inventory Management System), and the relevant RBS power outlets 2, 4, 7 8, 9 10 (English: UOP/ Utility Outlet Panel). In addition, there are "generic" handovers where crewmembers are scheduled together to complete various designated standard tasks.]*

After wakeup and before breakfast, FE-2 Chamitoff & SFP (Space Flight Participant) Garriott downloaded the daily SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data from their Actiwatches to the HRF-1 (Human Research Facility 1) laptop. Garriott is participating in the SLEEP experiment for NASA. *[To monitor the crewmember's sleep/wake patterns and light exposure, crewmembers wear a special Actiwatch device which measures the light levels encountered by them as well as their patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

CDR Volkov performed the (currently daily) visual status check on the running DAKON-M hardware in the second session of the Russian experiment TEKh-15/ IZGIB ("Bend"), tagging up with the ground, downlinking data and restarting the data taking afterwards. *[The activity runs till 10/19, requiring visual control of hardware operations three times a day and report to the ground. The first IZGIB*

session, for checkout, was conducted on 9/23. IZGIB has the objective to help update mathematical models of the ISS gravitation environment, using accelerometers of the Russian SBI Onboard Measurement System, the GIVUS high-accuracy angular rate vector gyrometer of the SUDN Motion Control & Navigation System and other accelerometers for unattended measurement of micro-accelerations at science hardware accommodation locations - (1) in operation of onboard equipment having rotating parts (gyrodynes, fans), (2) when establishing and keeping various ISS attitude modes, and (3) when performing crew egresses into space and physical exercises.]

FE-1 Kononenko used the Russian MBI-21 PNEVMOKARD experiment hardware and conducted his fifth session, which disallows moving or talking during data recording. Volkov had his fifth session yesterday. The experiment is controlled from the RSE-med A31p laptop, equipped with new software, and uses the TENZOPLUS sphygmomanometer to measure arterial blood pressure. *[PNEVMOKARD (Pneumocard) attempts to obtain new scientific information to refine the understanding about the mechanisms used by the cardiorespiratory system and the whole body organism to spaceflight conditions. By recording (on PCMCIA cards) the crewmember's electrocardiogram, impedance cardiogram, low-frequency phonocardiogram (seismocardiogram), pneumotachogram (using nose temperature sensors), and finger photoplethysmogram, the experiment supports integrated studies of (1) the cardiovascular system and its adaptation mechanisms in various phases of a long-duration mission, (2) the synchronization of heart activity and breathing factors, as well as the cardiorespiratory system control processes based on the variability rate of physiological parameters, and (3) the interconnection between the cardiorespiratory system during a long-duration mission and the tolerance of orthostatic & physical activities at the beginning of readaptation for predicting possible reactions of the crewmembers organism during the their return to ground.]*

FE-2 Chamitoff conducted the monthly 30-min PEP (Fire Detection & Suppression/ Portable Emergency Provisions) safety inspection/audit in the ISS modules. *[The IMS-supported inspection involves verification that PFEs (Portable Fire Extinguishers), PBAs (Portable Breathing Apparatus), QDMAs (Quick-Don Mask Assemblies) and EHTKs (Extension Hose/Tee Kits) are free of damage to ensure their functionality, and to track shelf life/life cycles on the hardware.]*

Chamitoff and CDR-18 Fincke conducted their first standard 30-min Shuttle RPM (R-bar Pitch Maneuver) skill training, using the NIKON D2Xs digital still camera with 400 & 800mm (by teleconverter) lenses at SM (Service Module) windows 6, 7 & 8 (facing in flight direction) to take CEO (Crew Earth Observations) target imagery with manual focusing. The practice run involved mapping of ground features with images having 40-50% overlap and about 20 images in each sequence.

Afterwards, the obtained OBT (onboard training) images were downlinked by Gregory to the ground for analysis (~3:55am). *[The RPM drill prepares crewmembers for the bottom-side mapping of the Orbiter at the arrival of the Shuttle (STS-126/Endeavour/ULF2 on 11/16. During the RPM at ~600 ft from the station, the “shooters” have only ~90 seconds for taking high-resolution digital photographs of all tile areas and door seals on Discovery, to be downlinked for launch debris assessment. Thus, time available for the shooting will be very limited, requiring great coordination between the two headset-equipped photographers and the Shuttle pilot.]*

Working on the MATRYOSHKA-R (RBO-3-2) radiation instrumentation in the SM (panel 326), Yuri Lonchakov conducted a health check on the new setup and downlinked the first data from the ALC-954 PCMCIA (Portable Computer Memory Card International Adapter) memory card via the RSK1 laptop. The AST Spectrometer afterwards remained off. *[RBO-3-2 is using the ESA/RSC-Energia experiment ALTCRISS (ALC/Alteino Long Term monitoring of Cosmic Rays on the ISS) with its Spectrometer (AST) and ALC equipment, which is periodically moved around and now located again in the SM.]*

Major science activities in the RS by Yuri Lonchakov today focused on the biotechnological experiment BIOEMULSION, ARIL, RECOMB-K and BIO-4. *[BIOEMULSION (BTKh-14): activation of mixing mode Day 1, photography during mixing ops; retrieving BTKh-14 Bioreactor #02, ARIL tubes & Recomb-K hardware from thermostat-controlled container KRIOGEM-3M (Cryogem-3M), resetting thermostat temperature to +4 degC and re-inserting the previous payloads. BIO-4: fourth relocation of RLD containers to KUBIK-2 and then to MELFI (Minus-Eighty Laboratory Freezer for ISS).]*

The FE-2 completed the weekly 10-min. CWC (Contingency Water Container) inventory as part of on-going WRM (Water Recovery & Management) assessment of onboard water supplies. Updated “cue cards” based on the crew’s water calldowns are sent up every other week. *[The new card (17-1016C), to be updated with today’s data, lists 28 CWCs (~911.2 L total) for the four types of water identified on board: technical water (263.2 L, for Elektron electrolysis, except for 22.2 L off-limit because of Wautersia bacteria), potable water (627.6 L, incl. 174.6 L currently on hold), condensate water (3.4 L), waste/EMU dump and other (17 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]*

Volkov performed the regular transfer of US condensate to the Russian water supply system (SVO-ZV) by taking the filled CWC (Contingency Water Container) #1094 to the RS (Russian Segment) and transferring the water to two EDV containers via the BP transfer pump. One of the EDVs was then connected to the

SVO-ZV, replacing the emptied container.

For Sergey, with Yuri for handover, it was time again for recharging the Motorola Iridium-9505A satellite phone brought up on Soyuz 16S, a monthly routine job and his sixth time. *[After retrieving it from its location in the TMA-12/16S descent module (BO), Sergey and Yuri initiated the recharge of its lithium-ion battery, monitoring the process every 10-15 minutes as it took place. Upon completion at ~10:15am, the phone was returned inside its SSSP Iridium kit and stowed back in the BO's operational data files (ODF) container. The satphone accompanies returning ISS crews on Soyuz reentry & landing for contingency communications with SAR (Search-and-Rescue) personnel after touchdown (e.g., after an "undershoot" ballistic reentry, as happened during the recent 15S return). The Russian-developed procedure for the monthly recharging has been approved jointly by safety officials. During the procedure, the phone is left in its fire-protective fluoroplastic bag with open flap. The Iridium 9505A satphone uses the Iridium constellation of low-Earth orbit satellites to relay the landed Soyuz capsule's GPS (Global Positioning System) coordinates to helicopter-borne recovery crews. The older Iridium-9505 phones were first put onboard Soyuz in August 2003. The newer 9505A phone, currently in use, delivers 30 hours of standby time and three hours of talk, up from 20 and two hours, respectively, on the older units.]*

Oleg Kononenko conducted the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the DC1-to-Soyuz tunnel, and the FGB-to-Soyuz and FGB-to-Node passageway. *[This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently six persons, and one of the two Russian SKV air conditioners still off (SKV-1), having run out of service life.]*

Greg Chamitoff performed the periodic battery replacement on the prime CSA-CP (Compound Specific Analyzer-Combustion Products) instrument.

VC-15 Richard Garriott, assisted in part by Russian crewmembers, worked on his daily onboard program which today included –

- SLEEP Actiwatch logging;
- Telephone talk to AT via USB1;
- Tagup with consultants at TsUP-Moscow via VHF-1;
- 2 Ham radio sessions with Austin, TX (VC-15 program & Challenger Center);
- TV conference with family at TsUP (Owen Garriott);
- PICTURE experiment (creation of a painting in zero-G with free-floating paint drops, along with still & video documentation);
- PRK Visual Acuity evaluation;
- MUSCLE-G (LBP/Low Back Pain) questionnaire;
- MOP-G (Motion Perception; vestibular adaptation to changes in micro-G);

- Video blogs (e.g., SEIKO watch, UK Challenge, Art topics & Art Show in Space);
- Earth photography (Phoenix and across mid0-US); and
- Copying files to HDD (Hard Disk Drive) for return.

The CDR-17 performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Sergey also conducted the daily IMS maintenance, updating/editing the standard IMS “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Volkov & Lonchakov spent ~30 min in the two Soyuz spacecraft to conduct the regular multi-element communications test between Soyuz TMA-12, the SM and Soyuz TMA-13. *[Test objectives are to check hard-line comm mode (MBS) & S-band link, Soyuz VHF-2 with S-band & SM VHF-1 in relay mode, Soyuz-to-Soyuz VHF-2 in simplex mode with S-band & SM VHF-1, and to perform some multielement communications procedures training.]*

As part of handover activities, Yuri Lonchakov spent ~30 min on a familiarization review of the onboard physical exercise equipment.

Greg & Mike had another ~3.5 hrs set aside on their timeline for pre-packing hardware to be returned on STS-126/ULF-2.

Lonchakov & Fincke performed their standard PMCs (Private Medical Conferences), via S-band/audio & Ku-band/video, Yuri at ~11:20am, Mike at ~1:15pm.

The E17 crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR/2.5h, FE-1/2.5h), and RED resistive exercise device (FE-2).

Later, Greg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~12:25pm, Mike Fincke and Greg Chamitoff participated in two PAO TV interview

events, one with CBS News (Bill Harwood, Peter King), the other with ABC News (Gina Sunseri).

OGS Update: After yesterday's successful activation of the US OGS (Oxygen Generation System) with the WDS (Water Delivery System) as part of the nominal 90-day procedure, the OGS ran nominally until it was turned off again last night. O₂ is being provided by the Elektron in the RS.

Conjunctions: Two conjunctions with orbital debris are being closely monitored by MCC-H specialists, both for 10/18 (Saturday): Object #33326 (from a Chinese CZ-2C rocket) with a TCA (Time of Closest Approach) at 9:55am EDT and a predicted overall miss distance (R) of 4.87km, and Object #87985 (unknown) with TCA of 4:44pm and R = 7.544km.

CEO (Crew Earth Observations) photo target uplinked for today was **Aral Sea, Kazakhstan, Uzbekistan** (*Dynamic Event: Aral Sea. The Aral Sea is one of CEO's long-term monitoring sites. Once the fourth largest inland sea, Aral Sea lake levels have been steadily declining since the 1960's. The reason for the decline is that the Amu Darya and the Syr Darya rivers that feed the Aral were diverted by the former Soviet Union for irrigation projects. By 2004 the Aral had shrunk to 25% of its original surface area. Context views of the Aral Sea were requested*).

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

Week 26 Scheduled Main Activities:

- *Fri. (10/17):* ISS-18 expmts.; VC15 Prgm.; PAO; GOGU tagup; ULF-2 prepacking; Handovers ISS-18; ODNT/LBNP OBT; IDZ-2 smoke detector mntn.; CMS sampling; IP-1 check.
- *Sat. (10/18):* ISS-18 expmts.; VC15 Prgm.; BMP ch.1 regen.; GANK sampling; IP-1 check; FFQ; Handovers ISS-18; Symbolic Activity; OGS deact.; DOUG review for JEMRMS checkout.
- *Sun. (10/19):* ISS-18 expmts.; VC15 Prgm.; Handovers ISS-18; BMP ch.2 regen.; JEMRMS DOUG review ; JEMRMS activities/checkout ; MBI-15 NEURO; O-OHA assess.; IP-1 check; Elektron BZh check.

ISS Orbit (as of this morning, 8:07am EDT [= epoch]):

Mean altitude -- 352.3 km

Apogee height -- 354.6 km

Perigee height -- 350.0 km

Period -- 91.58 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0003459
Solar Beta Angle -- -60.5 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.72
Mean altitude loss in the last 48 hours -- 85 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 56762

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

10/23/08 -- Soyuz TMA-12/16S undock (DC1 nadir, 8:15pm) & land (11:36pm) =
10/24 -- 9:36am Kazakhstan)
11/02/08 -- Progress 30P reboost; *Daylight Saving Time (DST) ends*
11/14/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/16/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
12/01/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.)
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 10/15/08

All ISS systems continue to function nominally, except those noted previously or below. *Day 2 of joint E17/18 operations.*

The crew's work/sleep cycle returned to the normal wake-up time of 2:00am EDT; sleeptime tonight remains at the earlier 4:30pm, for an earlier wakeup tomorrow morning, at 1:00am.

Aboard ISS, the E17/18 crew rotation/handover period went underway with full activity schedules for all six residents involved. Volkov, Kononenko, Fincke and Lonchakov had ~2.5 hrs between them for dedicated CDR/CDR & FE/FE handover activities, focusing today on USOS (US Segment), Elektron oxygen generator servicing in the RS (Russian Segment), and the relevant RBS power outlet 10 (English: UOP/ Utility Outlet Panel). In addition, there are "generic" handovers where crewmembers are scheduled together to complete various designated standard tasks.

After wakeup and before breakfast, FE-2 Chamitoff & SFP (Space Flight Participant) Garriott downloaded the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data from their Actiwatches to the HRF-1 (Human Research Facility 1) laptop. Garriott is participating in the SLEEP experiment for NASA. *[To monitor the crewmember's sleep/wake patterns and light exposure, crewmembers wear a special Actiwatch device which measures the light levels encountered by them as well as their patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

As part of the crew's regular morning inspection tour, CDR Volkov, with Kononenko and Fincke, conducted the routine checkup of DC1 (Docking Compartment) circuit breakers and fuses. *[The monthly checkup in the "Pirs" module looks at AZS circuit breakers on the BVP Amp Switch Panel (they should all be On) and the LEDs (light-emitting diodes) of 14 fuses in fuse panels BPP-30 & BPP-36.]*

Major science activities in the RS by Yuri Lonchakov, beginning with activation of the Cryogem-03M (KRIOGEM-03M) thermostatic facility at +29 degC (later reset to +4 degC), today focused on the biotechnological experiment BIOEMULSION, CONJUGATION, BIOEKOLOGIYA/ARIL, and BIO-4. *[BIOEMULSION (BTKh-14): transferring Bioreactor #02 from KT thermostat shell to Cryogem-3M and replacing it in KT with Bioreactor #05 for culturing. CONJUGATION (Pairing): removal of the Recomb-K hybridization experiment from Cryogem, process activation at ambient temperature, photography of Recomb-K hardware, completing activation and returning to Cryogem, set at +4 degC. ARIL: relocating ARIL tubes (in Ziploc bag) from BIOEKOLOGIYA (Bioecology) container #18 to Cryogem. BIO-4: third relocation of RLD containers from KUBIK-2 to MELFI.]*

Sergey Volkov set up the hardware for the Russian MBI-21 PNEVMOKARD experiment and conducted the session, his fifth, which does not allow moving or talking during data recording. Kononenko will have his fifth session tomorrow. The experiment is controlled from the RSE-med A31p laptop, equipped with new software, and uses the TENZOPLUS sphygmomanometer to measure arterial blood pressure. *[PNEVMOKARD (Pneumocard) attempts to obtain new scientific information to refine the understanding about the mechanisms used by the cardiorespiratory system and the whole body organism to spaceflight conditions. By recording (on PCMCIA cards) the crewmember's electrocardiogram, impedance cardiogram, low-frequency phonocardiogram (seismocardiogram), pneumotachogram (using nose temperature sensors), and finger photoplethysmogram, the experiment supports integrated studies of (1) the cardiovascular system and its adaptation mechanisms in various phases of a long-duration mission, (2) the synchronization of heart activity and breathing factors, as well as the cardiorespiratory system control processes based on the variability rate of physiological parameters, and (3) the interconnection between the cardiorespiratory system during a long-duration mission and the tolerance of orthostatic & physical activities at the beginning of readaptation for predicting possible reactions of the crewmembers organism during the their return to ground.]*

FE-2 Greg Chamitoff conducted the regular 30-day inspection of the new AED (Automated External Defibrillator) in the CHeCS (Crew Health Care Systems) rack. *[The AED is a portable electronic device that automatically diagnoses the potentially life threatening cardiac arrhythmias of ventricular fibrillation and ventricular tachycardia in a patient. It then can treat them through defibrillation, i.e., the application of electrical therapy which stops the arrhythmia, allowing the heart to re-establish an effective rhythm. AEDs are generally either held by trained personnel who will attend events or are public access units which can be found in places including corporate and government offices, shopping centers, airports, restaurants, casinos, hotels, sports stadiums, schools and universities, community*

centers, fitness centers, health clubs and any other location where people may congregate.]

Volkov worked on the Service Module toilet systems (SM ASU), performing the monthly 30-min. maintenance/servicing of the facility, changing out replaceable ASU parts with new components, i.e., the urine receptacle (MP) and a filter insert (F-V). The old parts were discarded as trash.

In the Soyuz TMA-13/17S Orbital Module, docked at the FGB, Lonchakov installed the LKT local temperature sensor switch (TA251M1B) of the BITS2-12 onboard telemetry system and its ROM/read-only memory unit (PZU TA765B), both kept in storage from an earlier Soyuz.

The FE-2 transferred US condensate from the Lab CCAA (Common Cabin Air Assembly) dehumidifier tank to a CWC (Contingency Water Container, #1070), while monitoring the time it took for the pump to fill the latter (in order to evaluate the performance of the US filter used). *[Starting at 7:20am, it took until 8:05am to reduce the amount of 24.29 kg condensate to 5.71 kg until tank and CWC pressures had equalized.]*

After moving the MATRYOSHKA-R (RBO-3-2) radiation instrumentation from the FGB to the SM (panel 326) yesterday, Yuri Lonchakov today retrieved a new ALC dosimeter kit from Soyuz 17S, mounted the dosimeters on the ALC hardware, activated the AST spectrometer (with memory card ALC-954) and took documentary photography with the Nikon D2X. *[RBO-3-2 is using the ESA/RSC-Energia experiment ALTCRISS (ALC/Alteino Long Term monitoring of Cosmic Rays on the ISS) with its Spectrometer (AST) and ALC equipment, which is periodically moved around and now located again in the SM.]*

Oleg reconfigured the SSC-15 (Station Support Computer 15) in the JAXA Kibo module. *[The reconfiguration consisted in removing the Ethernet hatch drag-through cable and connecting the laptop instead to power & data in the JPM (JEM Pressurized Module) via a 120V Power/Ethernet cord.]*

Sergey unstowed, set up and activated the DAKON-M hardware for the second session of the Russian experiment TEKh-15/IZGIB ("Bend"), taking photography of the activity which will run till 10/19, requiring visual control of hardware operations three times a day and report to the ground. The first IZGIB session, for checkout, was conducted on 9/23. *[IZGIB has the objective to help update mathematical models of the ISS gravitation environment, using accelerometers of the Russian SBI Onboard Measurement System, the GIVUS high-accuracy angular rate vector gyrometer of the SUDN Motion Control & Navigation System and other accelerometers for unattended measurement of micro-accelerations at science*

hardware accommodation locations - (1) in operation of onboard equipment having rotating parts (gyrodynes, fans), (2) when establishing and keeping various ISS attitude modes, and (3) when performing crew egresses into space and physical exercises.]

Chamitoff and Fincke spent handover time on the US ACS OGS (Atmosphere Control & Supply/Oxygen Generation System), going through the steps of setting it up for activation. *[Steps included accessing the OGS rack front and mating the O₂ outlet jumper QD (Quick Disconnect) at the N₂ Purge ORU (Orbit Replaceable Unit, LAB1PD1 panel), then performing an N₂ (nitrogen) purge of the H₂ (hydrogen) sensor and letting the OGA (Oxygen Generation Assembly) powered for ~20 min. Afterwards, the H₂ sensor QDs were reconnected, the rack door closed, and the WDS (Water Delivery System) re-attached and activated.]*

VC-15 Richard Garriott, assisted in part by Russian crewmembers, worked on his daily onboard program which today included –

- INTEGRATED IMMUNE (Validating Procedures for Monitoring Crew member Immune Function), before breakfast (collecting dry saliva sample);
- SLEEP Actiwatch logging;
- Telephone talk to AT;
- SSTV (Slow-Scan TV) ham radio session with Star City/Shchelkovo (with Volkov & Kononenko);
- PMC (Private Medical Conference);
- Ham radio session with Austin, TX (friends & family, Mayor of Austin);
- PRK Visual Acuity evaluation;
- MUSCLE-G (LBP/Low Back Pain) questionnaire;
- MOP-G (Motion Perception; vestibular adaptation to changes in micro-G);
- Earth photography (Asia); and
- Video blogs (e.g., on NASA Sleep Study, Visual Acuity Study, Immune Study, wedding rings, Operation Immortality – developing a digital time capsule for future generations, etc.).

Oleg & Yuri had an hour reserved for replacing and updating RODF (Russian Operations Data File) procedures pages, updating four books (VC Emergency, Technical Experiments, LDM/Long Duration Missions, TORU) and stowing two new ODF CD-ROMs plus two new books (VC15, E17/18 Crew Handover).

CDR Volkov conducted the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the DC1-to-Soyuz tunnel, and the FGB-to-Soyuz and FGB-to-Node passageway. *[This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently six persons, and one of the two Russian SKV air conditioners still*

off (SKV-1) because it has run out of service life.]

The FE-1 performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The daily IMS (Inventory Management System) maintenance was conducted today by Yuri Lonchakov, updating/editing the standard IMS “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Greg & Mike had another ~90 min on their timeline for pre-packing hardware to be returned on STS-126/ULF-2.

The crew had their regular PMCs (Private Medical Conferences), via S-band/audio & Ku-band/video, Richard at ~7:55am, Oleg at ~12:05pm, Yuri at ~12:35pm, Sergey at ~2:00pm, Greg at ~2:15pm. Mike’s was yesterday.

Today’s schedule also provided for an approximately 1-hr repressurization of the ISS atmosphere with O₂ from Progress 30P’s SrPK tankage, conducted by Oleg and Yuri.

The E17 crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR/2.5h, FE-1/2.5h), and RED resistive exercise device (FE-2).

Later, Greg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

CEO (Crew Earth Observations) photo target uplinked for today was **Ouarkziz Impact Crater, Algeria** *(weather was predicted to be clear over this 3.5 km in diameter impact structure. Looking for the distinctive linear features caused by folded strata of the Ouarkziz Monocline as an indicator of the crater's location. The circular crater is distinctive within the folded rock beds when viewed with the long lens. Nadir-viewing, overlapping frames taken as ISS passed over the monocline from SW to NE should have captured the crater).*

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

Week 26 Scheduled Main Activities:

- *Thu. (10/16):* ISS-18 expmts.; VC15 Prgm.; EDV replace; ULF-2 prepacking; Handovers ISS-18; WRM CWC audit; PEPS inspect.; Iridium recharge; IP-1 check.
- *Fri. (10/17):* ISS-18 expmts.; VC15 Prgm.; PAO; GOGU tagup; ULF-2 prepacking; Handovers ISS-18; ODNT/LBNP OBT; IDZ-2 smoke detector mntn.; CMS sampling; IP-1 check.
- *Sat. (10/18):* ISS-18 expmts.; VC15 Prgm.; BMP ch.1 regen.; GANK sampling; IP-1 check; FFQ; Handovers ISS-18; Symbolic Activity; OGS deact.; DOUG review for JEMRMS checkout.
- *Sun. (10/19):* ISS-18 expmts.; VC15 Prgm.; Handovers ISS-18; BMP ch.2 regen.; JEMRMS DOUG review ; JEMRMS activities/checkout ; MBI-15 NEURO; O-OHA assess.; IP-1 check; Elektron BZh check.

ISS Orbit (as of this morning, 4:32am EDT [= epoch]):

Mean altitude -- 352.4 km

Apogee height -- 354.7 km

Perigee height -- 350.1 km

Period -- 91.59 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0003436

Solar Beta Angle -- -58.9 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 119 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56744

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

10/23/08 -- Soyuz TMA-12/16S undock (DC1 nadir, 8:15pm) & land (11:36pm) =

10/24 -- 9:36am Kazakhstan)

11/02/08 -- Progress 30P reboost; *Daylight Saving Time (DST) ends*

11/14/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/16/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

12/01/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.)

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 10/14/08

All ISS systems continue to function nominally, except those noted previously or below.

Yest kasaniya! Soyuz TMA-13/17S docked smoothly at the FGB nadir port at 4:26am EDT, seven minutes ahead of time, with Expedition 18 crewmembers CDR-18 Michael Fincke, Soyuz CDR/FE-1-18 Yuri Lonchakov, and SFP (Spaceflight Participant) Richard Garriott, the 15th Visiting Crewmember (VC) and the 6th "space tourist". He and Sergey are the first children of veteran space-flyers who also have made it to space. After about 1.5 hrs spent in Soyuz on pre-transfer activities, the crew opened hatches, followed by crew transfer, the traditional joyful welcome event and the installation of the BZV QD (quick disconnect) clamps by Lonchakov and Kononenko. *[After successful "kasaniya" (contact), automatic "sborka" (closing of Soyuz & FGB port hooks & latches) took place shortly thereafter while ISS was in free drift. Attitude control authority had been handed over to the Russian MCS (Motion Control System) at ~00:25am and was returned to US CMG control at ~6:58am. For the 17S docking, Russian thrusters were disabled during Soyuz volume pressurization and clamp installation; they were afterwards returned to active attitude control (~4:53am. fore hatch opening, the crew performed leak checks of the Soyuz modules and the Soyuz/FGB interface vestibule. They then doffed their Sokol suits and set them up for drying, deactivated the Atmosphere Purification Unit (BOA) in the Descent Module (SA), replaced the Soyuz ECLSS LiOH cartridges, equalized Soyuz/ISS pressures, and put the spacecraft into conservation mode on ISS integrated power. Fincke & Lonchakov are replacing Expedition 17 CDR Volkov & FE-1 Kononenko. FE-2 Dr. Gregory Chamitoff remains on the station, joining Expedition 18 until next month (November) when he is replaced by U.S. Astronaut Sandy Magnus, arriving on STS-126/ULF2. Richard Garriott, the son of veteran U.S. Skylab/Shuttle Astronaut Owen Garriott, returns with Sergey & Oleg on 10/23 in Soyuz TMA-12/16S.]*

The ISS crew's work/sleep cycle shifted this morning by one hour, from wakeup at 2:00am to 1:00am EDT (sleeptime tonight at 4:30pm, from 5:30pm).

FE-2 Chamitoff continued his third week-long session of the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment, using payload software for data downloading and filling in questionnaire entries in the experiment's session file on the HRF-1 laptop. *[To monitor the crewmember's sleep/wake patterns and light exposure, Greg wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. He will be joined in this experiment by Fincke and Garriott. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

Gregory also had the fifth day of his second SOLO (Sodium Loading in Microgravity) session, which runs in two blocks of six days each. Today, Greg again began with measurements and sampling of body mass (with SLAMMD/Space Linear Acceleration Mass Measurement Device), blood (with PCBA/Portable Clinical Blood Analyzer), and urine, to continue for three more days. Samples were stowed in the MELFI (Minus-Eighty Laboratory Freezer for ISS). *[Background: For the SOLO experiment, Chamitoff follows a special high-salt diet, for which prepared meals are provided onboard. All three daily meals are being logged on sheets stowed in the PCBA Consumable Kit in the MELFI along with control solution and cartridges for the PCBA. Blood and urine samples are stowed in the freezer. SOLO, an ESA/German experiment from the DLR Institute of Aerospace Medicine in Cologne/Germany, investigates the mechanisms of fluid and salt retention in the body during long-duration space flight. Background: The hypothesis of an increased urine flow as the main cause for body mass decrease has been questioned in several recently flown missions. Data from the US SLS1/2 missions as well as the European/Russian Euromir '94 & MIR 97 missions show that urine flow and total body fluid remain unchanged when isocaloric energy intake is achieved. However, in two astronauts during these missions the renin-angiotensin system was considerably activated while plasma ANP concentrations were decreased. Calculation of daily sodium balances during a 15-day experiment of the MIR 97 mission (by subtracting sodium excretion from sodium intake) showed an astonishing result: the astronaut retained on average 50 mmol sodium daily in space compared to balanced sodium in the control experiment. SLAMMD, performed first on Expedition 12 in December 2005, provides an accurate means of determining the on-orbit mass of humans spanning the range from the 5th percentile Japanese female and the 95th percentile American male. The procedure, in accordance with Newton's 2nd Law of Motion, finds the mass by dividing force, generated by two springs inside the SLAMMD drawer, by acceleration measured with a precise optical instrument that detects the position versus time trajectory of the SLAMMD guide arm and a micro controller which collects the raw data and provides the precise timing. The final computation is done via portable laptop computer with SLAMMD unique software. To calculate their*

mass, crewmembers wrap their legs around a leg support assembly, align the stomach against a belly pad and either rest the head or chin on a head rest. For calibration, an 18-lbs. mass is used at different lengths from the pivot point, to simulate different mass values. Crew mass range is from 90 to 240 lbs.]

Steps by the ISS crew leading up to the Soyuz docking included:

- Testing, by Kononenko, of the RS (Russian Segment) video system, which uses the SONY HDV camera for transmitting over the MPEG-2 (Moving Pictures Expert Group 2) encoder from FGB & SM to downlink via U.S. OpsLAN and Ku-band in “streaming video” packets *[deactivated and disassembled later in the day by Volkov]*,
- Configuring and activating the A31p SSC (Station Support Computer) laptop for the TV conversion to NTSC and Ku-band, by Chamitoff *[later, Greg removed the downlink test equipment and disconnected the hook-up of the UOP DCP (utility outlet panel/display & control panel) power bypass cable at the CUP RWS (Cupola Robotic Work Station)]*,
- Activating the video equipment for covering the Soyuz approach & docking (CDR),
- Oleg configuring the station comm (STTS) for the docking *[plus reconfiguring it afterwards for the nominal post-docking hardline mode (MBS)]*,
- Powering down the amateur radio (ham) equipment to prevent RF interference with the KURS automated approach & docking system (FE-2), and
- Monitoring approach and final docking of Soyuz from the SM (FE-1).

After the successful docking at the FGB nadir port –

- CDR Volkov downlinked the docking video via Ku-band,
- FE-1-18 Lonchakov & CDR-18 Fincke conducted the ~1 hr FGB interface leak check,
- Kononenko switched hatch KVDs (Pressure Equalization Valves) between FGB GA and Soyuz to electric control mode,
- The crew opened the Soyuz-FGB transfer tunnel hatches,
- Both crews then joined for the obligatory standard Safety Briefing of the newcomers by CDR Volkov to familiarize them with procedures and escape routes in case of an emergency *[the Briefing included pointing out the location of the “Emergency Response/Visiting Crew” books, showed how to move about the station without getting hurt or accidentally disturbing air flow meters/sensors (PP IP-1) and familiarized the SFP with his switch to a different Soyuz for return]*,
- As part of Soyuz deactivation after the docking, Yuri Lonchakov installed the intermodular air exchange ducting between the Soyuz (through both Orbital & Descent Modules) and the FGB *[the two optional modes for the ducting configuration are with & without air heating]*,

- Volkov meanwhile set up the three Sokol spacesuits and their gloves for drying out, followed later today by
- Yuri and Sergey swapped out Chamitoff's and Garriott's IELKs (Individual Equipment & Liner Kits, Russian: USIL) between the two Soyuz vehicles, TMA-12/16S & TMA-13/17S, including their tailored Sokol spacesuits. The IELKs of Fincke & Lonchakov are already in the 17S spacecraft that has now become the Expedition 18 CRV (Crew Return Vehicle), good for a maximum of 200 days in space, while Volkov's & Kononenko's IELKs remain in 16S for the return on 10/23. *[A crewmember is not considered transferred until her/his IELK, AMP (Ambulatory Medical Pack) and ALSP (Advanced Life Support Pack) drug kit are transferred. After today's installation of the VC15 IELK, Richard is now considered a 16S crewmember, and **Expedition 18 has technically begun its residence** aboard ISS, with Sergey Volkov passing his CDR-baton to Mike Fincke. TMA-12 has been docked at ISS since 4/10/08. By the time of its return on 10/23 (with one pyro bolt removed), the spacecraft will have spent 199 days in space, one day short of its "warranty" life. Of course, Volkov & Kononenko also will have accumulated 199 days in space at their return.]*

After activating the three thermostat-controlled sample containers KUBIK-1 (+21 degC), KUBIK-2 (+37 degC) and KRIOGEM-03 (+4 degC) in the RS, Oleg and Yuri transferred, installed and photographed high-priority science equipment, including –

- BIO-12/REGENERATION *(a study of micro-G effects on structural and functional recovery of damaged organs and tissues in animal tests, specifically Planaria worms),*
- BTKh-10/KONYUGATSIYA *("Conjugation" in its Biokont-T container, also in KRIOGEM, which deals with the processes of genetic material transmission using bacterial conjugation, in the Biokont-T container and Rekomb-K hardware in the KRIOGEM-03M),*
- BTKh-14/BIOEMULSIYA *(Bioemulsion, which investigates the design and improvement of a closed-type autonomous thermostat-controlled bioreactor for obtaining biomass of organisms and bioactive substances (BAV) without additional ingredients input or removal of metabolism products, for bacterial, enzymatic, and pharmaceutical preparations),*
- BTKh-12/ BIOEKOLOGIYA *(Bioecology, kits & containers with BIOTREK, LAKTOLEN, ARIL, and ANTIGEN) [BTKh-5/ARIL studies the effects of space flight on cultures of Lactolen- and Interleukin ARIL producing cells] and*
- BIO-4 *(the latest in a series of ESA's BIO payload system which makes use of the KUBIK incubator facilities, currently the "facilities of choice" for this program).*

Sergey Volkov took Richard Garriott on the standard one-hour guided tour of the ISS. *[The tour was to acquaint the SFP with both station segments, his living*

quarters in the RS, his work station in the DC1 Docking Compartment, other work locations (e.g., SM windows #7 & #8 for his Earth photo/video activities), the sites for his scheduled once-daily VHF conferences with his consultant group and his ham radio sessions, location of his RSK2 laptop, stowage of his VC15 experiments, uplink printouts and camera equipment for his use, email ops, and PFC (Private Family Conference) using the IP (Internet Protocol) phone.]

Assisted by Sergey, Richard later –

- Installed his removable HDD (Hard Disk Drive) in the RSK2 A31p laptop,
- Transferred his PCG (Protein Crystallization in micro-G) experiment container from Soyuz, set it up in the SM and photographed it,
- Configured the ham radio in slow-scan TV mode,
- Donned the Actiwatch for the U.S. SLEEP experiment (in which he participates along with Mike Fincke),
- Performed his first on-board experiment, Visual Acuity in Space (PRK), with eye charts and log charts, which he will conduct every day, along with SLEEP log entries and, at some days, the Integrated Immune assessment with liquid collections, and
- Filled in the daily questionnaires for the two medical ESA assessments MUSCLE-G (LBP/Low Back Pain) and MOP (Motion Perception, study of vestibular adaptation to gravity transition).

Earlier in the day, FE-2 Chamitoff worked on the MELFI (Minus-Eighty Laboratory Freezer for ISS) to free a stuck drawer and prepare the freezer for the subsequent transfer of the new BIO-4 payload from the KUBIK-2 facility to MELFI.

Gregory also used the HRF printer to print out an uplinked 30-page “17S SFP Science Packet” for Richard Garriott, containing detailed instructions, timeline overview, SLEEP log sheets, visual acuity eye charts and forms, etc.

Oleg Kononenko deactivated the hardware of the MATRYOSHKA-R (RBO-3-2) radiation instrumentation on panel 429 in the FGB, packed the ALC-952 data storage card for return on Soyuz 16S and took documentary photographs. Afterwards, he deinstalled the AST Spectrometer in the FGB, moved it to the SM and re-installed it on panel 326. *[RBO-3-2 is using the ESA/RSC-Energia experiment ALTCRIS (Alteino Long Term monitoring of Cosmic Rays on the ISS/ALC) with its Spectrometer (AST) and ALC equipment, which is periodically moved around and now located again in the SM.]*

Greg Chamitoff set up the NetMeeting application on SSC-1 in the SM for the SFP and conducted a network conference test. *[This capability will allow the SFP to participate in a conference later during the mission.]*

Afterwards, the FE-2 relocated more empty food containers to Node-2 and prepacked them to get them ready for return on ULF-2.

Chamitoff also updated the SODF POC (System Operations Data File/Portable Onboard Computer) procedures book with File Server Recovery procedures printed out from a file uplinked overnight.

The CDR meanwhile downloaded the accumulated structural dynamics data from this morning's Soyuz docking from the IWIS RSUs (Internal Wireless Instrumentation System/Remote Sensor Units).

The FE-2 had an additional hour reserved for unpacking US cargo delivered on Progress 30P.

Later, Greg also spent ~30 min on US cargo unpacking from Soyuz 17S.

Volkov performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The daily IMS (Inventory Management System) maintenance was conducted today by Oleg, updating/editing the standard IMS "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The FE-2 completed another one of the periodic inspections of the RED (Resistive Exercise Device) canister cords and accessories, currently done every two weeks.

The crew performed an abbreviated physical workout program on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), and RED resistive exercise device (FE-2).

FE-1 Kononenko conducted the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS (Russian Segment) hatchways, including the DC1-to-Soyuz tunnel, and the FGB-to-Soyuz and FGB-to-Node passageway. *[This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently six persons, and one of the two Russian SKV air conditioners still off (SKV-1) because it has run out of service life.]*

Before his sleep time tonight, Gregory will unstow the INTEGRATED IMMUNE

Saliva Collection kit (#1005) in preparation for the upcoming series of sample collections by himself, Mike Fincke and Richard Garriott, the latter starting already tomorrow. Greg and Mike will begin their collections on 10/17. *[Integrated Immune is a 24-hr.assessment of human immune system changes, with the objective to investigate immune neuro-endocrine reactions in the space environment by studying samples of saliva, blood and urine using collection kits and the biomedical (MBI) protection kit, to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects. The saliva is collected in two forms, dry and liquid. The dry samples are collected at intervals during the collection day using a specialized book that contains filter paper. The liquid saliva collections require that the crewmember soak a piece of cotton inside their mouth and place it in a salivette bag; there are four of the liquid collections during docked operations. The on-orbit blood samples are collected right before undocking and returned on the Shuttle so that analysis can occur with 48 hours of the sampling. This allows assays that quantify the function of different types of white blood cells and other active components of the immune system. Saliva samples are secured in the MELFI (Minus-Eighty Laboratory Freezer for ISS). Also included are entries in a fluid/medications intact log, and a stress-test questionnaire to be filled out by the subject at begin and end. Urine is collected during a 24-hour period, conventionally divided into two twelve-hour phases: morning-evening and evening-morning.]*

At ~1:45pm EDT, CDR-18 Fincke had his first regular weekly PMC (Private Medical Conference) via S- & Ku-band audio/video.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

Week 26 Scheduled Main Activities:

- *Wed. (10/15):* IMMUNE; SLEEP log; ISS-18 expmts.; VC15 Prgm.; Handovers ISS-18; AED inspect.; WRM CWC fill; OGS activ.; Ham; IP-1 check.
- *Thu. (10/16):* ISS-18 expmts.; VC15 Prgm.; EDV replace; ULF-2 prepacking; Handovers ISS-18; WRM CWC audit; PEPS inspect.; Iridium recharge; IP-1 check.
- *Fri. (10/17):* ISS-18 expmts.; VC15 Prgm.; PAO; GOGU tagup; ULF-2 prepacking; Handovers ISS-18; ODNT/LBNP OBT; IDZ-2 smoke detector mntn.; CMS sampling; IP-1 check.
- *Sat. (10/18):* ISS-18 expmts.; VC15 Prgm.; BMP ch.1 regen.; GANK

sampling; IP-1 check; FFQ; Handovers ISS-18; Symbolic Activity; OGS deact.; DOUG review for JEMRMS checkout.

- *Sun. (10/19):* ISS-18 expmts.; VC15 Prgm.; Handovers ISS-18; BMP ch.2 regen.; JEMRMS DOUG review ; JEMRMS activities/checkout ; MBI-15 NEURO; O-OHA assess.; IP-1 check; Elektron BZh check.

ISS Orbit (as of this morning, 8:50am EDT [= epoch]):

Mean altitude -- 352.5 km

Apogee height -- 355.1 km

Perigee height -- 349.9 km

Period -- 91.59 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.000381

Solar Beta Angle -- -56.5 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 100 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56731

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

10/23/08 -- Soyuz TMA-12/16S undock (DC1 nadir, 8:15pm) & land (11:36pm) =

10/24 -- 9:36am Kazakhstan)

11/02/08 -- Progress 30P reboost; *Daylight Saving Time (DST) ends*

11/14/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/16/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

12/01/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.)

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking

02/26/09 -- STS-119/Discovery/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress M-67/32P undocking & deorbit

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/25/09 -- Soyuz TMA-15/19S launch

05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**

07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 10/13/08

All ISS systems continue to function nominally, except those noted previously or below. *Columbus Day – off-duty for CDR Volkov, FE-1 Kononenko, FE-2 Chamitoff. Underway: Week 26 of Increment 17.*

Soyuz TMA-13/17S, with Exp-18 crewmembers CDR Michael Fincke, Soyuz CDR/ISS-18 FE-1 Yuri Lonchakov, and SFP (Spaceflight Participant) Richard Garriott, 15th guest cosmonaut for the RS (Russian Segment), continues to catch up with the ISS for the **docking tomorrow morning at ~4:33am EDT**. *[FD2 activities, started yesterday afternoon with Soyuz crew wakeup on Orbit 12, include systems & crew health status reports to TsUP, preparation of the Soyuz Habitation Module (SA) workspace, building attitude for and executing the DV3 burn, placing Soyuz back in its sun-spinning "barbecue" mode (ISK), and swapping CO₂ absorption cartridges (LiOH) in the BO. Afterwards, the crewmembers put on their Sokol suits and PKO biomed harnesses, transferred to the SA, activated its air purification system (SOA) and closed the hatch to the Descent Module (BO). After activation of the active Kurs-A system on Soyuz and of the passive Kurs-P on the Service Module (SM), with a short Kurs-A/P test and several additional adjustment burns during automated rendezvous, station fly-around to align with the FGB nadir port will begin tomorrow morning at ~4:05am at ~400m range, followed by station keeping at ~160m (~4:14am) and docking at the FGB at ~4:33am. Fincke & Lonchakov will replace Exp-17 CDR Volkov & FE-1 Kononenko. FE-2 Dr. Gregory Chamitoff remains on the station, joining Exp-18 until next month (November) when he is replaced by U.S. Astronaut Sandra Magnus, arriving on STS-126/ULF2. Richard Garriott, the son of veteran U.S. Astronaut Owen Garriott (Skylab, Shuttle), will return with Sergey & Oleg on 10/23 in Soyuz TMA-12/16S.]*

FE-2 Chamitoff started out with his third week-long session of the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment, using payload software for data downloading and filling in questionnaire entries in the experiment's session file on the HRF-1 laptop. *[To monitor the crewmember's sleep/wake patterns and light exposure, Greg wears a special Actiwatch device which*

measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]

Gregory also had the fourth day of his second SOLO (Sodium Loading in Microgravity) session, which runs in two blocks of six days each. Today, Greg again began with measurements and sampling of body mass (with SLAMMD/Space Linear Acceleration Mass Measurement Device), blood (with PCBA/Portable Clinical Blood Analyzer), and urine, to continue for three more days. Samples were stowed in the MELFI (Minus-Eighty Laboratory Freezer for ISS). *[Background: For the SOLO experiment, Chamitoff follows a special high-salt diet, for which prepared meals are provided onboard. All three daily meals are being logged on sheets stowed in the PCBA Consumable Kit in the MELFI along with control solution and cartridges for the PCBA. Blood and urine samples are stowed in the freezer.]*

Sergey & Oleg conducted their third preliminary training session with the Russian "Chibis" LBNP suit (lower body negative pressure; Russian: ODNT), ramping up to get them ready for returning to gravity on 10/23. Assisting each other in turn as CMO (Crew Medical Officer), the subjects were supported in their two one-hour sessions by ground specialist tagup via VHF at 5:25am (DO3) & 7:00am EDT (DO4). *[The assessment uses the Gamma-1 ECG equipment with biomed harness, skin electrodes and a blood pressure and rheoplethysmograph cuff wired to the cycle ergometer's instrumentation panels. The Chibis ODNT provides gravity-simulating stress to the body's cardiovascular/circulatory system for evaluation of Volkov's and Kononenko's orthostatic tolerance (e.g., the Gauer-Henry reflex) after several months in zero-G. The preparatory training generally consists of first imbibing 150-200 milliliters of water or juice, followed by two cycles of a sequence of progressive regimes of reduced ("negative") pressure, set today at -20, -25, -30 and -35 mm Hg (Torr) for five min. each while shifting from foot to foot at 10-12 steps per minute, wearing a sphygmomanometer to measure blood pressure. The body's circulatory system interprets the pressure differential between upper and lower body as a gravity-like force pulling the blood (and other liquids) down. Chibis data and biomed cardiovascular readings are recorded. The Chibis suit (not to be confused with the Russian "Penguin" suit for spring-loaded body compression, or the "Kentavr" anti-g suit worn during reentry) is similar to the U.S. LBNP facility (not a suit) used for the first time on Skylab in 1973/74, although it appears to accomplish its purpose more quickly.]*

For another try at the BCAT-4 (Binary Colloid Alloy Test 4) experiment with a new SSC (Station Support Computer) for his VolSci (Voluntary Science) program session, Gregory configured the equipment in the Lab Avionics Racks 2 & 3 seat

track area (no MWA/Maintenance Work Area table), along with camcorder and still camera,- to take video and photos of his subsequent sample homogenization plus the last sample (#3), and then initiated the activity. *[The FE-2 set up the SGSM (slow growth sample module) by mixing the samples 8, 9, 10, and 3 and starting automated photography of sample 3 with the Kodak DCS-760 digital still camera controlled by the EarthKAM software running on a new SSC (Station Support Computer), automatically taking one photo every hour of sample 3 for the next six days.]*

In preparation for tomorrow's Soyuz docking and the preceding thruster activity, the FE-2 ensured that the protective science window shutters in the US Lab and JAXA Kibo JPM (JEM Pressurized Module) are closed.

At ~105am EDT, the crew downlinked two PAO video messages of greetings,- one to the opening ceremony on 10/17 of the 16th International Space Olympiad for Schoolchildren in Korolev, the other to a Moscow event to present books by Konstantin E. Tsiolkovsky. *[The International Space Olympiad for Schoolchildren is conducted annually by the City of Korolev's Council of Education jointly with RSC-Energia. This time around it's the XVI Olympiad that will take place from 10/15-26 in Korolev, dedicated to the 70th Anniversary of the City of Korolev and to the 45th Anniversary of Valentina N. Tereshkova's flight to space. High school students from Korolev, Moscow Region, USA, and the UK are among the participants of the International Space Olympiad. The best of delegates will come to TsUP to see the ISS crew during a comm session. Also, on 10/16, a presentation of new K. E. Tsiolkovsky's books to be sent to the ISS Space Library in orbit will take place at Biblio-Globus book store in Moscow. Media, representatives of Roskosmos, faculty and students of Bauman University, MAI, MATI, and other institutions of higher learning, are invited to this presentation. The ISS crew was to point out that there are already two books by Konstantin Eduardovich on board -- "The Science Faith Shield " and "About My Life" -- as well as his picture.]*

Sergey Volkov performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Chamitoff's weekly PFC (Private Family Conference), which had to be aborted yesterday due to a video issue, was re-scheduled today for ~4:10pm, as usual via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop).

The crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), and RED resistive exercise device (FE-2). Sergey's & Oleg's exercise regimen today was in part accounted for by their Chibis/ODNT training activity.

An activity to upgrade SSC (Station Support Computer) laptops to Wireless capability (by installing wireless cards and modifying software) remains on Greg's discretionary "job jar" task list.

17S Flight Plan Overview:

- Flight Day 2
 - Post-sleep activities; BO Workstation prepared; data for DV3 burn uplinked; crew tests RUO-2 & RUD-2 rotational and translational hand controllers; DV3 attitude established by crew; DV3 burn executed; Soyuz back in ISK attitude; crew swaps CO2 filters in BO; crew sleep.
- Flight Day 3
 - Post-sleep activities; KURS-A heaters activated; data for automated rendezvous uplinked; crew dons Sokols; SOA deactivated in BO and activated in SA; crew ingresses SA, closes BO-SA hatch and dons harnesses for docking; DV5 burn; automated rendezvous & docking via KURS-P in ISS and KURS-A in Soyuz; docking; pressure equalized between Soyuz and ISS ; crew transfers.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

Week 26 Scheduled Main Activities:

- *Tue. (10/14):* TV prep.; Soyuz TMA-13/17S docking; Sokol dryout; KRIOGEM & KUBIK activate; Safety Briefing; Priority Transfers; Soyuz deact.; IWIS dwnl.; SODF update; SLEEP Actiwatch init.; VC15 Program.
- *Wed. (10/15):* IMMUNE; SLEEP log; ISS-18 expmts.; VC15 Prgm.; Handovers ISS-18; AED inspect.; WRM CWC fill; OGS activ.; Ham; IP-1 check.
- *Thu. (10/16):* ISS-18 expmts.; VC15 Prgm.; EDV replace; ULF-2 prepacking; Handovers ISS-18; WRM CWC audit; PEPS inspect.; Iridium recharge; IP-1 check.
- *Fri. (10/17):* ISS-18 expmts.; VC15 Prgm.; PAO; GOGU tagup; ULF-2

prepacking; Handovers ISS-18; ODNT/LBNP OBT; IDZ-2 smoke detector mntn.; CMS sampling; IP-1 check.

- *Sat. (10/18):* ISS-18 expmts.; VC15 Prgm.; BMP ch.1 regen.; GANK sampling; IP-1 check; FFQ; Handovers ISS-18; Symbolic Activity; OGS deact.; DOUG review for JEMRMS checkout.
- *Sun. (10/19):* ISS-18 expmts.; VC15 Prgm.; Handovers ISS-18; BMP ch.2 regen.; JEMRMS DOUG review ; JEMRMS activities/checkout ; MBI-15 NEURO; O-OHA assess.; IP-1 check; Elektron BZh check.

ISS Orbit (as of this morning, 5:13am EDT [= epoch]):

Mean altitude -- 352.6 km

Apogee height -- 355.0 km

Perigee height -- 350.2 km

Period -- 91.59 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0003502

Solar Beta Angle -- -53.4 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 85 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56713

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

10/14/08 -- Soyuz TMA-13/17S dock (FGB nadir port, ~4:33am EDT)

10/23/08 -- Soyuz TMA-12/16S undock (DC1 nadir, 8:15pm) & land (11:36pm) =

10/24 -- 9:36am Kazakhstan)

11/02/08 -- Progress 30P reboost; *Daylight Saving Time (DST) ends*

11/14/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/16/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

12/01/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.)

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking

02/26/09 -- STS-119/Discovery/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 10/12/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – off-duty day for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff. Ahead: Week 26 of Increment 17.*

Soyuz TMA-13 (17S) launched flawlessly this morning on time at 3:01:38am EDT carrying ISS-18 CDR Michael Fincke (first American to launch twice on a Soyuz), Soyuz CDR/ISS-18 FE-1 Yuri Lonchakov, and SFP/VC15 Richard Garriott (**picture, below**). Separations from second & third stage were nominal. Orbit was attained at L+ 8:45 min at an altitude of 230.3 km (perigee ~200.7 km/apogee ~259.9 km, downrange ~520 km, velocity ~7.50 km/s, orbit period 88.8 min). Antennas and solar arrays deployed nominally at orbit insertion. 17S has a planned two-day rendezvous profile, to aim for docking on Thursday, 10/14, at (12:33pm Moscow time). See *Flight Plan*, below. *[At orbit insertion, Soyuz unfolded two solar arrays, four Kurs antennas, one TORU/Rassvet-M antenna and one telemetry antenna. Later, the crew activated antenna heaters, set the maneuver mode, turned on the RKO orbit radio tracking system, started leak checks, etc. Two orbit adjustment burns of ~5 min duration each were executed this morning, DV1 (~17.91 m/s) at 6:42am, DV2 (9.40 m/s) at 7:22am, both with the SKD main engine. After the two-day "chase", supported by several more midcourse burns, 17S will dock at the FGB nadir port on 10/14 at ~4:38am EDT (12:33pm Moscow time).]*

FE-2 Chamitoff had the third day of his second SOLO (Sodium Loading in Microgravity) session, which runs in two blocks of six days each. Today, Greg again began with measurements and sampling of body mass (with SLAMMD/Space Linear Acceleration Mass Measurement Device), blood (with PCBA/Portable Clinical Blood Analyzer), and urine, to continue for three more days. Samples were stowed in the MELFI (Minus-Eighty Laboratory Freezer for ISS). *[Background: For the SOLO experiment, Chamitoff follows a special high-salt diet, for which prepared meals are provided onboard. All three daily meals are being logged on sheets stowed in the PCBA Consumable Kit in the MELFI along with control solution and cartridges for the PCBA. Blood and urine samples are stowed in the freezer. SOLO, an ESA/German experiment from the DLR Institute of Aerospace Medicine in Cologne/Germany, investigates the mechanisms of fluid and salt retention in the body during long-duration space flight. Background: The hypothesis of an increased urine flow as the main cause for body mass decrease has been questioned in several recently flown missions. Data from the US SLS1/2 missions as well as the European/Russian Euromir '94 & MIR 97 missions show that urine flow and total body fluid remain unchanged when isocaloric energy intake is achieved. However, in two astronauts during these missions the renin-angiotensin system was considerably activated while plasma ANP concentrations were decreased. Calculation of daily sodium balances during a 15-day experiment of the MIR 97 mission (by subtracting sodium excretion from sodium intake) showed an astonishing result: the astronaut retained on average 50 mmol sodium daily in space compared to balanced sodium in the control experiment. SLAMMD, performed first on Expedition 12 in December 2005, provides an accurate means of determining the on-orbit mass of humans spanning the range from the 5th percentile Japanese female and the 95th percentile American male. The procedure, in accordance with Newton's 2nd Law of Motion, finds the mass by dividing force, generated by two springs inside the SLAMMD drawer, by acceleration measured with a precise optical instrument that detects the position versus time trajectory of the SLAMMD guide arm and a micro controller which collects the raw data and provides the precise timing. The final computation is done via portable laptop computer with SLAMMD unique software. To calculate their mass, crewmembers wrap their legs around a leg support assembly, align the stomach against a belly pad and either rest the head or chin on a head rest. For calibration, an 18-lbs. mass is used at different lengths from the pivot point, to simulate different mass values. Crew mass range is from 90 to 240 lbs.]*

In the JAXA Kibo JPM (JEM Pressurized Module), Gregory supported tonight's continuing Marangoni Surface experimentation in the FPEF (Fluid Physics Experiment Facility), ground-commanded from the SSIPC (Space Station Integration & Promotion Center) at Tsukuba/Japan, by activating the MMA (Microgravity Measurement Apparatus) and its laptop (MLT), first powering up the MMA's NCU/RSU (Network Control Unit/Remote Sensor Unit) set from the Ryutai rack's UDC (Utility DC-to-DC Converter), then turning on both NCU/RSU and MLT.

[Tsukuba is conducting the Marangoni experiment basically only during crew sleep (for quiescence), starting again tonight until 10/16 (except for 10/9). Running time tonight will be from 5:30pm EDT to 2:00am. Crewmembers can enter Kibo during the experiment but are advised not to cause any major disturbance of the micro-G environment.]

Also in the JAXA Kibo module, the FE-2 removed & replaced a number of recording disks (#1030, #1031, #1032, #1033, #1034) of the IPU VRU (Image Processing Unit/Video Recording Unit).

Sergey Volkov performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module), including the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

SOZh checkups by the CDR today also include the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem, gathering weekly data on total operating time & "On" durations for reporting to TsUP-Moscow.

Chamitoff had the usual three hours reserved for his part of the regular weekly station cleaning in the USOS (US Segment), including COL (Columbus Orbital Laboratory) and Kibo, that was not scheduled yesterday alongside the RS (Russian Segment) "uborka" housecleaning by his two crewmates.

At ~10:15am, Greg had his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop).

The crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR/2.5h, FE-1/2.5h, FE-2), and RED resistive exercise device (FE-2).

Working off the discretionary "time permitting" task list, CDR Volkov ran another session for Russia's Environmental Safety Agency (EKON), making observations and taking KPT-3 aerial photography with the NIKON D2X camera of environmental conditions in Russia. *[Today's target were London and Brussels.]*

A second item on the discretionary task list for FE-1 Kononenko was another run of the Russian DZZ-2 "Diatomeya" ocean observations program, the last one for Expedition 17, using the NIKON-F5 DCS still camera and the HDV (high-definition) video camcorder from SM window 8 for ~20 min to record high production water areas. *[Target zones today in the Atlantic Ocean were the coastal area of Brazil to the Strait of Gibraltar, and from the Gulf of Mexico to the English Channel, in the Pacific Ocean the Line Archipelago to the US coast.]*

Also off the Russian suggestions list, Kononenko performed a session of the Russian GFI-8 "Uragan" (hurricane) earth-imaging program, using the D2X to take telephotos. *[Uplinked target zones were the Ugra National Park, forest vegetation in the steppe, the northernmost island of the Galapagos archipelago, and Darwin Island.]*

As generally every day now, today starting at 9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) is running intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking. CDRA remains "yellow" on the ISS critical systems list.]*

An activity to upgrade SSC (Station Support Computer) laptops to Wireless capability (by installing wireless cards and modifying software) remains on Chamitoff's discretionary "job jar" task list.

17S Flight Plan Overview:

- Flight Day 1:
 - Launch to Orbit, ~9 min in duration; auto deployment of solar arrays & antennas; pressurization of prop tanks and filling of Soyuz manifolds; docking probe extended; leak check by crew of BO & SA modules; KURS self tests; test of BDUS angular rate sensors; attitude established (OSK/ LVLH); crew opens BO-SA hatch, ingresses BO and doffs Sokol suits; test of RUO rotational hand controller; Soyuz put in ISK (sun spinning/«barbecue») mode; data for DV1 & DV2 burns uplinked; SOA air purification system activated in BO and deactivated in SA; DV1 burn; DV2 burn; Soyuz back in ISK attitude; crew clean & dry Sokols; crew sleep.
- Flight Day 2
 - Post-sleep activities; BO workstation prepared; data for DV3 burn uplinked; crew tests RUO-2 & RUD-2 rotational and translational hand controllers; DV3 attitude established by crew; DV3 burn executed; Soyuz back in ISK attitude; crew swaps CO2 filters in BO; crew sleep.
- Flight Day 3
 - Post-sleep activities; KURS-A heaters activated; data for automated rendezvous uplinked; crew dons Sokols; SOA deactivated in BO and activated in SA; crew ingresses SA, closes BO-SA hatch and dons harnesses for docking; DV5 burn; automated rendezvous & docking via KURS-P in ISS and KURS-A in Soyuz; docking; pressure equalized between Soyuz and ISS ; crew transfers.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

Week 26 Scheduled Main Activities:

- *Mon. (10/13):* SOLO #2; ODNT/LBNP OBT; PAO.
- *Tue. (10/14):* TV prep.; Soyuz TMA-13/17S docking; Sokol dryout; KRIOGEM & KUBIK activate; Safety Briefing; Priority Transfers; Soyuz deact.; IWIS downl.; SODF update; SLEEP Actiwatch init.; VC15 Program.
- *Wed. (10/15):* IMMUNE; SLEEP log; ISS-18 expmts.; VC15 Prgm.; Handovers ISS-18; AED inspect.; WRM CWC fill; OGS activ.; Ham; IP-1 check.
- *Thu. (10/16):* ISS-18 expmts.; VC15 Prgm.; EDV replace; ULF-2 repacking; Handovers ISS-18; WRM CWC audit; PEPS inspect.; Iridium recharge; IP-1 check.
- *Fri. (10/17):* ISS-18 expmts.; VC15 Prgm.; PAO; GOGU tagup; ULF-2 repacking; Handovers ISS-18; ODNT/LBNP OBT; IDZ-2 smoke detector mntn.; CMS sampling; IP-1 check.
- *Sat. (10/18):* ISS-18 expmts.; VC15 Prgm.; BMP ch.1 regen.; GANK sampling; IP-1 check; FFQ; Handovers ISS-18; Symbolic Activity; OGS deact.; DOUG review for JEMRMS checkout.
- *Sun. (10/19):* ISS-18 expmts.; VC15 Prgm.; Handovers ISS-18; BMP ch.2 regen.; JEMRMS DOUG review ; JEMRMS activities/checkout ; MBI-15 NEURO; O-OHA assess.; IP-1 check; Elektron BZh check.

ISS Orbit (as of this noon, 12:46pm EDT [= epoch]):

Mean altitude -- 352.7 km

Apogee height -- 355.3 km

Perigee height -- 350.0 km

Period -- 91.59 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0003925

Solar Beta Angle -- -49.9 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 58 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56702

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

10/14/08 -- Soyuz TMA-13/17S dock (FGB nadir port, ~4:33am EDT)
10/23/08 -- Soyuz TMA-12/16S undock (DC1 nadir, 8:15pm) & land (11:36pm) = 10/24 -- 9:36am Kazakhstan
11/02/08 -- Progress 30P reboost; *Daylight Saving Time (DST) ends*
11/16/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC (~7:02pm EST) - U/R
11/18/08 -- STS-126/Endeavour/ULF2 docking - U/R
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
12/01/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.)
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at

http://www.hq.nasa.gov/osf/iss_reports/index.htm

Soyuz TMA-13/17S launch at Baikonur --- 10/12/08 --- 3:01am EDT

ISS On-Orbit Status 10/11/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – off duty day for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff.*

After yesterday's deferral of the on-orbit Soyuz 16S motion control system (SUD) test due to failure of the Russian BITS2-12 onboard measurement telemetry system (see below), Sergey Volkov & Oleg Kononenko today spent an hour in the TMA-12 Descent Module (SA) supporting the ground-commanded checkout of the SUD, Mode 2/"Docked". *[The test, to prepare for a possible contingency relocation of the spacecraft to the FGB, should 17S be unable to dock at the FGB nadir port on 10/14, and the 16S undocking on 10/23, included pressurization of the KDU Combined Propulsion System Section 2 and Tank 2, a test of the pilot's RUD translational hand controller, and a hot firing of the DPO braking thrusters. KDU maneuver thrusters and DPO lateral thrusters were not fired. For the test, the science windows in the US Lab and Kibo module were shuttered, and station attitude was handed over to Russian thruster control at 4:25am EDT, commanded to free drift at 4:45am, then back to LVLH XVV (Local Vertical Local Horizontal/x-axis in velocity vector) attitude. The one-minute firing started on Daily Orbit 1 at ~4:46am. Attitude control was returned to the U.S. segment (USOS) at 5:40am, and the Lab window could be re-opened at ~8:40am for CEO.]*

FE-2 Chamitoff continued the daily diet monitoring for the SOLO (Sodium Loading in Microgravity) experiment. SOLO runs in two blocks of six days each, with the second having started yesterday. *[For SOLO, Chamitoff follows a special high-salt diet, for which prepared meals are provided onboard. All three daily meals are being logged on sheets stowed in the PCBA Consumable Kit in the MELFI (Minus-Eighty Laboratory Freezer for ISS) along with control solution and cartridges for the PCBA. Blood and urine samples are stowed in the MELFI.]*

The crew performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste*

products, cleaning of compartments with vacuum cleaner, damp cleaning of the SM (Service Module) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]

As part of the house cleaning, Volkov & Kononenko conducted regular maintenance inspection & cleaning on fan screens in the FGB (TsV2), DC-1 (V3) and SM (VPkhO, VPrK, FS5, FS6 & FS9).

Kononenko later also completed the routine daily servicing of the SOZh system (ECLSS/Environment Control & Life Support System) in the SM, including the periodic checkup on the Russian POTOK-150MK(150 micron) air filter unit of the SOGS air revitalization subsystem, gathering weekly data on total operating time & "On" durations for reporting to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

At ~9:45am EDT the crewmembers conducted their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-Houston and TsUP-Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

The two cosmonauts had their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop), Oleg at ~7:15am, Sergey at ~8:50am.

At ~8:18am, Chamitoff conducted a test pass of the onboard ham radio station with an ARISS (Amateur Radio on ISS) ground station, preceded by a 15-min telecon on S-band.

At ~12:05pm EDT, Gregory powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, & power supply) and conducted, at 12:10am, a ham radio exchange with the Colombia Mission Project at Buchanan High School, Clovis, CA. The COLUMBIA Mission began three years ago as a classroom project to introduce students to the magnificent accomplishments of space exploration. Due to its popularity with the broad student population, it is now an on-campus club. Each year the Project creates, and continues to evolve, a space station/planetary exploration simulation and ENDEAVOUR to excite, educate, and illuminate young minds to the staggering

tasks undertaken by NASA. Each year, approximately 100 students organize themselves into an administrative structure of committees and subcommittees with the shared goal of “launching” our chosen astronauts into space for a two day mission aboard our mock space station. Questions were uplinked to Greg beforehand. *["Do you notice that your body composition changes over the course of the mission? If so, what training will you do to return it to normal?"; "What has been your favorite moment during your time on the ISS? Do you receive up-to-date entertainment, such as TV episodes or movies on the ISS?"; "Have you been able to follow the presidential campaign?"; "Since we last spoke, have you been able to spot any new locations on earth that you were interested in observing?"; "Has being in space affected your dream patterns?"; "What food items on earth do you miss the most?"; "Were you able to see Hurricane Ike form over the Caribbean a few weeks ago? From your view, were you able to observe how devastating it was?"; "What is the most interesting task you've performed this week?"; "What will you miss most about your time on the ISS? We know that you are unable to bathe in a conventional manner. How do you maintain your personal hygiene while on the Space Station?"; "What was either the most gruesome, or the funniest aspect of astronaut training?"]*

The crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR/2.5h, FE-1/2.5h), and RED resistive exercise device (FE-2).

Later, the FE-1 will transfer the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working off the discretionary “time permitting” task list, CDR Volkov ran another session for Russia's Environmental Safety Agency (EKON), making observations and taking KPT-3 aerial photography with the NIKON D2X camera of environmental conditions in Russia. *[Today's target was the Plymouth area.]*

As generally every day now, today starting at 9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) is running intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking. CDRA remains “yellow” on the ISS critical systems list.]*

An activity to upgrade SSC (Station Support Computer) laptops to Wireless

capability (by installing wireless cards and modifying software) has been added to Chamitoff's discretionary "job jar" task list.

BITS Failure: Overnight on 10/9-10, the Russian BITS2-12 onboard telemetry measurement system failed, resulting in a shutdown of RS (Russian Segment) SOZh/ECLSS equipment. As per program, this caused a Low Pressure alarm and a transition of the station to Survival Mode at 2:02am EDT (yesterday morning) and load shedding (power down of selected systems). Attitude control was automatically handed over to the RS while the US CMGs (Control Moment Gyroscopes) also briefly remained in control until MCC-H flight controllers commanded the USOS (US On-orbit Segment) to free drift to avoid a "force fight" between the control systems, allowing RS to take full attitude control. ISS attitude control never was lost, and RS thrusters maintained control for approximately 4 hours, expending about 44 kg of propellants. USOS systems were recovered, and the ground commanded attitude control handover to CMG Momentum Management, while TsUP-Moscow switched to the BITS backup system and recovered telemetry. All RS ECLSS were recovered. The actual source of the BITS failure is still under investigation.

MFCV Adjustments Update: FE-2 Chamitoff yesterday completed the fourth and last MTL MFCV (Moderate Temperature Loop/Manual Flow Control Valve) adjustment in preparation for Flight ULF-2, using the Non-Intrusive Flow Meter in the Lab Aft Endcone to adjust the MFCV to the desired flow reading of 79 kg/hr. Because of another zero-calibration required for the Flow Meter, the adjustment activity took longer than expected, and the also planned Node-1 MTL RFCA (Rack Flow Control Assembly) measurement task could not be performed. The BOB (Breakout Box)/Flow Meter setup was left intact, but the remaining task has not yet been rescheduled.

Soyuz TMA-13/17S Launch Update: The launch of Soyuz TMA-13/17S to the ISS is planned for tomorrow morning at 3:01:29 am EDT (11:01am Moscow time).

17S Flight Plan Overview:

- Flight Day 1:
 - Launch to Orbit, ~9 min in duration; auto deployment of solar arrays & antennas; pressurization of prop tanks and filling of Soyuz manifolds; docking probe extended; leak check by crew of BO & SA modules; KURS self tests; test of BDUS angular rate sensors; attitude established (OSK/LVLH); crew opens BO-SA hatch, ingresses BO and doffs Sokol suits; test of RUO rotational hand controller; Soyuz put in ISK (sun spinning/«barbecue») mode; data for DV1 & DV2 burns uplinked; SOA air purification system activated in BO and deactivated in SA; DV1 burn; DV2 burn; Soyuz back in ISK

- attitude; crew clean & dry Sokols; crew sleep.
- Flight Day 2
 - Post-sleep activities; BO workstation prepared; data for DV3 burn uplinked; crew tests RUO-2 & RUD-2 rotational and translational hand controllers; DV3 attitude established by crew; DV3 burn executed; Soyuz back in ISK attitude; crew swaps CO2 filters in BO; crew sleep.
- Flight Day 3
 - Post-sleep activities; KURS-A heaters activated; data for automated rendezvous uplinked; crew dons Sokols; SOA deactivated in BO and activated in SA; crew ingresses SA, closes BO-SA hatch and dons harnesses for docking; DV5 burn; automated rendezvous & docking via KURS-P in ISS and KURS-A in Soyuz; docking; pressure equalized between Soyuz and ISS ; crew transfers.

Weekly Science Update (*Expedition Seventeen -- Week 25*)

3-D SPACE: In progress.

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):
Measurements continue in FGB module.

ANITA (Analyzing Interferometer for Ambient Air): Continuing.

BCAT-3/4 (Binary Colloidal Alloy Test 3/4): “Greg, thank you for setting up the BCAT-4 experiment. We’re looking forward to seeing your experiment sample photographs when they are downlinked.”

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System):
Samples returned on 1J.

CSI-2/CGBA-5 (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus 5): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): Due to safety concerns identified for the PLEGPAY instrument (when operated in Plasma Discharge mode), the entire EuTEF platform was put in survival mode on 9/1 at around 11:00am EDT (just prior to 29P undocking). Since then, the EuTEF power feeder#1 has been de-activated and no science acquisition is possible. Request has been approved for intermittent activation for 3 of the 9 EUTEF payloads. EuTEF platform power feeder#1 has been re-activated for 8-hrs periods on 10/4, 10/6 and 10/8. This activation protocol will continue every other day until safety issues are solved with the PLEGPAY instrument. This only mitigates the science loss for the EXPOSE, DOSTEL and MEDET instruments. -- DEBIE-2: Inactive;-- DOSTEL: Inactive, part of proposed intermittent activation;-- EuTEMP: Inactive;-- EVC: Inactive;-- EXPOSE: Inactive, part of proposed intermittent activation;-- FIPEX: Inactive; -- MEDET: Inactive, part of proposed intermittent activation; -- PLEGPAY: Inactive;-- TRIBOLAB: Inactive.

FSL (Fluid Science Laboratory): FSL is nominal.

GEOFLOW: In progress.

HDTV System Test DL (JAXA): In progress.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): In progress.

Marangoni Experiment for ISS (JAXA Fluid Physics Experiment Facility): Run #4 completed. However, because of the liquid bridge separation, the parameters of the 4th run were changed.

Micro-G Clay (JAXA EPO): Complete.

MISSE (Materials ISS Experiment): Ongoing.

Moon Photography from ISS (JAXA EPO): Complete.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-1/-2 (Nitric Oxide Analyzer, ESA): Complete.

NUTRITION w/REPOSITORY: In progress.

PADLES (Passive Dosimeter for Lifescience Experiment in Space): In progress.

PCRF (Protein Crystallization Research Facility) Reconfiguration (JAXA): Complete.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SAMPLE: Complete.

SHERE (Shear History Extensional Rheology Experiment): Complete.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): In progress.

SOLAR (Solar Monitoring Observatory): The last Sun visibility window ended on 10/4. The instruments operated nominally, with the exception of SOLACES which encountered a synchronization problem for its two micro-controllers units. - SOVIM: acquiring science until 10/4; since idle;- SOLSPEC: acquiring science until 10/4; since idle; -- SOLACES: instrument powered on and troubleshooting is ongoing, on

the micro-controllers synchronization problems.

SOLO (Sodium Loading in Microgravity): The first SOLO session started on 10/3, and it consists of 2 blocks, ending on the 17S docking day 10/14. The first block started on 10/3 and finished on 10/8 and included a normal sodium diet for the crewmember. For the first block the crewmember performed 2 body mass measurements (10/6 and 10/8), urine collection (from 10/7 to 10/8) and blood (PCBA) and 18ml SERUM + EDTA plasma) collection (10/7). These operations will be repeated during the second block which is with a low sodium diet of 5 days. The ground teams have seen spikes in the delta pressure water loop for both HRF racks during activation, deactivation and the setting of flow cases. ESA and NASA teams are currently assessing a work-around plan to allow for the operation of the racks for the second block of SOLO started on 10/9.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): Reserve.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): Completed.

CEO (Crew Earth Observations): Through 10/1 the ground has received a total of 8,210 frames of CEO images for review and cataloging. Photos with times corresponding to CEO target request times are reviewed first and since last week's report included: South Tibesti Megafan, Chad (a) (some of the area was acquired, but dust clouds obscured most of it); Post-Ike Survey, Upper Texas Coast (some useful imagery was acquired, but there were focus issues); B.P. Structure, Libya (several useful context views acquired, two including Oasis Impact Crater as well); South Tibesti Megafans, Chad (b) (target acquired, but dust clouds present again); and Sevilleta Wild Life Refuge, New Mexico (target not acquired). "Your recent fine view of Sandy Cape, Fraser Island, Australia will be published on NASA/GSFC's Earth Observatory website this weekend. Your image of northern end of the world's largest sand Island, located off the coast of Queensland offers an excellent illustration of the geologic processes related to sand dune formation. Great shot!"

CEO photo targets uplinked for today were **Tenoumer Impact Crater** (*this tiny 1.9km-diameter impact crater is located in the desert interior of northern Mauritania. Despite its small size, the crater is geologically fresh [just over 20,000*

years old] and relatively unweathered in its desert setting. Researchers are seeking a few detailed, near-nadir views of this feature. ISS had a mid-morning track with clear weather anticipated. As ISS tracked northeastward from the Mauritanian coast, Greg was to note the large, well-photographed Richat Structure to the right of track and then begin looking only seconds later for Tenoumer just right of track), **Caracas, Venezuela** (the Venezuelan capital city is situated in a narrow valley, just inland from the Caribbean Sea coast south of a forested mountain range. Trying for detailed near-nadir views of the city as ISS approached from the SW in mid-morning light with possibly partly cloudy conditions), **Hubbard Brook, New Hampshire** (this small Long Term Ecological Research [LTER] site, located in northwestern New Hampshire, is one of several in the New England region that researchers have been attempting to acquire. Although most of these targets were well right of track on this early afternoon pass, this may have been some of the best weather conditions in months and just prior to winter snows. Looking right of track and trying for oblique, contextual views of the area roughly between Albany, New York and Quebec, Canada using the short lens settings), and **Niwot Ridge Tundra, Colorado** (ISS had a near-nadir view of this target area in late morning with generally fair weather anticipated. This LTER site is located in north-central Colorado within the alpine areas above 3,000m just west of Boulder. As the station tracked northeastward over the Colorado Rockies, before it reached the plains to the E, Greg was to try for contextual mapping of the ridge and its surroundings).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

Week 25 Scheduled Main Activities:

- Sun. (10/12): Soyuz TMA-13/17S launch; SOLO #2; PFC; VRU disk exchange.

ISS Orbit (as of this morning, 5:57am EDT [= epoch]):

Mean altitude -- 352.7 km

Apogee height -- 355.4 km

Perigee height -- 350.0 km

Period -- 91.59 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0004014

Solar Beta Angle -- -45.9 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 38 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56682

Significant Events Ahead (all dates Eastern Time, some changes possible.):

10/12/08 -- Soyuz TMA-13/17S launch (3:01:29 am EDT; Fincke, Lonchakov, Garriott)
 10/14/08 -- Soyuz TMA-13/17S dock (FGB nadir port, ~4:33am EDT)
 10/23/08 -- Soyuz TMA-12/16S undock (DC1 nadir, 8:15pm) & land (11:36pm) = 10/24 -- 9:36am Kazakhstan)
 11/02/08 -- Progress 30P reboost; *Daylight Saving Time (DST) ends*
 11/16/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC (~7:02pm EST) - U/R
 11/18/08 -- STS-126/Endeavour/ULF2 docking - U/R
 11/20/08 -- **ISS 10 Years**
 11/25/08 -- Progress M-65/30P undocking & deorbit
 11/26/08 -- Progress M-66/31P launch
 11/30/08 -- Progress M-66/31P docking
 12/01/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.)
 02/09/09 -- Progress M-66/31P undocking & deorbit
 02/10/09 -- Progress M-67/32P launch
 02/12/09 -- Progress M-67/32P docking
 02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
 02/14/09 -- STS-119/Discovery/15A docking
 02/24/09 -- STS-119/Discovery/15A undocking
 02/26/09 -- STS-119/Discovery/15A landing (nominal)
 03/25/09 -- Soyuz TMA-14/18S launch
 03/27/09 -- Soyuz TMA-14/18S docking (DC1)
 04/05/09 -- Soyuz TMA-13/17S undocking
 04/07/09 -- Progress M-67/32P undocking & deorbit
 05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 05/25/09 -- Soyuz TMA-15/19S launch
 05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
 07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
 10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
 12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
 02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
 04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
 05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osp/iss_reports/index.htm

ISS On-Orbit Status 10/10/08

All ISS systems continue to function nominally, except those noted previously or below.

Upon wakeup, CDR Volkov terminated his twelfth SONOKARD experiment session for the long-term Russian sleep study MBI-12, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

FE-2 Chamitoff continued the daily diet monitoring for the SOLO (Sodium Loading in Microgravity) experiment. SOLO runs in two blocks of six days each, with the second having started yesterday. *[For SOLO, Chamitoff follows a special high-salt diet, for which prepared meals are provided onboard. All three daily meals are being logged on sheets stowed in the PCBA Consumable Kit in the MELFI (Minus-Eighty Laboratory Freezer for ISS) along with control solution and cartridges for the PCBA. Blood and urine samples are stowed in the MELFI.]*

The three crewmembers began their workday before breakfast with the periodic session of the Russian biomedical routine assessment PZEH-MO-8/Body Mass Measurement, using the IM mass measurement device which Oleg Kononenko broke down afterwards for stowage. *[For determining body mass in zero-G, where things are weightless but not massless, the Russian IM "scales" measure the inertial forces that arise during the oscillatory motion of a mass driven by two helical metering springs with known spring constants. By measuring the time period of each oscillation of the unknown mass (the crewmember) and comparing it to the period of a known mass, the crewmember's mass is calculated by the computer and displayed.]*

For their departure on 10/23, Sergey Volkov and Oleg Kononenko spent an hour in the Soyuz TMA-12/16S Descent Module (SA) supporting a ground-commanded checkout of the Soyuz motion control system (SUD, Mode 2/"Docked") which included pressurization of the KDU Combined Propulsion System Section 2 and Tank 2, a test of the pilot's RUD translational hand controller, and a hot firing of the DPO braking thrusters. KDU maneuver thrusters and DPO lateral thrusters were not fired. *[For the test, the science windows in the US Lab and Kibo module were shuttered, and station attitude was handed over to Russian thruster control at 4:00am EDT, commanded to free drift at 4:20am, then back to LVLH XVV (Local Vertical Local Horizontal/x-axis in velocity vector) attitude. The one-minute firing started on Daily Orbit 1 at ~4:25am. Attitude control was returned*

to the U.S. segment (USOS) at 5:15am, and the Lab window could be re-opened at ~8:15am for CEO.]

Afterwards, Sergey & Oleg also had two hours set aside to conduct the Soyuz descent training exercise, standard procedure for each returning cosmonaut crew. The exercise, which does not involve any command activation, uses computer simulation on the RSK1 laptop with a descent hand controller (RUS) to set up reentry conditions and switch between modes. It was supported by a tagup and discussions with a ground instructor at TsUP/Moscow via S-band. *[The onboard training (OBT) session included a review of the pertinent RODF (Russian Operations Data Files), specifically the books on Soyuz Insertion & Descent Procedures, Emergency Descents, and Off-Nominal Situation Procedures such as manual undocking. Nominal return of Soyuz 16, with Volkov, Kononenko and the US SFP (Spaceflight Participant) Garriott, is scheduled for 10/23.]*

The CDR completed the periodic collection of air samples in the SM (Service Module) & FGB using the AK-1M sampler kit, recording date, time & location. Kits and pouches were then restowed.

FE-2 Chamitoff set up the freshly (10/8) checked-out Shuttle BOB (Breakout Box) to use the Ku-band power supply for operating the Non-Intrusive Flow Meter, then conducted the flow rate adjustment for the MFCV (Manual Flow Control Valve) in the Lab Aft Endcone. Later, after lunch, Gregory also used the Flow Meter for conducting a flow rate test of the RFCA (Rack Flow Control Assembly) in Node-1, before disconnecting the Flow Meter and re-stowing all the hardware.

[Purpose of these valve adjustments is to optimize the ITCS (Internal Thermal Control System) flow throughout the USOS to allow for the incorporation of the Regenerative ECLSS, to be launched on the ULF2 mission. BOB was used in lieu of the Flow Meter batteries which had not charged properly.]

FE-1 Kononenko meanwhile used the vacuum cleaner plus other tools to perform the periodic USOS hatch seal inspection (Node-1 Forward, Aft & Starboard, Lab Aft & Forward, Node-2 Aft, Starboard & Port, Airlock, Columbus, Kibo JPM Zenith & Starboard, Kibo JLP Nadir) in support of ACS (Atmospheric Control System) maintenance (last time done: 7/8).

CDR Volkov took trial photography of the damaged radiator on the S1 truss. *[The S1 photos, with a 400mm-lens, from SM window 2 and the Soyuz 16S "blister" window are to include all three S1 radiators. Photos are also to be taken of the three P1 radiators, from SM window 12. The damage is on the 7th panel of the S1-3 radiator, primarily on the nadir side and there is also some buckling on the zenith side of the panel. The trial photography has the purpose of assessing the ability to stage future photography with TRRJ (Thermal Radiator Rotary Joint) rotation and possible Russian solar array re-positioning.]*

Later, after Chamitoff configured the designated A31p laptop in the FGB for converting analog-to-digital video, he and Volkov set up the system for a video transmission test from the SONY HVR-Z1J digital high-definition camcorder and the ZVK LIV Experimental Video Complex in the SM over the MPEG-2 (Moving Pictures Expert Group 2) encoder to downlink via U.S. OpsLAN and Ku-band in "streaming video" packets. After the test, with the RSCE PingMaster application, Gregory deactivated the A31p again. *[Volkov's setup involves the KL-211 MPEG-2 Encoder which uses the RSS1 A31p laptop (for monitoring the digital video) and a U.S. SSC (Station Support Computer) laptop (for converting analog TV from Russian PAL mode to U.S. NTSC) and making the video hardware connections, checked with a network ping test. Transmission tests with the ground followed (12:50pm – 1:20pm EDT). The digital video transmission is carried over JSL (Joint Station LAN)/Ethernet plus OCA/Ku-Band to MCC-Houston and from there to Moscow via the ESA*

Gateway for COL-CC/Oberpfaffenhofen transmission to TsUP-Moscow, plus transfer of the USOS analog video of the RS ISS video downlink via Streambox 2 to NISN (i.e., the Moscow Oostankino communication hub).]

Oleg did another run of the Russian DZZ-2 "Diatomeya" ocean observation program, using the NIKON-F5 DCS digital still camera to shoot color contrast formations and wind-induced wave anomalies (foam bands, smooth-out sections) in sea water at specified times. *[The current DZZ-2 sessions are in support of a multi-discipline scientific expedition of the Institute of Oceanic Studies under the Russian Academy of Science, chief developer of the Diatomeya space experiment, which will be operating in the first ten days of October in the NE part of the Black Sea. Water areas with the most pronounced hydro-physical and hydro-biological characteristics are selected to be measured from the sea vessel. In good weather these water areas can be easily observed from space in colored and bright fields.]*

Greg completed the visual "T+2 Day" microbial (bacterial & fungal) analysis of the Week 25 potable water samples, collected on 10/8 from the SRV-K hot tap and two CWC (Contingency Water Containers) specimens and processed on board with the MCDs (Microbial Capture Devices) and coliform detection bags.

Chamitoff also filled out the regular FFQ (Food Frequency Questionnaire), his 15th, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

The two cosmonauts again had a one-hour period each to themselves for the regular crew departure preparations, working on the standard end-of-increment cleanup preparatory to their return to Earth later this month. *[It is usual for Russian crewmembers to be granted reduced workdays for making their departure preparations, as their return date approaches.]*

Gregory conducted the regular bi-monthly reboots of the OCA Router and File Server SSC (Station Support Computer) laptops.

Chamitoff is timelined for another VolSci (Voluntary Science) program "installment" with the BCAT-4 (Binary Colloid Alloy Test 4) experiment tonight, completing the hardware set-up in the Lab Avionics Racks 2 & 3 seat track area (no MWA/Maintenance Work Area table), along with camcorder and still camera, - to take photograph sample 3) and then initiate homogenization and the automated picture taking. *[The SGSM (slow growth sample module) was to be configured by mixing the samples 8, 9, 10, and 3 and starting automated photography with the Kodak DCS-760 digital still camera controlled by the EarthKAM software running on an SSC (Station Support Computer), automatically taking one photo every hour of sample 3 for the next six days.]*

Sergey performed the regular daily maintenance servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The daily job of IMS (Inventory Management System) maintenance was listed for Kononenko on the discretionary "time permitting" task list, involving updating/editing of its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR/2.5h, FE-1/2.5h), and RED resistive exercise device (FE-2).

Later, the CDR will transfer the exercise data file to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Around ~2:30pm, the FE-2 is scheduled to take measurements for the regular atmospheric status check for ppCO₂ (Carbon Dioxide partial pressure) in the Lab, SM at panel 449 and COL (Columbus Orbital Laboratory) plus battery ticks, using the hand-held CDMK (CO₂ Monitoring Kit, #1002). The unit will then be deactivated and returned to its stowage location (LAB1S2). *[Purpose of the 5-min activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements. As usual, the results will be logged in the OSTPV (Onboard Short Term Plan Viewer) and are immediately available to the ground.]*

At ~4:35am EDT, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~2:55pm, the crewmembers will convene for their standard bi-weekly teleconference with the JSC Astronaut Office (Steve Lindsey), via S-band S/G-2 audio & phone patch.

At ~6:15pm, Greg Chamitoff will have his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop).

As generally every day now, today starting at 9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) is running intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking. CDRA remains "yellow" on the ISS critical systems list.]*

WRM Update: An updated WRM (Water Recovery Management) "cue card" was uplinked overnight for the crew's reference, updated with yesterday's water audit. *[The new card (17-1016C) lists 28 CWCs (~911.2 L total) for the four types of water identified on board: technical water (263.2 L, for Elektron electrolysis, except for 22.2 L off-limit because of Wautersia bacteria), potable water (627.6 L, incl. 174.6 L currently on hold), condensate water (3.4 L), waste/EMU dump and other (17 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]*

Soyuz TMA-13/17S Launch Update: This morning in Baikonur/Kazakhstan, the Soyuz 17 spacecraft was rolled out from the Assembly-Test Facility to the launch site and erected on the launch pad. L-2 operations are underway. The launch of the Soyuz-FG integrated launch vehicle

with the Soyuz TMA-13 spacecraft to the ISS is planned for 10/12 at 3:01:29 am EDT (11:01am Moscow time). **[See picture, below]**

Week 25 Scheduled Main Activities:

- Sat. (10/11): Station cleaning; PFCs; Ham radio call; SOLO #2.
- Sun. (10/12): SOLO #2; PFC; VRU disk exchange.

CEO (Crew Earth Observations) photo targets uplinked for today were **Arkenu 1 and Arkenu 2 Impact Craters** (*Arkenu 1 & 2 are a rarely exposed double impact structure created by a 500 m diameter pair of asteroids. Located in southeastern part of the Libyan Desert, Arkenu 1 is 6.8 km in diameter and Arkenu 2 is 10 km. Both have been dated as less than 140 million years old. Detailed images of the structures of both craters were requested*), **Teide Volcano, Tenerife Island, Canary Islands** (*the large triangular island of Tenerife is composed of a complex of overlapping volcanoes that have remained active into historical time. The United Nations Committee for Disaster Mitigation has designated Teide as a Decade Volcano. It is considered to be the 13th most dangerous volcano in the world due to its proximity to several major towns and the nearby city of Puerto de la Cruz*), **Hurricane Norbert** (*Dynamic Event: Hurricane Norbert. Looking right of track at Category 3 storm with a distinct eye. Norbert is expected to cross the lower Baja late Friday*), **Madrean Sky Islands** (*the Madrean Sky Islands are patches of forest near the summits of the high mountains of the southwestern USA and northwestern Mexico. These forests are remnants of much more extensive vegetation that once existed at lower elevations in cooler and wetter climates. Looking left of track into southeastern Arizona and southwestern New Mexico for the dark forested patches. Context views were requested*), and **Konza Prairie, Kansas** (*the Konza Prairie is one of the Long Term Ecological Research [LTER] sites. This target is located in the Flint Hills of northeastern Kansas. The vegetation is primarily native tall grass prairie. CEO imagery will help in the study of the effects of fire, grazing and climate variability as well as help to document the grassland ecosystems. Overlapping mapping pass was requested*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 7:21am EDT [= epoch]):

Mean altitude -- 352.8 km
Apogee height -- 355.4 km
Perigee height -- 350.1 km
Period -- 91.59 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0003914
Solar Beta Angle -- -41.6 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.72
Mean altitude loss in the last 48 hours -- 49 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 56667

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

10/12/08 -- Soyuz TMA-13/17S launch (3:01:29 am EDT; Fincke, Lonchakov, Garriott)
10/14/08 -- Soyuz TMA-13/17S dock (FGB nadir port, ~4:33am EDT)
10/23/08 -- Soyuz TMA-12/16S undock (DC1 nadir, 8:15pm) & land (11:36pm) = 10/24 -- 9:36am Kazakhstan)
11/02/08 -- Progress 30P reboost; *Daylight Saving Time (DST) ends*

11/16/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC (~7:02pm EST) - U/R
 11/18/08 -- STS-126/Endeavour/ULF2 docking - U/R
 11/20/08 -- **ISS 10 Years**
 11/25/08 -- Progress M-65/30P undocking & deorbit
 11/26/08 -- Progress M-66/31P launch
 11/30/08 -- Progress M-66/31P docking
 12/01/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.)
 02/09/09 -- Progress M-66/31P undocking & deorbit
 02/10/09 -- Progress M-67/32P launch
 02/12/09 -- Progress M-67/32P docking
 02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
 02/14/09 -- STS-119/Discovery/15A docking
 02/24/09 -- STS-119/Discovery/15A undocking
 02/26/09 -- STS-119/Discovery/15A landing (nominal)
 03/25/09 -- Soyuz TMA-14/18S launch
 03/27/09 -- Soyuz TMA-14/18S docking (DC1)
 04/05/09 -- Soyuz TMA-13/17S undocking
 04/07/09 -- Progress M-67/32P undocking & deorbit
 05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 05/25/09 -- Soyuz TMA-15/19S launch
 05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
 07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
 10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
 12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
 02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
 04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
 05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 10/09/08

All ISS systems continue to function nominally, except those noted previously or below.

FE-2 Chamitoff continued the daily diet monitoring for the SOLO (Sodium Loading in Microgravity) experiment. SOLO runs in two blocks of six days each, with the second starting today. *[For the SOLO experiment, Chamitoff follows a special high-salt diet, for which prepared meals are provided onboard. All three daily meals are being logged on sheets stowed in the PCBA Consumable Kit in the MELFI (Minus-Eighty Laboratory Freezer for ISS) along with control solution and cartridges for the PCBA. Blood and urine samples are stowed in the MELFI.]*

Upon wakeup, FE-1 Kononenko terminated his twelfth SONOKARD experiment session for the long-term Russian sleep study MBI-12, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. Sergey Volkov's new MBI-12 session starts tonight (~4:50pm). *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

The two Russian crewmembers had their second preliminary training session with the Russian "Chibis" LBNP suit (lower body negative pressure; Russian: ODNT), ramping up to get them ready for returning to gravity on 10/24. Assisting each other in turn as CMO (Crew Medical Officer), the subjects were supported in their two one-hour sessions by ground specialist tagup via VHF at 5:20am (DO16) & 6:50am EDT (DO1). *[The assessment uses the Gamma-1 ECG equipment with biomed harness, skin electrodes and a blood pressure and rheoplethysmograph cuff wired*

to the cycle ergometer's instrumentation panels. The Chibis ODNT provides gravity-simulating stress to the body's cardiovascular/circulatory system for evaluation of Volkov's and Kononenko's orthostatic tolerance (e.g., the Gauer-Henry reflex) after several months in zero-G. The preparatory training generally consists of first imbibing 150-200 milliliters of water or juice, followed by two cycles of a sequence of progressive regimes of reduced ("negative") pressure, set today at -15, -20, -25, and -30 mmHg (Torr) for five min. each while shifting from foot to foot at 10-12 steps per minute, wearing a sphygmomanometer to measure blood pressure. The body's circulatory system interprets the pressure differential between upper and lower body as a gravity-like force pulling the blood (and other liquids) down. Chibis data and biomed cardiovascular readings are recorded. The Chibis suit (not to be confused with the Russian "Penguin" suit for spring-loaded body compression, or the "Kentavr" anti-g suit worn during reentry) is similar to the U.S. LBNP facility (not a suit) used for the first time on Skylab in 1973/74, although it appears to accomplish its purpose more quickly.]

The CDR worked on the BRPK air/liquid separator of the SRVK-2M condensate water processor, replacing two A-B hoses and using water from an EDV container and a pump to test the impact of a possibly clogged A-N hose hydro-connector on the separator's service life.

The FE-1 meanwhile completed the monthly radiation data checkup for accumulated flux & dose rate data with the Matryoshka-R radiation payload (RBO-3-2) and its LULIN-5 electronics box. Afterwards, Kononenko also conducted the periodic data transfer and time synchronization between the RSS1 laptop and the BSPN payload server for transfer of accumulated Matryoshka data from the BSPN, to be downlinked on OCA comm (via the Russian RSS1 laptop to a PCMCIA flash card). *[Before RSS1/BSPN synchronization, the RSS1 is updated with the exact time as per the station clock (which in turn is synchronized daily from RGS/Russian Ground Site). Experiment control application is a payload file transfer program called ShellForKE.]*

After yesterday's preparations for today's rack relocation, Greg Chamitoff, assisted by the CDR, moved the last three racks from their original positions to their final locations, preceded by clearing obstructing equipment items from the rack fronts, the destination bays and the transfer "corridor". The relocations also required the temporary relocation of the Lab & Cupola RWS (Robotic Work Station) laptops, which were subsequently restored, and some reconfigurations in the JAXA Kibo module. For the outfitting, the following rack transfers were complete:

- One ZSR (Zero-G Stowage Rack) from the US Lab (position O5) to the JPM (JEM Pressurized Module, pos. F6),
- one ZSR from the Node-2 (pos. D5) to the JLP (JEM Pressurized Logistics Segment, pos. A2), and

- one RSR (Resupply Stowage Rack) from Node-2 (pos. P5) to the US Lab (pos. O5).

Preparatory to the return flight of the Soyuz TMA-12/16S vehicle, docked at the DC1 nadir port, Volkov performed the periodic cleaning of the screen of the BVN air heater fan assembly in the spacecraft's Orbital Module (BO).

For the Russian BTKh-11 BIODegradatsiya ("Biodegradation") experiment, Oleg collected surface samples from specific equipment and structures in the Service Module (SM) for subsequent stowage in the TMA-12 Descent Module for microbial analysis on Earth. *[The activities, supported by ground specialist tagup via S-band, were documented with the Nikon D1X digital camera with SB 28DX flash attachment for downlink via OCA.]*

Sergey conducted the periodic checkout/verification of IP-1 airflow sensors in the various RS (Russian Segment) hatchways, including the passageways SM PrK (Transfer Compartment)–SM RO (Working Compartment), SM PkhO (Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1, and skipping the Soyuz hatch today.

Gregory completed the weekly 10-min. CWC (Contingency Water Container) inventory as part of on-going WRM (Water Recovery & Management) assessment of onboard water supplies. Updated "cue cards" based on the crew's water calldowns are sent up every other week. *[The new card (17-1016B) lists 29 CWCs (~962.3 L total) for the four types of water identified on board: technical water (283.2 L, for Elektron electrolysis, except for 22.2 L off-limit because of Wautersia bacteria), potable water (627.6 L, incl. 174.6 L currently on hold), condensate water (34.5 L), waste/EMU dump and other (17 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]*

For another VolSci (Voluntary Science) program session later tonight, Greg set up the BCAT-4 (Binary Colloid Alloy Test 4) experiment in the Lab Avionics Racks 2 & 3 seat track area (no MWA/Maintenance Work Area table), along with camcorder and still camera,- to take video and photos of Greg's subsequent sample homogenization plus the last sample (#3), and then initiated the activity. *[The FE-2 configured the SGSM (slow growth sample module) by mixing the samples 8, 9, 10, and 3 and starting automated photography of sample 3 with the Kodak DCS-760 digital still camera controlled by the EarthKAM software running on an SSC (Station Support Computer), automatically taking one photo every hour of sample 3 for the next six days.]*

The FE-2 verified closure of the protective window shutters in the Lab and Kibo

module, preparatory to tomorrow morning's Soyuz 16S thruster/SUDN testing at ~4:25am EDT, for which the ISS will briefly go into free drift (so jet thrust can be measured).

The two cosmonauts also had a 50-min period each to themselves for the regular crew departure preparations, working on the standard end-of-increment cleanup preparatory to their return to Earth later this month. *[It is usual for Russian crewmembers to be granted reduced workdays for making their departure preparations, as their return date approaches.]*

The regular daily maintenance servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM today was listed for Volkov on the discretionary "time permitting" task list. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

For Kononenko the job list suggested, at his discretion, the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

At ~12:50pm, CDR Volkov conducted a ham radio session with school children from Montreal, Canada.

Greg Chamitoff, an accomplished chess player who has been winning matches with Flight Control Center personnel around the world, at ~2:05pm EDT engaged in a PAO TV event with the Stevenson Elementary School Chess Team at Bellevue Community College in Bellevue, Washington, for about 20 minutes of air time.

The crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), and RED resistive exercise device (FE-2). Part of Sergey's & Oleg's exercise regimen was contributed by their one-hour ODNT sessions.

Later, the CDR transfers the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

As generally every day now, today starting at 9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) is running intermittently for two half-

cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking. CDRA remains "yellow" on the ISS critical systems list.]*

Shuttle BOB Update: Greg's Breakout Box troubleshooting yesterday was successful and cleared the BOB for tomorrow's Flow Meter operations. *[During the checkout, the installation of a ground wire caused a blown fuse, but it showed voltage readings that indicate that the BOB will function correctly and safely. Additionally, with newly added Kapton tape insulation on the Flow Meter transducer's metal surface there will be no more sparking to the ISS structure in case of contact.]*

16S Docking Contingency Planning: RSC-Energia has developed a "just in case" contingency plan for the very unlikely event that the Soyuz 16S, currently docked at the DC1 nadir port, must relocate to the FGB to make room for Soyuz TMA-13/17S, should the latter be prevented from nominal docking at the FGB (as would be the case if the KURS antenna fails to retract). *[FGB docking is not allowed for Soyuz/Progress docking with unretracted KURS antenna.]*

GNC MDM Update: Both GNC MDM (Guidance, Navigation & Control Multiplexer/Demultiplexer) computers appear stable with no failures in 13 days. Remaining steps for completion of X2R7 software transition, including stepping up the C&C-3 (Command & Control) MDM 3 to R7 will be performed. *[Proposed on-orbit testing to incorporate GPS (Global Positioning System) satellite data into GNC MDM to attempt to recreate the recent failure will be deferred until after 16S undock.]*

Vozdukh Failures: The Russian Vozdukh CO₂ removal system has had repeated failures, believed to be due to microswitches. The system is currently restarted after each failure. Troubleshooting plan is in work.

RGA Failures: Two US RGAs (Rate Gyroscope Assemblies) failed due to a skewed FDIR (Fault Detection, Isolation & Recovery) system software file. *[This type of failure has been seen in the past with a single RGA but not both. Both RGAs were successfully recovered after the skewed FDIRs were disabled. This configuration does not violate any Flight Rules.]*

Week 24/25 Scheduled Main Activities:

- Fri. (10/10): Soyuz 16S thruster/SUDN test; MO-8; MBI-12 dwld.; FFQ; ITCS MFCV adjust; RS Video MPEG config.; Water T+2 anal.; SOLO #2; CDMK check.
- Sat. (10/11): Station cleaning; PFCs; Ham radio call; SOLO #2.

- Sun. (10/12): SOLO #2; PFC; VRU disk exchange.

CEO (Crew Earth Observations) photo targets uplinked for today were **Tenoumer Impact Crater** (*this tiny, 1.9km-diameter impact crater is located in the desert interior of northern Mauritania. Despite its small size, the crater is geologically fresh [just over 20,000 years old] and relatively unweathered in its desert setting. CEO researchers are seeking detailed, near-nadir views of this feature. Greg had a mid-morning track with clear weather anticipated. As ISS tracked NE-ward from the Mauritanian coast, he was to note the large, well-photographed Richat Structure and begin looking only seconds later for Tenoumer just left of track*), **London, England, Great Britain** (*on this early afternoon pass, ISS had a rare break in the typical fall weather pattern over the British Isles, with a near-nadir view of this renowned mega-city in relatively fair weather. As the station approached England from the W, Greg was to look just inland from the southern coast and use the long-lens settings for a detailed mapping of the urban margins*), and **Niwot Ridge Tundra, Colorado** (*nadir view of this target area in late morning with clear weather anticipated. This Long Term Ecological Research [LTER] site is located in north-central Colorado within the alpine areas above 3,000m just west of Boulder. As ISS tracked NE-ward over the Colorado Rockies, before reaching the plains to the E, Greg was to try for contextual mapping of the ridge and its surroundings*).

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 6:53am EDT [= epoch]):

Mean altitude -- 352.8 km

Apogee height -- 355.5 km

Perigee height -- 350.1 km

Period -- 91.60 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0004029

Solar Beta Angle -- -37.2 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 64 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56636

Significant Events Ahead (*all dates Eastern Time, some changes possible*.):

10/10/08 -- Soyuz 16S thruster test

10/12/08 -- Soyuz TMA-13/17S launch (~3:01:29 am EDT; Fincke, Lonchakov, Garriott)

10/14/08 -- Soyuz TMA-13/17S dock (FGB nadir port, ~4:33am EDT)

10/23/08 -- Soyuz TMA-12/16S undock (DC1 nadir, 8:15pm) & land (11:36pm) =
 10/24 -- 9:36am Kazakhstan)
 11/02/08 -- Progress 30P reboost; *Daylight Saving Time (DST) ends*
 11/16/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC (~7:02pm EST) - U/R
 11/18/08 -- STS-126/Endeavour/ULF2 docking - U/R
 11/20/08 -- **ISS 10 Years**
 11/25/08 -- Progress M-65/30P undocking & deorbit
 11/26/08 -- Progress M-66/31P launch
 11/30/08 -- Progress M-66/31P docking
 12/01/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.)
 02/09/09 -- Progress M-66/31P undocking & deorbit
 02/10/09 -- Progress M-67/32P launch
 02/12/09 -- Progress M-67/32P docking
 02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
 02/14/09 -- STS-119/Discovery/15A docking
 02/24/09 -- STS-119/Discovery/15A undocking
 02/26/09 -- STS-119/Discovery/15A landing (nominal)
 03/25/09 -- Soyuz TMA-14/18S launch
 03/27/09 -- Soyuz TMA-14/18S docking (DC1)
 04/05/09 -- Soyuz TMA-13/17S undocking
 04/07/09 -- Progress M-67/32P undocking & deorbit
 05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 05/25/09 -- Soyuz TMA-15/19S launch
 05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
 07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
 10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
 12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
 02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
 04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
 05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osp/iss_reports/index.htm

ISS On-Orbit Status 10/08/08

All ISS systems continue to function nominally, except those noted previously or below.

FE-2 Chamitoff had the last day of his first SOLO (Sodium Loading in Microgravity) session, which runs in two blocks of six days each. Greg finished up with measuring body mass (with SLAMMD/Space Linear Acceleration Mass Measurement Device), and sampling of blood (with PCBA/Portable Clinical Blood Analyzer) and urine, begun 10/5. Then, the equipment was stowed for now. *[For the SOLO experiment, Chamitoff follows a special high-salt diet, for which prepared meals are provided onboard. All three daily meals are being logged on sheets stowed in the PCBA Consumable Kit in the MELFI (Minus-Eighty Laboratory Freezer for ISS) along with control solution and cartridges for the PCBA. Blood and urine samples are stowed in the MELFI.]*

FE-1 Kononenko completed his first session of the 24-hour of ECG (electrocardiogram) recording under the Russian MedOps MO-2 protocol. *[For the ECG recording, the Russian flight engineer yesterday donned the five-electrode Holter harness which read his dynamic (in motion) heart function from two leads over 24 hours and recorded data on the Kardioregistrator 90205 unit. CDR Volkov's MO-2 session took place the day before.]*

Afterwards, the FE-1 collected the periodic readings of potentially harmful atmospheric contaminants in the SM (Service Module), using the CMS (Countermeasure System), a component of the SKDS GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, today using preprogrammed microchips to measure for Isopropanol ("rubbing alcohol", C_3H_8O), Methanol ("wood alcohol", CH_3OH) and Toluene (methylbenzene, C_7H_8).

FE-2 Chamitoff conducted "Exp-17 Week 25" sampling of potable water for chemical and microbial analysis from the SVO-ZV tap and the SRV-K Warm tap,

the latter after preliminary heating of the water (three heating cycles) and flushing. *[Gregory collected three 225 mL samples (for inflight microbial analysis) and two 750 mL samples (for postflight chemical analysis) from each of three ports (SRV-K hot, SRV-K warm, SVO-ZV) for return on STS-126/ULF2. The flush water, collected in three small waste water bags, was then reclaimed for technical use. For the in-flight chemistry/microbiology analysis, Greg used MCDs (microbial capture devices) from the U.S. WMK (water microbiology kit) for treatment/processing after no more than 6 hours of the collection (done ~10:55am EDT). Sample analysis included subsequent processing of water samples in the MWAK (microbial water analysis kit) for inflight coliform bacteria (Escherichia coli) detection (done ~11:55am). Results of the on-board processing will be available after a two-day incubation period, in case of the MWAK after 4-6 days of incubation.]*

Kononenko took US CWCs (Contingency Water Containers) #1064 & #1008 to the Russian Segment (RS) for the periodic (about twice a month) replenishing of the Elektron oxygen generator's water supply for electrolysis, filling the KOV thermal loops' EDV container. Once filled, the EDV was connected to the BPK transfer pump for processing. *[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]*

Continuing the current round of periodic preventive maintenance of RS ventilation systems, Volkov replaced the four dust collector filters (PF1-4) in the SM. Additional cleaning of fan grilles and air ducts remains on the Russian discretionary "time permitting" task list.

In preparation for the relocation of the ZSR (Zero-G Stowage Rack) at the Node-2 D5 position to the JAXA JLP (JEM Logistics Pressurized Section) position A2 tomorrow (10/9), the FE-2 cleared up the D5 location by removing stowage items, which required rotating the rack down and later moving it upright again. The removed items were restowed at other locations. *[Two more racks are also to be moved: one ZSR from Lab O5 to JPM (JEM Pressurized Module) F6, and one RSR (Resupply Stowage Rack) from Node-2 P5 to Lab O5.]*

Chamitoff also performed a test on the BOB (Breakout Box) power unit to ascertain that it can be used for Flow Meter operations on (still incomplete) ITCS MFCV (Internal Thermal Control System/Manual Flow Control Valve) adjustment later this week. *[The ground-developed test involved resistance and voltage measurements. Afterwards, the Flow Meter was also checked out, including a zero calibration, to verify that it was not damaged by the electrical anomaly on 9/30 and is still functioning properly.]*

Sergey & Oleg had 2 hrs. reserved to setting up the work area for SFP/VC15

(Space Flight Participant/Visiting Cosmonaut 15) Richard Garriott, due to arrive on 10/14 on Soyuz 17S. *[To support the ESA BIO#4 experiments during the ISS-17/ISS-18 handover, the crewmembers unstowed and set up the KUBIK 1 & 2 controlled temperature containers (thermostats) in the SM. Activation at +21 degC and +37 degC, respectively, will occur on docking day. The equipment setups pertain to the BIOEMULSION and CONJUGATION experiments, and include the KRIOGEM-03 refrigerator, laptop HDDs (Hard Disk Drives) and digital storage cards for VC-15.]*

The FE-1 conducted another run of the Russian DZZ-2 "Diatomeya" ocean observation program, using the NIKON-F5 DCS digital still camera to shoot color contrast formations and wind-induced wave anomalies (foam bands, smooth-out sections) in sea water at specified times. *[The current DZZ-2 sessions are in support of a multi-discipline scientific expedition of the Institute of Oceanic Studies under the Russian Academy of Science, chief developer of the Diatomeya space experiment, which will be operating in the first ten days of October in the NE part of the Black Sea. Water areas with the most pronounced hydro-physical and hydro-biological characteristics are selected to be measured from the sea vessel. In good weather these water areas can be easily observed from space in colored and bright fields.]*

Sergey Volkov completed the monthly & quarterly TVIS treadmill maintenance. *[The inspection checks out the TVIS in the current SLD (subject loading device) contingency configuration, primarily looking at the condition of the SPDs (subject positioning devices) with clamp/rope assembly wire rope isolators for fraying and damage, and recording time & date values.]*

Oleg performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Sergey later took care of the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

At ~5:20pm EDT, just before sleep time, Kononenko will again set up the Russian MBI-12 SONOKARD (Sonocard) payload and start his twelfth experiment session, using a sports shirt from the SONOKARD kit with a special device in the pocket for testing a new method for acquiring physiological data without using direct contact on the skin. Measurements are recorded on a data card for return to Earth.

[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]

The CDR & FE-1 worked another hour on pre-packing cargo for return or disposal on Soyuz TMA-12, based on a detailed 15-page loading list with schematics ("maps") as stowage guides for the extremely limited stowage space in the 16S Descent Module (SA). Trashed items will be packed in the spacecraft's Orbital Module (BO).

The two cosmonauts also had a 50-min period each to themselves for the regular crew departure preparations, working on the standard end-of-increment cleanup preparatory to their return to Earth later this month. *[It is usual for Russian crewmembers to be granted reduced workdays for making their departure preparations, as their return date approaches.]*

The crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR/2.5h, FE-1/2.5h), and RED resistive exercise device (FE-2).

Later, the FE-1 transfers the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~3:15pm, the crewmembers will convene for their standard bi-weekly teleconference with the JSC Astronaut Office (Steve Lindsey), via S-band S/G-2 audio & phone patch.

As generally every day now, today starting at 9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) is running intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking. CDRA remains "yellow" on the ISS critical systems list.]*

Conjunction Update: One conjunction pass (of originally two) with orbital debris

from the Kosmos-2421 satellite remained under observation for today at a TCA (Time of Closest Approach) of 10:18am EDT. With a total miss distance of 18.5 km predicted yesterday and updates remaining consistently stable, the pass had a PC (Probability of Collision) of zero.

Marangoni Experiment: Today's Marangoni experiment in the JAXA JPM, requiring a "quiet" environment, will be performed between 5:30pm and 2:00am EDT, remotely controlled from Tsukuba/Japan.

MCAS Checkout Update: Yesterday's checkout by ground controllers of the MCAS (Mobile Servicing System Common Attach System) and UMA (Umbilical Mechanism Assembly) on both MBS (Mobile Base System) strings showed that the "Demated" microswitch on the string 2 MCAS UMA was not depressed as expected when powered up, and neither was the "Mated" microswitch on the prime string after the MBS switched to it. Additional commanding was required to reset. No impact to the upcoming ESP-3 (External Stowage Platform 3) operations.

GNC Issue Troubleshooting: After recent intermittent anomalous behaviors of both GNC MDM (Guidance, Navigation & Control Multiplexer/Demultiplexer) computers, flight controllers uploaded a software patch to the MDMs to gather more data for diagnostic analysis. The patch will not be exercised on orbit until after the Soyuz 16S undocking.

Week 24/25 Scheduled Main Activities:

- Thu. (10/9): MBI-12 dwnld.; ODNT OBT; IP-1 mnt.; ZSR-LAB1O5 relocate; ZSR NOD2D5 relocate; WRM CWC audit;
- Fri. (10/10): Soyuz 16S thruster/SUDN test; MO-8; MBI-12 dwld.; FFQ; ITCS MFCV adjust; RS Video MPEG config.; Water T+2 anal.; SOLO #2; CDMK check.
- Sat. (10/11): Station cleaning; PFCs; Ham radio call; SOLO #2.
- Sun. (10/12): SOLO #2; PFC; VRU disk exchange.

CEO (Crew Earth Observations) photo targets uplinked for today were **Afar Rift Zone, Ethiopia** (*the Afar Rift Zone is a depression caused by the rifting or spreading apart of the Red Sea and the Gulf of Aden. The Afar is one of two places on Earth where a spreading center can be studied on land, the other being Iceland. Greg was asked to document the modern lava flows as well as the alignment of the fault lines. Erte Ale, a large, dark volcanic structure should also have been visible*), **Teide Volcano** (*the large triangular island of Tenerife is composed of a complex of overlapping volcanoes that have remained active into historical time. The United Nations Committee for Disaster Mitigation has designated Teide as a Decade Volcano. It is considered to be the 13th most dangerous volcano in the world due*

to its proximity to several major towns and the nearby city of Puerto de la Cruz), **Hurricane Norbert** (Hurricane Norbert is a Category 1 storm, moving toward the Baja Peninsula. It is forecasted to possibly become a Category 2 before landfall on the Baja), and **Konza Prairie, Kansas** (the Konza Prairie is one of the Long Term Ecological Research [LTER] sites. This target is located in the Flint Hills of northeastern Kansas. The vegetation is primarily native tall grass prairie. ISS CEO imagery will help in the study of the effects of fire, grazing and climate variability as well as help to document the grassland ecosystems. Overlapping mapping pass was requested).

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this noon, 8:00am EDT [= epoch]):

Mean altitude -- 352.9 km

Apogee height -- 355.6 km

Perigee height -- 350.2 km

Period -- 91.60 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0003998

Solar Beta Angle -- -32.5 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 64 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56636

Significant Events Ahead (all dates Eastern Time, some changes possible.):

10/10/08 -- Soyuz 16S thruster test

10/12/08 -- Soyuz TMA-13/17S launch (~3:01:29 am EDT; Fincke, Lonchakov, Garriott)

10/14/08 -- Soyuz TMA-13/17S dock (FGB nadir port, ~4:33am EDT)

10/23/08 -- Soyuz TMA-12/16S undock (DC1 nadir, 8:15pm) & land (11:36pm) =

10/24 -- 9:36am Kazakhstan)

11/02/08 -- Progress 30P reboost; *Daylight Saving Time (DST) ends*

11/16/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC (~7:02pm EST) - U/R

11/18/08 -- STS-126/Endeavour/ULF2 docking - U/R

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

12/01/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.)

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at

ISS On-Orbit Status 10/07/08

All ISS systems continue to function nominally, except those noted previously or below.

FE-2 Chamitoff had the fifth day of his first SOLO (Sodium Loading in Microgravity) session, which runs in two blocks of six days each. Today, Greg continued with measurements and sampling of body mass (with SLAMMD/Space Linear Acceleration Mass Measurement Device), blood (with PCBA/Portable Clinical Blood Analyzer), and urine, begun yesterday and continuing for one more day.

[Background: For the SOLO experiment, Chamitoff follows a special high-salt diet, for which prepared meals are provided onboard. All three daily meals are being logged on sheets stowed in the PCBA Consumable Kit in the MELFI (Minus-Eighty Laboratory Freezer for ISS) along with control solution and cartridges for the PCBA. Blood and urine samples are stowed in the MELFI. SOLO, an ESA/German experiment from the DLR Institute of Aerospace Medicine in Cologne/Germany, investigates the mechanisms of fluid and salt retention in the body during long-duration space flight. Background: The hypothesis of an increased urine flow as the main cause for body mass decrease has been questioned in several recently flown missions. Data from the US SLS1/2 missions as well as the European/Russian Euromir '94 & MIR 97 missions show that urine flow and total body fluid remain unchanged when isocaloric energy intake is achieved. However, in two astronauts during these missions the renin-angiotensin system was considerably activated while plasma ANP concentrations were decreased. Calculation of daily sodium balances during a 15-day experiment of the MIR 97 mission (by subtracting sodium excretion from sodium intake) showed an astonishing result: the astronaut retained on average 50 mmol sodium daily in space compared to balanced sodium in the control experiment. SLAMMD, performed first on Expedition 12 in December 2005, provides an accurate means of determining the on-orbit mass of humans spanning the range from the 5th percentile Japanese female and the 95th percentile American male. The procedure, in accordance with Newton's 2nd Law of Motion, finds the mass by dividing force, generated by two springs inside the SLAMMD

drawer, by acceleration measured with a precise optical instrument that detects the position versus time trajectory of the SLAMMD guide arm and a micro controller which collects the raw data and provides the precise timing. The final computation is done via portable laptop computer with SLAMMD unique software. To calculate their mass, crewmembers wrap their legs around a leg support assembly, align the stomach against a belly pad and either rest the head or chin on a head rest. For calibration, an 18-lbs. mass is used at different lengths from the pivot point, to simulate different mass values. Crew mass range is from 90 to 240 lbs.]

FE-1 Kononenko updated the AntiVirus program in the Russian auxiliary (VKS) laptops RSS1, RSK1, RSK2, RSE1 from a new uplinked program copy on the RSS2 laptop, first scanning the latter, then transferring the database by flash-card to the other computers and scanning them one by one.

CDR Volkov terminated his first session of the Russian MedOps MO-2 protocol which calls for 24-hour recording of his ECG (electrocardiogram) and assisted the FE-1 in donning the equipment for his turn with MO-2 for the next 24 hrs. *[For the ECG recording, each cosmonaut wears the five-electrode Holter harness that reads their dynamic (in motion) heart function from two leads over 24 hours and record data on the Kardioregistrator 90205 unit.]*

After downloading the accumulated IWIS (Internal Wireless Instrumentation System) structural dynamics data from Saturday's (10/4) Progress thruster reboost of the ISS from the RSUs (Remote Sensor Units) in the US Lab, Node-1, Node-2, FGB and SM (Service Module), Volkov today powered down the sensors and NCU (Network Control Unit).

FE-2 Chamitoff had about two hours reserved for unpacking US cargo delivered on Progress M65/30P.

Volkov & Kononenko worked another two hours each on pre-packing return cargo to be loaded on Soyuz TMA-12, based on a detailed 15-page loading list with schematics ("maps") as stowage guides for the extremely limited stowage space in the 16S Descent Module (SA).

For a VolSci (Voluntary Science) program session tonight before bedtime, Gregory set up the BCAT-4 (Binary Colloid Alloy Test 4) experiment, first familiarizing himself with payload hardware & operations, then setting up the experiment in the Lab Avionics Racks 2 & 3 seat track area, along with camcorder and still camera,- to take video and photos of Greg performing sample homogenization, the first crystal check of the session, crystal photography, and sample photography, and then initiated the activity. *[The FE-2 configured the SGSM (slow growth sample module) by mixing the samples 8, 9, 10, and 3 and*

starting automated photography of sample 3 with the Kodak DCS-760 digital still camera controlled by the EarthKAM software running on an SSC (Station Support Computer).]

The two cosmonauts again had a one-hour period each to themselves for the regular crew departure preparations, working on the standard end-of-increment cleanup preparatory to their return to Earth later this month. *[It is usual for Russian crewmembers to be granted reduced workdays for making their departure preparations, as their return date approaches.]*

In preparation for the arrival of Mike Fincke, the new CDR of Expedition 18, Greg Chamitoff collected and gathered the physical exercise equipment to be used by Mike, already in stowage on board or newly delivered on Progress 30P. *[Typical items are HRM (Heart Rate Monitor) chest strap, watch & transmitter, PCMCIA memory cards, treadmill harness, and exercise shoes, etc.]*

The crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR/2.5h, FE-1/2.5h), and RED resistive exercise device (FE-2).

Later, the CDR transfers the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Oleg performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Sergey later took care of the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

In preparation for the arrival and on-orbit stay of the next SFP & VC15 (Space Flight Participant/Visiting Cosmonaut 15) Richard Garriott, the crew conducted a 90-min. review of Garriott's projected timeline and then tagged up with ground specialists to discuss the planned VC15 activity program. *[VC15 will be performed from 10/12-10/23 (10/14-10/23 in the ISS RS/Russian Segment). The program involves 3 real-time TV events between RS and TsUP-Moscow, 12 ham radio sessions, photo &*

video imagery in the RS interior, commemorative activities and once-daily tagups with an advisory group. There are three experiment blocks: (1) Richard Garriott's VC-15 experiments: "**PICTURE**" (creation of a painting in micro-G), "**DHL-G**" (demonstration of the law of preservation of energy), "**PCG**" (protein crystallization in micro-G), and "**ARISS**" (ham radio comm using slow-scan TV system); (2) ESA VC-15 experiments: "**MUSCLE-G**" (assessment of micro-G impact on contracting muscles & neurophysiological properties of quadrocetal muscle in humans), "**MOP-G**" (vestibular adaptation to changes in micro-G, SAS/ Space Adaptation Syndrome); and (3) NASA VC-15 experiments: "**SLEEP-G**" (Actiwatch recording of activity during sleep and after waking & exposure to light during spaceflight), "**IMMUNO-G**" (immune system monitoring), "**CORNEA-G**" study of effects of micro-G on eye corona). There will also be a Russian and ESA experiment program performed by ISS-17 & ISS-18 crewmembers during the VC-15 period.]

The crew had their regular PMCs (Private Medical Conferences), via S-band/audio & Ku-band/video, Greg at ~10:25am, Sergey at ~12:55pm, Oleg at ~2:30pm.

A new job on the Russian discretionary task list for Volkov & Kononenko is to take out time for more RS ventilation system cleaning.

At ~7:24am EDT, Gregory powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, & power supply) and conducted, at 7:29am, a ham radio exchange with the Scuola Media Statale Donato Forlani in Conversano, Italy. *[The Scuola media D. Forlani is a middle school in the suburb of Conversano, a small town located 30km from Bari in South-east Italy. The school has 30 classrooms and various laboratories, including an astronomy lab. About 250 pupils attend the school, aged from 11 to 14. Extracurricular activities include English conversation, sport, theatre, the environment and other research activities. Questions to Greg were uplinked beforehand. "What is the most ambitious spatial project for the future?"; "What do you see at the moment when you are looking outside the ISS?"; "How does it feel to be in space?"; "Is it difficult to get used to zero gravity?"; "What do you think about extraterrestrial life in the universe?"; "How many years ago did you start your career as astronaut?"; "What studies are necessary to become an astronaut?"; "Where does the electric power come from on board the ISS?"; "Was it your childhood dream to become an astronaut?"; "At what age did you discover your passion for space?"]*

As generally every day now, today starting at 9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) is running intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require

connecting & disconnecting the ITCS cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking. CDRA remains “yellow” on the ISS critical systems list.]*

Conjunction Update: Two conjunction passes with orbital debris from the Kosmos-2421 satellite are being closely monitored for tomorrow (Wednesday, 10/8), for a TCA (Time of Closest Approach) at 10:18am EDT and at 11:49am. The passes are not considered to be threat at this point. The preliminary PC (Probability of Collision) for each is zero and is expected to remain zero.

Marangoni Experiment: Today’s Marangoni experiment in the JAXA JPM, requiring a “quiet” environment, will be performed between 5:30pm and 2:00am EDT, remotely controlled from Tsukuba/Japan.

MCAS Checkout: MCC-Houston, by ground control, performed a checkout of the MCAS (Mobile Servicing System Common Attach System) in early preparation for ULF-2. Russian thrusters were inhibited during the period from 9:00am to 11:50am for the checkout, and physical exercise by the crew could not be performed during this time on unisolated equipment (i.e., RED).

Week 24/25 Scheduled Main Activities:

- Wed. (10/8): SOLO; MO-2; 16S Return stowage; CMS analyz.; Diatomeya; Water sampling; ZSR Rack prep.; MBI-12 prep./init.
- Thu. (10/9): MBI-12 dwnld.; ODNT OBT; IP-1 mnt.; ZSR-LAB1)5 relocate; ZSR NOD2D5 relocate; WRM CWC audit;
- Fri. (10/10): Progress thruster/SUDN; MO-8; MBI-12 dwld.; FFQ; ITCS MFCV adjust; RS Video MPEG config.; Water T+2 anal.; SOLO #2; CDMK check.
- Sat. (10/11): Station cleaning; PFCs; Ham radio call; SOLO #2.
- Sun. (10/12): SOLO #2; PFC; VRU disk exchange.

CEO (Crew Earth Observations) photo targets uplinked for today were **East Haruj Megafans** *(one of CEO’s terrestrial analogues for Mars, the East Haruj megafans shows ancient river courses that originated from the Tibesti Mountains. These numerous ancient river channels can be compared to similar regions on Mars. The area of interest is to the south and east of the very dark volcanic structure called Waw an Namus [Oasis of Mosquitoes]. Mapping pass with overlapping images was requested. The area of interest was to the right of the ISS orbital track),* **Mount Vesuvius** *(known for its historic eruption in 79 A.D., Vesuvius lead to the destruction of Pompeii and Herculaneum, but ironically also allowed for their preservation. Vesuvius is still considered an active volcano. It is located east of Naples and is the only volcano on the European mainland to have erupted within*

*the last 100 years. Detailed views of Vesuvius were requested. Some clouds may have been present), and **Barringer Impact Crater** (also known as Meteor crater, this approximately 50,000 year old impact crater is about 1.2 km in diameter and 170 m deep. It is located 43 miles east of Flagstaff, near Winslow, Arizona. Detailed images of this impact crater were requested).*

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this noon, 12:06pm EDT [= epoch]):

Mean altitude -- 352.9 km

Apogee height -- 355.7 km

Perigee height -- 350.2 km

Period -- 91.60 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0004082

Solar Beta Angle -- -27.8 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 48 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56623

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

10/10/08 -- Progress 30P thruster test

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Fincke, Lonchakov, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/24/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) & landing (local time!)

11/02/08 -- Progress 30P reboost; *Daylight Saving Time (DST) ends*

11/16/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC (~7:02pm EST) - U/R

11/18/08 -- STS-126/Endeavour/ULF2 docking - U/R

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

12/01/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.)

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking

02/26/09 -- STS-119/Discovery/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 10/06/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 25 of Increment 17.*

FE-2 Chamitoff had the fourth day of his first SOLO (Sodium Loading in Microgravity) session, which runs in two blocks of six days each. Today, Greg began with measurements and sampling of body mass (with SLAMMD/Space Linear Acceleration Mass Measurement Device), blood (with PCBA/Portable Clinical Blood Analyzer), and urine, to continue for two more days. *[Background: For the SOLO experiment, Chamitoff follows a special high-salt diet, for which prepared meals are provided onboard. All three daily meals are being logged on sheets stowed in the PCBA Consumable Kit in the MELFI (Minus-Eighty Laboratory Freezer for ISS) along with control solution and cartridges for the PCBA. Blood and urine samples are stowed in the MELFI. SOLO, an ESA/German experiment from the DLR Institute of Aerospace Medicine in Cologne/Germany, investigates the mechanisms of fluid and salt retention in the body during long-duration space flight. Background: The hypothesis of an increased urine flow as the main cause for body mass decrease has been questioned in several recently flown missions. Data from the US SLS1/2 missions as well as the European/Russian Euromir '94 & MIR 97 missions show that urine flow and total body fluid remain unchanged when isocaloric energy intake is achieved. However, in two astronauts during these missions the renin-angiotensin system was considerably activated while plasma ANP concentrations were decreased. Calculation of daily sodium balances during a 15-day experiment of the MIR 97 mission (by subtracting sodium excretion from sodium intake) showed an astonishing result: the astronaut retained on average 50 mmol sodium daily in space compared to balanced sodium in the control experiment. SLAMMD, performed first on Expedition 12 in December 2005, provides an accurate means of determining the on-orbit mass of humans spanning the range from the 5th percentile Japanese female and the 95th percentile American male. The procedure, in accordance with Newton's 2nd Law of Motion, finds the mass by dividing force, generated by two springs inside the SLAMMD drawer, by acceleration measured with a precise optical instrument that detects the*

position versus time trajectory of the SLAMMD guide arm and a micro controller which collects the raw data and provides the precise timing. The final computation is done via portable laptop computer with SLAMMD unique software. To calculate their mass, crewmembers wrap their legs around a leg support assembly, align the stomach against a belly pad and either rest the head or chin on a head rest. For calibration, an 18-lbs. mass is used at different lengths from the pivot point, to simulate different mass values. Crew mass range is from 90 to 240 lbs.]

CDR Volkov & FE-1 Kononenko tried on their KENTAVR suits for a fit check, supported by tagup with specialists (S-band). *[The Kentavr ("Centaur") garment (not to be confused with the Russian "Penguin" suit for spring-loaded body compression, or the "Chibis" lower body negative pressure suit) is a protective anti-g suit ensemble to facilitate the return of a long-duration crewmember into the Earth gravity. Consisting of shorts, gaiters, underpants, jersey and socks, it acts as countermeasure for circulatory disturbance, prevents crewmember from overloading during descent and increases orthostatic tolerance during post-flight adaptation. Russian crewmembers are also advised to ingest fluid-electrolyte additives, viz., three sodium chloride tablets during breakfast and after the midday meal, each time with 300 ml of fluid, and two pills during the meal aboard Soyuz before deorbit.]*

Sergey & Oleg also started their first session of the Russian MedOps MO-2 protocol which calls for 24-hour recording of their ECGs (electrocardiograms). *[For the ECG recording, Sergey & Oleg donned the five-electrode Holter harness that read their dynamic (in motion) heart function from two leads over 24 hours and record data on the Kardioregistrator 90205 unit. The crewmembers assisted each other in the harness donning (and will also do so in tomorrow's doffing).]*

The CDR set up the equipment for transferring TEKh-20 PK-3+ (Plasma Crystal-3+) experiment digital video data to the Russian BSPN Payload Server. After the transfer, the Telescience hardware was torn down for stowage. *[When operating, the PK-3+ experiment studies dust plasma crystallization processes in a vacuum chamber at specified settings of HF (high frequency) discharge power, chamber pressure, and a varied number of particles, followed by observing the melting of the structures formed earlier.]*

FE-2 Chamitoff checked out the U.S. SLM (Sound Level Meter) instrument and then used it to conduct the periodic noise level measurements program in the station interior for a 2-hr acoustic survey, including transfer of the recorded data to the MEC (Medical Equipment Computer). *[A total of 48 acoustic measurements were obtained, specifically at 13 locations in the Lab, four locations in Node-1, 11 locations in the SM, three locations in the DC1 (Docking Compartment), seven locations in the FGB and eight locations in the JPM (JEM Pressurized Module). The survey also includes two crew preference locations taken at their perceived*

loudest locations in the station. The SLM gives instantaneous noise levels and their frequency spectra, which are transferred to the MEC laptop via an RS232 cable and later downlinked with regular CHeCS (Crew Health Care Systems) data dump or via OCA.]

After setting up the Rodnik “plumbing” gear with pump, adapters and hoses, Malenchenko transferred accumulated urine from three EDV-U containers (#824, #827, #789) to the BV1 water tank. BV1 was then flushed with 5 liters of disinfectant solution, followed by disassembly and stowage of the equipment. The first urine transfer to 30P took place on 9/24. *[Each of the two spherical Rodnik tanks consists of a hard shell with a soft membrane (bladder) composed of elastic fluoroplastic. The bladder is used to expel water from the tank by compressed air pumped into the tank volume surrounding the membrane.]*

Gregory powered down PCS (Portable Computer System) laptops in COL (Columbus Orbital Laboratory), JPM and US Lab (Cupola A31p). *[Infrequently used laptops are turned off to preserve lifetime.]*

FE-1 Kononenko set up and ran a hardware test on the control unit laptop of the BIO-5/Rasteniya-2 ("Plants-2") Lada-13 greenhouse to check its hard drive for possible virus infection.

FE-2 Chamitoff performed another standard sensor calibration on the CSA-O₂ (Compound Specific Analyzer-Oxygen) units #1043 & #1059, delivered on 1J, using a new calibration adapter (#1001), brought up by 30P.

Later, Greg conducted microbiological sampling, taking surface samples with the SSK (Surface Sample Kit) for the visual microbial (bacterial & fungal) “T+5 Day” analysis. SSK samples were not taken last month due to crew time constraints. *[The sampling analysis is performed once per month for the first three months, and once every three months thereafter. Bacterial and fungal air samples are taken at two locations in each module. The colony growth on the sampling slides is analyzed after five days of incubation in four Petri dishes. For onboard visual analysis of media slides from SSK (Surface Sampling Kit), MCDs (microbial capture devices) from WMK (Water Monitoring Kit), coliform detection bags from MWAK (Microbial Water Analysis Kit), and MAS (Microbial Air Sampler) Petri dishes, the crew has a procedure for visual inspection of samples for bacterial and fungal colony growths after appropriate incubation periods.]*

Oleg conducted another run of the Russian DZZ-2 "Diatomeya" ocean observation program, using the NIKON-F5 DCS digital still camera to shoot color contrast formations and wind-induced wave anomalies (foam bands, smooth-out sections) in

sea water at specified times. *[The current DZZ-2 sessions are in support of a multi-discipline scientific expedition of the Institute of Oceanic Studies under the Russian Academy of Science, chief developer of the Diatomeya space experiment, which will be operating in the first ten days of October in the NE part of the Black Sea. Water areas with the most pronounced hydro-physical and hydro-biological characteristics are selected to be measured from the sea vessel. In good weather these water areas can be easily observed from space in colored and bright fields.]*

The CDR and FE-2 had time reserved for unpacking US cargo delivered by Progress 30P.

Volkov and Kononenko also had about two hours set aside for pre-packing return cargo to be loaded on Soyuz TMA-12/16S, based on a detailed 15-page loading list with schematics ("maps") as stowage guides for the extremely limited stowage space in the Soyuz Descent Module (SA).

Sergey performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Oleg later performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The CDR downloaded the accumulated structural dynamics data from Saturday's (10/4) Progress thruster reboost of the ISS from the IWIS RSUs (Internal Wireless Instrumentation System/Remote Sensor Units).

The two cosmonauts again had a one-hour period each to themselves for the regular crew departure preparations, working on the standard end-of-increment cleanup preparatory to their return to Earth later this month. *[It is usual for Russian crewmembers to be granted reduced workdays for making their departure preparations, as their return date approaches.]*

The crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR/2.5h, FE-1/2.5h), and RED resistive exercise device (FE-2).

Later, the CDR transfers the exercise data file to the MEC laptop for downlink,

including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~4:30am EDT, Volkov & Kononenko tagged up with ground specialists at TsUP/ Moscow via S-band to discuss their preparations for their return on 16S and expected events & experiences during their ride in the Soyuz Descent Capsule to touchdown in Kazakhstan on 10/24.

At ~12:45pm, Greg Chamitoff supported two PAO TV interviews of ~10 min each, one with the “Gil Gross” syndicated radio show on KGO Radio (Gil Gross), San Francisco, CA, the other with SPACE.COM (Tariq Malik).

At ~2:10pm, the FE-2 is also scheduled for a CDE (Crew Discretionary Event) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop).

As generally every day now, today starting at 9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) is running intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking. CDRA remains “yellow” on the ISS critical systems list.]*

Vozdukh Malfunctions: The Vozdukh CO₂ removal system has exhibited several temporary failures in the last few days, “more frequently than usual”, according to RSC-Energia. Analysis is underway.

Conjunction Advisory: Another conjunction with a piece of orbital debris is being closely monitored, for a TCA (Time of Closest Approach) on Wednesday morning (10/8), possibly requiring a DAM (Debris Avoidance Maneuver). Decision point for conducting the DAM is tomorrow morning.

Marangoni Experiment: Today’s Marangoni experiment in the JAXA JPM, requiring a “quiet” environment, will be performed between 5:30pm and 2:00am EDT, remotely controlled from Tsukuba/Japan.

Week 24/25 Scheduled Main Activities:

- Tue. (10/7): SOLO; MO-2; ITCS RFCA reconfig.; PEP R7 transition.
- Wed. (10/8): SOLO; MO-2; 16S Return stowage; CMS analyz.; Diatomeya; Water sampling; ZSR Rack prep.; MBI-12 prep./init.

- Thu. (10/9): MBI-12 dwnld.; ODNT OBT; IP-1 mnt.; ZSR-LAB1)5 relocate; ZSR NOD2D5 relocate; WRM CWC audit;
- Fri. (10/10): Progress thruster/SUDN; MO-8; MBI-12 dwld.; FFQ; ITCS MFCV adjust; RS Video MPEG config.; Water T+2 anal.; SOLO #2; CDMK check.
- Sat. (10/11): Station cleaning; PFCs; Ham radio call; SOLO #2.
- Sun. (10/12): SOLO #2; PFC; VRU disk exchange.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 6:51am EDT [= epoch]):

Mean altitude -- 353.0 km

Apogee height -- 355.8 km

Perigee height -- 350.2 km

Period -- 91.60 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0004156

Solar Beta Angle -- -23.0 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 20 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56603

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

10/10/08 -- Progress 30P thruster test

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Fincke, Lonchakov, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/24/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) & landing (local time!)

11/02/08 -- Progress 30P reboost; *Daylight Saving Time (DST) ends*

11/16/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC (~7:02pm EST) - *U/R*

11/18/08 -- STS-126/Endeavour/ULF2 docking - *U/R*

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

12/01/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.)

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 10/05/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – off-duty day for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff. Ahead: Week 25 of Increment 17.*

The two Russian crewmembers had their first preliminary training session with the Russian "Chibis" LBNP suit (lower body negative pressure; Russian: ODNT), ramping up to get them ready for returning to gravity on 10/24. Assisting each other in turn as CMO (Crew Medical Officer), the subjects were supported in their two one-hour sessions by ground specialist tagup via VHF at 5:13am (DO16) & 6:48am EDT (DO1). *[The assessment uses the Gamma-1 ECG equipment with biomed harness, skin electrodes and a blood pressure and rheoplethysmograph cuff wired to the cycle ergometer's instrumentation panels. The Chibis ODNT provides gravity-simulating stress to the body's cardiovascular/circulatory system for evaluation of Volkov's and Kononenko's orthostatic tolerance (e.g., the Gauer-Henry reflex) after several months in zero-G. The preparatory training generally consists of first imbibing 150-200 milliliters of water or juice, followed by two cycles of a sequence of progressive regimes of reduced ("negative") pressure, set today at -15, -20, -25, and -30 mmHg (Torr) for five min. each while shifting from foot to foot at 10-12 steps per minute, wearing a sphygmomanometer to measure blood pressure. The body's circulatory system interprets the pressure differential between upper and lower body as a gravity-like force pulling the blood (and other liquids) down. Chibis data and biomed cardiovascular readings are recorded. The Chibis suit (not to be confused with the Russian "Penguin" suit for spring-loaded body compression, or the "Kentavr" anti-g suit worn during reentry) is similar to the U.S. LBNP facility (not a suit) used for the first time on Skylab in 1973/74, although it appears to accomplish its purpose more quickly.]*

FE-2 Chamitoff observed the third day of his first SOLO (Sodium Loading in Microgravity) session, which runs in two blocks of six days each. Measurements and sampling of body mass, blood, and urine will begin this week. *[During this period, Chamitoff follows a special high-salt diet, for which prepared meals are*

provided onboard. All three daily meals will be logged on sheets stowed in the PCBA (Portable Clinical Blood Analyzer) Consumable Kit in the MELFI (Minus-Eighty Laboratory Freezer for ISS) along with control solution and cartridges for the PCBA. SOLO, an ESA/German experiment from the DLR Institute of Aerospace Medicine in Cologne/Germany, investigates the mechanisms of fluid and salt retention in the body during long-duration space flight. Background: The hypothesis of an increased urine flow as the main cause for body mass decrease has been questioned in several recently flown missions. Data from the US SLS1/2 missions as well as the European/Russian Euromir `94 & MIR 97 missions show that urine flow and total body fluid remain unchanged when isocaloric energy intake is achieved. However, in two astronauts during these missions the renin-angiotensin system was considerably activated while plasma ANP concentrations were decreased. Calculation of daily sodium balances during a 15-day experiment of the MIR 97 mission (by subtracting sodium excretion from sodium intake) showed an astonishing result: the astronaut retained on average 50 mmol sodium daily in space compared to balanced sodium in the control experiment.]

Gregory also had three hours reserved for his part of the regular weekly station cleaning in the USOS (US Segment) which was not scheduled yesterday alongside the RS (Russian Segment) "uborka" housecleaning by his two crewmates due to his VolSci (Voluntary Science) program with SPHERES.

Sergey Volkov performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module), including the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

SOZh maintenance by the CDR today also involved the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem, gathering weekly data on total operating time & "On" durations for reporting to TsUP-Moscow.

Gregory unstowed the Contingency Jumper Kit SODF (Systems Operation Data File) and updated it with pen & ink changes according to recent removals or installations of tools, jumpers, etc.

At ~10:20am, Dr. Chamitoff also had his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop).

The crew completed their daily physical workout program (about half of which is

used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-2, FE-1), and RED resistive exercise device (FE-2). Part of Sergey's & Oleg's exercise was accounted for by their 1-hr Chibis sessions.

As generally every day now, today starting at 9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) is running intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking. CDRA remains "yellow" on the ISS critical systems list.]*

Reboost Actuals: Yesterday's ISS reboost by Progress 30P thrusters at 6:06am EDT yielded a delta-V of 0.75 m/s (2.5 ft/s) and a mean altitude increase of 1.3 km (0.7 n.mi.), all very close to predicted values.

Week 24/25 Scheduled Main Activities:

- Mon. (10/6): SOLO; KENTAVR adjust; MO-2; PMCs; TEKh-20 (PK-3+) BSPN transfer; 30P stow; SLM Acoustic Survey; Rodnik transfer; CSA-O2 cal.; SSK sampling.
- Tue. (10/7): SOLO; MO-2; ITCS RFCA reconfig.; PEP R7 transition.
- Wed. (10/8): SOLO; MO-2; 16S Return stowage; CMS analyz.; Diatomeya; Water sampling; ZSR Rack prep.; MBI-12 prep./init.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

Significant Events Ahead (all dates Eastern Time, some changes possible.):

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Fincke, Lonchakov, Garriott)
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)
10/24/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) & landing
11/02/08 -- Progress 30P reboost; *Daylight Saving Time (DST) ends*
11/16/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC (~7:02pm EST) - U/R
11/18/08 -- STS-126/Endeavour/ULF2 docking - U/R
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
12/01/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.)

02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 10/04/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – off duty day for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff.*

The delayed **ISS reboost by Progress 30P thrusters took place this morning** at 6:06am EDT. It was deferred from 10/2 because of a post-reboost conjunction conflict. *[Station attitude control authority was handed over to Russian thruster control at 3:55am and returned to US CMGs (Control Moment Gyroscopes) at 7:45am. The purpose of the reboost was to set up phasing for the Soyuz-16/17 landing & launch. Actual performance data are not available yet. The latest projection showed one post-burn orbital debris conjunction at -1.9 km radial miss distance, which satisfied the clearing requirement of >0.75 km.]*

The crew performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the SM (Service Module) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

At ~10:00am EDT the crewmembers conducted their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-Houston and TsUP-Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

FE-2 Chamitoff checked out the SAMS ICU (Space Acceleration Measurement System/Interface Control Unit) and its PCMCIA (Portable Computer Memory Card International Adapter) memory card and associated cable as initial troubleshooting

steps. *[Efforts to complete a SAMS ghost load procedure have been delayed by the inability of the SAMS ICU laptop to communicate via FTP to the ER#4 ELC (EXPRESS Rack 4 Laptop Computer). Troubleshooting efforts to date indicate a "broken" connection between the two laptop computers. Today's check was to see whether the memory card is loose or faulty.]*

Oleg Kononenko conducted the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Gregory Chamitoff's chosen VolSci (Voluntary Weekend Science) program today was another 3.5-hour run with the payload SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellites), for which Greg set up the work area in the Lab and two PD-100 camcorders for video capture, dimmed the GLAs (General Luminaire Assemblies) and used the SSC (Station Support Computer) laptop to control the test satellites. *[The SPHERES experiment is a test bed for the development and testing of formation flying and other multi-spacecraft control algorithms. Today's session again used three satellites and five beacons on mounts, with three CO₂ (Carbon Dioxide) tanks and six battery packs, to experiment with docking, formation flight, and reconfigurations. In addition, the session added a wide range of control algorithms for maneuvers previously demonstrated using basic control laws. Modern robust control techniques are combined with path planning and formation flight algorithms to improve the performance of the system. The session also continued to obtain data for control reconfiguration after satellites dock (and their mass properties change). Per applicable Flight Rule, SPHERES operations have no CO₂ output constraints if the CDRA (CO₂ Removal Assembly) is operating in dual-bed or single-bed mode.]*

The FE-1 conducted another run of the Russian DZZ-2 "Diatomeya" ocean observation program, using the NIKON-F5 DCS digital still camera to shoot color contrast formations and wind-induced wave anomalies (foam bands, smooth-out sections) in sea water at specified times. *[The current DZZ-2 sessions are in support of a multi-discipline scientific expedition of the Institute of Oceanic Studies under the Russian Academy of Science, chief developer of the Diatomeya space experiment, which will be operating in the first ten days of October in the NE part of the Black Sea. Water areas with the most pronounced hydro-physical and hydro-biological characteristics are selected to be measured from the sea vessel. In good weather these water areas can be easily observed from space in colored and bright fields.]*

Gregory observed the second day of his first SOLO (Sodium Loading in Microgravity) session, which runs in two blocks of six days each. Measurements and sampling of body mass, blood, and urine will begin next week. *[During this period, Chamitoff follows a special high-salt diet, for which prepared meals are provided onboard. All three daily meals will be logged on sheets stowed in the PCBA (Portable Clinical Blood Analyzer) Consumable Kit in the MELFI (Minus-Eighty Laboratory Freezer for ISS) along with control solution and cartridges for the PCBA. SOLO, an ESA/German experiment from the DLR Institute of Aerospace Medicine in Cologne/Germany, investigates the mechanisms of fluid and salt retention in the body during long-duration space flight. Background: The hypothesis of an increased urine flow as the main cause for body mass decrease has been questioned in several recently flown missions. Data from the US SLS1/2 missions as well as the European/Russian Euromir '94 & MIR 97 missions show that urine flow and total body fluid remain unchanged when isocaloric energy intake is achieved. However, in two astronauts during these missions the renin-angiotensin system was considerably activated while plasma ANP concentrations were decreased. Calculation of daily sodium balances during a 15-day experiment of the MIR 97 mission (by subtracting sodium excretion from sodium intake) showed an astonishing result: the astronaut retained on average 50 mmol sodium daily in space compared to balanced sodium in the control experiment.]*

The crew completed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR/2.5h, FE-1/2.5h), and RED resistive exercise device (FE-2).

Later, the FE-1 is to transfer the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

As generally every day now, today starting at 10:05am and running until 4:05pm (timed to support Greg's SPHERES activities), the US CDRA (Carbon Dioxide Removal Assembly) is running intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking. CDRA remains "yellow" on the ISS critical systems list.]*

Week 24/25 Scheduled Main Activities:

- Sun. (10/5): PFP-ODNT OBT/trng.; SODF updating.
- Mon. (10/6): SOLO; KENTAVR adjust; MO-2; PMCs; TEKh-20 (PK-3+)

BSPN transfer; 30P stow; SLM Acoustic Survey; Rodnik transfer; CSA-O2 cal.; SSK sampling.

- Tue. (10/7): SOLO; MO-2; ITCS RFCA reconfig.; PEP R7 transition.

Weekly Science Update (*Expedition Seventeen -- Week 24*)

3-D SPACE: In progress.

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):
Measurements continue in FGB module.

ANITA (Analyzing Interferometer for Ambient Air): Continuing.

BCAT-3/4 (Binary Colloidal Alloy Test 3/4): “Greg, some of the photos you took earlier of BCAT-3 & BCAT-4 are excellent. You managed to get the focus nice and sharp revealing that four of the seven Harvard samples near the critical point are phase separated. This will help guide future operations. We are ready for operations this coming Tuesday where you will homogenize BCAT-4 samples 8, 9, 10, and 3 and then take both manual and automated EarthKAM photos of Sample 3, which will run for 6 days. Thank you very much.”

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System):
Samples returned on 1J.

CSI-2/CGBA-5 (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus 5): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): Due to safety concerns identified for the PLEGPAY instrument (when operated in Plasma Discharge mode), the entire EuTEF platform was put in survival mode on 9/1 at around 11:00am EDT (just prior to 29P undocking). Since then, the EuTEF power feeder#1 has been deactivated and no science acquisition is possible. Request has been approved for intermittent activation for 3 of the 9 EUTEF payloads. EuTEF platform power feeder#1 has been re-activated for 4-hrs periods on 9/20, 9/22, 9/24 and will continue to be re-activated every other day until safety issues are solved with the PLEGPAY instrument. This mitigates the science loss for the EXPOSE, DOSTEL and MEDET instruments only. EuTEF platform power feeder#1 has been re-activated for 4-hrs periods on 9/20, 9/22, 9/24, 9/26, 9/28, 9/30 and 10/2. This activation protocol will continue every other day until safety issues are solved with the PLEGPAY instrument. This only mitigates the science loss for the EXPOSE, DOSTEL and MEDET instruments. -- DEBIE-2: Inactive;-- DOSTEL: Inactive, part of proposed intermittent activation;-- EuTEMP: Inactive;-- EVC: Inactive;-- EXPOSE: Inactive, part of proposed intermittent activation;-- FIPEX: Inactive; -- MEDET: Inactive, part of proposed intermittent activation; -- PLEGPAY: Inactive;-- TRIBOLAB: Inactive.

FSL (Fluid Science Laboratory): FSL is nominal.

GEOFLOW: In progress.

HDTV System Test DL (JAXA): In progress.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): In progress.

Marangoni Experiment for ISS (JAXA Fluid Physics Experiment Facility): In the early morning of 9/29, the liquid bridge in the FEEF Experiment Chamber has broken. PI team is investigating the future plan, but will not require crew time for

this trouble shooting during Increment 17. The experiment itself will be continued at least until next week. Today's (10/4) Marangoni Experiment will be performed between 7:30pm EDT and 2:00am tomorrow morning.

Micro-G Clay (JAXA EPO): Complete.

MISSE (Materials ISS Experiment): Ongoing.

Moon Photography from ISS (JAXA EPO): Complete.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-1/-2 (Nitric Oxide Analyzer, ESA): Last NOA-1 session for Sergey and Oleg has been successfully performed on 9/30. NOA return items have been pre-packed for 16S return.

NUTRITION w/REPOSITORY: "Greg, thanks for your hard work in successful completion of your FD120 session! We appreciate all of the barcode information provided in crew notes. In progress."

PADLES (Passive Dosimeter for Lifescience Experiment in Space): In progress.

PCRF (Protein Crystallization Research Facility) Reconfiguration (JAXA): Complete.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SAMPLE: Complete.

SHERE (Shear History Extensional Rheology Experiment): "Congratulations, Greg, for successfully completing the final test runs for SHERE! The final two runs were successful despite the behaviour of the first run. The "snapped" fluid provided valuable information on our stability limits and showed the issue is more complex than we originally thought. We also obtained a full data file despite the computer reboot. The second run looked beautiful, and we are currently analyzing it in detail.

Thanks for all your hard work!"

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): "Greg, Thanks for completing your Actiwatch download and initialization as well as getting the Actiwatchs ready for I-18 CDR and 17S SFP. We are currently targeting the week of Oct 13 for your next week of sleep logging."

SOLAR (Solar Monitoring Observatory): Current Sun visibility window has started on 9/27. Since then the instruments have been operating nominally, with the exception of SOLACES which encountered a synchronization problem for its two micro-controllers units. Three Criss-Cross maneuvers have been successfully performed on 10/1 for the SOLSPEC instrument. SOLAR platform has also been put in safe mode on 10/2 in preparation of the 30P reboost. After the reboost postponement, SOLAR has been put back into Pointing Mode.-- SOVIM: acquiring science;-- SOLSPEC: acquiring science – science team is currently assessing the influence of the SAA crossing for their data. In their data, they noticed a higher than expected background level; -- SOLACES: instrument powered on, but since 09/30 (GMT274) no science acquisition is possible due to micro-controllers synchronization problems. Teams on ground are investigating.

SOLO (Sodium Loading in Microgravity): First SOLO session started yesterday (10/3), to consist of 2 blocks of 6 days each, ending on the 17S docking day (10/14).

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): Reserve.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): Completed.

CEO (Crew Earth Observations): Through 9/28 the ground has received a total of 7,874 frames of CEO images for review and cataloging. Photos with times corresponding to CEO target request times are reviewed first and since the last report included Tenoumer Impact Crater, Mauritania (20 frames-unconfirmed and under review); Southern Mozambique (25 frames-unconfirmed and under review); and Lake Poopo, Bolivia (24 frames-confirmed with a number of useful frames). "Your recent rare image of icy Bouvet Island in the South Atlantic Ocean will be published on NASA/GSFC's Earth Observatory website this weekend. Your crisp,

long-lens view of the world's most remote island updates and exceeds the quality of the last one acquired during Increment 2. Nice shot! Although you continue to acquire good imagery at times, most of your recent imagery is soft or seems improperly exposed. We encourage you to keep practicing with the cameras. Thank you for your continued support of our payload."

CEO photo targets uplinked for today were **Lake Nasser, Toshka Lakes, Egypt** (*Greg recently acquired a number of excellent context views of this target area located in the desert just west of the Aswan Dam and Lake Nasser. On this midday pass in clear weather he should have had a near-nadir view of the western lakes. This time he was to try for a detailed long lens view of the recent human development near the lake, i.e. agriculture, roads, canals*), **Georgia Coastal Ecosystems** (*this Long Term Ecological Research [LTER] site consists primarily of coastal wetland areas and barrier islands. On this clear to partly cloudy, early afternoon pass ISS track was offshore, with the areas of interest to the left. Trying for short-lens context views of the coastal features from just south of Brunswick to just north of Savannah, Georgia*), and **Palmerston Island reef, central South Pacific** (*this oddly shaped atoll is located in the tropical south Pacific over 2,500 miles south of the Hawaiian Islands. The lagoon is about seven miles across. As part of an international inventory and monitoring effort of the Earth coral reef resources, CEO researchers are seeking detailed, near-nadir views of the coral reef structures of this atoll system. ISS had a fine pass in mid-morning with partly cloudy skies expected. Looking just right of track*).

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this noon, 12:34pm EDT [= epoch]):
Mean altitude -- 352.9 km
Apogee height -- 358.7 km
Perigee height -- 347.0 km
Period -- 91.60 min.
Inclination (to Equator) -- 51.65 deg
Eccentricity -- 0.0008661
Solar Beta Angle -- -13.1 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.72
Mean altitude gain in the last 48 hours -- 77 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 56576

Significant Events Ahead (*all dates Eastern Time, some changes possible*):
10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Fincke, Lonchakov, Garriott)
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/24/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) & landing
11/02/08 -- Progress 30P reboost; *Daylight Saving Time (DST) ends.*
11/16/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC (~7:02pm EST) - U/R
11/18/08 -- STS-126/Endeavour/ULF2 docking - U/R
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
12/01/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.)
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 10/03/08

All ISS systems continue to function nominally, except those noted previously or below.

FE-2 Chamitoff started out in the JAXA Kibo JPM (JEM Pressurized Module) by preparing the AVCO (Air Ventilation Closeout) for the subsequent MELFI rack transfer. *[The reconfiguration consisted in removing a soft dummy panel from location A4 and relocating a hard dummy panel from the D4 bay to A4, torquing it down and fastening its ground strap to a standoff.]*

Assisted by CDR Volkov where necessary, the FE-2 then relocated the MELFI (Minus-Eighty Laboratory Freezer for ISS) rack from the US Lab (O4 bay) to the JPM (D4 bay). *[For the long-planned transfer to the Japanese Kibo, Gregory had to disconnect/reconnect umbilicals, remove fasteners, release capture mechanisms, disassemble braces, free the rack from its position, "fly" it to the JPM, install it at D4, perform post-transfer checkouts on the MELFI electronics box and PCS (Portable Computer System) laptop and reconfigure it and the rack for future use.]*

Afterwards, temporarily removed items were to be restowed and everything cleaned up. Unlike the other racks, during the transfer MELFI was on a "thermal clock", viz.: once its internal Brayton motor (for cooling) was turned off, there was an 8-hr window to get the freezer rack turned on again. If problems cropped up during the relocation (e.g., with a QD/quick disconnect) which would have exceeded the window, the crew had a back-out plan to return the rack to LAB1O4 for reconnection.]

Then, the FE-2 worked on the JPM's TCA (Thermal Control Assembly) Low Temperature Loop by repositioning its gas trap bypass valve for upcoming gas trap activities.

Also in the Kibo module, Gregory supported ongoing Marangoni Surface experimentation in the FPEF (Fluid Physics Experiment Facility), ground-

commanded from the SSIPC (Space Station Integration & Promotion Center) at Tsukuba/Japan, by activating the MMA (Microgravity Measurement Apparatus) and its laptop (MLT), first powering up the MMA's NCU/RSU (Network Control Unit/Remote Sensor Unit) set from the Ryutai rack's UDC (Utility DC-to-DC Converter), then turning on both NCU/RSU and MLT. *[Tsukuba is conducting the Marangoni experiment basically only during crew sleep (for quiescence), starting again tonight until 10/16 (except for 10/9). Crewmembers can enter Kibo during the experiment but are advised not to cause any major disturbance of the micro-G environment.]*

Later, Chamitoff updated the three copies of the SODF (Systems Operation Data File) EMER-2 emergency books from the SM (Service Module), FGB and Lab. *[The books were updated with new pages on Fire Source Locations in Lab, COL (Columbus Orbital Laboratory) and JPM.]*

In the SM, FE-1 Kononenko performed the periodic download of protocol/log files of the BRI Smart Switch Router to the RSS1 laptop for subsequent dumping to the ground via OCA, for specialists to review performance parameters, then rebooted the RRS1. *[BRI is part of the RS OpsLAN network with connections to the three SSC clients, the relatively new Ethernet tie-in with the US network, and a network printer in the RS (Russian segment).]*

Continuing the current round of the monthly preventive maintenance of RS (Russian segment) ventilation systems, Volkov performed a 1h15m inspection and cleaning of Group A ventilator fans and grilles in the SM, while Kononenko a bit later conducted ventilation system maintenance in the DC1 (Docking Compartment) by cleaning the PF1 & PF2 dust collectors in its air duct system and the protective mesh screens of the V1 & V2 ventilator fans.

Greg Chamitoff took measurements for the regular atmospheric status check for ppCO₂ (Carbon Dioxide partial pressure) in the Lab, SM at panel 449 and COL (Columbus Orbital Laboratory) plus battery ticks, using the hand-held CDMK (CO₂ Monitoring Kit, #1002). The unit was then deactivated and returned to its stowage location (LAB1S2). *[Purpose of the 5-min activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements. Measurements were 0.47% in SM, 0.47% in US Lab, 0.46% in COL.]*

The FE-2 performed the periodic (monthly) battery check and reboot of all active US PCS (Portable Computer System) and the COL PWS (Portable Workstation) laptops.

Oleg performed the routine daily servicing of the SOZh system (ECLSS,

Environment Control & Life Support Systems) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Later, Kononenko also conducted the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The CDR & FE-1 had another 4h10m scheduled between them for stowage activities on Progress M-65/30P, going by an uplinked list of items to be discarded and their stowage locations. *[30P currently also contains liquid waste (urine), pumped to water tank BV1 from 8 EDV-U containers and to BV2 from 6 EDV-Us. Solid waste is stored in 10 KTO containers, besides discarded BKO & BRPK condensate hardware, 22 food ration containers, 12 used dust collector cartridges, a replaceable SPN pump unit, and other items of trash.]*

Oleg & Sergey each had the daily one-hour period to themselves for the regular crew departure preparations, working on the standard end-of-increment cleanup preparatory to their return to Earth later this month. *[It is usual for Russian crewmembers to be granted reduced workdays for making their departure preparations, as their return date approaches.]*

The crew completed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR/2.5h, FE-1/2.5h), and RED resistive exercise device (FE-2).

Later, the FE-2 is to transfer the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Afterwards, Gregory will be starting his first SOLO (Sodium Loading in Microgravity) session, which runs for five days. *[During this period, Chamitoff follows a special high-salt diet, for which prepared meals are provided onboard. All three daily meals will be logged on sheets stowed in the PCBA (Portable Clinical Blood Analyzer) Consumable Kit in the MELFI along with control solution and cartridges for the PCBA. SOLO, an ESA/German experiment from the DLR Institute of Aerospace Medicine in Cologne/Germany, investigates the mechanisms of fluid and salt retention in the body during long-duration space flight. Background: The hypothesis of an increased urine flow as the main cause for body mass decrease*

has been questioned in several recently flown missions. Data from the US SLS1/2 missions as well as the European/Russian Euromir '94 & MIR 97 missions show that urine flow and total body fluid remain unchanged when isocaloric energy intake is achieved. However, in two astronauts during these missions the renin-angiotensin system was considerably activated while plasma ANP concentrations were decreased. Calculation of daily sodium balances during a 15-day experiment of the MIR 97 mission (by subtracting sodium excretion from sodium intake) showed an astonishing result: the astronaut retained on average 50 mmol sodium daily in space compared to balanced sodium in the control experiment.]

At ~4:15am EDT, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~4:30am, the two cosmonauts linked up with TsUP-Moscow stowage specialists via S-band to conduct the weekly IMS tagup, discussing stowage issues and equipment locations.

At ~11:00am, Sergey, Oleg and Greg supported two live PAO TV interviews with US clients,- CBS News (Bill Harwood), and KHOU-TV "Great Day, Houston" (Deborah Duncan).

At ~3:55pm, the crewmembers will convene for their standard bi-weekly teleconference with the JSC Astronaut Office (Steve Lindsey), via S-band S/G-2 audio & phone patch.

As generally every day now, today starting at ~9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) is being activated intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking. CDRA remains "yellow" on the ISS critical systems list.]*

WRM Update: An updated WRM (Water Recovery Management) "cue card" was uplinked overnight for the crew's reference, updated with yesterday's water audit. *[The new card (17-1016B) lists 29 CWCs (~962.3 L total) for the four types of water identified on board: technical water (283.2 L, for Elektron electrolysis, except for 22.2 L off-limit because of Wautersia bacteria), potable water (627.6 L, incl. 174.6 L currently on hold), condensate water (34.5 L), waste/EMU dump and other (17 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]*

New tasks currently on Greg Chamitoff's discretionary US "job jar" task list are –

- Labeling a new PMIC (Portable Microphone) & HHM (Hand-Held Microphone),
- Hard-wiring & reconfiguring the SSC-15 (Station Support Computer 15) laptop in the Kibo JPM for wireless operation via the new WAPs (Wireless Access Points), thus getting rid of the drag-through Ethernet cable (which could slow down rapid hatch closure); and
- Searching for MSG (Microgravity Science Glovebox) glove rings, then dividing them into old vs. new.

Reboost Planning: Planning for tomorrow's ISS reboost is underway, with details TBD. Attitude control authority handover to RS thrusters, for maneuvering to burn attitude and conduct the firing, is expected for 7:30am EDT, with return to US Momentum Management at ~8:30am.

Week 24 Scheduled Main Activities:

- Sat. (10/4): Station cleaning; SAMS activation; SOLO Diet monitor; ISS reboost (~7:45am EDT);
- Sun. (10/5): PFP-ODNT OBT/trng.; SODF updating.

CEO (Crew Earth Observation) photo targets uplinked for today were **Karakoram** (*this target area, NW of the Himalaya, is considered as one of the Greater Ranges of Asia. With over 60 peaks above 7,000m, it is also the most heavily glaciated area of the world outside the Polar Regions. ISS had a fair-weather pass before the start of the snow season in early afternoon sun. Looking left of track and trying for context views of this beautiful area using the short lens settings*), **Hurricane Ike Devastation** (*DYNAMIC EVENT: There is ongoing interest in views of the extent and impact of the recent devastation of the upper Texas coast by Hurricane Ike. Greg's early afternoon pass should have offered clear, oblique views of SE Texas as he tracked NE-ward over the Gulf, parallel to the coast. Using the long lens settings and looking left of track for extensive debris fields and possible coastline changes from the station's unique vantage point*), **Madrean Sky Islands** (*these ecologically diverse "islands" exist in the higher elevations of the mountain ranges of the Sonora desert of northwestern Mexico and the southwestern US. As ISS tracked NE-ward over the Baja Peninsula, Greg was to shoot right of track for oblique contextual views of this region using the short lens settings. Fair weather was anticipated*), and **Coral reefs, American Samoa** (*although much of this target area was to the right of track, Greg appeared to have an excellent late morning pass with only a few clouds. It should have provided nadir views of the islands of Western Samoa and Apia. Using the long lens settings and trying to map in detail the beautiful fringing reef structures of these islands*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:45am EDT [= epoch]):

Mean altitude -- 352.0 km

Apogee height -- 356.2 km

Perigee height -- 347.7 km

Period -- 91.58 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006307

Solar Beta Angle -- -8.2 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 73 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56558

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

10/04/08 -- ISS Reboost (~7:45am)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Fincke, Lonchakov, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/24/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) & landing

11/02/08 -- Progress 30P reboost; *Daylight Saving Time (DST) ends.*

11/16/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC (~7:02pm EST) - U/R

11/18/08 -- STS-126/Endeavour/ULF2 docking - U/R

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

12/01/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.)

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking

02/26/09 -- STS-119/Discovery/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress M-67/32P undocking & deorbit

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/25/09 -- Soyuz TMA-15/19S launch

05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at

ISS On-Orbit Status 10/02/08

All ISS systems continue to function nominally, except those noted previously or below.

FE-1 Kononenko terminated the recharge of the power packs for the BAR instruments "Kelvin-Video" and TTM-2 anemometer/thermometer for the Russian KPT-12 science payload EXPERT, then continued experiment activity, which Volkov began on 9/30, with another ~3 hr session. *[Objective of EXPERT is to measure environmental parameters (temperature, humidity, air flow rate) and module shell surface temperatures behind SM (Service Module) panels and other areas susceptible to possible micro-destruction (corrosion), before and after insolation (day vs. night). The payload uses a remote infrared thermometer (Kelvin-Video), a thermohygrometer (Iva-6A) and a heat-loss anemometer/thermometer (TTM-2) to determine environmental data in specific locations and at specific times. Activities included documentary photography with the NIKON D2X camera and flash.]*

FE-2 Chamitoff, assisted by CDR Volkov, completed the transfer of the HRF-1 (Human Research Facility 1) rack from its US Lab position P2 to the ESA Columbus module, position F4. Having made the necessary umbilical connections and switched on rack power to enable testing, the FE-2 then performed the post-move checkout, supported by the ground (POIC/Payload Operation & Integration Center), and configured the rack's PC1 laptop for later use. *[In addition, HRF-1 was set up for its use as a power source, which required utilization of a 28V power supply rather than the 120V supply to which it was previous connected. Rechecking all connections for proper seating, including the Ethernet plug-in on the back of the laptop, was to ensure two-way communication. The transfer of the MELFI rack from the Lab to the JAXA Kibo module is scheduled tomorrow. Three more racks will be relocated on 10/7.]*

Kononenko & Volkov had another 4:20h scheduled between them for stowage activities on Progress M-65/30P, going by an uplinked list of items to be discarded

and their stowage locations. *[30P currently also contains liquid waste (urine), pumped to water tank BV1 from 8 EDV-U containers and to BV2 from 6 EDV-U's.*

Solid waste is stored in 10 KTO containers, besides discarded BKO & BRPK condensate hardware, 22 food ration containers, 12 used dust collector cartridges, a replaceable SPN pump unit, and other items of trash.]

The CDR started a new round of the periodic preventive maintenance of RS (Russian Segment) ventilation systems in the FGB (Funktsionalnyi-Grusovoi Blok), first removing & replacing the filter cartridges of the PS1 & PS2 dust collectors, then cleaning the grille of the TsV1 fan.

The FE-2 completed the weekly 10-min. CWC (Contingency Water Container) inventory as part of on-going WRM (Water Recovery & Management) assessment of onboard water supplies. Updated "cue cards" based on the crew's water calldowns are sent up every other week. *[The current card (17-1016A), being updated, lists 29 CWCs (~1047.5 L total) for the four types of water identified on board: technical water (326.2 L, for flushing only because of Wautersia bacteria), potable water (647.8 L, incl. 194.8 L currently on hold), condensate water (56.5 L), waste/EMU dump and other (17 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]*

Gregory also filled out the regular FFQ (Food Frequency Questionnaire), his 14th, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

Oleg performed the routine daily servicing of the SOZh system (ECLSS, Environment Control & Life Support Systems) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Later, the FE-1 also conducted the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Working in the JAXA Kibo module, Chamitoff removed & replaced a number of recording disks (#1025, #1026, #1027, #1028, #1029) of the IPU VRU (Image Processing Unit/Video Recording Unit), then performed troubleshooting of the used VRU #4 HDD (Hard Disk Drive), checking it for bent connector pins. *[If such were found, Greg was to photograph them and notify SSIPC (Space Station Integration & Promotion Center) at Tsukuba.]*

Oleg & Sergey had another hour each to themselves for the regular crew departure preparations, working on the standard end-of-increment cleanup preparatory to their return to Earth later this month. *[It is usual for Russian crewmembers to be granted reduced workdays for making their departure preparations, as their return date approaches.]*

The crew completed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR/2.5h, FE-1/2.5h), and RED resistive exercise device (FE-2).

Later, the FE-2 will be transferring the exercise data file to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

New tasks added to Greg Chamitoff's discretionary US "job jar" are –

- Labeling a new PMIC (Portable Microphone) & HHM (Hand-Held Microphone),
- Troubleshooting the FSL VMU (Fluid Science Laboratory/Video Management Unit) in the Columbus module (only if supported by all COL-CC console personnel),
- Exchanging WAICO1 ECs (Waving & Coiling of Arabidopsis Roots at Different g-levels/Experiment Containers) on Rotor B of the BLB INC (Biolab Incubator), which requires 2-hr. prior notification of COL-CC,
- Hard-wire installing & checking out SSC-15 (Station Support Computer 15) laptop in the Kibo JPM, and
- Searching for MSG (Microgravity Science Glovebox) glove rings, then dividing them into old vs. new.

ISS Reboost Cancellation: This morning's planned ISS reboost by Progress M-65/30P was cancelled shortly before its scheduled time due to a post-reboost conjunction conflict. *[Planning of the reboost maneuver originally looked at five options, each with its respective potential for creating a conjunction with Kosmos-*

2421 satellite pieces and other debris. The five options were then narrowed down to two with the least likelihood for a conjunction (they showed ~1 km radial miss distance). Both options were acceptable as of 24h before the reboost since they stayed out of the “forbidden” box, defined by 0.75 km radial miss distance, and both were pursued. But at about 2-3 h before the maneuver, the pieces’ predicted flight paths had moved into the box, passing at ~0.71 km -- which triggered the cancellation for today. Backup date for the reboost is now 10/4 (Saturday), with all options being screened starting 48 hrs before. Significantly (fortunately), the cancellation occurred before attitude control authority was handed over to Russian MCS (Motion Control System). The purpose of the reboost is to set up orbital phasing for the 17S/16S Soyuz launch & landing. The number of conjunctions has increased in the recent past, both due to the Kosmos-2412 debris cloud and the currently unusually quiet sun with the resulting reduced atmospheric density at high altitudes causing less orbital drag, i.e., less orbit clean-up.]

Vozdukh Glitch: The Vozdukh CO₂ removal system in the RS (Russian Segment) failed this morning due to an operational “glitch” which, according to TsUP-Moscow, happens from time to time and is non-critical. The system was restarted nominally.

HRF-2 Leak Investigation: After the successful relocation of the HRF-2 rack to the Columbus module yesterday and its subsequent power-up, ground controllers noticed the water flow through the rack to be less than expected, and the rack did not pass the required vent leak check. COL-CC and payload experts are investigating and are also deferring the leak check on the HRF-1 rack, relocated today to Columbus.

MFCV Adjustment Update: The adjustment of the final MFCV (Manual Flow Control Valve), in the Lab Aft Endcone, deferred yesterday after Greg Chamitoff reported observing a spark when the Non-invasive Flow Meter touched metal ducting, will be rescheduled next week. After reviewing the Flow Meter and the BOB (Breakout Box) power unit, engineers determined that the equipment was not properly grounded. A workaround to ground the gear is under development. Lesson learned! *[Purpose of these valve adjustments is to optimize the ITCS (Internal Thermal Control System) flow throughout the USOS (US Segment) to allow for the incorporation of the Regenerative ECLSS to be launched on the ULF-2 mission.]*

Week 24 Scheduled Main Activities:

- Fri. (10/3): MELFI rack relocate & mate; CDMK chck.; BRI-RSS1 data dump; JPM Panels reconfig; RS Ventilation cleaning; 30P trash stow.
- Sat. (10/4): Station cleaning; SAMS activation; SOLO Diet monitor; ISS reboost (?);
- Sun. (10/5): PFP-ODNT OBT/trng.; SODF updating.

CEO (Crew Earth Observations) photo targets uplinked for today were **Western Pamirs** (*these remote, rugged mountains are located in north-central Tajikistan and range from 19,000 to 25,000 feet in elevation. They support ice fields feeding a number of long glaciers with handsomely banded moraine features and extensive rock glaciers evident in some valleys. ISS had a clear, nadir pass in late afternoon. Trying for a detailed mapping of one or more of the longer glacier features*), **Luquillo Forest, Puerto Rico** (*this Long Term Ecological Research [LTER] site is located on the northeastern tip of the island of Puerto Rico. On this midday pass with the target just right of track, Greg was to try simply for a few short-lens context views of the area*), and **Palmerston Island reef, central South Pacific** (*this oddly shaped atoll is located in the tropical south Pacific over 2,500 miles south of the Hawaiian Islands. The lagoon is about seven miles across. As part of an international inventory and monitoring effort of the Earth coral reef resources, CEO researchers are seeking detailed, near-nadir views of the coral reef structures of this atoll system. ISS had a near-nadir pass in late morning with partly cloudy skies expected*).

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 11:42am EDT [= epoch]):

Mean altitude -- 352.0 km

Apogee height -- 356.2 km

Perigee height -- 347.9 km

Period -- 91.58 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006225

Solar Beta Angle -- -3.2 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 88 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56544

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

10/04/08 -- ISS Reboost (under review)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Fincke, Lonchakov, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/24/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) & landing

11/02/08 -- Progress 30P reboost; *Daylight Saving Time (DST) ends.*

11/16/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC (~7:02pm EST) - U/R

11/18/08 -- STS-126/Endeavour/ULF2 docking - U/R

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
12/01/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.)
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 10/01/08

All ISS systems continue to function nominally, except those noted previously or below.

>>>Happy Golden Anniversary, NASA! Keep on trekking! <<<

As part of the crew's regular morning inspection tour, CDR Sergey Volkov conducted the routine checkup of DC1 (Docking Compartment) circuit breakers and fuses. *[The monthly checkup in the "Pirs" module looks at AZS circuit breakers on the BVP Amp Switch Panel (they should all be On) and the LEDs (light-emitting diodes) of 14 fuses in fuse panels BPP-30 & BPP-36.]*

After yesterday's preparations for today's rack relocation, FE-2 Chamitoff, assisted by the CDR, moved the HRF-2 (Human Research Facility 2) rack from its Lab position P4 to the Columbus module, position A4. Having made the necessary umbilical connections and switched on rack power, the FE-2 then performed the post-move checkout, supported by the ground (POIC/Payload Operation & Integration Center), and configured the rack's PC2 laptop for later use. .

For the two Russian crewmembers, it was time today for their first orthostatic hemodynamic endurance test session with the Russian Chibis suit in preparation for their return to gravity on 10/24, conducting the MedOps MO-4 exercise protocol in the below-the-waist reduced-pressure device (ODNT, US: LBNP/Lower Body Negative Pressure). Assisting each other in turn as CMO (Crew Medical Officer), the subjects were supported in their two one-hour sessions by ground specialist tagup via VHF at 6:38am (DO16) & 8:13am EDT (DO1). *[The Chibis provides gravity-simulating stress to the body's cardiovascular/circulatory system for evaluation of Malenchenko's orthostatic tolerance (e.g., the Gauer-Henry reflex) after 200 days in zero-G. Data output includes blood pressure readings.]*

FE-2 Chamitoff collected the periodic microbiological surface samples with the SSK (Surface Sample Kit) in the SM, Node-1 (at the location where the crew dries their clothing), US Lab and JAXA Kibo JPM (JEM Pressurized Module). *[Bacterial and fungal air samples are usually taken at two locations in the module being checked. The samples are then analyzed after 5-days of incubation. For onboard visual analysis of media slides, the crew has a procedure for visual inspection of samples for bacterial and fungal colony growths after appropriate incubation periods.]*

Gregory also unstowed the three copies of the SODF (Systems Operation Data File) Warning Book from the Lab, SM (Service Module) and FGB, to make P&I (pen & ink) updates reflecting the completion of OGA (Oxygen Generation Assembly) and OGS (Oxygen Generation System) installation.

Later, the FE-2 worked on the OGS in the Lab, reconfiguring its SPS (Secondary Power System).

Sergey Volkov conducted the periodic (about twice a month) replenishing of the Elektron's water supply for electrolysis, filling the KOV thermal loops' EDV container with purified water from CWCs (Contingency Water Containers, #1074) collected by the U.S. CCAA (Common Cabin Air Assembly) dehumidifier. *[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron micropump shutdown.]*

Today it was Greg Chamitoff's turn to undergo the monthly CMO (Crew Medical Officer) proficiency training on using HMS (Health Maintenance System) hardware including ACLS (Advanced Cardiac Life Support) equipment which may be used in contingency situations where crew life is at risk. *[To maintain proficiency, the CMOs spend one hour per month reviewing HMS and ACLS equipment and procedures via the HMS CBT (Computer Based Training) and the ACLS CBT. Maintaining proficiency with the HMS hardware and procedures is essential to successful ISS operations and well-being of the crew.]*

Oleg Kononenko set up the power packs for the BAR instruments "Kelvin-Video" and TTM-2 for charging for another operational run of the Russian KPT-12/EXPERT science payload after yesterday's session. Charging will be terminated tomorrow (10/2), and data taking will be continued in a second session. *[Objective of EXPERT is to measure environmental parameters (temperature, humidity, air flow rate) and module shell surface temperatures behind SM panels and other areas susceptible to possible micro-destruction (corrosion), before and after insolation (day vs. night). The payload uses a remote infrared thermometer (Kelvin-Video), a thermohygrometer (Iva-6A) and a heat-loss anemometer/thermometer (TTM-2) to determine environmental data in specific locations and at specific times. Activities*

include documentary photography with the NIKON D2X camera and flash.]

The Elektron electrolysis machine, turned off yesterday due to the temporary deactivation of the BITS2-12 onboard telemetry measurement system for the replacement of the BRPK separator in the SRVK-2M condensate water processor, was reactivated today at 32 amps, supported by Kononenko, who monitored the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating. *[The gas analyzer used on the Elektron during nominal operations for detecting hydrogen (H₂) in the O₂ line (which could cause overheating) is not included in the control algorithm until 10 minutes after Elektron startup.]*

As has become standard operating procedure after deactivation/reactivation of the BITS2-12 onboard measurement telemetry system and VD-SU monitoring mode, Oleg also performed a quick function verification of the relatively new SUBA Ethernet connection between the OpsLAN (Operations Local Area Network) and the BRI Smart Switch Router in the SM.

The FE-1 had 1:45h reserved for stowage activities on Progress M-65/30P, going by an uplinked list of items to be disposed and their stowage locations. *[30P currently also contains liquid waste (urine), pumped to water tank BV1 from 8 EDV-U containers and to BV2 from 6 EDV-U's. Solid waste is stored in 10 KTO containers, besides discarded BKO & BRPK condensate hardware, 22 food ration containers, 12 used dust collector cartridges, a replaceable SPN pump unit, and other items of trash.]*

Oleg & Sergey also had an hour each for the regular crew departure preparations, starting to get ready for their return to Earth later this month. *[This week they are granted reduced workdays for making their departure preparations, as is usual for Russian crewmembers.]*

The CDR conducted the routine daily servicing of the SOZh system (ECLSS, Environment Control & Life Support Systems) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The FE-1 later performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew completed their physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), and RED resistive exercise device (FE-2). For Sergey & Oleg, the MO-4 Chibis exercises replaced part of their regular workouts today.

Later, the FE-2 will transfer the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~10:05am EDT, the crew downlinked a message of greetings to an ESA/DLR space “gala” at the Sinsheim-Speyer Museum in Germany, going through the ESA Gateway via Col-CC (Columbus Control Center) in Oberpfaffenhofen. *[The privately-financed space museum at Speyer today opened its spectacular new Buran Hall to the public, exhibiting the flight test model of the Soviet space shuttle “Buran” (Blizzard), recently purchased from Russia and transported from Bahrain on a special ship. Total investment in the Buran exhibit, incl. hall: 10 million Euros. Anyone has a Soyuz capsule for sale? They’re interested.]*

SHERE Science Program: With the last two runs of the SHERE (Shear History Extensional Rheology Experiment) experiment yesterday, Greg Chamitoff has successfully completed the 20 runs desired for Increment 17. Thanks and congratulations went up to the FE-2 from the SHERE PI & engineering teams, both of which are “ecstatic over the result”. *[SHERE is designed to investigate the effect of preshearing (rotation) on the stress and strain response of a polymer fluid being stretched in microgravity.]*

MFCV Adjustments: Yesterday, after the FE-2 had successfully performed two of the three remaining MFCV (Manual Flow Control Valve) adjustments in the US Lab (at P3 & O6), the adjustment of the final valve, in the Lab Aft Endcone, had to be deferred after Chamitoff reported observing a spark when the Flow Meter touched the metal ducting in the D6-O3 location, apparently from the screws on the transducer. Engineers are investigating the anomaly. *[Purpose of these valve adjustments is to optimize the ITCS (Internal Thermal Control System) flow throughout the USOS (US Segment) to allow for the incorporation of the Regenerative ECLSS to be launched on the ULF-2 mission.]*

ISS Reboost Preview: Tomorrow’s ISS reboost by Progress M-65/30P is scheduled for a TIG (Time of Ignition) of 7:33am EDT and duration of 4min 41s, to yield an expected delta-V of 0.7 m/s (2.3 ft/s). Projected mean altitude increase is 1.2 km (0.7 n.mi.). The purpose of the reboost is to set up orbital phasing for the 17S/16S Soyuz launch & landing.

Week 24 Scheduled Main Activities:

- Thu. (10/2): Progress reboost (7:33am); HRF-1 relocate & mate; 30P trash stow; KPT-12 expmt.; RS Ventilation cleaning; WRM CWC audit.
- Fri. (10/3): MELFI rack relocate & mate; CDMK chck.; BRI-RSS1 data dump; JPM Panels reconfig; RS Ventilation cleaning; 30P trash stow.
- Sat. (10/4): Station cleaning; SAMS activation; SOLO Diet monitor.
- Sun. (10/5): PFP-ODNT OBT/trng.; SODF updating

CEO (Crew Earth Observations) photo targets uplinked for today were **Vredefort Impact Crater, South Africa** (*Vredefort is the largest confirmed impact crater that has been discovered on Earth so far. The original size of this ancient crater [approximately 2 billion years] is believed to have been 250 km in diameter. While Greg has already taken excellent detail images of the Vredefort structure, researchers now asked him to take context views of the entire crater with the 50 mm lens. Weather satellites suggested that clouds should not obscure the view*), **South Tibesti Megafans, Chad** (*these subtle, ancient erosional features in the Sahara are located between Lake Chad to the south and closer to the southern flank of the rugged Tibesti Mountains to the north. Requested were short-lens oblique views of the region for use later to help pinpoint areas for more detailed shots. After crossing to the W of Lake Chad, Greg was to begin shooting broad mapping views of the area to the right of track until ISS reached the mountains*), **Post-Ike Survey, Upper Texas Coast** (*Dynamic Event: This is the first time that the ISS orbit allowed for context views of the upper Texas coast after the passage of Hurricane Ike. Looking left of track towards the coast. CEO researchers received numerous requests through PAO for post-Ike imagery. Greg's context views of the upper coast using the 800 mm lens may allow for comparisons of shoreline erosion to pre-Ike imagery. The imagery can also complement satellite images that have also been requested. With the passage of a cold front it was hoped that clouds were not a factor. Image taking was to be continued over the Mississippi delta so that post-Hurricane Gustav coastal changes were documented as well*), and **Sevilleta Wildlife Area, New Mexico** (*this wildlife area is also designated as a Long Term Ecological Research [LTER] site. It is primarily situated near either side of the Rio Grande River in central New Mexico. Detailed, mapping views along the orbit track were requested*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 7:56am EDT [= epoch]):

Mean altitude -- 352.1 km

Apogee height -- 356.4 km

Perigee height -- 347.9 km

Period -- 91.58 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0006331
Solar Beta Angle -- 1.7 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.72
Mean altitude loss in the last 48 hours -- 67 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 56525

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

10/02/08 -- ISS Reboost (~0.7 m/s; 7:33am EDT)
10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Fincke, Lonchakov, Garriott)
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)
10/24/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) & landing
11/02/08 -- Progress 30P reboost; *Daylight Saving Time (DST) ends.*
11/16/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC (~7:02pm EST) - *U/R*
11/18/08 -- STS-126/Endeavour/ULF2 docking - *U/R*
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
12/01/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.)
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 09/30/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Volkov, FE-1 Kononenko and FE-2 Chamitoff began their workday before breakfast with the periodic session of the Russian biomedical routine assessments PZEH-MO-7/Calf Volume Measurement. *[Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference points, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures.]*

The CDR serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out"-to-vacuum cycle on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated tonight at ~4:15pm EDT. Filter bed #1 was regenerated yesterday. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently to remove any lingering Freon-218 from the cabin atmosphere (last time: 9/22 & 9/23).]*

For the Russian KPT-12 science payload EXPERT, the CDR terminated charging of the power packs for the BAR instruments "Kelvin-Video" and TTM-2 anemometer/thermometer, then conducted the experiment for the next 2.5 hrs. *[Objective of EXPERT is to measure environmental parameters (temperature, humidity, air flow rate) and module shell surface temperatures behind SM (Service Module) panels and other areas susceptible to possible corrosion, before and after insolation (day vs. night). The payload uses a remote infrared thermometer (Kelvin-Video), a thermohygrometer (Iva-6A) and a heat-loss anemometer/thermometer (TTM-2) to determine environmental data in specific locations and at specific times. Activities included documentary photography with the NIKON D2X camera and flash.]*

Afterwards, Volkov & Kononenko completed a session with the ESA experiment

NOA1 (Nitric Oxide Analyzer, MBI-21), Sergey's fifth, Oleg's fourth, filling in the electronic log book on the RSE1 laptop for downlink and restowing the hardware. During the session, each subject took two NO (Nitric Oxide) measurements in exhaled air. *[Purpose of the ESANO1 experiment, consisting of the "Platon" analyzer and its power supply, is to monitor expired NO in the subject's exhaled air to detect signs of airway inflammation and indications of venous gas emboli (bubbles) that may be caused by inhalation of pollutants in the closed environment of the ISS cabin and increased risk of decompression sickness.]*

The FE-1 performed CSA-CP (Compound Specific Analyzer-Combustion Products) maintenance, first replacing the battery of the four units (#1382 being prime), then conducting the usual zero-calibration. *[The sampling pumps used for the checkout measurements and the backup CSA-CPs were returned to their Node-1 and -2 locations.]*

In preparation for the planned relocations of the HRF (Human Research Facility) racks tomorrow (10/1) & 10/2 from the US Lab to the ESA COL (Columbus Orbital Laboratory), Gregory Chamitoff cleared stowage items from the rack fronts at the Lab S2 & P4 locations and from the empty rack bays F4 & A4 in COL, the new locations for HRF-1 & -2. *[Preparations included removing any protruding items from the 50in x 72in. translation path needed for the rack transfer. Cables were to be temporarily rerouted as necessary, and stowage items will be returned after the rack move.]*

Chamitoff also completed the periodic relocation of the TEPC (Tissue Equivalent Proportional Counter) detector assembly, the primary radiation measurement tool in the ISS, from the JAXA JPM (JEM Pressurized Module) 1A5 location to the SM (panel 338). *[The FE-2 also photo-documented the current state of the TEPC power/data cable which he had covered with fresh Kapton tape on 8/24 to contain any FOD (Foreign Object/Debris). TEPC had been relocated to the JPM by Greg on 8/24.]*

Afterwards, Gregory disassembled still remaining BCAT-3 (Binary Colloidal Alloy Test-3) payload equipment and stowed the hardware.

In the JAXA Kibo laboratory, the FE-2 powered off the MMA (Microgravity Measurement Apparatus) and its laptop (MLT), by first deactivating the MMA's NCU/RSU (Network Control Unit/Remote Sensor Unit), powered since 9/25 from the Ryutai rack's UDC (Utility DC-to-DC Converter) unit.

In the Soyuz TMA-12/16S crew return vehicle, Sergey, Oleg and Greg conducted once again the standard 30-min. fit check of the Kazbek couches, the contoured shock absorbing seats in the Descent Module (SA) of the spacecraft docked at the

DC1 Docking Compartment. (Last time done: 6/24). *[For the fit check, crew members remove their cabin suits and don Sokol KV-2 suit and comm caps, get into in their seats and assess the degree of comfort & uniform body support provided by the seat liner. Using a ruler, they then measure the gap between the top of the head and the top edge of the structure facing the head crown. The results are reported to TsUP-Moscow. Kazbek-UM couches are designed to withstand g-loads during launch and orbital insertion as well as during reentry and brake-rocket-assisted landing. Each seat has two positions: cocked (armed) and noncocked. In cocked position, they are raised to allow the shock absorbers to function during touchdown. The fit check assures that the crewmembers, whose bodies gain in length during longer-term stay in zero-G, will still be adequately protected by the seat liners for their touchdown in Kazakhstan, either emergency or regular return.]*

Volkov performed regular maintenance on the SRVK-2M condensate water processor, replacing one of the two BRPK separators with a new spare. The old unit was discarded as trash.

The CDR also transferred US condensate, generated by the Lab CCAA (Common Cabin Air Assembly) dehumidifier and collected in a CWC (Contingency Water Container, #1070), to a Russian EDV container, while monitoring the time it took for the pump to fill the latter (in order to evaluate the performance of the US filter used).

Gregory worked on completing the ITCS MFCV (Internal Thermal Control System/ Manual Flow Control Valve) adjustments in the US Lab, using the Non-intrusive Flow Meter powered from the Shuttle BOB (Breakout Box), instead of batteries.

[After adjusting the MFCVs in the Lab Forward End/cone and behind the O3 rack yesterday, Greg today dealt with the MFCVs at the P3, O6 & S6 rack locations (for which the racks were rotated out of the way yesterday. Later, BOB was torn down and stowed again. The MFCV adjustments in the Lab are in preparation for the future Regenerative ECLSS (Environment Control & Life Support System).]

Sergey Volkov undertook his monthly CMO (Crew Medical Officer) proficiency training on using HMS (Health Maintenance System) hardware including ACLS (Advanced Cardiac Life Support) equipment which may be used in contingency situations where crew life is at risk. *[To maintain proficiency, the CMOs spend one hour per month reviewing HMS and ACLS equipment and procedures via the HMS CBT, and CBT (Computer Based Training (CBT) and the ACLS CBT. Maintaining proficiency with the HMS hardware and procedures is essential to successful ISS operations and well-being of the crew.]*

In preparation for the Progress 30P reboost on 10/2 (Thursday), the CDR set up

and configured the IWIS RSUs (Internal Wireless Instrumentation System Remote Sensor Units) in the Lab, Node-1, Node-2, FGB (#1035) and SM (#1028), then programmed the timing of the IWIS ICU (Interface Control Unit) for the automated activation on 10/2 (start time 6:20am EDT). *[IWIS will monitor dynamic/vibrational responses of the ISS structure during the reboost thrusting, measured by RSUs which transmit their measurements via radio to the central NCU (Network Control Unit). Structural vibrational data will also be taken by the SDMS (Structural Dynamic Measurement System).]*

Oleg meanwhile conducted the routine daily servicing of the SOZh system (ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Later, Sergey performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

With the SHERE (Shear History Extensional Rheology Experiment) science program almost finished for his Increment, Greg Chamitoff had volunteered for another VolSci (Voluntary Science) activity today to complete the last two remaining SHERE test points, for which he –

- Activated the MSG (Microgravity Science Glovebox) from the A31p laptop,
- Powered on the SHERE hardware,
- Accessed the CGBA (Commercial Generic Bioprocessing Apparatus) to install the SHERE FM (Fluid Module) #20;
- Supported the first SHERE experiment run (Test Point 14);
- Transferred the module with the fluid sample,
- Installed FM #16 for the second experiment run (Test Point 15);
- Removed the FM from the CGBA, followed by SHERE data transfer;
- Turned off the SHERE/CGBA equipment;
- Transferred the data files to the MSG laptop for subsequent downlink, and
- Powered down the MSG.

[Background: Rheology is the study of the deformation and flow of matter under the influence of an applied stress (“preshearing” = rotation) which might be, for example, a shear stress or extensional stress. In practice, rheology is principally concerned with extending the “classical” disciplines of elasticity and (Newtonian) fluid mechanics to materials whose mechanical behavior cannot be described with the classical theories. SHERE is designed to study the effect of preshear (rotation) on the transient evolution of the microstructure and viscoelastic tensile stresses for solutions with long chains of monodisperse dilute polymer molecules in the MSG. Collectively referred to as “Boger fluids,” these polymer solutions have become a

popular choice for rheological studies of non-Newtonian fluids and are the non-Newtonian fluid used in this experiment. The SHERE hardware consists of the Rheometer, Camera Arm, Interface Box, Cabling, Keyboard, Tool Box, Fluid Modules, and Stowage Tray.]

Chamitoff completed another one of the periodic inspections of the RED (Resistive Exercise Device) canister cords and accessories, currently done every two weeks.

Later today, the FE-2 is scheduled to take down and stow the UOP DCP (Utility Outlet Panel/Display & Control Panel) bypass power cable to the VTR (Video Tape Recorder) at the Lab CUP RWS (Cupola Robotics Work Station).

Also late tonight, Gregory will retrieve and stow the four passive FMK (Formaldehyde Monitoring Kit) sampling assemblies deployed by him on 9/28 in the Lab (at P3, below CEVIS) and SM (at the most forward handrail, on panel 307), to catch any atmospheric formaldehyde on a collector substrate for subsequent analysis on the ground. *[Two monitors each are usually attached side by side, preferably in an orientation with their faces perpendicular to the direction of air flow.]*

The crew completed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), and RED resistive exercise device (CDR, FE-1, FE-2).

Later, Volkov will transfer the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

The crew had their regular PMCs (Private Medical Conferences), via S-band/audio & Ku-band/video, Sergey at ~10:10am, Oleg at ~10:25am, Greg at ~2:40pm.

COL False Fire Alarm: Yesterday, a smoke detector (SD1) in the Columbus module erroneously annunciated an emergency, probably triggered by some dust particles floating close to the sensor. Since no controlled air flow was in place at the time (due to an ongoing air loop characterization test), the SD1 reading was not reliable, and a False Fire alarm was declared. SD readings went back to nominal after 10 seconds, and no further suspect behavior was detected afterwards.

VolSci Program Preview: For the weekend ahead (10/4-5), Greg Chamitoff was offered three choices for the Voluntary Weekend Science program: (1) an operations improvement session with SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellites) with all three satellites; (2) a LOCAD-

PTS (Lab-On-A-Chip Application Development – Portable Test System) surface sampling session in COL using Glucan LAL cartridges, targeting fungus on ISS surfaces; and (3) an EPO (Education Payload Operations) session with “Buzz Lightyear”, to shoot a video of the Buzz Lightyear doll demonstrating working aspects of working and living in the space environment by showing how micro-G affects familiar objects and activities.

Week 24 Scheduled Main Activities:

- Wed. (10/1): HRF-2 relocate & mate; 30P trash stow; MO-4; SODF updates; REGUL-Paket reconfig.; Crew Departure preps.; OGS Power reconfig.
- Thu. (10/2): Progress reboost; HRF-1 relocate & mate; 30P trash stow; KPT-12 expmt.; RS Ventilation cleaning; WRM CWC audit.
- Fri. (10/3): MELFI rack relocate & mate; CDMK chck.; BRI-RSS1 data dump; JPM Panels reconfig; RS Ventilation cleaning; 30P trash stow.
- Sat. (10/4): Station cleaning; SAMS activation; SOLO Diet monitor.
- Sun. (10/5): PFP-ODNT OBT/trng.; SODF updating

CEO (Crew Earth Observations) photo targets uplinked for today were **Yellow River Delta** (*“The Mother River” of China empties into the Bohai Sea on the northeastern coast. The dynamic nature of the river’s delta is the focus of interest for this target. As ISS approached it from the SW in mid-afternoon light, Greg should have had a nadir pass in fair weather. Trying to acquire a seasonal, low water view of the delta*), **Lake Nasser, Toshka Lakes, Egypt** (Greg recently acquired a number of excellent context views of this target area located in the desert just west of the Aswan Dam and Lake Nasser. On this early-afternoon pass in clear weather he should have had a nadir view. This time trying for a detailed long lens view of the recent human development near the lake, i.e. agriculture, roads, canals), **Red River Basin, TX** (CEO researchers are continuing to document and monitor land use patterns and change in this still largely agricultural area. Greg’s pass was in mid-afternoon sun and fair weather. Since most of the area is left of track, researchers requested a short-lens contextual mapping from W to E as ISS approached and crossed from the SW), and **Santa Barbara Coast, California** (this Long-term Ecological Research site [LTER] is located on the southern California coast NW of the Los Angeles area. On this mid-afternoon pass in fair weather, Greg was to look just left of track and attempt a detailed mapping strip of the Santa Inez River valley from Lompoc to Lake Cachuma).

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 4:54am EDT [= epoch]):

Mean altitude -- 352.2 km

Apogee height -- 356.5 km

Perigee height -- 347.9 km

Period -- 91.58 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.000634

Solar Beta Angle -- 6.7 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 74 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56508

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

10/01/08 -- **NASA 50 Years**

10/02/08 -- ISS Reboost (~1.8 m/s; 6:25am EDT)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Fincke, Lonchakov, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/24/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) & landing

11/02/08 -- Progress 30P reboost; *Daylight Saving Time (DST) ends.*

11/16/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC (~7:02pm EST) - *U/R*

11/18/08 -- STS-126/Endeavour/ULF2 docking - *U/R*

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

12/01/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.)

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking

02/26/09 -- STS-119/Discovery/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress M-67/32P undocking & deorbit

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/25/09 -- Soyuz TMA-15/19S launch

05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**

07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation

10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 09/29/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 24 of Increment 17.*

At 9:31am EDT, the ATV (Automated Transfer Vehicle) "Jules Verne" entered the atmosphere at an altitude of 120 km, breaking up at ~75 km and splashing into the Pacific Ocean about 12 minutes later.

FE-2 Chamitoff ended his fifth run (FD120) with the NASA/JSC experiment NUTRITION w/Repository by collecting a final urine sample upon wakeup for storage in the MELFI (Minus-Eighty Laboratory Freezer for ISS). The sampling kit was then stowed away. His next NUTRITION activity will be the FD180 session.

[The current NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]

CDR Volkov performed the periodic maintenance of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The process will be terminated at ~4:15pm EDT and Bed #2 regeneration performed tomorrow. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently (last time: 9/16 & 9/17).]*

Volkov also had ~90 min set aside for the periodic equipment servicing in the SM's ASU toilet facility, changing out replaceable parts with new components, e.g., a filter

insert (F-V), the pretreat container (E-K), and the E-K's hose. All old parts were discarded as trash. *[E-K contains five liters of pre-treat solution, i.e., a mix of H_2SO_4 (sulfuric acid), CrO_3 (chromium oxide, for oxidation and purple color), and H_2O (water). The pre-treat liquid is mixed with water in a dispenser (DKiV) and used for toilet flushing.]*

FE-1 Kononenko performed IFM (Inflight Maintenance) and functionality checks on the Russian VELO cycle ergometer (VB-3), replacing parts of the cycle's generator and reassembling the exercise device's generator unit with its noise-suppressing rubber-metal bushings, then configuring it for operation.

FE-2 Chamitoff set up the video equipment in the Japanese JPM (JEM Pressurized Module) and later recorded some footage for JAXA.

Continuing the extended leak checking of the spare BZh Liquid Unit (#056) for the Elektron O_2 generator, Oleg Kononenko charged the unit once again with pressurized N_2 from the BPA Nitrogen Purge Unit (#23) to 1 atm (1 kg/cm²). The last test pressurization to monitor for leakage was on 7/20. *[Objective of the checkout of the BZh, which has been in stowage for almost 2 years, was to check for leakage and good water passage through the feed line inside of the BZh (from ZL1 connector to the buffer tank) and to check the response of the Electronics Unit's micro switches (signaling "Buffer Tank is Empty" & "Buffer Tank is Full". During Elektron operation, the inert gas locked up in the BZh has the purpose to prevent dangerous O_2/H_2 mixing. A leaking BZh cannot be used.]*

In preparation for brief Progress thruster firings at ~9:20am EDT, Chamitoff closed the protective shutters of the science window in the JAXA JPM and U.S. Lab.

[The firings were in support of the ATV "Jules Verne" viewing activity with the Russian GFI-1 Relaksatsiya equipment. For the experiment, ISS attitude control authority was handed over to Russian MCS (Motion Control System) at 9:10am and returned to US Momentum Management at ~10:10am. The Lab window could then be re-opened two orbits later, at ~1:10pm.]

The FE-1 set up the Fialka-MV-KOSMOS hardware of the GFI-1 RELAXATION experiment hardware at SM window #9 and used its UV (ultraviolet) camera and spectrometer, controlled from Laptop 3, to record relaxation process imagery & plasma spectra of the ATV's fiery entry in the Earth's atmosphere at 9:31am EDT. Afterwards, Oleg tore down and stowed the hardware. *[The return of ESA's first logistics vehicle began with a deorbit burn of 70 m/s delta-V at 8:58am. ATV1 breakup started at an altitude of about 75 km, with the remaining fragments splashing into the Pacific Ocean some 12 min later.]*

After clearing the rotation paths of four racks (D1, P3, O6, S6) in the US Lab and configuring the settings (viscosity readings) of the Non-intrusive Flow Meter, Gregory Chamitoff worked on adjusting the ITCS MFCVs (Internal Thermal Control System/Manual Flow Control Valves) in the Lab Forward Endcone and behind the P3 and O3 racks. *[The MFCV adjustments in the Lab with the battery-driven non-intrusive Flow Meter are in preparation for the future Regenerative ECLSS (Environment Control & Life Support System). Working in the Fwd Endcone required partial-to-full rotation of the D1 rack and removal of the OGS WDS (Oxygen Generation System/Water Delivery System), D1 SD (Smoke Detector) and demating of ISL (Integrated Station OpsLAN) Ethernet cabling. For accessing the MFCV behind the rotated P3 rack required removal of the CEVIS, and for getting behind the rotated O6 rack, Greg had to remove stowage from the Bay 6 area.]*

Sergey Volkov performed the periodic inspection & cleaning of the FDS (Fire Detection & Suppression) system's bacteria filters and SDs (smoke detectors) in the US Airlock (one SD), Node-1 (2 SDs) and Lab (2 SDs). After removing the closeouts in Node-2 (2 SDs) for the cleaning, the CDR removed SD #2 and replaced it with a new spare, taking documentary photography of the SD connectors afterwards.

After temporarily turning off the SRVK-2M Condensate Processor behind panel 436 in the SM, Oleg installed a "residue-trap" insert in the condensate hose upstream of the Processor's inlet. *[Purpose: to collect and provide visual monitoring of sediments brought in with the condensate from the BRPK-1/2 (Condensate Separator & Pumping Unit), downstream from the BKO Multifiltration Unit and the BKV Water Conditioning Unit (which treats the condensate water with salts for taste and silver ions for preservation).]*

Afterwards, Kononenko took the periodic readings of potentially harmful atmospheric contaminants in the SM, using the CMS (Countermeasure System), a component of the SKDS GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, today using preprogrammed microchips to measure for Isopropanol ("rubbing alcohol", C_3H_8O), Methanol ("wood alcohol", CH_3OH) and Toluene (methylbenzene, C_7H_8).

The FE-1 completed the periodic collection of air samples in the SM & FGB using the AK-1M sampler kit, recording date, time & location. A second sample for Freon-210 was taken in the SM with the AK-1M-F. Kits and pouches were then restowed.

Kononenko also conducted the periodic atmospheric sampling in the center of the Lab, SM and COL (Columbus Orbital Laboratory) with the U.S. GSC (Grab Sample

Container), using GSCs #1038, #1011, and one 30P-delivered GSC.

Additionally, Oleg performed the periodic checkout/verification of IP-1 airflow sensors in the various RS (Russian Segment) hatchways, including the passageways SM PrK (Transfer Compartment) – RO (SM Working Compartment), PkhO (SM Transfer Tunnel) – RO, PkhO – DC1, PkhO – FGB PGO, FGB PGO – FGB GA, and FGB GA–Node-1.

The CDR meanwhile conducted the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Sergey also took care of the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew completed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR/2.5h, FE-1/2.5h), and RED resistive exercise device (FE-2).

Later, Volkov will transfer the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Sergey set up the TTM-2 and “Kelvin-Video” batteries for charging for another operational run of the Russian KPT-2 “Expert” science payload BAR-RM. Charging will be terminated tomorrow (9/30), followed by closeout ops and re-stowing. *[Payload objective is to experiment with ISS leak detection based on environmental data anomalies (temperature, humidity, and ultrasound emissions) at leak locations. The payload uses a remote infrared thermometer (Kelvin-Video), a thermohygrometer (Iva-6A), a heat-loss anemometer/thermometer (TTM-2), an ultrasound analyzer (AU-01), and a leak detector (UT2-03) to determine physical background signs of loss of ISS pressure integrity which could be indicative of leaks in the working compartments of the station. Measurements are to be taken in specific zones (13 in SM PkhO and 4 in DC1), both with lights & fans turned on and off.]*

Week 24 Scheduled Main Activities:

- Tue. (9/30): MO-7; BMP ch.2 regen; TEPC relocate; NOA1 exp.; RED inspect.; IWIS reprog.; Node-1 RFCA Flowmeter test, ITCS MTL (MFCV) adjust, A/L MTL Flowmeter meas.; FMK stow; Kazbek fit checks; crew dep. preps.
- Wed. (10/1): HRF-2 relocate & mate; 30P trash stow; MO-4; SODF updates; REGUL-Paket reconfig.; Crew Departure preps.; OGS Power reconfig.
- Thu. (10/2): HRF-1 relocate & mate; 30P trash stow; KPT-12 expmt.; RS Ventilation cleaning; WRM CWC audit.
- Fri. (10/3): MELFI rack relocate & mate; CDMK chck.; BRI-RSS1 data dump; JPM Panels reconfig; RS Ventilation cleaning; 30P trash stow.
- Sat. (10/4): Station cleaning; SAMS activation; SOLO Diet monitor.
- Sun. (10/5): PFP-ODNT OBT/trng.; SODF updating

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 6:02am EDT [= epoch]):

Mean altitude -- 352.3 km

Apogee height -- 356.6 km

Perigee height -- 348.0 km

Period -- 91.58 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.000643

Solar Beta Angle -- 11.5 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 70 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56493

ISS On-Orbit Status 09/28/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – off-duty day for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff. Ahead: Week 24 of Increment 17.*

Gregory Chamitoff started out on Part 2 of his FD120 (Flight Day 120) session with the NASA/JSC experiment NUTRITION w/Repository. This is an all-day session, the fifth for Greg, of collecting urine samples several times for 24 hrs through first void tomorrow morning, labeling each sample and storing it in the MELFI (Minus Eighty Degree Laboratory Freezer for the ISS), Dewar 1 Tray B/Section 1. *[The NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by supercold MELFI dewars), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

Chamitoff also had three hours reserved for his part of the regular weekly station cleaning in the USOS (US Segment) which was not scheduled yesterday alongside the RS (Russian Segment) “uborka” housecleaning by his two crewmates due to his VolSci (Voluntary Science) program.

Sergey Volkov conducted the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module), including the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The FE-2 performed the periodic deployment of four passive FMK (Formaldehyde Monitoring Kit) sampling assemblies in the Lab (at P3, below CEVIS) and SM (at the most forward handrail, on panel 307) for two days, to catch any atmospheric formaldehyde on a collector substrate for subsequent analysis on the ground.

[Two monitors each are usually attached side by side, preferably in an orientation with their faces perpendicular to the direction of air flow.]

Working off his discretionary "as time permits" task list, FE-1 Kononenko gathered and prepared the Fialka-MV-KOSMOS science hardware, including starting recharging the SONY DCR TRV-900E camcorder battery, for tomorrow's GFI-1 recording of images and spectra of the ATV "Jules Verne" reentry. *[The experiment uses the onboard "Relaksatsiya" ("relaxation") equipment with its Fialka-MV-Kosmos multispectral hardware (spectrometer, video camera plus Laptop 3 software) to observe the plasma glow and its spectra created by the ATV on its high-speed interaction with the Earth atmosphere.]*

At ~10:15am EDT, Greg Chamitoff had his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop).

The crew completed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS (Treadmill with Vibration Isolation & Stabilization) with vibration isolation (CDR/2.5h, FE-1/2.5h, FE-2), and RED resistive exercise device (FE-2).

Before starting his exercise session, Gregory set up the video equipment for filming his subsequent workout on the treadmill for biomechanical evaluation of his performance and assessment of the hardware status by ground engineers. Afterwards, the camera gear was torn down and stowed. *[This was part of Greg's 60-90 day requirement. Sergey & Oleg have already completed their requirements.]*

A second item on the discretionary task list for Oleg was another run of the Russian DZZ-2 "Diatomeya" ocean observations program, using the NIKON-F5 DCS still camera and the HDV (high-definition) video camcorder from SM window 8 for ~20 min to record high production water areas for obtaining data on color field composition in dynamic regions of the ocean and in near-estuary areas of large rivers, plus the current cloud cover above these waters, its rating, and special forms of cloud formation (this was the last day for using film in the NIKON, to be replaced by digital photography in future sessions). *[Target zones today in the Atlantic Ocean were the Magellan Strait to the coastal area of Angola as well as the coastal zone of Brazil and Mauritania, in the Pacific Ocean the area west of New Zealand to the upwelling area of Peru.]*

Also off the Russian suggestions list, Kononenko performed a session of the Russian GFI-8 "Uragan" (hurricane) earth-imaging program, using the D2X to take telephotos. *[Uplinked target zones were the glaciers of the Southern Andes and the Laganaki Plateau, the site of future Olympic Games.]*

As generally every day now, today starting at 9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) is activated intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking. CDRA remains "yellow" on the ISS critical systems list.]*

Conjunction Update: Latest tracking data for Object 87055, a piece of debris from the Kosmos-2421 satellite, indicate that its pass tomorrow at ~5:04am EDT will be of no concern (miss ~42.5 km). MCC-H specialists are continuing to monitor.

Week 24 Scheduled Main Activities:

- Mon. (9/29): NUTRITION; BMP ch.1 regen; VELO maint.; ASU toilet replmnts; Elektron maint.; MFCV valve adjustments; Node-2, A/L, Lab SD/BF maint.; GFI-1/Relax. exp. (ATV1 reentry); air sampling (CMS, GSC, AK-1M); IP-1 inspect.; KPT/BAR-RM power charge.
- Tue, (9/30): MO-7; BMP ch.2 regen; TEPC relocate; NOA1 exp.; RED inspect.; IWIS reprog.; Node-1 RFCA Flowmeter test, ITCS MTL (MFCV) adjust, A/L MTL Flowmeter meas.; FMK stow; Kazbek fit checks; crew dep. preps.

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 5:37am EDT [= epoch]):

Mean altitude -- 352.4 km

Apogee height -- 356.8 km

Perigee height -- 347.9 km

Period -- 91.59 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006581

Solar Beta Angle -- 16.4 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 80 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56477

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/29/08 -- ATV de-orbit (nighttime re-entry for observation from 2 NASA aircraft; ~9:12pm)
10/01/08 -- **NASA 50 Years** (official)
10/02/08 -- ISS Reboost (~1.8 m/s)
10/14/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
12:33am
10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)
10/24/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) & landing
11/02/08 -- Progress 30P reboost
11/16/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC (~7:02pm EST)
11/18/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
12/01/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.)
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at

http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 09/27/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – light duty day for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff. Congratulations to Taikonaut Zhai Zhigang for spending ~20 minutes outside the Shenzhou-7 spacecraft on the first Chinese spacewalk today (see picture below)!*

The crew performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the SM (Service Module) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

Afterwards, Volkov temporarily powered down the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem for the periodic cleaning of its pre-filter, using the vacuum cleaner with narrow-slit nozzle attachment.

At ~10:00am EDT the crewmembers conducted their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-Houston and TsUP-Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

FE-2 Chamitoff conducted Part 1 of his Flight Day 120 session (his fifth) with the NASA/JSC experiment NUTRITION w/Repository, for blood collection only, for which he had to forego exercising and food intake since yesterday for eight hours. Later today, the FE-2 will set up the equipment for the 24-hour urine collections which start with the first void early tomorrow morning. Volkov & Kononenko assisted. *[After the CDR performed the phlebotomy, i.e., drawing Greg's blood samples (from an arm vein), with the FE-1 taking photographs, the samples were first allowed to coagulate in the Repository for 20-30 minutes, then spun in the HRF RC (Human Research Facility/Refrigerated Centrifuge) and finally placed in MELFI (Minus-Eighty Laboratory Freezer for ISS). No*

thruster activity was allowed during the blood drawing. The RC was later powered off after a temperature reset to limit wear on the compressor, and cleaned. The NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by supercold MELFI dewars), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]

Oleg Kononenko conducted the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Gregory Chamitoff's chosen VolSci (Voluntary Weekend Science) program today involved a 3.5-hour run with the payload SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellites), for which Greg set up the work area in the Lab and two PD-100 camcorders for video capture, dimmed the GLAs (General Luminaire Assemblies) and used the SSC (Station Support Computer) laptop to control the test satellites. *[The SPHERES experiment is a test bed for the development and testing of formation flying and other multi-spacecraft control algorithms. Today's session (Session 13) concentrated on three satellites and five beacons on mounts, with three CO₂ (Carbon Dioxide) tanks and six battery packs, to experiment with docking, formation flight, and reconfigurations. In addition, the session added a wide range of control algorithms for maneuvers previously demonstrated using basic control laws. Modern robust control techniques are combined with path planning and formation flight algorithms to improve the performance of the system. The session also continued to obtain data for control reconfiguration after satellites dock (and their mass properties change). Per applicable Flight Rule, SPHERES operations have no CO₂ output constraints if the CDRA (CO₂ Removal Assembly) is operating in dual-bed or single-bed mode.]*

Later tonight, Chamitoff will disconnect and stow the Ethernet cabling of the A31p PCS-2 (Portable Computer System 2) laptop of the HRF-2 (Human Research Facility 2), used for ANITA (Analyzing Interferometer for Ambient Air), in preparation of the upcoming relocation of the rack from the US Lab to COL (Columbus Orbital Laboratory).

At ~10:55am EDT, Sergey & Oleg downlinked a PAO TV address of greetings to the participants of the Third Science Festival in Moscow, to be held October 10-12 at M. V. Lomonosov Moscow State University, with participation of the Moscow City Government and support of the Federal Agency for Science & Innovations under the Russian

Federation's Ministry of Education & Science. Goals of the festival are to demonstrate the latest scientific achievements and advancement of science research into manufacturing, to draw talented youth into institutions of higher learning, to promote a profession of teacher and scientist. *[“...We are sending our heartfelt greetings to the participants of Science Festival in Moscow from onboard of the International Space Station. We are thousands of miles apart now, but we are with you in our thoughts, in Moscow State University, where the Festival's opening ceremony is under way. Most likely this is a very colorful, interesting, and informative event, just like the entire festival's program. This is a remarkable idea to conduct a real celebration of science with participation not just scientists but everybody who is interested in scientific quest and has a thirst for knowledge....Yes, the future of our home very much depends on the extent to which science, engineering and technology are developed, and the degree the world relies on scientific research and knowledge. Moscow Science Festival just serves this noble goal. We are being heard in the MSU Grand Conference Hall, where science festival guests are gathered. Among them there are those whose inspirational work opened a road into space. Our best wishes to you on this day celebrating science and intellect.”]*

The two cosmonauts also had their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop), Oleg at ~6:50am, Sergey at ~8:20am.

The crew completed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill with vibration isolation (CDR/2.5h, FE-1/2.5h), and RED resistive exercise device (FE-2).

Later, Oleg transferred the exercise data files to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

As generally every day now, today starting at 9:00am and running until 3:00pm (during the SPHERES session), the US CDRA (Carbon Dioxide Removal Assembly) is activated intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking. CDRA remains “yellow” on the ISS critical systems list.]*

Conjunction Advisory: Another piece of debris from the Kosmos-2421 satellite (Object 87055) will pass by ISS on 9/29 (Monday) at 5:04am EDT. Latest trajectory predictions indicate a miss distance of 30.4 km. MCC-H specialists are closely monitoring. If DAM (Debris Avoidance Maneuver) is required, it could replace the ISS reboost scheduled for 10/2.

Week 23/24 Scheduled Main Activities:

- Sun. (9/28): NUTRITION w/urine collect; TVIS video; FMK deploy; SOLO diet mntr.; GFI-1 charge; PFC (FE-2).
- Mon. (9/29): NUTRITION; BMP ch.1 regen; VELO maint.; ASU toilet replmnts; Elektron maint.; MFCV valve adjustments; Node-2, A/L, Lab SD/BF maint.; GFI-1/ Relax. exp. (ATV1); air sampling (CMS, GSC, AK-1M); IP-1 inspect.; KPT/BAR-RM power charge.
- Tue. (9/30): MO-7; BMP ch.2 regen; TEPC relocate; NOA1 exp.; RED inspect.; IWIS reprog.; Node-1 RFCA Flowmeter test, ITCS MTL (MFCV) adjust, A/L MTL Flowmeter meas.; FMK stow; Kazbek fit checks; crew dep. preps.

Weekly Science Update (*Expedition Seventeen -- Week 23*)

3-D SPACE: In progress.

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):
Measurements continue in FGB module.

ANITA (Analyzing Interferometer for Ambient Air): Continuing.

BCAT-3/4 (Binary Colloidal Alloy Test 3/4): BCAT team coordinating pictures with sample modules, ascertaining image quality and comparing Kodak and Nikon camera results. Data download delayed by hurricane Ike. Looking forward to BCAT-4 data.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System):
Samples returned on 1J.

CSI-2/CGBA-5 (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus 5): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): Due to safety concerns identified for the PLEGPAY instrument (when operated in Plasma Discharge mode), the entire EuTEF platform was put in survival mode on 9/1 at around 11:00am EDT (just prior to 29P undocking). Since then, the EuTEF power feeder#1 has been de-activated and no science acquisition is possible. Request has been approved for intermittent activation for 3 of the 9 EUTEF payloads. EuTEF platform power feeder#1 has been re-activated for 4-hrs periods on 9/20, 9/22, 9/24 and will continue to be re-activated every other day until safety issues are solved with the PLEGPAY instrument. This mitigates the science loss for the EXPOSE, DOSTEL and MEDET instruments only. -- DEBIE-2: Inactive; -- DOSTEL: Inactive, part of proposed intermittent activation;-- EuTEMP: Inactive as planned; -- EVC: Inactive; -- EXPOSE: Inactive, part of proposed intermittent activation; -- FIPEX: Inactive; -- MEDET: Inactive, part of proposed intermittent activation; -- PLEGPAY: Inactive; -- TRIBOLAB: Inactive.

FSL (Fluid Science Laboratory): FSL is nominal.

GEOFLOW: The GEOFLOW EC (Experiment Container) has been removed on 9/16 in view of the 30P docking.

HDTV System Test DL (JAXA): In progress.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): "Greg, thanks for choosing LOCAD on Saturday. You did a great job again and got some interesting results. The LOCAD test you performed was for 'beta-glucan', a molecule found in fungal cell walls. As you know, each test provides 5 sets of data on the display: sample concentration, sample coefficient of variation (CV) %, spike concentration, spike CV%, and recovery %. We're mainly interested in the first number: 'sample concentration' (from 1ng/ml to 100ng/ml). We expected readings around 1ng/ml in Node 1 (a relatively 'clean' location), but you have obtained readings up to 18ng/ml! This was exciting for us because, while not a concern for crew health, it would be a significant event during exploration missions where a major scientific challenge will be to search for

extraterrestrial life AND differentiate it from microbial life associated with the spacecraft and crew. Your work is providing valuable data to help prepare for that challenge.”

Marangoni Experiment for ISS (JAXA Fluid Physics Experiment Facility): The fourth run started on 9/25. Part of the differed third run will be conducted in the Inc 17 and some part also in Inc 18.

Micro-G Clay (JAXA EPO): Complete.

MISSE (Materials ISS Experiment): Ongoing.

Moon Photography from ISS (JAXA EPO): Complete.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 “Pirs”.

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-1/-2 (Nitric Oxide Analyzer, ESA): Next NOA-1 session currently planned on 9/30.

NUTRITION w/REPOSITORY: In progress.

PADLES (Passive Dosimeter for Lifescience Experiment in Space): In progress.

PCRF (Protein Crystallization Research Facility) Reconfiguration (JAXA): Complete.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SAMPLE: Complete.

SHERE (Shear History Extensional Rheology Experiment): In progress.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): In progress.

SOLAR (Solar Monitoring Observatory): The next sun visibility window expected to open as of 9/26. -- SOVIM: awaiting the Sun to acquire science; -- SOLSPEC: awaiting the Sun to acquire science; -- SOLACES: awaiting the Sun to acquire science.

SOLO (Sodium Loading in Microgravity): PCBA (Portable Clinical Blood Analyzer) pouches with control solution and cartridges have been transferred to MELFI and all SOLO kits have been transferred from Progress to the ETC (European Transport

Carrier) in COL on 9/18. First SOLO session currently planned to start on 10/3. *[Note: The ETC carries payload items that cannot be launched within the ESA facilities because of stowage or transport limitations. In orbit it serves as a workbench and stowage facility to support experiments with Biolab, the Fluid Science Lab, the European Physiology Modules and the European Drawer Rack.]*

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): Reserve.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): Teams on ground continue to assess the results of the BIOLAB Rotor A Bellow Test, which gave faulty signals for 4 out of 6 Reference ECs. Rotor B Actuator test and Rotor B bellow test have been successfully performed on 9/5.

CEO (Crew Earth Observations): Through 9/15 the ground has received a total of 7,434 frames of CEO images for review and cataloging. "Photos with times corresponding to our CEO target list request times are reviewed first and since our last report included: Pilcomayo River Dynamics, N. Argentina (unconfirmed and under review); Araguainha Impact Crater, Brazil (unconfirmed and under review); Jarvis Island, Equatorial Pacific (acquisition confirmed and under review); Lake Poopo, Bolivia (acquisition confirmed and under review); and Red River Basin (acquisition confirmed and under review). We also wish to acknowledge several of your timely Hurricane Ike images that were used by PAO and the new media. Other imagery of interest noted and under review include: Iceberg A43a, South Atlantic Ocean; Bovet Island, South Atlantic Ocean; sessions with views of Auroras; and views of cities at night, all acquired without our prompting. Your recent striking shot of the Tifernine Dune Field in eastern Algeria will be published on NASA/GSFC's Earth Observatory website this weekend. It nicely illustrates the impact of climate change on the evolution and character of topographic features in this region. Please keep up your good work as we continue to work through our backlog of your imagery due to the JSC closure for Ike."

CEO (Crew Earth Observations) photo targets uplinked for today were **S. Mozambique** (*ISS had a fair-weather pass near midday with the center of this target area just right of track. Researchers requested overlapping long lens views mapping the area along the ground track. The region is undergoing rapid development, and baseline imagery of land cover will be useful to track changes to regional ecosystems over time*), **South Tibesti Megafans** (*these subtle, ancient erosional features in the Sahara are located between Lake Chad to the south and closer to the southern flank of the rugged Tibesti Mountains to the north. Requested were short lens oblique views of the region for later*

use to help pinpoint areas of more detailed shots. ISS approach was from the SW in midday sun and fair weather. After crossing Lake Chad, Greg was to begin shooting broad mapping views of the area to the left of track until he reached the mountains), **B. P. Structure** (this tiny impact site in eastern Libya near the border with Egypt is just 2 km in diameter and few crews have managed to spot it. On nadir pass in clear weather and early afternoon CEO researchers requested a short lens mapping strip along the track since they plan to use a suitable context view from one of the views to aid in locating it for a long lens shot in the future), **Pilcomayo River, N Argentina** (ISS pass over this target area was nadir and at midday with fair weather expected at this time. This failing river system serves as the international boundary between Argentina and Paraguay as it tracks SE-ward from the central Andes Mountains towards the large Parana River. This river has special geological interest because it is blocking its own course with sediment, and spilling out onto the surrounding flatlands, at the point near where the track crosses the course. Also, this river has built the largest megafan [inland delta] on Earth. Greg was to attempt to map the river in detail from where it breaks out of the mountains until it becomes indistinct [Note: The Pilcomayo River should not be confused with the more distinct, neighboring Bermejo River further south which follows a similar course southeastward]), and **Sevilleta Wildlife Area, New Mexico** (this wildlife area is also designated as a Long Term Ecological Research [LTER] site. It is primarily situated near either side of the Rio Grande River in central New Mexico. As ISS approached from the SW in late afternoon sun, it may have been partly cloudy, but Greg was to try for detailed views S-to-N along the east side of the river as far north as Santa Fe).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 5:11am EDT [= epoch]):

Mean altitude -- 352.4 km

Apogee height -- 356.9 km

Perigee height -- 348.0 km

Period -- 91.59 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006617

Solar Beta Angle -- 21.1 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 68 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56461

Significant Events Ahead (all dates Eastern Time, some changes possible.):

09/29/08 -- ATV de-orbit (nighttime re-entry for observation from 2 NASA aircraft; ~9:12pm)

10/01/08 -- **NASA 50 Years** (official)

10/02/08 -- ISS Reboost (~1.8 m/s)

10/14/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4) 12:33am
 10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)
 10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)
 10/24/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) & landing
 11/02/08 -- Progress 30P reboost
 11/16/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC (~7:02pm EST)
 11/18/08 -- STS-126/Endeavour/ULF2 docking
 11/20/08 -- **ISS 10 Years**
 11/25/08 -- Progress M-65/30P undocking & deorbit
 11/26/08 -- Progress M-66/31P launch
 11/30/08 -- Progress M-66/31P docking
 12/01/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.)
 02/09/09 -- Progress M-66/31P undocking & deorbit
 02/10/09 -- Progress M-67/32P launch
 02/12/09 -- Progress M-67/32P docking
 02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
 02/14/09 -- STS-119/Discovery/15A docking
 02/24/09 -- STS-119/Discovery/15A undocking
 02/26/09 -- STS-119/Discovery/15A landing (nominal)
 03/25/09 -- Soyuz TMA-14/18S launch
 03/27/09 -- Soyuz TMA-14/18S docking (DC1)
 04/05/09 -- Soyuz TMA-13/17S undocking
 04/07/09 -- Progress M-67/32P undocking & deorbit
 05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 05/25/09 -- Soyuz TMA-15/19S launch
 05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
 07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
 10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
 12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
 02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
 04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
 05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 09/26/08

All ISS systems continue to function nominally, except those noted previously or below.

After configuring the PFE-OUM (Periodic Fitness Evaluation - Oxygen Uptake Measurement) equipment at the HRF-2 (Human Research Facility 2) rack, Gregory Chamitoff conducted his second PFE-OUM session on the CEVIS cycle ergometer while wearing an HRM (Heart Rate Monitor), with Sergey Volkov as operator to obtain measurements of the subject. (First session: 8/21). *[The equipment includes the HRF PFM/PAM (Pulmonary Function Module/Photoacoustic Analyzer Module), Mixing Bag System and GDS (Gas Delivery System). Today's session used GDS tanks 1, 2 & 5. After calibration of the DPFM (Differential Pressure Flowmeter), Gregory, assisted by Sergey, worked through the protocol, changing the loads on the ergometer and recording data. Later, the FE-2 updated the evaluation protocol, deactivated & stowed the gear, and powered down the PFE-OUM laptop. Purpose of PFE-OUM is to measure aerobic capacity during exercise within 14 days after arrival on ISS, and once monthly during routine PFEs. The data allows exercise physiologists & flight doctors to assess the crew's health & fitness and to provide data for modifying & updating crew-specific exercise regimes. By hooking up a special cable, continuous oxygen uptake measurements can now be taken while riding the CEVIS without requiring access to the CEVIS control panel as before. PFE-OUM is a collaborative effort between NASA and ESA (European Space Agency).]*

FE-1 Kononenko underwent his first session of the biomedical MBI-5/KARDIO-ODNT protocol, an extensive cardiovascular test of human pericardium (heart muscle) activity as well as of primary parameters of central and regional blood circulation at rest and under the effect of lower body negative pressure (LBNP, Russian: ODNT). The test was controlled from TsUP-Moscow by a biomed specialist via VHF over RGS (Russian ground site) comm window (~9:08am EDT). CDR Volkov, who had his session yesterday, assisted as CMO (Crew Medical Officer). *[The LBNP, generated by a specially designed "Chibis" suit (PVK),*

applies suction on the lower body ranging from 10 to 60 mm Hg, thereby exerting a functional loading roughly equivalent to 10-60 kg of force on the musculoskeletal system to test the body's adaptation to prolonged exposure to microgravity. After an initial setup period, during which Sergey attached a large number of electrodes to Oleg's head, body and extremities, cardiographic readings on the oscilloscope of the Gamma-1M medical complex were taken during two RGS comm passes, first without, then with the Chibis suit.]

In preparation for another run with the US SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment, FE-2 Chamitoff first changed the batteries in three Actiwatches & the Actiwatch Reader, then downloaded SLEEP data from his Actiwatch to the HRF-1 (Human Research Facility 1) laptop for subsequent downlink and verification by the support scientist. Afterwards, he re-initialized all three Actiwatches. *[To monitor his sleep/wake patterns and light exposure, Chamitoff wears the special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout this run. The log entries are done within 15 minutes of final awakening for seven consecutive days. The other two Actiwatches were initialized for Soyuz 17S CDR Yuri Lonchakov and SFP (Space Flight Participant) Richard Garriott.]*

After recharging the SONY camcorder battery, Oleg Kononenko installed the geophysical GFI-1 Relaksatsiya ("relaxation") experiment at Service Module (SM) window #1 from six GFI-1 hardware kits, reconfigured the Payload Laptop 3 for the experiment and installed the spectrometer (SP) lens accessory on the camcorder.

[Purpose of the science experiment, which ran from 1:45pm to 2:10pm, was to contribute to a hyperspectral space/time study of radiation patterns from the Earth ionosphere and Earth limb. Afterwards the equipment was stowed again.

Relaksatsiya normally deals with the study of the chemoluminescent chemical reactions and atmospheric light phenomena (emissions, i.e., molecular relaxation processes), including those that occur during high-velocity interaction between the exhaust products from space vehicles and the atmosphere at orbital altitude and during the entry of space vehicles into the Earth's upper atmosphere. For the Russian Relaxation experiment, ISS attitude was changed at 1:25pm for 20 min, with control authority handed over to Russian thrusters at 1:20pm, to be returned to US Momentum Management at ~3:08pm. Before the maneuvers, Chamitoff closed the protective Lab science window shutters; the Kibo laboratory window was already shuttered from earlier.]

Before sleeptime tonight, the FE-2 will set up NASA's NUTRITION w/Repository experiment hardware for his fifth session, starting tomorrow with the standard blood draw (phlebotomy), for which Greg has to start fasting 8 hrs before, i.e., tonight, with only water consumption allowed. *[The NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes*

during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by supercold MELFI dewars), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]

Continuing the current round of periodic preventive maintenance of RS (Russian Segment) ventilation systems, Kononenko used a vacuum cleaner and soft brush to clean the detachable VT7 fan screens 1, 2, and 3 of the three SOTR gas-liquid heat exchangers (GZhT4) in the FGB (Funktsionalnyi-Grusovoi Blok). The CDR later did his share by cleaning the VD1 & VD2 air ducts in the "Pirs" DC-1 (Docking Compartment).

In preparation for upcoming adjustment work on four MFCVs (Manual Flow Control Valves) in the Lab, required for the installation of the Regenerative ECLSS racks arriving on ULF2, Gregory set up and tested the hardline power supply for the Non-intrusive Flowmeter, required for the valve adjustments and an ITCS MTL (Internal Thermal Control Systems/Moderate Temperature Loop) accuracy check. *[These activities were originally scheduled in May this year, prior to 1J, but had to be aborted due to issues with the Flowmeter batteries. As a work-around, Greg will use the Shuttle Breakout Box to connect the Flowmeter to hardline power. The MFCV flow adjustments are scheduled on 9/29 & 9/30, along with time for removing stowage from the translation paths of racks that may need to be rotated for access, and an activity to configure the Flowmeter settings.]*

The FE-1 completed another radiation data checkup for accumulated flux & dose rate data with the Matryoshka-R radiation payload (RBO-3-2) and its LULIN-5 electronics box.

CDR Volkov meanwhile worked in the SM on the "Sputnik" amateur radio station, removing the old Kenwood radio and replacing it with a new Kenwood VHF transceiver. After connecting it and its IBM ThinkPad web camera to the RSK2 laptop and power, Sergey configured the ham radio's settings and conducted a health check.

The FE-2 turned off PCS (Portable Computer System) laptops not being used at the moment, and conducted the regular bi-monthly reboots of the OCA Router and File Server SSC (Station Support Computer) laptops.

The FE-1 completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance*

consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

Oleg also handled the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

In the Kibo JPM (JEM Pressurized Module), Gregory supported Tsukuba flight controllers by verifying a ground-commanded checkout of the CB (Clean Bench) subrack facility (except its microscope). *[Ground commanding of JPM payloads is done by JAXA’s SSIPC (Space Station Integration & Promotion Center) at Tsukuba/ Japan. The CB, a subrack of the Saibo (“living cell”) Rack, provides a germ-free environment for life science and biotechnological experiments. It has a specially designed microscope that operates with bright-field, phase-contrast and fluorescence modes.]*

Chamitoff filled out the regular FFQ (Food Frequency Questionnaire), his 13th, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

The crew completed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2/PFE-OUM), TVIS treadmill with vibration isolation (CDR/2.5h, FE-1/2.5h), and RED resistive exercise device (FE-2).

Later, Oleg transferred the exercise data files to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

As generally every day now, today starting at ~5:30am and running until 11:30am, the US CDRA (Carbon Dioxide Removal Assembly) is activated intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does

not require connecting & disconnecting the ITCS cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking. CDRA remains “yellow” on the ISS critical systems list.]*

At ~4:10am EDT, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU/*Glavnaya operativnaya gruppа upravleniya* = “Chief Operative Control Group”), including Shift Flight Director (SRP), at TsUP-Moscow via S-band/audio, phone-patched from Houston and Moscow.

At ~3:10pm, the ISS crew is scheduled for their regular weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. *[S/G-2 (Space-to-Ground 2) phone patch via SSC].*

WRM Update: An updated WRM (Water Recovery Management) “cue card” was uplinked overnight for the crew’s reference, updated with yesterday’s water audit. *[The new card (17-1016A) lists 29 CWCs (~1047.5 L total) for the four types of water identified on board: technical water (326.2 L, for flushing only because of Wautersia bacteria), potable water (647.8 L, incl. 194.8 L currently on hold), condensate water (56.5 L), waste/EMU dump and other (17 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]*

Week 23/24 Scheduled Main Activities:

- Fri. (9/26): CB (Clean Bench) funct. checkout; PFE-OUM exam; VT-7 heat exch. fan grille cleaning, MBI-5/KARDIO-ODNT/LBNP; GFI-1; ham equipmt R&R; FS & OCA router reboot; FFQ; NUTRITION prep.
- Sat. (9/27): NUTRITION w/blood collect; station cleaning; POTOK maint.; PFCs (CDR, FE-1); prep for HRF-2 rack transfer (PC2 laptop decable).
- Sun. (9/28): NUTRITION w/urine collect; TVIS video; FMK deploy; SOLO diet mntr.; GFI-1 charge; PFC (FE-2).
- Mon. (9/29): NUTRITION; BMP ch.1 regen; VELO maint.; ASU toilet replmnts; Elektron maint.; MFCV valve adjustments; Node-2, A/L, Lab SD/BF maint.; GFI-1/Relax. exp. (ATV1); air sampling (CMS, GSC, AK-1M); IP-1 inspect.; KPT/BAR-RM power charge.
- Tue. (9/30): MO-7; BMP ch.2 regen; TEPC relocate; NOA1 exp.; RED inspect.; IWIS reprog.; Node-1 RFCA Flowmeter test, ITCS MTL (MFCV) adjust, A/L MTL Flowmeter meas.; FMK stow; Kazbek fit checks; crew dep. preps.

CEO (Crew Earth Observations) photo targets uplinked for today were **Mt.**

Kilimanjaro, Kenya (*Kilimanjaro is the highest peak in Africa at 5,895 meters. The highest point on Kilimanjaro is Uhuru Peak, located on the volcano Kibo. The top of*

*Kibo is a 1.5 mile wide crater. Of interest to researchers is the documentation of the ice cap. Originally predicted in 2002 to be gone some time between 2015 and 2020 by paleoclimatologist Lonnie Thompson, new studies indicate the ice will remain until 2040. Other studies suggest that the retreat of the ice cap is due to decreased precipitation rather than rising temperatures), and **Lake Poopo, Bolivia** (Lake Poopo is a large saline lake located in a shallow depression in Bolivia at about 3,700 meters. This is a very shallow lake with a mean depth of no more than 3 meters. The surface area of the lake, however, varies greatly indicating the seasonal precipitation levels. Documenting the lake color and extent).*

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 6:19am EDT [= epoch]):

Mean altitude -- 352.5 km

Apogee height -- 357.0 km

Perigee height -- 348.0 km

Period -- 91.59 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006717

Solar Beta Angle -- 25.7 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 57 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56446

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/29/08 -- ATV de-orbit (nighttime re-entry for observation from 2 NASA aircraft; ~9:12pm)

10/01/08 -- **NASA 50 Years** (official)

10/02/08 -- ISS Reboost (~1.8 m/s)

10/14/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
12:33am

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/24/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) & landing

11/02/08 -- Progress 30P reboost

11/16/08 -- STS-126/Endeavour/ULF2 launch -- MPLM Leonardo, LMC (~7:02pm EST)

11/18/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking
12/01/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.)
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osp/iss_reports/index.htm

ISS On-Orbit Status 09/25/08

All ISS systems continue to function nominally, except those noted previously or below.

Upon wake-up, CDR Volkov terminated his 11th SONOKARD experiment session for the long-term MBI-12 Russian sleep study, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

Continuing communications outfitting activities in the SM (Service Module), begun earlier, CDR Volkov installed new cabling connecting the BSK-1B and BSK-2B Common Power Switching Timers behind panel 436 to the ASN Satellite Navigation System. *[BSK-2B was temporarily taken out to for installing the connections and a subsequent checkout of the activated ASN and SM Printer1, before these systems were powered off again and the BSK-2B re-installed.]*

Later, the Elektron electrolysis machine, turned off for the duration of BITS2-12 onboard measurement telemetry system powerdown, was reactivated at 32 amps, supported by Kononenko monitoring the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating. *[The gas analyzer used on the Elektron during nominal operations for detecting hydrogen (H₂) in the O₂ line (which could cause overheating) is not included in the control algorithm until 10 minutes after Elektron startup.]*

As has become standard operating procedure after deactivation/reactivation of VD-SU monitoring mode, Oleg also performed a quick function verification of the SUBA Ethernet connection between the OpsLAN (Operations Local Area Network) and the BRI Smart Switch Router in the SM.

FE-2 Chamitoff unstowed and set up the PFE-OUM (Periodic Fitness Exam-Oxygen Uptake Measurement) equipment on the HRF-2 (Human Research Facility 2) rack, including the PFM/PAM (Pulmonary Function Module/Photoacoustic Analyzer Module), Mixing Bag System and GDS (Gas Delivery System), for his second PFE-OUM protocol session tomorrow, with Volkov serving as operator. *[The PFE-OUM experiment, using the CEVIS ergometer for workout, demonstrates the capability of crewmembers to perform periodic fitness evaluations with continuous oxygen consumption measurements within 14 days after arrival on ISS, and once monthly during routine PFEs. Once the capability of the pulmonary function system (PFS) to perform PFEs is verified, crewmembers will be able to integrate their monthly PFE with oxygen consumption measurements to fulfill the requirement for cardiovascular fitness evaluations during long-duration space flight.]*

Volkov underwent his first session of the biomedical protocol KARDIO-ODNT (MBI-5), an extensive cardiovascular test of human pericardium (heart muscle) activity as well as of primary parameters of central and regional blood circulation at rest and under the effect of lower body negative pressure (LBNP, Russian: ODNT). The test was controlled from TsUP-Moscow by a biomed specialist via VHF over RGS (Russian ground site) comm window (~10:16am EDT). FE-1 Kononenko assisted as CMO (Crew Medical Officer). *[The LBNP, generated by a specially designed "Chibis" suit (PVK), applies suction on the lower body ranging from 10 to 60 mm Hg, thereby exerting a functional loading roughly equivalent to 10-60 kg of force on the musculoskeletal system to test the body's adaptation to prolonged exposure to microgravity. After an initial setup period, during which Oleg attached a large number of electrodes to Sergey's head, body and extremities, cardiographic readings on the oscilloscope of the Gamma-1M medical complex were taken during two RGS comm passes, first without, then with the Chibis suit.]*

The CDR had two hours set aside to work in the DC1 (Docking Compartment), removing the SU-95 matching unit of the RS (Russian Segment) STTS onboard radio communications system and replacing it with a new spare.

In preparation for brief Progress thruster firings at ~11:35am EDT, Chamitoff closed the protective shutters of the science window in the JAXA JPM and in the U.S. Lab. *[The thruster firings were in support of the R7 software upload to the primary & backup GNC (Guidance, Navigation & Control) MDMs at ~11:30am. For the transitioning of the backup GNC to primary, ISS attitude control authority was handed over to the RS MCS (Motion Control System) at 11:30am, to be returned to*

US Momentum Management at ~2:10pm after the GNC MDM transition. The Lab window can be re-opened two orbits later, at ~5:10pm. The Kibo window remains closed at least until after the Relaxation Experiment tomorrow (9/26, ~1:45pm).]

Chamitoff's participation in the ongoing X2R7 software transition today focused on

- (1) Powering on the CUP PCS (Cupola Portable Computer System) and A/L (Airlock) PCS A31p laptops, each equipped with vers. R11 hard disks, following the ground-controlled transition of the C&C (Command & Control) MDMs to CCS R7, and
- (2) Replacing the remaining old R10 hard drives of the SM, COL, JEM and Lab RWS PCS laptops with the deployed new R11 drives, powering each PCS laptop up after the swap and finally stowing the old R10s.

[Reconfiguration of the new primary and backup C&C MDMs was performed by MCC-H. The ground also loaded the Node-1 MDMs (with NCS R3) and the GNC MDMs (with GNC R7).]

Sergey Volkov performed monthly maintenance on the deactivated Russian IK0501 GA (Gas Analyzer) of the SOGS Pressure Control & Atmospheric Monitoring System by replacing its CO₂ filter assembly (BF) with a new unit from FGB stowage (done last: 8/14), then reactivating the unit. The old filter was discarded.

FE-1 Kononenko updated the Russian laptops RSS1, RSS2, RSE1, RSK1 and RSK2 with the latest virus definition database for their Norton AntiVirus application, then scanned the laptops, saving the scan protocols for downlink to TsUP-Moscow via OCA for analysis.

Oleg also collected the periodic ISS cabin air readings with the Russian GANK-4M Real-Time Harmful Contaminant Gas Analyzer system. *[AOK GANK-4M tests for Methane (CH₄), Ammonia (NH₃), Carbon Monoxide (CO), Formaldehyde (HCHO), Nitrogen Oxides (NO, NO₂), Hydrogen Chloride (HCl), Hydrogen Fluoride (HF), and Hydrogen Cyanide (HCN).]*

To support IPU (Image Processing Unit) activation in the JAXA JPM (JEM Pressurized Module) by the ground, Gregory Chamitoff turned on the MMA (Microgravity Measurement Apparatus) and its laptop (MLT), by first powering up the MMA's NCU/RSU (Network Control Unit/Remote Sensor Unit) set from the Ryutai rack's UDC (Utility DC to DC Converter), then turning on both the NCU/RSU and MLT. *[Kibo Lab systems were powered down by SSIPC (Space Station Integration & Promotion Center) in Tsukuba from 8:30am-10:00am in support of the GNC X2R7 software transition.]*

In the COL (Columbus Orbital Laboratory), Gregory was to search for a stowage

bag with 5 pairs of K-BAR (Knee-Brace Assembly Replacement) capture mechanisms (CMs), required for the upcoming relocation of the two HRF (Human Research Facility) racks to Columbus, set for 10/1 & 10/2, and their correct installation at the F4 & A4 locations. The K-BAR CMs were to be installed right away. *[If the bag is not found, two pairs of CMs from NASA stock were to be used for now, to avoid delaying the rack relocation.]*

Chamitoff and Kononenko each had about 1.5 hrs reserved for deploying new Emecy-2/Warning SODF (Station Operations Data File) procedure documents reflecting the X2R7 software upgrade.

The CDR completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Sergey also handled the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Gregory retrieved the LOCAD-PTS (Lab-On-a-Chip Application Portable Test System) media slides of his last VolSci (Voluntary Weekend Science) session from incubation, recorded the temperature reading from the incubation bag and the colony count for each slide, photographed the slides and then discarded them as wet trash. *[LOCAD technology has an ever-expanding range of applications in the biotech industry. Chips are available (or in development) which can also detect yeast, mold, and gram positive bacteria, identify environmental contaminants, and perform quick health diagnostics in medical clinics. The technology has been used to swab the MERs (Mars Exploration Rovers) for planetary protection. With expanded testing on ISS, began by Sunita Williams in March/April of last year, this compact technology has broad potential applications in space exploration--from monitoring environmental conditions to monitoring crew health. The current study should prepare for long-duration exploration by demonstrating a system that enables the crew to perform biochemical analysis in space without having to return samples to Earth.]*

The FE-2 completed the weekly 10-min. CWC (Contingency Water Container) inventory as part of on-going WRM (Water Recovery & Management) assessment of onboard water supplies. Updated “cue cards” based on the crew’s water calldowns are sent up every other week. *[The new card (17-1016) lists 29*

CWCs (~1047.4 L total) for the four types of water identified on board: technical water (326.2 L, for flushing only because of Wautersia bacteria), potable water (669.8 L, incl. 174.6 L currently on hold), condensate water (34.4 L), waste/EMU dump and other (17 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]

Gregory also conducted another one of the periodic offloadings of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling a CWC (#1054) with the collected water slated for processing. Samples were not required.

Chamitoff performed periodic maintenance on the CEVIS (Cycle Ergometer with Vibration Isolation & Stabilization), changing out its isolators with new 6-inch units from a stowage kit.

The crew completed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill with vibration isolation (CDR, FE-1/2.5h), and RED resistive exercise device (FE-2).

Later, Oleg transferred the exercise data files to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

As generally every day now, today starting at ~4:00am and running until 10:00am, the US CDRA (Carbon Dioxide Removal Assembly) is activated intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking. CDRA remains "yellow" on the ISS critical systems list.]*

At ~7:30am, Gregory powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, & power supply) and conducted, at 7:35am, a ham radio exchange with the Michael Sobell Sinai School in Harrow, Middlesex, UK. *[The Michael Sobell Sinai School opened in 1981 and is the largest Jewish Primary School in Europe. It caters for children aged 3-11 and offers a challenging curriculum and the highest standard of education. Two of its pupils, Jessica and Amelia Diamond, visited KSC in May to see their cousin, FE-2 Greg Chamitoff, launch on the Shuttle to the ISS. Questions were uplinked beforehand. "What training do you do to become an astronaut?", "What is the purpose of your trip?"; "How do you go to the toilet?"; "Will there ever be a day*

when we can holiday on the moon?"; "Could you describe what the earth looks like when you are in space and can you identify continents, weather conditions and the seas?"; "If one of your children wanted to be an astronaut, what would you say to them?"]

Week 23/24 Scheduled Main Activities:

- Fri. (9/26): CB (Clean Bench) funct. checkout; PFE-OUM exam; VT-7 heat exch. fan grille cleaning, MBI-5/KARDIO-ODNT/LBNP; GFI-1; ham equipmt R&R; FS & OCA router reboot; FFQ; NUTRITION prep.
- Sat. (9/27): NUTRITION w/blood collect; station cleaning; POTOK maint.; PFCs (CDR, FE-1); prep for HRF-2 rack transfer (PC2 laptop decable).
- Sun. (9/28): NUTRITION w/urine collect; TVIS video; FMK deploy; SOLO diet mntr.; GFI-1 charge; PFC (FE-2).
- Mon. (9/29): NUTRITION; BMP ch.1 regen; VELO maint.; ASU toilet replmnts; Elektron maint.; MFCV valve adjustments; Node-2, A/L, Lab SD/BF maint.; GFI-1/Relax. exp. (ATV1); air sampling (CMS, GSC, AK-1M); IP-1 inspect.; KPT/BAR-RM power charge.

CEO (Crew Earth Observations) photo target uplinked for today was S. Mozambique (Greg had a nadir pass over this site; overlapping mapping frames taken along track were requested. The region is undergoing rapid development, and imagery of the existing state of land cover will be useful to track changes to regional ecosystems over time).

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 7:27am EDT [= epoch]):

Mean altitude -- 352.6 km

Apogee height -- 357.2 km

Perigee height -- 347.9 km

Period -- 91.59 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006862

Solar Beta Angle -- 30.2 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 57 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56431

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/29/08 -- ATV de-orbit (nighttime re-entry for observation from 2 NASA aircraft;

~9:12pm)

10/01/08 -- **NASA 50 Years** (official)

10/02/08 -- ISS Reboost (~1.8 m/s)

10/14/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

12:33am

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/24/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) & landing

11/02/08 -- Progress 30P reboost

11/16/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC (~7:02pm EST)

11/18/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

12/01/08 -- STS-126/Endeavour/ULF2 landing (~1:25pm EST est.)

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking

02/26/09 -- STS-119/Discovery/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress M-67/32P undocking & deorbit

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/25/09 -- Soyuz TMA-15/19S launch

05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**

07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation

10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A – MPLM(P)

04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1

05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 09/24/08

All ISS systems continue to function nominally, except those noted previously or below.

Upon wakeup, FE-1 Kononenko terminated his eleventh SONOKARD experiment session for the long-term Russian sleep study MBI-12, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. Sergey Volkov's new MBI-12 session starts tonight (~5:20pm). *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

CDR Volkov worked several hours on the Russian BITS2-12 onboard telemetry measurement system, performing maintenance by removing its PTsB central processor subsystem (Monoblock TA968MA) and replacing it with a new TA968MA unit delivered on Progress 30P. *[Deactivating the BITS2-12 and VD-SU monitoring mode also required the Elektron oxygen generator to be turned off during the outfitting activities.]*

Later, the Elektron electrolysis machine was activated again at 32 amps, supported by Kononenko monitoring the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating.

[The gas analyzer used on the Elektron during nominal operations for detecting hydrogen (H₂) in the O₂ line (which could cause overheating) is not included in the control algorithm until 10 minutes after Elektron startup.]

As has become standard operating procedure after deactivation/reactivation of VD-

SU monitoring mode, Oleg also performed a quick function verification of the SUBA Ethernet connection between the OpsLAN (Operations Local Area Network) and the BRI Smart Switch Router in the SM.

The FE-1 performed the periodic hardware structure & surface sampling for microbial contamination in the RS (Russian Segment), using a sampling kit for taking swabs from designated panel locations in the SM (Service Module) and FGB. The sample tubes were then prepared for return on Soyuz TMA-12 next month.

For FE-2 Chamitoff and the USOS (US Segment), today began the long-awaited X2FR7 software transition during which MCC-Houston is remotely upgrading several MDM (Multiplexer/Demultiplexer) computers to new software versions, from today to 9/26 (Friday). For Chamitoff, today's activities consisted of installing new 60GB hard drives with R11 software into the Airlock & CUPOLA PCS (Portable Computer System) A31p ThinkPad laptops which he had previously image-ghosted. The old CPS R10 hard drives were stowed away. *[MCC-H will transition the C&C (Command & Control) MDM to CCS R7 software, the GNC (Guidance, Navigation & Control) MDM to GNC R7, and the Node-1 MDMs to NCS R3 software. More upgrade steps are scheduled tomorrow and Friday.]*

Gregory also had 3.5 hrs for unpacking and stowing US cargo delivered on Progress 30P, with special attention to his food for the upcoming SOLO (Sodium Loading in Microgravity) experiment. Completed items were reported to MCC-H for IMS (Inventory Management System) logging.

After emptying 30P's potable water tanks BV1 & BV2 yesterday, Sergey Volkov today began the usual transfer of liquid waste (urine) from 2-3 EDV-U containers to the cargo ship's BV1 Rodnik tank, using jumpers and the electric pump. *[More transfers from an accumulated total of currently 5 EDV-U's will be performed in the next several days as part of SOZh maintenance.]*

Oleg Kononenko worked on the plant growth experiment BIO-5 Rasteniya-2 ("Plants-2"), first copying accumulated CR10X data files to a memory card for return to Earth, then collecting samples of grown Mizuna plants, taking documentary photography, placing the samples in a Ziploc bag and stowing the package in the MELFI (Minus Eighty Degree Laboratory Freezer for the ISS), in Dewar 3, Tray B. *[Mizuna (Brassica rapa nipposinica) is a tasty variety of Japanese mustard greens, also known as California Peppergrass, eaten as a salad.]*

In the Node-1, Chamitoff performed maintenance on the RED (Resistive Exercise Device) workout machine, adjusting the spiral pulleys of both canisters (to increase their load for the user) and installing an external spline (which he had found) on the

fore canister. Afterwards Greg concluded the job with the standard Flexpac canister load calibration, as required after cable replacements/adjustments. *[Chamitoff's on-orbit calibration of the Schwinn RED cans re-established the relationship of specific load settings with a specific number of pulls per setting, followed by recording of the load values measured with a calibration tool and steel handles from the on-orbit calibration kit.]*

On the Russian Matryoshka-R (RBO-3-2) radiation payload in the DC1 (Docking Compartment), Oleg checked out the ALC-952 memory card and activated the AST Spectrometer for data takes. *[After retrieving a used PCMCIA (Portable Computer Memory Card International Adapter) card, ALC-952, from stowage, Oleg activated the AST twice to verify the card's labels and orientation, then re-inserted ALC-952 in the spectrometer and activated the AST again after its powerdown yesterday.]*

The FE-1 also conducted the periodic checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the passageways SM PrK (Transfer Compartment) – RO (SM Working Compartment), PkhO (SM Transfer Tunnel) – RO, PkhO – DC1, PkhO – FGB PGO, FGB PGO – FGB GA, and FGB GA–Node-1, but not for the hatch to Soyuz.

Afterwards, Kononenko took the periodic readings of potentially harmful atmospheric contaminants in the SM, using the CMS (Countermeasure System), a component of the SKDS GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, today using preprogrammed microchips to measure for Isopropanol (“rubbing alcohol”, C_3H_8O), Methanol (“wood alcohol”, CH_3OH) and Toluene (methylbenzene, C_7H_8).

Continuing the current round of periodic preventive maintenance of RS ventilation systems, the FE-1 spent an hour in the FGB (*Funktsionalnyi-Grusovoi Blok*), cleaning the detachable fan screens 1, 2, and 3 of the three SOTR gas-liquid heat exchangers (GZhT4) and the fixed grill of GZhT #4.

As a new item on the Russian discretionary “time permitting” task list, the CDR completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Oleg meanwhile handled the daily IMS maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew completed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill with vibration isolation (CDR/2.5h, FE-1/2.5h), and RED resistive exercise device (FE-2).

Later, Sergey transferred the exercise data files to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

As generally every day now, starting at ~9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) is activated intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking. CDRA remains "yellow" on the ISS critical systems list.]*

At ~2:00pm EDT, Gregory is scheduled for his regular weekly PMC (Private Medical Conferences) via S- & Ku-band audio/video, deferred from yesterday.

Week 23 Scheduled Main Activities:

- Thu. (9/25): SODF deploy; PCS R11 reload; MDM X2R7 software upgrade; BSK-2B timer R&R; CO₂ BF filter R&R; CEVIS R&R; WRM/CWC audit; MBI-5/KARDIO-ODNT/LBNP; SONOKARD.
- Fri. (9/26): CB (Clean Bench) funct. checkout; PFE-OUM exam; VT-7 heat exch. fan grille cleaning, MBI-5/KARDIO-ODNT/LBNP; GFI-1; ham equipment R&R; FS & OCA router reboot; FFQ; NUTRITION prep.
- Sat. (9/27): NUTRITION w/blood collect; station cleaning; POTOK mtn; PFCs (CDR, FE-1); prep for HRF-2 rack transfer (PC2 laptop decable).
- Sun. (9/28): NUTRITION w/urine collect; TVIS video; FMK deploy; SOLO diet mon; GFI-1 charge; PFC (FE-2).

CEO (Crew Earth Observations) photo targets uplinked for today were **Typhoon Hagupit, Pacific Ocean** (*Dynamic Event. Looking to the right of track for Typhoon Hagupit, predicted to be a Category 1 storm at the time of ISS overpass. The storm was beginning to interact with land along the northern Gulf of Tonkin, and the center should have been over the island of Hainan, Antarctic Ice Pack, S. Atlantic Ocean* (shooting to the right of track as ISS approached Antarctica for ice rafts; a gap in the cloud cover is predicted for this portion of the South Atlantic Ocean. Photographs of sea ice are requested as part of IPY [International Polar Year]

activities), and **Tenoumer Impact Crater, Mauritania** (*Greg had a nadir pass over this young, small [2 km diameter] impact structure. While a well-defined circular crater is present, its small size will make it a challenging target. Overlapping mapping nadir-viewing frames, taken along track, were recommended in order to obtain imagery of the crater*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 7:01am EDT [= epoch]):

Mean altitude -- 352.6 km

Apogee height -- 357.2 km

Perigee height -- 348.0 km

Period -- 91.59 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006805

Solar Beta Angle -- 34.5 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 54 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56415

Significant Events Ahead (*all dates Eastern Time, some changes possible*.):

09/29/08 -- ATV de-orbit (nighttime re-entry for observation from 2 NASA aircraft; ~9:12pm)

10/01/08 -- **NASA 50 Years** (official)

10/02/08 -- ISS Reboost (~1.8 m/s)

10/10/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
12:33am

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/24/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) & landing

11/12/08 -- STS-126/Endeavour/ULF2 launch -- MPLM Leonardo, LMC

11/14/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch -- S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 09/23/08

All ISS systems continue to function nominally, except those noted previously or below. >>>> Today at ~8:10am EDT, the ISS (specifically its FGB module) completed **56,400 orbits** of the Earth, having covered a distance of 2.362 billion kilometers (1.476 billion st.miles) in 3595 days. The 19,300 kg (42,600 lbs) Zarya ("Dawn") was launched on a Russian/Khrunichev Proton from Baikonur almost ten years ago (11/20/98) as the first element of the multi-national space station. <<<<

CDR Volkov serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out"-to-vacuum cycle on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated tonight at ~4:15pm EDT. Filter bed #1 was regenerated yesterday. [Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently to remove any lingering Freon-218 from the cabin atmosphere (last time: 9/16 & 9/17).]

Volkov prepared, set up and activated the DAKON-M hardware for the new Russian experiment TEKh-15/"IZGIB" ("bend", "curve"), conducting equipment calibration and taking camcorder imagery of the activity, before tearing the gear down and putting it back in stowage. The video footage was downlinked at ~8:00am EDT.

[For the purpose of updating mathematical models of the ISS gravitation environment, IZGIB uses accelerometers of the Russian SBI Onboard Measurement System, the GIVUS high-accuracy angular rate vector gyrometer of the SUDN Motion Control & Navigation System and other accelerometers for unattended measurement of micro-accelerations at science hardware accommodation locations - (1) in operation of onboard equipment having rotating parts (gyrodynes, fans), (2) when establishing and keeping various ISS attitude modes, and (3) when performing crew egresses into space and physical exercises.]

The CDR & FE-1 completed the two-hour Part 2 of their second onboard "Profilaktika" (MBI-8, "Countermeasures") series of preventive health maintenance fitness testing on the treadmill, assisting each other in turn. *[Today's fitness test was performed on the TVIS in unmotorized (idle) mode, with free choice of speeds within the range permitted. The test investigates the action mechanism and efficiency of various countermeasures (currently VELO and TVIS) aimed at preventing locomotor system disorders in weightlessness. The test differs from the normal TVIS session by the use of the TEEM-100 gas analyzer (via a mask equipped with a pneumotachometer sensor), measurement of blood lactate level and subjective evaluation of physical exertion levels during the test. The lactate blood samples were taken twice at the end of the session, using the ACCUSPORT analyzer and REFLOTRON-4 accessories. Results were entered on a log sheet. TEEM and ECG (electrocardiograph) data were transferred to the RSE-Med laptop, also on a tape cassette (Cardiocassette-2000), and prepared for later downlink via Regul-Packet comm.]*

FE-2 Chamitoff deployed five new 30P-delivered SODF ATU (Station Operations Data File/Audio Terminal Unit) procedures cue cards in the Airlock (A/L), in the Lab (at the aft ATU), in Node-2 (at the port ATU), in the JPM (JEM Pressurized Module) near the JEM RMS (Robotic Manipulator System) workstation, and in the COL (Columbus Orbital Laboratory) at the portside aft ATU.

Afterwards, Gregory completed another run with the MedOps experiment WinSCAT (Spaceflight Cognitive Assessment Tool for Windows), his fourth onboard session, by logging in on the MEC (Medical Equipment Computer) and performing the psychological evaluation exercise on the laptop-based WinSCAT application. *[WinSCAT is a monthly time-constrained questionnaire test of cognitive abilities, routinely performed by astronauts aboard the ISS every 30 days before or after the PHS (periodic health status) test or on special CDR's, crewmembers or flight surgeons request. The test uses cognitive subtests that measure sustained concentration, verbal working memory, attention, short-term memory, spatial processing, and math skills. The five cognitive subtests are Coding Memory - Learning, Continuous Processing Task (CPT), Match to Sample, Mathematics, and Coding Delayed Recall. These WinSCAT subtests are the same as those used during NASA's long-duration bed rest studies.]*

After recharging the battery for the SONY DVCAM-150 video camcorder, the CDR set it up alongside the Fialka UVC (Ultraviolet Video Camera) for an equipment test of the geophysical GFI-1 Relaksatsiya ("relaxation") experiment, with which to record images and radiation patterns of the ATV (Automated Transfer Vehicle) "Jules Verne" during its reentry next week (9/29, ~9:12pm EDT). Afterwards, the equipment was deactivated and disassembled. *[Relaksatsiya normally deals with the study of the chemoluminescent chemical reactions and atmospheric light*

phenomena (emissions, i.e., molecular relaxation processes), including those that occur during high-velocity interaction between the exhaust products from space vehicles and the atmosphere at orbital altitude and during the entry of space vehicles into the Earth's upper atmosphere. "Relaxation", in Physics, is the transition of an atom or molecule from a higher energy level to a lower one, emitting radiative energy in the process as equilibrium is achieved.]

The FE-2 took down and stowed the UOP DCP (Utility Outlet Panel/Display & Control Panel) bypass power cable to the VTR (Video Tape Recorder) at the Lab CUP RWS (Cupola Robotics Work Station), set up for the recent SSRMS (Space Station Remote Manipulator System) activities (9/8).

Chamitoff & Volkov conducted the major task, deferred earlier, of relocating the CHeCS (Crew Health Care Systems) Rack in the Lab from the D4 position to the LAB S4 position, which required them to –

- Clear stowage items from the D4 rack front and from the S4 empty rack bay;
- Clear a 50in x 72in. translation passage of protruding items, needed for the rack transfer,
- Relocate the CHeCS Rack from position D4 to S4,
- Reroute cables as required and mate CHeCS umbilicals, and
- Restow any items temporarily relocated before the transfer to their original locations.

[The remaining rack transfers have been rescheduled as follows:

- *HRF-2 from Lab P1 to COL SA4 (10/1),*
- *HRF-1 from Lab S2 to COL F4 (10/2),*
- *MELFI from Lab O4 to JPM D4 (10/3),*
- *a ZSR (Zero-G Stowage Rack) from Lab O5 to JPM F6 (10/7),*
- *a second ZSR from Node-2 D5 to JLP A2 (10/7), and*
- *an RSR (Resupply Stowage Rack) from Node-2 P5 to Lab O5 (10/7).]*

With the CHeCS Rack transferred, Chamitoff worked on completing the outfitting of the future Regenerative ECLSS with the Modification Kit #1, started earlier (8/28).

On the Russian Matryoshka-R (RBO-3-2) radiation payload in the DC-1 Docking Compartment, Oleg deactivated the AST Spectrometer, removed its ALC-951 PCMCIA (Portable Computer Memory Card International Adapter) and checked out its contents on the RSK-1 laptop before stowing it in its kit. AST remains off.

Sergey Volkov did additional work on the two new Zveno-B ("Link-B") modems plus, installed last month for the TVS LIV television system, by installing two VM electronic filters and their connection and grounding cables behind SM (Service Module) panel 437.

Oleg Kononenko meanwhile set up hoses, adapters and electric pump for transferring the potable water supplies from Progress M-65's BV1 & BV2 Rodnik water tanks into EDV containers in the SM. Later, the pumping equipment was dismantled and the activities were closed out. *[After hooking up the plumbing, the water was transferred at first to the EDVs in self-flow (under its own tank pressure), then using the compressor pump via a GZhS gas/liquid separator to remove air bubbles in the water. The tank bladders were then compressed. The subsequent filling of the empty Progress tanks with urine will be scheduled later. Each of the two Progress tanks carries 53 liters of water, which amounts to two full EDVs, leaving 9 liter for filling into a fifth EDV. One of the full EDVs was then installed in the SVO-ZV Water Supply System, replacing an empty EDV (#4).]*

Starting a new round of periodic preventive maintenance of ventilation systems in the RS (Russian Segment), the FE-1 had almost 3 hrs reserved for cleaning fan screens in the SM.

At ~1:35pm EDT, MCC-H uplinked and installed a new payload software patch to the Lab RWS PCS (Portable Computer System), and later today Greg Chamitoff will configure the A31p after its ground-commanded reboot. *[Uploaded files were R10011PYLDP4.pch & R10011PYLDP4.cmd.]*

In the SM, Oleg completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Sergey took care of the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew had their regular weekly PMCs (Private Medical Conferences) via S- & Ku-band audio/video, Sergey at ~12:05pm, Oleg at ~1:30pm, Greg at ~1:45pm EDT.

At ~5:20pm, just before sleep time, the FE-1 will again set up the Russian MBI-12 SONOKARD (Sonocard) payload and start his eleventh experiment session, using a sports shirt from the SONOKARD kit with a special device in the pocket for testing a new method for acquiring physiological data without using direct contact on the skin. Measurements are recorded on a data card for return to Earth.

[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3)

study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]

At ~11:10am, TsUP-Moscow ran a test of String 3 of the Regul-OS, without requiring crew attendance. *[Regul-OS is the Russian radio control and communications system (RSUS), equivalent to the U.S. S-band system. It is the nominal uplink path for all Russian commanding, and it handles two-way voice comm, digital/command/program data, as well as telemetry via RGS (Russian ground sites).]*

The crew completed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill with vibration isolation (CDR/MBI-8, FE-1/MBI-8), CEVIS cycle ergometer (FE-2), and RED resistive exercise device (FE-2).

Later, Sergey transferred the exercise data files to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

As generally every day now, starting at ~9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) is activated intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking. CDRA remains “yellow” on the ISS critical systems list.]*

Conjunction: Another piece of debris from the Kosmos-2421 satellite (Object 33134) will pass by ISS tomorrow morning at 6:03am EDT. Latest trajectory predictions indicate a miss distance of 19.13 km ($P_c = 6.3 \times 10^{-15}$). No avoidance action is required.

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this “Gateway” website:
<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 8:10am EDT [= epoch]):
Mean altitude -- 352.7 km

Apogee height -- 357.3 km
Perigee height -- 348.0 km
Period -- 91.59 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0006907
Solar Beta Angle -- 38.6 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.72
Mean altitude loss in the last 48 hours -- 89 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 56400

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/29/08 -- ATV de-orbit (nighttime re-entry for observation from 2 NASA planes; 9:12pm)
10/01/08 -- **NASA 50 Years** (official)
10/02/08 -- ISS Reboost (~1.8 m/s)
10/10/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4) 12:33am
10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)
10/24/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) & landing
11/12/08 -- STS-126/Endeavour/ULF2 launch -- MPLM Leonardo, LMC
11/14/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch -- S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A -- MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A -- Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osp/iss_reports/index.htm

ISS On-Orbit Status 09/22/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 23 of Increment 17.*

CDR Volkov performed the periodic maintenance of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The process will be terminated at ~4:30pm EDT and Bed #2 regeneration performed tomorrow. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently (last time: 9/16 & 9/17).]*

Sergey Volkov and Oleg Kononenko again had several hours set aside for Progress 30P unloading, transferring and stowing Russian & US cargo aboard the station, while tracking moves & locations in the IMS (Inventory Management System) database with BCRs (Bar Code Readers).

The CDR and FE-1 both completed the first part of the onboard "Profilaktika" (MBI-8, "Countermeasures") preventive health maintenance fitness test on the VELO bicycle ergometer, assisting each other in turn. Part 2, on the TVIS treadmill, is scheduled tomorrow. *[Test procedure for MBI-8, which requires workouts on the VELO and TVIS, is identical to the Russian MO-5 assessment, but in addition to the nominal procedure it uses the TEEM-100M gas analyzer with breathing mask, a blood lactate test with the ACCUSPORT analyzer and REFLOTRON-4 accessories, and a subjective evaluation of physical exertion levels during the test (using the Borg Perceived Exertion Scale, viz., 10 steps from very light over hard and very hard to maximum). Results are entered on a log sheet. TEEM and ECG (electrocardiograph) data are transferred to the RSE-Med laptop, also on a tape cassette (Cardiocassette-2000), and prepared for later downlink via Regul-Packet comm. Results are also called down to specialists standing by at TsUP.]*

Sergey Volkov spent some time familiarizing himself with the DAKON-M hardware and procedures for the new Russian TEKh-15 experiment “IZGIB” (“bend”, “curve”), scheduled tomorrow. *[IZGIB uses accelerometers of the Russian SBI Onboard Measurement System, the GIVUS high-accuracy attitude sensors of the SUDN Motion Control & Navigation System and the LKT local temperature sensor in the Progress 30P vehicle for unattended study of the relationships between onboard systems operating modes and ISS flight conditions.]*

FE-2 Chamitoff conducted the periodic inspection of the SPS ELPS (Secondary Power System/Emergency Lighting & Power Supply) subsystems in the Lab (2 units), Node-2 (2 units), A/L (US Airlock, 1 unit), and Node-1 (3 units).

In the U.S. “Quest” A/L, FE-2 Chamitoff installed EMU (Extravehicular Maneuvering Unit) spacesuit #3003 for the standard suit maintenance process, including dumping water from and refilling the feedwater tank. Afterwards, the scrubbing was terminated, the EMU water processing kit disassembled and the equipment stowed.

[After removing EMU #3018 from the aft EDDA (EMU Don Doff Assembly) and installing #3003 instead, Greg connected it to its SCUs (Service & Cooling Umbilicals) and initiated the standard 1hr scrubbing process on the spacesuit’s cooling water loops, filtering ionic and particulate matter (via a 3-micron filter). Afterwards, the FE-2 reconfigured the cooling loops and initiated the ~2hr biocide filtering. Loop scrubbing, incl. iodination of the LCVGs (Liquid Cooling & Ventilation Garments) for biocidal maintenance, is done to eliminate any biomass and particulate matter that may have accumulated in the loops].

The FE-1 took and downloaded the periodic sensor readings of the Russian “Pille-MKS” (MKS = ISS) radiation dosimetry experiment which has ten sensors placed at various locations in the Russian segment (DC1, SM starboard & port cabin windows, ASU toilet facility, control panel, etc.). *[Nine of the ten dosimeters are read manually.]*

The CDR initiated another recharge cycle on the batteries for the SONY HVR-Z1J digital high-definition camcorder used for onboard video tapings.

In the SM, Oleg completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Sergey took care of the daily IMS maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Gregory restored the AAL (Alternate Applications Laptop) in the US Lab to its previous SSC (Station Support Computer) configuration by replacing the AAL HDD (Hard Disk Drive) with the original SSC drive and stowing the AAL drive. *[The AAL was prepared on 9/9 from a previously-loaded SSC for use on the OpsLAN network with applications requiring older software & driver versions, specifically to run the DCS760 digital cameras needed for the BCAT-3/4 (Binary Colloidal Alloy Test) science experiment.]*

The FE-2 also spent several hours supporting JAXA's SSIPC (Space Station Integration & Promotion Center) in checking out the CB (Clean Bench) subrack's Microscope unit. Afterwards, Greg deactivated CB ventilation. *[CB checkout, without Microscope, was started last month. Ground commanding of JPM (JEM Pressurized Module) payloads, including checkout and temperature control, is done remotely by the SSIPC at Tsukuba/Japan. The CB provides a germ-free environment for life science and biotechnological experiments. It has a specially designed microscope that operates with bright-field, phase-contrast and fluorescence modes. The objective lens can be switched between four magnification levels (4x, 10x, 20x, 40x).]*

Working off the Russian at-crew's-discretion task list, Kononenko conducted the regular status check of the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (barley) under spaceflight conditions in the Lada-13 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}).

The crew completed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), RED resistive exercise device (FE-2), and VELO bike with bungee cord load trainer (CDR/MBI-8, FE-1/MBI-8).

Later, Sergey transferred the exercise data files to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~3:10pm EDT, the crew will convene for their standard bi-weekly teleconference with the JSC Astronaut Office (Steve Lindsey), via S-band S/G-2 audio & phone patch.

As generally every day now, starting at ~9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) is activated intermittently for two half-

cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking. CDRA remains "yellow" on the ISS critical systems list.]*

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 9/1/08, this database contained 770,668 views of the Earth from space, with 324,812 from the ISS alone).

ISS Orbit (as of this morning, 7:44am EDT [= epoch]):

Mean altitude -- 352.8 km

Apogee height -- 357.5 km

Perigee height -- 348.0 km

Period -- 91.59 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007075

Solar Beta Angle -- 42.4 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 48 hours -- 48 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56384

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/29/08 -- ATV de-orbit (nighttime re-entry for observation from 2 NASA planes; 9:12pm)

10/01/08 -- **NASA 50 Years** (official)

10/02/08 -- ISS Reboost (~1.8 m/s)

10/10/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
12:33am

ISS On-Orbit Status 09/21/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – off-duty day for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff. Last day of Summer! Ahead: Week 23 of Increment 17.*

The crew performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the SM (Service Module) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

As part of the house cleaning, Volkov and Kononenko conducted regular maintenance inspection & cleaning on fan screens in the FGB (TsV2), DC-1 (V3) and SM (VPkhO, VPrK, FS5, FS6 & FS9).

Kononenko completed the routine daily servicing of the SOZh system (ECLSS/ Environment Control & Life Support System) in the SM, including the periodic checkup on the Russian POTOK-150MK(150 micron) air filter unit of the SOGS air revitalization subsystem, gathering weekly data on total operating time & "On" durations for reporting to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

At ~10:15am EDT the crewmembers conducted their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-Houston and TsUP-Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

Working off the discretionary “time permitting” task list, CDR Volkov ran another session for Russia's Environmental Safety Agency (EKON), making observations and taking KPT-3 aerial photography with the NIKON D2X camera of environmental conditions in Russia.

Also for Sergey, the voluntary job list called for another run of the Russian DZZ-2 "Diatomeya" ocean observations program, using the NIKON-F5 DCS still camera with f85mm lens and the HDV camcorder from SM window #7 to record color field patterns in target water areas and current atmospheric conditions above them.

[Uplinked target zones in the Atlantic Ocean were the coastal area from the Argentine Bay Baja Grande to the Guinea coast, and in the Indian Ocean the area from the south of South Africa to the Bay of Bengal.]

The FE-1 meanwhile had two suggested tasks on the “available time” list: the regular status check of the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (barley) under spaceflight conditions in the Lada-13 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}), and the periodic documentary close-up photography of the two SKK materials exposure payloads mounted on the outside of the station,- SKK-2 on the “Pirs” Docking Compartment (DC-1) from SM window #6, and SKK-9 on the SM hull, from the DC-1 EVA hatch window.

A third voluntary task for Kononenko was another run of the Russian GFI-8 "Uragan" (hurricane) earth-imaging program, using the D2X digital camera with the F800 telephoto lens. *[Uplinked target areas were Andean glaciers in South America.]*

The crew completed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-2), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1).

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this “Gateway” website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (as of this morning, 7:17am EDT [= epoch]):

Mean altitude -- 352.8 km

Apogee height -- 357.3 km

Perigee height -- 348.3 km

Period -- 91.60 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0006687
Solar Beta Angle -- 45.7 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.72
Mean altitude gain in the last 48 hours -- 89 m (30P thruster test)
Revolutions since FGB/Zarya launch (Nov. 98) -- 56368

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/29/08 -- ATV de-orbit (nighttime re-entry for observation from 2 NASA planes; 9:12pm)
10/01/08 -- **NASA 50 Years** (official)
10/02/08 -- ISS Reboost (~1.8 m/s)
10/10/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4) 12:33am
10/11/08 -- Progress M-65/30P undocking (from SM aft)
10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)
10/24/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) & landing
11/12/08 -- STS-126/Endeavour/ULF2 launch -- MPLM Leonardo, LMC
11/14/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch -- S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A -- MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A -- Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A -- MPLM(P)

04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1

05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 09/20/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – light duty day for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff.*

Post-Hurricane Ike Update: JSC/MCC-H operations have been handed back to Houston. JSC will open officially for business on 9/22 (Monday). Overnight uplink from BCC (Backup Control Center) at MSFC/Huntsville to the ISS crew: *“By the time you read this, we should be well on our way back to Houston. Our stay in Huntsville has been amazing; the folks at the Huntsville Operations Support Center really know how to host a visiting Flight Control Team!”*

CDR Volkov and FE-1 Kononenko again had several hours set aside for Progress unloading, transferring and stowing Russian & US cargo aboard the station, while tracking moves & locations in the IMS (Inventory Management System) database with BCRs (Bar Code Readers).

Volkov also performed the routine task of taking two photos of the internal part of the SM (Service Module) aft port's SSVP-StM docking cone, used for the 30P linkup on 9/17 and earlier for the docking of ATV1 “Jules Verne”. These images are used to refine current understanding of docking conditions. The pictures were then transferred to OCA for subsequent downlinking. *[The objective is to take photo imagery of the scratch or scuff mark left by the head of the active docking probe on the internal surface of the passive drogue (docking cone) ring, now rotated out of the passageway. As other crewmembers before him, the CDR used the Nikon D1X digital still camera to take two pictures each with the hatch closed down.]*

Kononenko initiated another recharge cycle on the batteries for the SONY HVR-Z1J digital high-definition camcorder used for onboard video tapings.

For his Voluntary Weekend Science (VolSci) program today, FE-2 Chamitoff conducted his second session with the LOCAD-PTS (Lab-on-a-Chip Application

Development-Portable Test System) payload, first connecting (later disconnecting) the Reader unit to a UOP (Utility Outlet Panel), then sampling/swabbing surface sites in Node-1 for yeast & molds, using Glucan LAL cartridges and a Negative Control sample of clean water. *[LOCAD uses small, thumb-sized “microfluidic” cartridges that are read by the experiment reader. The cartridges contain dried extract of horseshoe crab blood cells (LAL/Limulus ameobocyte lysate) and colorless dye. LAL tests are used for the detection and quantification of bacterial endotoxins: in the presence of the bacteria, the dried extract reacts strongly to turn the dye a green color. Therefore, the more green dye, the more microorganisms there are in the original sample. Glucans are complex carbohydrate (sugar, D-glucose) macromolecules. The handheld device tests this new analysis technology by sampling for the presence of gram negative bacteria in the sample in about 15 minutes, showing the results on a display screen. Background: Lab-on-a-Chip technology has an ever-expanding range of applications in the biotech industry. Chips are available (or in development) which can also detect yeast, mold, and gram positive bacteria, identify environmental contaminants, and perform quick health diagnostics in medical clinics. The technology has been used to swab the MERs (Mars Exploration Rovers) for planetary protection. With expanded testing on ISS, began by Sunita Williams in March/April last year, this compact technology has broad potential applications in space exploration--from monitoring environmental conditions to monitoring crew health. The current study should prepare for long-duration exploration by demonstrating a system that enables the crew to perform biochemical analysis in space without having to return samples to Earth.]*

Oleg Kononenko unloaded new RODF (Russian Operations Data File) material from Progress 30P and replaced/updated respective procedures sheets in seven RODF books (Technical Experiments, Medical Experiments, Long-Duration Missions, SM IFM IVA, DC-1 IFM IVA, FGB IFM IVA, Progress M-65 Transfer Ops) plus the BIO4 DVD disk.

A new item added to Greg Chamitoff's discretionary “job jar” task list is to look for and locate a number of GRAs (Glove Ring Assemblies) for the MSG (Microgravity Science Glovebox). *[13 older GRAs are to return to Earth on ULF-2, while 13 GRAs of newer design are to remain onboard for the ULF-2 stage.]*

In the SM, the CDR completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS), today as a discretionary job from the “time permitting” task list. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The FE-1 performed the daily IMS maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

WRM Update: An updated WRM (Water Recovery Management) “cue card” was uplinked overnight for the crew’s reference, updated with the latest water audit.

[The new card (17-1016) lists 29 CWCs (~1047.4 L total) for the four types of water identified on board: technical water (326.2 L, for flushing only because of Wautersia bacteria), potable water (669.8 L, incl. 174.6 L currently on hold), condensate water (34.4 L), waste/EMU dump and other (17 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]

The crew completed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1).

Later, Oleg transferred the exercise data files to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~11:15am EDT, the crew downlinked a PAO TV address of greetings to the participants of the International Conference "Life Support Systems as Means of Human Exploration of Deep Space", to take place in Moscow next week (9/24-27), *dedicated to the 45th Anniversary of the State Scientific Center of Russian Federation –IMBP (Institute of Medical and Biological Problems) of the Russian Academy of Science, and it is carried out under the aegis of the Russian Academy of Science, Russian Space Agency, Federal Medical and Biological Agency of Russia, IMBP, RSC-Energia and Khrunichiev State Space Scientific and Industrial Center. [“...As it goes in a song – “The environment at home is topmost...». The ISS is currently our home, our street, our stadium, our work. It is the functioning of the life support system (SOZh) that our well-being, our mood and finally the successful implementation of the mission program depend on. The life support systems that combine the physico-chemical and biological processes of the cycle of matter become even more crucial in course of interplanetary expeditions. We are confident that the research results provided in presentations of the eminent scientists and experts in the field of the life support systems development as well as discussions concerning various directions of these systems creation will serve as a powerful incentive for the development of new perspective means to support long-lasting human life and work in deep space. We wish you successful work.”]*

Weekly Science Update (*Expedition Seventeen -- Week 22*)

3-D SPACE: In progress.

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):
Measurements continue in FGB module.

ANITA (Analyzing Interferometer for Ambient Air): Continuing.

BCAT-3 (Binary Colloidal Alloy Test 3): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System):
Samples returned on 1J.

CSI-2/CGBA-5 (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus 5): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): Due to safety concerns identified for the PLEGPAY instrument (when operated in Plasma Discharge mode), the entire EuTEF platform was put in survival mode on 9/1 at around 11:00am EDT (just prior to 29P undocking). Since then, the EuTEF power feeder#1 has been deactivated and no science acquisition is possible. Request has been approved for intermittent activation for 3 of the 9 EUTEF payloads (EXPOSE, MEDET, DOSTEL) while working on ensuring permanent re-activation as soon as possible.

FSL (Fluid Science Laboratory): FSL is nominal.

GEOFLOW: The GEOFLOW EC (Experiment Container) has been removed on 9/16 in view of the 30P docking.

HDTV System Test DL (JAXA): In progress.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Planned.

Marangoni Experiment for ISS (JAXA Fluid Physics Experiment Facility): Parts of the third run have been deferred to later because of control transfer to the BCC.

Micro-G Clay (JAXA EPO): Complete.

MISSE (Materials ISS Experiment): Ongoing.

Moon Photography from ISS (JAXA EPO): Complete.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-1/-2 (Nitric Oxide Analyzer, ESA): Next NOA-1 session currently planned on 9/30.

NUTRITION w/REPOSITORY: In progress.

PADLES (Passive Dosimeter for Lifescience Experiment in Space): In progress.

PCRF (Protein Crystallization Research Facility) Reconfiguration (JAXA): Complete.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SAMPLE: Complete.

SHERE (Shear History Extensional Rheology Experiment): In progress.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): In progress.

SOLAR (Solar Monitoring Observatory): The Sun observation window closed on 9/7. In view of Hurricane Ike and transition to BAT/BCC, SOLAR has been required to go to feeder#2 only. Instruments were therefore switched off on 9/11. Upon 30P docking on 9/17, SOLAR and its instruments were powered back on, awaiting the next sun visibility window expected to open as of 9/26.

SOLO (Sodium Loading in Microgravity): PCBA (Portable Clinical Blood Analyzer) pouches with control solution and cartridges have been transferred to MELFI and all SOLO kits have been transferred from Progress to the ETC (European Transport Carrier) in COL on 9/18. First SOLO session currently planned to start on 10/5. *[Note: The ETC carries payload items that cannot be launched within the ESA facilities because of stowage or transport limitations. In orbit it serves as a workbench and stowage facility to support experiments with Biolab, the Fluid Science Lab, the European Physiology Modules and the European Drawer Rack.]*

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): Reserve.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): Teams on ground continue to assess the results of the BIOLAB Rotor A Bellow Test, which gave faulty signals for 4 out of 6 Reference ECs. Rotor B Actuator test and Rotor B bellow test have been successfully performed on 9/5.

CEO (Crew Earth Observations): Ongoing.

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/29/08 -- ATV de-orbit (nighttime re-entry for observation from 2 NASA planes; 9:12pm)

10/01/08 -- **NASA 50 Years** (official)

10/02/08 -- ISS Reboost (~1.8 m/s)

10/10/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
12:33am

10/11/08 -- Progress M-65/30P undocking (from SM aft)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/24/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) & landing

11/12/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/14/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking

02/26/09 -- STS-119/Discovery/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress M-67/32P undocking & deorbit

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/25/09 -- Soyuz TMA-15/19S launch

05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**

07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation

10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at

ISS On-Orbit Status 09/19/08

All ISS systems continue to function nominally, except those noted previously or below.

Post-Hurricane Ike Update: JSC/MCC-H operations will be handed back to Houston later today after the Progress thruster tests. JSC will open officially for business on 9/22 (Monday).

Working in the newly-arrived Progress M-65 cargo ship (TKG), CDR Volkov installed the LKT local temperature sensor commutator (TA251MB) of the BITS2-12 onboard telemetry measurement system, along with its ROM unit (read-only memory, TA765B), a 1-hr. job. The LKT was subsequently switched on by the ground to complete the basic configuration. *[The standard US-21 matching unit was installed yesterday, connecting the SM (Service Module) with the Progress motion control and DPO thrusters systems, so that they can be commanded by the SM computer system (BVS). The Progress thrusters will be test fired later today to insure their functionality in providing attitude control for ISS. This fully incorporates 30P into the steering logic for the ISS.]*

Volkov and FE-1 Kononenko had again several hours set aside for Progress unloading, transferring and stowing Russian & US cargo aboard the ISS, while tracking moves & locations in the IMS (Inventory Management System) database with BCRs (Bar Code Readers)

Afterwards, Sergey & Oleg undertook their fifth periodic (generally monthly) health test with the cardiological experiment PZEH MO-1 ("Study of the Bioelectric Activity of the Heart at Rest") on the TVIS (Treadmill with Vibration Isolation System). *[During the 50-min. test, the crewmembers tagged up with ground specialists on an RGS (Russian Groundsite) pass at ~12:23pm EDT via VHF and downlinked data from the Gamma-1M ECG (electrocardiograph) for about 5-6 minutes.]*

Working in the JAXA Kibo laboratory, FE-2 Chamitoff continued outfitting activities,

first assembling LDFR (Long Duration Foot Restraints), with plates and loops, and their mounting rails, then installing the LDFRs in the JPM (JEM Pressurized Module). After also unstowing and installing four SDFRs (Short Duration Foot Restraints) in Kibo, Gregory took a series of photographs in JPM and JLP (JEM Logistics Pressurized Section), documenting current stowage configurations.

Afterwards, Chamitoff replaced failed lights (GLAs/General Luminaire Assemblies) in Kibo, specifically in JLP

a failed LHA (Light Housing Assembly, FP2), replacing it with the LHA from lighting fixture PA2, plus a failed BBA (Baseband Assembly), and in JPM a failed LHA (OA2), replacing it with the LHA of OF2, plus a failed BBA (OF2).

Greg also made preparations for packing the dried marble papers that resulted from the JAXA EPO (Education Payload Operation) experiments AQUASPHERE and INK BALL for return to Earth. *[The Japanese EPO program consists of eight activities: Life in the Universe (study of space environment effects on living things for educational purpose); Space Poem Chain (poems by famous poets and general public composed & recorded before the launch on a DVD, played and stored on ISS); Microgravity Clay (sculpting in clay to express the inspiration of human space flight); Aquasphere (recording the motion of a water sphere after external oscillations in micro-G environment with an HDTV camera, making various water shapes by vibration); Ink Ball (creating ink flow patterns/"marbling" on the water sphere, then transferring the marbling from the water ball to handmade Japanese papers for recording); Art (images taken with the HDTV camera on the ISS); Space Clothes (studying new clothing designs in space); and Photographing the Moon (images taken of the Moon from the station).]*

In addition, the FE-2 performed troubleshooting on the JPM PLT (Payload Laptop), an A31p/ThinkPad, by calling up and checking its BIOS Setup Utility. As noticed early last month, the PLT had developed a noisy hard drive (see 8/1/08 status).

In the SM, the CDR completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS), today as a discretionary job from the "time permitting" task list. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The FE-1 performed the daily IMS maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Gregory completed the weekly 10-min. CWC (Contingency Water Container)

inventory as part of on-going WRM (Water Recovery & Management) assessment of onboard water supplies. Updated “cue cards” based on the crew’s water calldowns are sent up every other week. *[The new card (17-0002Z) lists 30 CWCs (~1100.4 L total) for the four types of water identified on board: technical water (342.3 L, for flushing only because of Wautersia bacteria), potable water (706.7 L, incl. 174.6 L currently on hold), condensate water (34.4 L), waste/EMU dump and other (17 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]*

Chamitoff completed another one of the periodic inspections of the RED (Resistive Exercise Device) canister cords and accessories, currently done every two weeks.

The FE-2 also took measurements for the regular atmospheric status check for ppCO₂ (Carbon Dioxide partial pressure) in the Lab, SM at panel 449 and COL (Columbus Orbital Laboratory) plus battery ticks, using the hand-held CDMK (CO₂ Monitoring Kit, #1002). The unit was then deactivated and returned to its stowage location (LAB1S2). *[Purpose of the 5-min activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements.]*

Greg conducted the regular 30-day inspection of the new AED (Automated External Defibrillator) in the CHeCS (Crew Health Care Systems) rack. *[The AED is a portable electronic device that automatically diagnoses the potentially life threatening cardiac arrhythmias of ventricular fibrillation and ventricular tachycardia in a patient. It then can treat them through defibrillation, i.e., the application of electrical therapy which stops the arrhythmia, allowing the heart to re-establish an effective rhythm. AEDs are generally either held by trained personnel who will attend events or are public access units which can be found in places including corporate and government offices, shopping centers, airports, restaurants, casinos, hotels, sports stadiums, schools and universities, community centers, fitness centers, health clubs and any other location where people may congregate.]*

The crew completed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR/MO-1, FE-1/MO-1), RED resistive exercise device (CDR, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1).

Later, FE-2 transferred the exercise data files to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~4:15am EDT, Sergey & Oleg linked up with TsUP stowage specialists via S-band to conduct the weekly IMS tagup, discussing inventory & stowage issues, equipment locations and cargo transfers.

At ~6:15am, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU/*Glavnaya operativnaya gruppа upravleniya* = “Chief Operative Control Group”), including Shift Flight Director (SRP), at TsUP-Moscow via S-band/audio, phone-patched from Houston and Moscow.

Dynamic 30P Thruster Tests: FE-2 Chamitoff closed the protective shutters of the science window in the JAXA JPM (~9:00am EDT) and in the US Lab (~9:15am) in preparation for the Progress thruster firings, which are scheduled at ~2:01pm (Manifold 1) & ~3:32pm (Manifold 2). The translational DPO-B (Approach & Attitude Control) thruster tests, intended to check 30P’s full integration into the ISS steering logic and ensure thruster functionality in providing attitude control, reboosts and debris avoidance maneuvers (DAMs), do not require any powerdowns. They are also used to determine which thruster manifold, of two jets each, will be considered the primary one for reboosting and DAMs.

CDRA Update: The US Carbon Dioxide Removal Assembly is working nominally.

[On 9/13, CDRA had a hardware failure caused by the CSV (Channel Selector Valve) and ASV (Air Supply Valve) not completing valve position changes during a half cycle transition. Manual commanding of the valves was attempted twice, without success, whereupon CDRA was shut down and the LTL (Low Temperature Loop) coolant jumper disconnected. On 9/15, the valves were successfully ground-commanded into position and the CDRA was reactivated. It is now operating without further problems. The 9/13 valve event is thought to be a recurrence of intermittent CSV valve positioning problems (“sticking”) encountered before, caused by zeolite dust contamination of the valve sealing surfaces. Procedures exist to manually command the valves to their correct positions. It is also possible to clean or replace the valves on orbit. Background: A zeolite is a hydrated aluminosilicate mineral with a micro-porous structure. More than 150 zeolite types have been synthesized and 48 naturally occurring zeolites are known (e.g., volcanic ashes).

They are the aluminosilicate members of the family of microporous solids known as “molecular sieves”, which refers to a particular property of these materials: the ability to selectively sort molecules based primarily on a size exclusion process.]

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (as of this morning, 8:00am EDT [= epoch]):

Mean altitude -- 352.7 km

Apogee height -- 357.3 km

Perigee height -- 348.1 km

Period -- 91.59 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006843

Solar Beta Angle -- 51.0 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 70 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56337

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/29/08 -- ATV de-orbit (nighttime re-entry for observation from 2 NASA planes; 9:12pm)

10/01/08 -- **NASA 50 Years** (official)

10/02/08 -- ISS Reboost (~1.8 m/s)

10/10/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4) 12:33am

10/11/08 -- Progress M-65/30P undocking (from SM aft)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/24/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) & landing

11/12/08 -- STS-126/Endeavour/ULF2 launch -- MPLM Leonardo, LMC

11/14/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch -- S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking

02/26/09 -- STS-119/Discovery/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress M-67/32P undocking & deorbit

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/25/09 -- Soyuz TMA-15/19S launch

05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 09/18/08

All ISS systems continue to function nominally, except those noted previously or below. *Crew wake-up time remained shifted forward by one hour (3:00am); sleeptime tonight is back on regular (5:30pm) as will be tomorrow's schedule.*

Hurricane Ike Recovery Update: JSC/MCC-Houston remains closed but will open on Monday (9/21). BAT/BCC (BCC Advisory Team/Backup Control Center) are maintaining monitoring and commanding through JSC assets. ISS FC (Flight Control) will resume from MCC-H tomorrow during the morning hours (9/19, Friday).

After yesterday's nominal Progress M-65/30P docking (2:43pm EDT), crew activities today dealt mostly with cargo unloading, transferring, unpacking, stowing and IMS (Inventory Management System) logging. *[Using an uplinked transfer list, CDR Volkov & FE-1 Kononenko had about 4.5 hrs reserved for stowing cargo items in the limited free volume zones of the FGB, including 26 KRP containers with Russian food rations (2 for ISS-17, 24 for ISS-18/Fincke, Lonchakov, Wakata), 6 containers and 2 CTBs (Cargo Transfer Bags) with American "bonus" food (Fincke, Lonchakov, Chamitoff). Food rations include "skip cycle" backup stock for the event of missed Progress 31P delivery. Eagerly awaited fresh food packages include tomatoes, apples, grapefruits, onions and garlic.]*

In addition, Volkov & Kononenko applied special priority to the unloading & transfer of time-critical science experiment/payloads to the ISS, specifically –

- TKhN-9 (KRISTALLIZATOR/Crystallizer): for biological macromolecule crystallization and to obtain bio-crystal films under micro-G conditions. *[Transferred to the SM (Service Module) plus activation of crystallization process and documentation with NIKON D2X digital photography by Oleg],*
- BTKh-1,2,3,4,20 (GLICOPROTEID/Glycoprotein, MIMETIK-K, KAF, VAKTSINA-K/Vaccine, INTERLEUKIN-K): for biotechnological crystal growth and study of various proteins. *[With the "Luch-2 biocrystallizer and the "Kriogem-03M" freezer, stowed in the SM and documented with NIKON*

- *photography],*
- BTKh-29 ZHENSHEN-2 (Ginseng-2), in BIOEKOLOGIYA #10 container, for the study of new plants for biological products and genotypes with increased biological activity. *[Transferred from 30P to the DC1 Docking Compartment & photographed],* and
- SOLO PCBAs (Sodium Loading in Microgravity/Portable Clinical Blood Analyzers) for upcoming experimentation by Gregory Chamitoff. *[Transferred from 30P to the MELFI (Minus Eighty Degree Laboratory Freezer for the ISS) and stowed in a box module in Dewar 4, with photo documentation.]*

After the unloading, with the Elektron O₂ generator and BITS2-12 onboard measurement telemetry (TM) system turned off by ground commanding, Sergey Volkov worked in the new Progress cargo ship, installing the standard US-21 matching unit, a 1-hr. task, and then hooked up its TM connector to the BITS2-12. *[The US-21 Matching Unit connects the SM with the Progress motion control and DPO thrusters systems, so that they can be commanded by the SM computer system (BVS). The BITS2-12 and its VD-SU control system mode were subsequently turned back on. A dynamic Progress thruster test of the complete integration of 30P into the ISS is scheduled tomorrow (2:01pm-2:04pm & 3:32pm-3:25pm), after installation of the LKT local temperature sensor commutator (TA251MB) of the BITS2-12, along with its ROM unit (read-only memory, TA765B).]*

With BITS2-12 again up and running, TsUP-Moscow will restart the Elektron electrolysis unit at ~2:45pm EDT in 32A mode, while Volkov monitors the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there is no overheating.

Also, as a new regular activity after deactivation/reactivation of the VD-SU control mode, Sergey will be checking the BRI Smart Switch Router computer and its new Ethernet connection to assess any potential impact of these activities on Ethernet comm. *[BRI is part of the RS OpsLAN (Russian Segment/Operations Local Area Network), with connections to the three SSC clients, the Ethernet tie-in with the US network, and a network printer in the RS.]*

FE-2 Chamitoff powered down the IWIS (Internal Wireless Instrumentation System), then downloaded the accumulated structural dynamics data of yesterday's Progress docking from the IWIS RSUs (Remote Sensor Units) in the Lab, Node-1, Node-2, FGB and SM.

Performing corrective outfitting in the JAXA JPM (JEM Pressurized Module), Gregory installed hatch handle guide rings at the overhead & starboard hatches

(EVA side), along with stowage decals for the two.

Also in the Kibo laboratory, the FE-2 connected the rack-to-module umbilicals of the ICS (Interorbit Communications System) Rack, one of the eight racks delivered on STS-123/Endeavour (1J/A) last March. *[Note: The JEMRMS (JEM Robotic Manipulator System) checkout planned for tomorrow was deferred to a later date.]*

In Node-2, Greg also installed a hatch handle guide ring, at its port hatch (EVA side).

In the SM, the CDR completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS), today as a discretionary job from the “time permitting” task list. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The crew completed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1).

Later, Chamitoff transferred the exercise data files to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

WRM Update: An updated WRM (Water Recovery Management) “cue card” was uplinked overnight for the crew’s reference, updated with the latest water audit.

[The new card (17-0002Z) lists 30 CWCs (~1100.4 L total) for the four types of water identified on board: technical water (342.3 L, for flushing only because of Wautersia bacteria), potable water (706.7 L, incl. 174.6 L currently on hold), condensate water (34.4 L), waste/EMU dump and other (17 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]

Dynamic 30P Thruster Tests: Standard Progress thruster test firings are scheduled tomorrow, in order to check 30P’s full integration into the ISS steering logic and ensure thruster functionality in providing attitude control, reboosts and debris avoidance maneuvers (DAMs). No powerdowns required. The DPO (Approach & Attitude Control) thrusters will be fired on Manifold 1 & 2 at 2:01pm EDT & 3:32pm, respectively. *[These dynamic firings test the installation of the electronic US-21 Matching Unit box in the Progress vehicle, performed today, which*

connects its motion control and DPO systems to the SM so that they can be commanded by the latter's BVS computer system. They are also used to determine which thruster manifold will be considered the primary one for reboosting and DAMs.]

TRRJ Anomalies: Three “tooth crashes” (temporarily misaligned gear teeth in weightlessness) occurred associated with TRRJ (Thermal Radiator Rotary Joint) operations during Progress docking; two were recovered by autorecovery and one was recovered manually. In all three cases, autorecovery software did not work as expected.

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this “Gateway” website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (as of this morning, 7:48am EDT [= epoch]):

Mean altitude -- 352.8 km

Apogee height -- 357.4 km

Perigee height -- 348.2 km

Period -- 91.60 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006802

Solar Beta Angle -- 52.7 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 58 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56321

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/19/08 -- Progress 30P dynamic thruster test

09/29/08 -- ATV de-orbit (nighttime re-entry for observation from 2 NASA planes; 9:12pm)

10/01/08 -- **NASA 50 Years** (official)

10/02/08 -- ISS Reboost (~1.8 m/s)

10/10/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
12:33am

10/11/08 -- Progress M-65/30P undocking (from SM aft)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/24/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) & landing

11/12/08 -- STS-126/Endeavour/ULF2 launch -- MPLM Leonardo, LMC

11/14/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 09/17/08

All ISS systems continue to function nominally, except those noted previously or below. *Crew sleep cycle: Wake time was shifted forward by one hour (3:00am-6:30pm EDT) to gain additional time tonight for Progress post-dock activities.*

Hurricane Ike Recovery Update: JSC/MCC-H remains closed but will open on Monday (9/21). BAT/BCC (BCC Advisory Team/Backup Control Center) are maintaining monitoring and commanding through JSC assets. Communications with ISS are open from JSC, but on single server/string (no redundancy). Ku-band downlink for video depends on TDRS (Tracking & Data Relay Satellite) availability.

Yest kasaniye! At 2:43pm EDT, Progress M-65 (30P) docked smoothly at the SM (Service Module) aft port, followed by a final DPO post-contact thrusting burn, docking probe retraction and hook closure ("sborka") after motion damp-out, while the ISS was in free drift for ~20 min. At "hooks closed" signal, the SM returned to active attitude control, maneuvering the ISS to LVLH TEA (local vertical/local horizontal Torque Equilibrium Attitude). Control authority will return to US Momentum Management at ~4:25pm. All Progress systems operated nominally from Automated Rendezvous start at ~2:12pm. The crew was provided with all necessary instructions for taking over USOS (US Segment) docking preparations in case the single-string command link from BCC/Huntsville was lost. *[Launched on 9/10 (3:50:02pm EDT), the cargo vehicle was "standing by" since 9/12, orbiting independently in a holding position to await resumption of adequate NASA ground support after the Hurricane emergency. For remote commanding of Progress, Russia has 12 RGSs (Russian Groundsites) spread west-to-east along northern Russia. They up-command autonomously but are connected to TsUP-Moscow for real-time telemetry & video via fiber optic land lines and the Primorya geostationary satellite (Molniya sats were not used for 30P). The M-65 resupply drone delivered about 2.4 tons (5357 lbs) of cargo for the ISS crews, including propellants (~1900 lbs) for the Russian thrusters, fresh water (~465 lbs), oxygen and air (~110 lbs), food, and dry cargo (~2865 lbs of spare parts, repair gear, life support and science experiment hardware).]*

CDR Volkov serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out"-to-vacuum cycle on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated tonight at ~4:50pm EDT. Filter bed #1 was regenerated yesterday. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently to remove any lingering Freon-218 from the cabin atmosphere (last time: 9/8 & 9/9).]*

FE-1 Kononenko conducted the periodic checkout/verification of IP-1 airflow sensors in the various RS (Russian Segment) hatchways, including the passageways SM PrK (Transfer Compartment) – RO (SM Working Compartment), PkhO (SM Transfer Tunnel) – RO, PkhO – DC1, PkhO – FGB PGO, FGB PGO – FGB GA, and FGB GA–Node-1.

In Node-1, FE-2 Chamitoff worked on the RED (Resistive Exercise Device), performing the periodic re-calibration of the two pulley canisters. *[The calibration is performed approximately every 2 months and after cable replacement to allow exercise specialists on the ground to update exercise protocols as necessary and track hardware status. Upon receipt of the results of the calibration, the specialists review the data and, assuming favorable engineering analysis, give the crew a GO for their RED exercise session. Calibration of the load settings of the pulley cans is performed with an on-orbit calibration kit with a special calibration tool and steel handles.]*

Volkov & Kononenko had their regular PMCs (Private Medical Conferences), via VHF and RGS comm on DO14. Chamitoff's PMC was yesterday, also over RGS/VHF.

In the SM, the CDR completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS), today as a discretionary job from the "time permitting" task list. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The FE-1 performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew completed their regular daily 2.5-hr. physical workout program (about half

of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1).

Later, Greg transferred the exercise data files to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Most of the crew's time today went to preparing and supporting the Progress 30P docking at 2:43pm. Pre-docking activities called for Greg Chamitoff to –

- Close the protective shutters of the science window in the JAXA JPM (JEM Pressurized Module) and in the US Lab (~8:30am),
- Power down the Kenwood amateur radio equipment in the SM, to prevent RF (radio frequency) interference with Progress final approach and docking,
- Activate & configure the A31p laptop to support the transmission of MPEG2 streaming video from the RS via OpsLAN/Ku-band and US assets to Moscow, and
- Power up & reprogram the IWIS ICU (Internal Wireless Instrumentation System Interface Control Unit) with its RSUs (Remote Sensor Units) in the Lab, Node-1, Node-2, FGB and SM, for the automated activation at 2:23pm to monitor dynamic/vibrational responses of the station structure during the docking.

Sergey and Oleg meanwhile prepared their workplace at the TORU control station in the SM and stood by during the docking in readiness to take over control of the cargo ship. *[TORU is the manual mode through which a crewmember can perform necessary guidance functions from the SM in the event of a failure of the KURS automated rendezvous and docking (AR&D) of the Progress. With both KURS systems active by ~1:10pm (Active KURS radar on Progress, passive KURS transponders on SM solar array wing tips), KURS health was determined by a test at ~2:05pm. Should the test have failed, Volkov would have controlled the cargo ship's motions from the TORU control panel with two hand controllers, viewing the approach to the ISS from a Progress point-of-view through the Klest-M television camera mounted on the Progress. Remote TORU control from the ground is not available.]*

After the cargo ship's successful docking, activities by the two cosmonauts include –

- Shutting off TORU and reconfiguring the STTS telephone/telegraph subsystem to normal ops *[the "Voskhod-M" STTS enables telephone communications between the SM, FGB, DC1 and USOS, and also with users on the ground over VHF channels selected by an operator at an SM comm*

panel, via STTS antennas on the SM's outside. There are six comm panels in the SM with pushbuttons for accessing any of three audio channels, plus an intercom channel. Other modes of the STTS include telegraphy (teletype), EVA voice, emergency alarms, Packet/Email, and TORU docking support];

- Conducting the standard one-hour leak checking of the docking vestibule and fuel/oxidizer transfer line interface between Progress and SM *[during leak checking and initial clamp installation, Russian thrusters were inhibited (as was the case during docking)]*;
- Opening the hatches (~4:15pm) and installing the QD (quick disconnect) screw clamps (BZV) of the docking & internal transfer mechanism (SSVP) to rigidize the coupling;
- Performing the standard air sampling inside Progress with the Russian AK-1M air sampler;
- Powering down the spacecraft and installing the ventilation/heating air duct (~5:00pm); and
- Dismantling & removing the video equipment for the TV Ku-band downlink of the docking.

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (as of this morning, 7:22am EDT [= epoch]):

Mean altitude -- 352.8 km

Apogee height -- 357.5 km

Perigee height -- 348.2 km

Period -- 91.60 min.

Inclination (to Equator) -- 51.64 deg

ISS On-Orbit Status 09/16/08

All ISS systems continue to function nominally, except those noted previously or below.

Post-Hurricane Ike Update: JSC/MCC-H remains closed. BAT/BCC (BCC Advisory Team/Backup Control Center) have maintained monitoring and commanding through JSC assets. The BAT handed over to the BCC team at MSFC but remains powered through JSC assets so IPs (International Partners) have telemetry and commanding through the US assets. Communications with ISS are open from JSC (Link 10A), but on single server/string (no redundancy). BAT/BCC is prepared to handle tomorrow's Progress docking.

CDR Volkov, FE-1 Kononenko and FE-2 Chamitoff began their workday before breakfast with the periodic session of the Russian biomedical routine assessments PZEh-MO-7/Calf Volume Measurement & PZEh-MO-8/Body Mass Measurement, using the IM mass measurement device which Sergey Volkov broke down afterwards for stowage. *[Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference points, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures. For determining body mass in zero-G, where things are weightless but not massless, the Russian IM "scales" measure the inertial forces that arise during the oscillatory motion of a mass driven by two helical metering springs with known spring constants. By measuring the time period of each oscillation of the unknown mass (the crewmember) and comparing it to the period of a known mass, the crewmember's mass is calculated by the computer and displayed.]*

Sergey Volkov set up the hardware for the Russian MBI-21 PNEVMOKARD experiment and conducted the session, his fourth, which does not allow moving or talking during data recording. Afterwards, Kononenko had his fourth session. The experiment is controlled from the RSE-med A31p laptop, equipped with new software, and uses the TENZOPLUS sphygmomanometer to measure arterial blood

pressure. *[PNEVMOKARD (Pneumocard) attempts to obtain new scientific information to refine the understanding about the mechanisms used by the cardiorespiratory system and the whole body organism to spaceflight conditions. By recording (on PCMCIA cards) the crewmember's electrocardiogram, impedance cardiogram, low-frequency phonocardiogram (seismocardiogram), pneumotachogram (using nose temperature sensors), and finger photoplethysmogram, the experiment supports integrated studies of (1) the cardiovascular system and its adaptation mechanisms in various phases of a long-duration mission, (2) the synchronization of heart activity and breathing factors, as well as the cardiorespiratory system control processes based on the variability rate of physiological parameters, and (3) the interconnection between the cardiorespiratory system during a long-duration mission and the tolerance of orthostatic & physical activities at the beginning of readaptation for predicting possible reactions of the crewmembers organism during the their return to ground.]*

Volkov and Kononenko also conducted another session with the Russian biomedical MBI-15 "Pilot-M"/NEURO signal response experiment after setting up the workplace and equipment, with Oleg today's subject and Sergey assisting. Afterwards, the FE-1 closed out the Pilot-M & Neurolab-2000M experiment and stowed the gear. *[MBI-15 requires a table, ankle restraint system, eyeball electrodes for an EOG (electrooculogram), and two hand controllers (RUO & RUD) for testing piloting skill in "flying" simulations on a laptop (RSK1) under stopwatch control, as well as for studying special features of the psychophysiological response of cosmonauts to the effects of stress factors in flight.]*

The CDR performed the periodic maintenance of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The process will be terminated at ~5:15pm EDT and Bed #2 regeneration performed tomorrow. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently (last time: 9/8 & 9/9).]*

Sergey also completed the periodic (about twice a month) replenishing of the Elektron's water supply for electrolysis, filling the KOV thermal loops' EDV container with purified water from CWCs (Contingency Water Containers, #1064, #1074) collected by the U.S. CCAA (Common Cabin Air Assembly) dehumidifier. *[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron micropump shutdown.]*

Gregory Chamitoff had an additional hour set aside for more unpacking and

stowing crew provisions delivered on the ATV-1 (Automated Transfer Vehicle), to consolidate like items, reduce wasted stowage space and make room for additional cargo coming up on ULF2. *[Provisions include such items as athletic shoes, running shorts, T-shirts, sleep shirts, Nitrile gloves, disinfectant wipes, printer paper, office supplies and gray & Kapton tape. All moves were recorded with the BCR (Bar Code Reader) to update the IMS (Inventory Management System), except for pens and pencils.]*

In preparation for tomorrow's Progress 30P docking, Chamitoff spent time in the COL (Columbus Orbital Laboratory) to remove brackets and the FSL (Fluid Science Laboratory) GEOFLOW EC (Experiment Container) in order to prevent its bumping against the bottom of the CEM Upper drawer under the estimated g-load of the docking impact (which could damage shatterable material such as the lamp of the workspace lighting assembly).

In the SM (Service Module), CDR Volkov had almost three hours to work on recovering the KOB2 loop of the Russian SOTR internal thermal control system by replacing its failed 4SPN1 pump panel with a spare unit. Afterwards, the two micro pumps were tested with a manual pump assembly and a pressure gauge. Last 4SPN1 panel replacement: 4/28/08. *[Each of the two SOTR KOB loops has two redundant pump panels with two redundant micro pumps each. While in the early years of Mir and ISS the pumps were integral to the SPN panels, the current design allows them to be replaced without requiring an entire new SPN block.]*

The FE-2 continued the software upgrading on three onboard PDAs (Personal Digital Assistants), after their charging, - two with BCR (Barcode Reader) software (replacing the previous "Dolphin" BCRs), the third with WINS (Wireless Network Survey) software. *[The loading had to be preceded by powering off the RF LAN (Radio Frequency Local Area Network) Access Point (Proxim) and activation of the new Netgear WAPs (Wireless Access Points) in Node-1 and Node-2.]*

Afterwards, Greg moved the wireless card-equipped SSC-14 (Station Support Computer 14) closer to the Node-2 hatch for more signal strength, activated the laptop and disconnected the ISL (Integrated Station OpsLAN) Ethernet "dragthrough" cables from the Node-2 ISL interface panel for stowage.

Chamitoff also looked for the Shuttle BOB (Breakout Box) and verified its readiness with the tools (fuses, test jumper, etc.) needed for upcoming Flowmeter IFM (In-Flight Maintenance) tasks.

Oleg Kononenko took the periodic readings of potentially harmful atmospheric contaminants in the SM, using the CMS (Countermeasure System), a component of the SKDS GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, today

using preprogrammed microchips to measure for Isopropanol (“rubbing alcohol”, C_3H_8O), Methanol (“wood alcohol”, CH_3OH) and Toluene (methylbenzene, C_7H_8).

After FE-2 Chamitoff set up and configured the usual equipment to downlink Russian analog video signals from the RS (Russian Segment) via streaming video on US Ku-band, he and the FE-1 checked it out with network “ping” tests. The supportive A31p laptop was later turned off again. Purpose of the video setup is to cover tomorrow’s Progress M-65/30P arrival. *[The equipment involves the KL-211 MPEG-2 Encoder, the RSS1 A31p laptop (for monitoring the digital video) and a U. S. SSC (Station Support Computer) laptop (for converting the analog TV from Russian PAL mode to U.S. NTSC). Transmission tests with the ground followed (9:45am – 12:45pm EDT), checking out connections and the digital video transmission over JSL/Ethernet plus OCA/Ku-Band to MCC-Houston and from there to Moscow via the ESA Gateway for COL-CC/Oberpfaffenhofen transmission to at TsUP-Moscow, plus transfer of the USOS analog video of the RS ISS video downlink via Streambox 2 to NISN (i.e., the Moscow Ostankino communication hub).]*

Kononenko took the periodic photographs of the barley plants growing in the BIO-5 Rasteniya-2 (“Plants-2”) Lada-13 greenhouse, using the Nikon D2 photo camera with F=17-55 mm lens, then downlinked the images via Regul BSR-TM.

After recharging the SONY HVR-Z1J digital high-definition camcorder’s battery, Oleg downlinked the video footage of “Life on ISS” filmed over the weekend for public viewing (on Russia’s “Vesti” 24 TV news channel in their “Kosmos” segment) to TsUP over RGS (Russian Groundsite) at ~3:50pm EDT.

In the SM, Sergey completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS), today as a discretionary job from the “time permitting” task list. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The crew completed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1).

Later, Oleg transferred the exercise data files to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM

storage medium (done six times a week).

CDRA Failure Update: Specialists are pursuing a theory that the CSV (CO₂ Selector Valve), which selects between the two Carbon Dioxide Removal Assembly absorption channels, gets to its latching positions (A/B) OK, but without contacting the position sensor at that position within the time required to produce the proper telemetry reading, thus showing “in transition”, i.e., seemingly being stuck. To test this theory, the ground today was to command CDRA activation after the crew connected the ITCS LTL (Low Temperature Loop) jumper for cooling. If the activation was successful, CDRA was to be operated for two cycles (channel switches) to get the correct timing data on the CSV and to bring down CO₂ levels (last night 3.7 mmHg). If unsuccessful, CDRA was to be turned off and the LTL hose taken off again. More to come.

Progress Docking: Progress M-65/30P continues to “hold” in orbit on its Flight Day 7, in a good standby mode configuration. At ~3:22pm today, the spacecraft is to perform a small phasing boost (DV5, 4 m/s). Docking, originally scheduled on 9/12, has been deferred until tomorrow (9/17), see timeline below. To prepare for the docking and the associated reduction in solar array output, Flight Controllers are setting up a series of commands for power-downs on board (mostly shell heaters), power reconfigurations and attitude control handovers from CMGs (Control Moment Gyroscopes) to RS (Russian Segment) thrusters & back.

Timeline for Progress 30P Rendezvous & Docking on 9/17 (all times EDT):

- ISS attitude handover to RS 11:10am
- ISS mnvr to dock attitude 12:20-1:00pm
- Progress Kurs-A Activation (T1) 1:08:30pm
- SM Kurs-P Activation (T1) 1:10 :30pm
- Good Kurs-P data at 80 km 1:34:24pm
- Kurs-A/Kurs-P Short Test @ 15km 1:55pm
- Range = 9km - VHF-2 activation 2:00pm
- Range = 8km – Progress TV act. 2:00:44pm
- AR&D Flyaround mode start 2:17:17pm
- AR&D Stationkeeping start 2:26:17pm
- AR&D Final Approach start 2:34pm
- Local Sunrise 2:35:46pm
- RGS AOS 2:41pm
- **30P Docking at SM aft port 2:43pm**
- Local Sunset 3:04pm
- ISS mnvr to US momentum mgmt. 3:03-3:43pm
- ISS attitude handover to USOS 4:25pm.

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (as of this morning, 8:32am EDT [= epoch]):

Mean altitude -- 352.9 km

Apogee height -- 357.6 km

Perigee height -- 348.2 km

Period -- 91.60 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006994

Solar Beta Angle -- 53.7 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 36 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56290

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/17/08 -- Progress M-65/30P docking (~2:43pm EDT)

09/29/08 -- ATV de-orbit (nighttime re-entry for observation from 2 NASA planes; 9:12pm)

10/01/08 -- **NASA 50 Years** (official)

10/10/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
12:33am

10/11/08 -- Progress M-65/30P undocking (from SM aft)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) & landing

11/12/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/14/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking

02/26/09 -- STS-119/Discovery/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 09/15/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 22 of Increment 17.*

Post-Hurricane Ike Update: JSC/MCC-H remains closed. Part of the building roof of Mission Control is damaged, but there was no flooding, and the Rideout Team of ~65 persons has kept computers up. Communications with ISS are open from JSC via the BCC (Backup Control Center) at MSFC/Huntsville (Link 10A), on single string (no redundancy). As of last night: "If JSC opens this week, it will be for limited operations and additional recovery only." Efforts are underway to get in touch with all employees in outlying areas to ascertain their status, needs for assistance and return-to-work estimates.

CDR Volkov and FE-1 Kononenko conducted another session with the Russian biomedical MBI-15 "Pilot-M"/NEURO signal response experiment after setting up the workplace and equipment, with Volkov today's subject and Kononenko assisting. Afterwards, the Pilot-M & Neurolab-2000M gear was left connected for Oleg's session tomorrow. *[MBI-15 requires a table, ankle restraint system, eyeball electrodes for an EOG (electrooculogram), and two hand controllers (RUO & RUD) for testing piloting skill in "flying" simulations on a laptop (RSK1) under stopwatch control, as well as for studying special features of the psychophysiological response of cosmonauts to the effects of stress factors in flight.]*

FE-2 Chamitoff ended his fourth run with the NASA/JSC experiment NUTRITION w/ Repository by collecting a final urine sample upon wakeup for storage in the MELFI (Minus-Eighty Laboratory Freezer for ISS). The sampling kit was then stowed away. *[The current NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional*

assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]

Also on Gregory's schedule for today was a two-hour activity of reloading three onboard PDAs (Personal Digital Assistants), after their charging, with new applications, - two with BCR (Barcode Reader) software (replacing the previous "Dolphin" BCRs), the third with WINS (Wireless Network Survey) software.

Oleg Kononenko worked on the Service Module toilet systems (SM ASU), performing the monthly 30-min. maintenance/servicing of the facility, changing out replaceable ASU parts with new components, i.e., the urine receptacle (MP) and a filter insert (F-V). The old parts were discarded as trash.

Chamitoff performed the periodic routine maintenance on the prime CSA-CP (Compound Specific Analyzer-Combustion Products) instrument, changing out its battery and zero-calibrating the unit (to eliminate drift in the combustion sensor), before returning the CSA-CP to its original location at the SM Central Post.

Afterwards, Greg had another hour reserved for unpacking and stowing crew provisions delivered on the ATV-1 (Automated Transfer Vehicle), to consolidate like items, reduce wasted stowage space and make room for additional cargo coming up on ULF2. *[Provisions include such items as athletic shoes, running shorts, T-shirts, sleep shirts, Nitrile gloves, disinfectant wipes, printer paper, office supplies and gray & Kapton tape. All moves were recorded with the BCR (Bar Code Reader) to update the IMS (Inventory Management System), except for pens and pencils.]*

The FE-1 conducted an audit/inventory of equipment items stowed in the FGB behind panels, going by an uplinked listing of 48 items with serial numbers and bar codes. *[The hardware includes such items as filters, BK-3M oxygen tanks, GA O₂ gas analyzer for Elektron, pressure sensors, absorption cartridges, cables and "Penguin-3" suits with shoes.]*

Later, Kononenko and Volkov started a new round of periodic preventive maintenance of ventilation systems in the RS (Russian Segment). *[Oleg worked in the FGB cleaning the ventilation screens of panels 201, 301 & 401, while Sergey spent time in the SM to change out the PF1-4 dust collector filters.]*

After recharging the SONY HVR-Z1J digital high-definition camcorder's battery, Kononenko downlinked the video footage of "Life on ISS" filmed last week for public viewing (on Russia's "Vesti" 24 TV news channel in their "Kosmos" segment) to TsUP over RGS (Russian Groundsite) at ~1:33pm EDT.

The two cosmonauts performed the periodic (monthly) functional closure test of the Vozdukh CO₂ (carbon dioxide) removal system's spare emergency vacuum valves (AVK), in the spare parts kit. See CDRA item, below. *[The AVKs are crucial because they close the Vozdukh's vacuum access lines in the event of a malfunction in the regular vacuum valves (BVK) or a depressurization in the Vozdukh valve panel (BOA). Access to vacuum is required to vent CO₂ during the regeneration of the absorbent cartridges (PP).*

Greg Chamitoff meanwhile worked in the COL (Columbus Orbital Laboratory) to prepare the future locations of the HRF-1 (Human Research Facility 1) and HRF-2 racks for their relocation from the US Lab. *[The two U.S. racks will be transferred to locations A4 & F4 later this month.]*

In the SM, Oleg completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS), today as a discretionary job from the "time permitting" task list. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Sergey performed the daily IMS maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Working off the Russian at-crew's-discretion task list, FE-1 Kononenko conducted the regular status check of the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (barley) under spaceflight conditions in the Lada-13 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}).

The crew completed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1).

Later, Oleg transferred the exercise data files to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

CDRA Failure: Yesterday, the U.S. CDRA (Carbon Dioxide Removal Assembly)

was reported failed after Flight Controllers tried for 13 hours (allowing for cooldown) to get the CSV (CO₂ Selector Valve), which selects between the two CDRA absorption channels, back into operation after it failed between its two positions (A/B). The crew then disconnected the ITCS LTL (Internal Thermal Control System/ Low Temperature Loop) cooling jumper. The failure of the CSV, which has drawn attention in the past because of “sticking”, also affected the correct function of the ASV (Air Supply Valve). With the CSV’s spring not able to hold the valve in either of its two positions, CDRA will not operate. The Vozdukh CO₂ scrubber in the Russian Segment continues to run nominally. If it should turn out that Vozdukh cannot maintain CO₂ partial pressure below ~4.5 mmHg, the crew has a large supply of LiOH (Lithium Hydroxide) absorber/filter canisters at hand.

Progress Docking: Progress M-65/30P continues to “hold” in orbit on its Flight Day 6. Docking, originally scheduled on 9/12, has been deferred until Wednesday (9/17), see new timeline below. To prepare for the docking and the associated reduction in solar array output, BCC Flight Controllers will command a series of power-downs on board (mostly shell heaters), power reconfigurations and attitude control handovers from CMGs to RS thrusters & back.

Timeline for Progress 30P Rendezvous & Docking on 9/17 (all times EDT):

- Correction burn DV5 (4.00 m/s) 3:22pm (9/16)
- ISS attitude handover to RS 11:10am (9/17)
- ISS mnvr to dock attitude 12:20-1:00pm
- Progress Kurs-A Activation (T1) 1:08:30pm
- SM Kurs-P Activation (T1) 1:10 :30pm
- Good Kurs-P data at 80 km 1:34:24pm
- Kurs-A/Kurs-P Short Test @ 15km 1:55pm
- Range = 9km - VHF-2 activation 2:00pm
- Range = 8km – Progress TV act. 2:00:44pm
- AR&D Flyaround mode start 2:17:17pm
- AR&D Stationkeeping start 2:26:17pm
- AR&D Final Approach start 2:34pm
- Local Sunrise 2:35:46pm
- RGS AOS 2:41pm
- **30P Docking at SM aft port 2:43pm**
- Local Sunset 3:04pm
- ISS mnvr to US momentum mgmt. 3:03-3:43pm
- ISS attitude handover to USOS 4:25pm.

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (as of this morning, 8:10am EDT [= epoch]):

Mean altitude -- 352.9 km

Apogee height -- 357.6 km

Perigee height -- 348.2 km

Period -- 91.60 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006976

Solar Beta Angle -- 52.9 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 27 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56274

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/17/08 -- Progress M-65/30P docking (~2:43pm EDT)

09/29/08 -- ATV de-orbit (nighttime re-entry for observation from 2 NASA planes; 9:12pm)

10/01/08 -- **NASA 50 Years** (official)

ISS On-Orbit Status 09/14/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – off-duty day for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff. Ahead: Week 22 of Increment 17.*

Today's on-orbit activities, monitored from the BCC (Backup Control Center) in Huntsville, AL, are expected to include the following tasks (pending confirmation of execution):

Gregory Chamitoff starting out on Part 2 of his session with the NASA/JSC experiment NUTRITION w/Repository. This is an all-day session, the fourth for Greg, of collecting urine samples several times for 24 hrs through first void tomorrow morning, labeling each sample and storing it in the MELFI (Minus Eighty Degree Laboratory Freezer for the ISS), Dewar 1/Tray B. *[The NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by supercold MELFI dewars), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

Sergey Volkov performing the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service Module), including the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Checkups by the CDR today also include the Russian POTOK-150MK (150 micron)

air filter unit of the SM's SOGS air revitalization subsystem, gathering weekly data on total operating time & "On" durations for reporting to TsUP-Moscow.

For Oleg Kononenko, the Russian discretionary "time permitting" task list called for another run of the Russian DZZ-2 "Diatomeya" ocean observations program on, using the NIKON-F5 DCS still camera with f85mm lens and the HDV camcorder from SM window #7 to record color field patterns in target water areas and current atmospheric conditions above them. *[Uplinked target zones in the Atlantic Ocean were the Argentine shelf to the Cape of Good Hope (South Africa) and in the Pacific Ocean the area west of the Peru-Chile coast.]*

Also on the at-crew's-discretion task list for the FE-1 was the regular status check of the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (barley) under spaceflight conditions in the Lada-13 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}).

The crew completed their regular daily 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1).

As generally every day now, starting at ~9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) is activated intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking. CDRA remains "yellow" on the ISS critical systems list.]*

Progress Docking: Progress M-65/30P is currently "holding" in orbit on its Flight Day 5. Docking, originally scheduled on 9/12, has been deferred until Wednesday (9/17), see new timeline below.

Timeline for Progress 30P Rendezvous & Docking on 9/17 (all times EDT):

- Correction burn DV5 (4.00 m/s) 3:22pm (9/16)
- ISS attitude handover to RS 11:10am (9/17)
- ISS mnvr to dock attitude 12:20pm
- Progress Kurs-A Activation (T1) 1:08:30pm
- SM Kurs-P Activation (T1) 1:10 :30pm
- Good Kurs-P data at 80 km 1:34:24pm
- Kurs-A/Kurs-P Short Test @ 15km 1:55pm
- Range = 9km - VHF-2 activation 2:00pm

- Range = 8km – Progress TV act. 2:00:44pm
- AR&D Flyaround mode start 2:17:17pm
- AR&D Stationkeeping start 2:26:17pm
- AR&D Final Approach start 2:34pm
- Local Sunrise 2:35:46pm
- RGS AOS 2:41pm
- **30P Docking at SM aft port 2:43pm**
- Local Sunset 3:04pm
- ISS attitude handover to USOS 4:30pm.

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (as of this morning, 9:12am EDT [= epoch]):

Mean altitude -- 353.0 km

Apogee height -- 357.7 km

Perigee height -- 348.3 km

Period -- 91.60 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006988

Solar Beta Angle -- 51.4 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 22 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56259

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/17/08 -- Progress M-65/30P docking (~2:43pm EDT)

09/29/08 -- ATV de-orbit (nighttime re-entry for observation from 2 NASA planes; 9:12pm)

10/01/08 -- **NASA 50 Years** (official)

10/10/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4) 12:33am

10/11/08 -- Progress M-65/30P undocking (from SM aft)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) & landing

11/12/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/14/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 09/13/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – off duty day for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff.*

Hurricane Ike: NASA-JSC/MCC-Houston is closed. Control of ISS USOS (US Segment) operations has been transferred to the BCC (Backup Control Center) at MSFC-Huntsville which has voice and command/telemetry capability for the US systems via S-band with single-string capability (no backup) and “cold” sparing (i.e., requiring time for repair turn-around). Columbus and Kibo/JEM are in Safe mode or powered down for the duration of BCC mode. The crew’s timeline for today and the next few days do not include activities that need significant interaction with US ground specialists.

Progress Docking: Progress M-65/30P is currently “holding” in orbit on its Flight Day 4. Docking, originally scheduled yesterday, has been deferred until Wednesday (9/17), see new timeline below.

On-orbit activities today are expected to include the following tasks (pending confirmation of execution):

- Part 1 of Gregory Chamitoff’s fourth session with the NASA/JSC experiment NUTRITION w/Repository, for blood collection only, for which he had to forego exercising and food intake since yesterday for eight hours. Later today, the FE-2 would set up the equipment for the 24-hour urine collections which start with the first void early tomorrow morning. *[After performing self-phlebotomy, i.e., drawing blood samples (from an arm vein), the samples are first allowed to coagulate in the Repository for 20-30 minutes, then spun in the HRF RC (Human Research Facility/Refrigerated Centrifuge) and finally placed in MELFI (Minus-Eighty Laboratory Freezer for ISS). No thruster activity is allowed during the blood drawing. The RC will later be powered off after a temperature reset to limit wear on the compressor, and*

cleaned. The NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by supercold MELFI dewars), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]

- Thorough interior cleaning of the station's living areas, a 3-hr. job performed regularly every week. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the SM (Service Module) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*
- Included in the house cleaning usually is a maintenance inspection & cleaning on fan grilles/screens in the FGB (TsV1), SM (VPkhO, VPrK, FS5, FS6 & FS9), DC1 "Pirs" (V3), as well as in the COL (Columbus Orbital Laboratory).
- Routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including checking the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem, gathering weekly data on total operating time & "On" durations for reporting to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*
- Filling out the regular FFQ (Food Frequency Questionnaire) by Chamitoff, his twelfth, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew*

health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]

- Conducting the crewmembers' regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer, TVIS treadmill, RED resistive exercise device, and VELO bike with bungee cord load trainer. Exercise data files are later transferred to the MEC laptop by Kononenko for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).
- As generally every day now, starting at ~9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) is activated intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking. CDRA remains "yellow" on the ISS critical systems list.]*
- In addition, regular routine uplinks & comm exchanges from TsUP-Moscow with the ISS RS (Russian Segment) during RGS (Russian Groundsite) comm passes are continuing. On a daily basis, they include –
 - SM power bus checks,
 - SD (Smoke Detector) tests,
 - IP-1 Air Flow Sensor tests,
 - Onboard time check & synchronization via Regul uplink,
 - State Vector update,
 - Activation/deactivation of KOB1(2) if temperatures on any of the SM batteries exceed op limits,
 - Activation/deactivation of FGB UPLU (program-logic control assembly),
 - TVM (terminal computer system) checks via data dumps,
 - Soyuz BILU (linear accelerometer) test, and
 - Uplinks to the Russian SPP (automated timeline sequencer) and other sequencers for special events such as SM & FGB battery moding.

Timeline for Progress 30P Rendezvous & Docking on 9/17 (all times EDT):

- Correction burn DV5 (4.00 m/s) 3:22pm (9/16)
- ISS attitude handover to RS 11:10am (9/17)
- ISS mnvr to dock attitude 12:20pm

- Progress Kurs-A Activation (T1) 1:08:30pm
- SM Kurs-P Activation (T1) 1:10 :30pm
- Good Kurs-P data at 80 km 1:34:24pm
- Kurs-A/Kurs-P Short Test @ 15km 1:55pm
- Range = 9km - VHF-2 activation 2:00pm
- Range = 8km – Progress TV act. 2:00:44pm
- AR&D Flyaround mode start 2:17:17pm
- AR&D Stationkeeping start 2:26:17pm
- AR&D Final Approach start 2:34pm
- Local Sunrise 2:35:46pm
- RGS AOS 2:41pm
- **30P Docking at SM aft port 2:43pm**
- Local Sunset 3:04pm
- ISS attitude handover to USOS 4:30pm.

No Weekly Science Summary available yet for Week 21.

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (as of this morning, 8:53am EDT [= epoch]):

Mean altitude -- 353.0 km

Apogee height -- 357.7 km

Perigee height -- 348.3 km

Period -- 91.60 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006989

Solar Beta Angle -- 49.2 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 35 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56243

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/17/08 -- Progress M-65/30P docking (~2:43pm EDT)

09/29/08 -- ATV de-orbit (nighttime re-entry for observation from 2 NASA planes; 9:12pm)

10/01/08 -- **NASA 50 Years** (official)

10/10/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
12:33am

10/11/08 -- Progress M-65/30P undocking (from SM aft)
10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) & landing
11/12/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/14/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 09/12/08

All ISS systems continue to function nominally, except those noted previously or below. *The crew has an off-duty day.*

Hurricane Ike: Hurricane Ike's landfall is predicted for tonight at Galveston, TX, and NASA-JSC at nearby Clear Lake is closed. Control of operations for the US systems on the ISS has been handed over to the BAT (Backup Advisory Team), a subset of the FCT (Flight Control Team) temporarily stationed near Austin, TX, with command & telemetry capability for the US systems while MCC-H remains powered. When MCC-H powers down completely tonight due to storm conditions (expected to be severe), the BCC (Backup Control Center) at MSFC-Huntsville will assume control, with voice and command/telemetry capability for the US systems via S-band in single-string capability (no backup), with "cold" sparing (i.e., requiring time for repair turn-around). Since the IPs (International Partners) do not have that capability for JEM/Kibo or Columbus, both Columbus and Kibo are in Safe mode or powered down for the duration of BCC mode. Changes were made to the crew's timeline for today and the next few days to remove activities that need significant interaction with US ground specialists.

Progress Docking Deferred: Progress M-65/30P is currently in orbit on its Flight Day 3. Due to the complexity of operations for the USOS (US Segment) to support a Progress (or Soyuz) docking, which involves configuring solar arrays, maintaining power balance, attitude handovers, etc., the M-65 docking scheduled for today has been deferred until no earlier than 9/17 (Wednesday, see new timeline below). The uncrewed cargo vehicle will be "loitering" in a safe orbit until commanded in for docking.

After connecting up the Telescience PK-3+ hardware yesterday, CDR Volkov today transferred digital video from the last session (7/30) of the Russian TEK-20 Plazmenniy-Kristall/PK-3+ (Plasma Crystal-3+) experiment to the BSPN payload server (TS laptop). *[Main objective of PK-3: studying non-linear dust plasma wave propagation and dispersion ratio at a specified power of an alternating electric*

field, pressure, and a varied number of particles, controlled by the experimenter. The research experiment was performed in semi-automatic mode with particles having a diameter of 9.19 μm under pressures of 20, 40, and 80 Pa (Pascal).]

Gregory Chamitoff took measurements for the regular atmospheric status check for ppCO₂ (Carbon Dioxide partial pressure) in the Lab, SM at panel 449 and COL (Columbus Orbital Laboratory) plus battery ticks, using the hand-held CDMK (CO₂ Monitoring Kit, #1002). The unit was then deactivated and returned to its stowage location (LAB1S2). *[Purpose of the 5-min activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements.]*

FE-1 Kononenko meanwhile completed another radiation data checkup for accumulated flux & dose rate data with the Matryoshka-R radiation payload (RBO-3-2) and its LULIN-5 electronics box.

Sergey Volkov performed an inspection of the tread patch which the crew installed on 8/11 in an improvised repair of the TVIS treadmill running belt.

In the US Airlock, the FE-2 terminated the 85-day maintenance cycle on the first two EMU (Extravehicular Mobility Unit) batteries (#2072, #2067) in BCM3 (Battery Charger Module 3) and BCM4. *[The periodic battery maintenance consists of fully discharging and then recharging the storage units to prolong their useful life. After end of the maintenance cycle, Greg restored the SSC laptop, which is used in DOS mode for the automated procedure, to nominal ops.]*

Oleg took care of the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

In the SM, Sergey completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS), today as a discretionary job from the "time permitting" task list. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Also from the at-crew's-discretion task list, Oleg Kononenko conducted the regular status check of the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (barley) under spaceflight conditions in the Lada-13 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}).

A third suggested task list job was for Sergey to conduct the periodic time synchronization between the RSS1 laptop and BSPN payload server, after a functionality test by checking data comm between the two computers and synching RSS1 to station time with the RSCE PingMaster application. The CDR then downlinked BSPN log files for ground review.

At ~9:15am EDT, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU/*Glavnaya operativnaya gruppа upravleniya* = “Chief Operative Control Group”), including Shift Flight Director (SRP), at TsUP-Moscow via S-band/audio, phone-patched from Houston and Moscow.

At ~9:30am, Sergey & Oleg linked up with TsUP stowage specialists via S-band to conduct the weekly IMS tagup, discussing inventory & stowage issues, equipment locations and cargo transfers.

Before sleeptime tonight, Chamitoff is to set up NASA’s NUTRITION/Repository experiment hardware for his fourth session scheduled tomorrow. For the phlebotomy (blood sample draw), Greg has to start fasting 8 hrs before, i.e., tonight, with only water consumption allowed. *[The NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by supercold MELFI dewars), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (CDR, FE-1), and RED resistive exercise device (CDR, FE-1, FE-2).

Later, Oleg transferred the exercise data files to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

As generally every day now, starting at ~9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) was activated intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require

connecting & disconnecting the ITCS cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking. CDRA remains "yellow" on the ISS critical systems list.]*

Timeline for Progress 30P Rendezvous & Docking on 9/17 (all times EDT):

- Correction burn DV5 (4.00 m/s) 3:22pm (9/16)
- ISS mnvr to dock attitude 12:20pm (9/17)
- Progress Kurs-A Activation (T1) 1:08:30pm
- SM Kurs-P Activation (T1) 1:10 :30pm
- Good Kurs-P data at 80 km 1:34:24pm
- Kurs-A/Kurs-P Short Test @ 15km 1:55pm
- Range = 9km - VHF-2 activation 2:00pm
- Range = 8km – Progress TV act. 2:00:44pm
- AR&D Flyaround mode start 2:17:17pm
- AR&D Stationkeeping start 2:26:17pm
- AR&D Final Approach start 2:34pm
- Local Sunrise 2:35:46pm
- RGS AOS 2:41pm
- **30P Docking at SM aft port 2:43pm**
- Local Sunset 3:04pm

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (as of this morning, 8:26am EDT [= epoch]):

Mean altitude -- 353.0 km

Apogee height -- 357.7 km

Perigee height -- 348.3 km

Period -- 91.60 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007025

Solar Beta Angle -- 46.4 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 36 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56227

Significant Events Ahead (all dates Eastern Time, some changes possible.):

09/17/08 -- Progress M-65/30P docking (~2:43pm EDT)

09/29/08 -- ATV de-orbit (nighttime re-entry for observation from 2 NASA planes;
9:12pm)

10/01/08 -- **NASA 50 Years** (official)

10/10/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
12:33am

10/11/08 -- Progress M-65/30P undocking (from SM aft)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) & landing

11/12/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/14/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking

02/26/09 -- STS-119/Discovery/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress M-67/32P undocking & deorbit

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/25/09 -- Soyuz TMA-15/19S launch

05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**

07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation

10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A – MPLM(P)

04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1

05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 09/11/08

All ISS systems continue to function nominally, except those noted previously or below. >>>Today 46 years ago (1962), President John F. Kennedy visited MSFC/Huntsville for a first-hand look at our progress with the big Saturn launch vehicles. <<<

Hurricane Ike: JSC-Houston has gone officially to preparedness Level 2, closing down at 1:00pm EDT, with a minimal team keeping MCC-H powered. If the storm becomes more severe, as expected, MCC-H will be powered down, and the BCC (Backup Control Center) in Huntsville/Alabama will take over tonight.

Progress M-65/30P launched nominally yesterday at Baikonur at 3:50:02pm EDT, when ISS was leading with 236 deg phase angle. Ascent was nominal, all appendages (antennae & solar arrays) deployed nominally, and the vehicle reached orbital insertion at 3:58:51pm. Corrective maneuvers DV1 & DV2 were conducted as per plan at 7:30pm (delta-V 14.86 m/s) and 8:16pm (16.81 m/s). A third burn will follow later today, with time and magnitude depending on the final docking parameters, because as a consequence of the foreseeable lack of adequate JSC ground support, our Russian partners have agreed not to attempt the 30P docking tomorrow as planned but to delay it until NASA has regained full ground control to support it (e.g., with ISS attitude control commanding, power-downs, etc.). [Note: Progress is equipped with sufficient power (solar arrays) and maneuvering propellants to allow quite extended station-keeping. The cargo ship will deliver more than 2.3 tons of various supplies to the ISS, including oxygen, water and food supplies, propellant, consumables, scientific hardware, spares and other equipment. The spacecraft was injected into a reference near-earth elliptical orbit with 51.65° inclination, min/max altitudes of 187.1/241.4 km and 89 min revolution. Onboard systems are operating as designed as the "chase" is on.]

In preparation for BCC Mode of operation during the hurricane, a number of configuration changes have been executed onboard. These include –

- COL (Columbus Orbital Laboratory) switched to Safe mode (i.e., video

equipment & payloads deactivated due to lack of Ku-band & command/telemetry insight),

- Kibo modules powered down (because no JAXA SSIPC/Tsukuba command capability during BCC), and
- JEM SD BITs (Smoke Detector built-in tests) to be conducted by BCC (no automatic capability),
- US CDRA (Carbon Dioxide Removal Assembly) & TCCS (Trace Contaminant Control System) remaining active,
- Starboard TRRJ (Thermal Radiator Rotary Joint) repositioned to -15 deg,
- Switching the ITCS (Internal Thermal Control System) to dual-loop operation (MTL/LTL), etc.

Upon wake-up, CDR Volkov terminated his ninth MBI-12 SONOKARD experiment session for the long-term Russian sleep study, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

In the SM (Service Module), Volkov performed Part 5 (of 5) of the scheduled R&R (removal & replacement) of the renewable condensate transfer lines (SMOK) of the Russian SOTR Thermal Control System, today replacing the SMOK components between the SK1 valve and the SBK1 condensate collector tank, both behind panel 131.

After going through the usual TORU (teleoperator control system) and TVS (television system) tests for the docking, Volkov & Kononenko had time set aside to discuss particulars of the drill with ground specialists.

FE-2 Chamitoff had on his timeline the relocation of the CHeCS (Crew Health Care Systems) rack in the US Lab from the LAB1D4 position to the LAB1S4 position, which required him and the assisting FE-1 to –

- Clear stowage items from the D4 rack front and from the S4 empty rack bay;
- Clear a 50in x 72in. translation path needed for the rack transfer of protruding items,
- Relocate the CHeCS rack from position D4 to S4,

- Mate CHeCS umbilicals, and
- Restow any items temporarily relocated before the transfer to their original locations.

Winding up the his extensive anti-virus campaign of scanning, cleaning and reloading RS (Russian Segment) crew support laptops, and flash memory cards with new Norton antivirus software, FE-1 Kononenko today worked on the RSK1, RSK2, RSS1, RSS2, RSE1 and RSEmed laptops to verify full elimination of the W32.Gammima.AG virus from all storage media.

Gregory Chamitoff completed the weekly 10-min. CWC (Contingency Water Container) inventory as part of on-going WRM (Water Recovery & Management) assessment of onboard water supplies. Updated “cue cards” based on the crew’s water calldowns are sent up every other week. *[The new card (17-0002Y) lists 30 CWCs (~1095.0 L total) for the four types of water identified on board: technical water (362.3 L, for flushing only because of Wautersia bacteria), potable water (706.7 L, incl. 174.6 L currently on hold), condensate water (9 L), waste/EMU dump and other (17 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]*

Sergey Volkov prepared for an upcoming new session with the Russian TEKh-20 Plazmennyi-Kristall/PK-3+ (Plasma Crystal-3+) experiment, setting up the Telescience PK-3+ hardware and its cabling in the SM on panel 230. Connecting to the BSPN payload server and transferring digital video from the last session (7/30) is scheduled tomorrow. This activity was deferred from 8/4. *[Main objective of PK-3 is to study non-linear dust plasma wave propagation and dispersion ratio at a specified power of an alternating electric field, pressure, and a varied number of particles, controlled by the experimenter. The research experiment was performed in semi-automatic mode with particles having a diameter of 9.19 μm under pressures of 20, 40, and 80 Pa (Pascal).]*

In the SM, Kononenko completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Oleg also took care of the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1).

Later, Greg transferred the exercise data files to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

During Kononenko's VELO exercising, the CDR filmed him with the video camcorder for public airing by the Russian Vesti 24 TV news channel in their "Kosmos" segment as Part 2 of several "Life aboard ISS" videos to be recorded this week. *[Yesterday's filming featured the CDR performing the DYKHANIE experiment. More scenes, such as food preparation, having a meal, performing Diatomeya/Uragan experiments and other views of interest to "Kosmos" viewers, will be filmed over the weekend, for downlink to Moscow on 9/15 and 9/17.]*

As generally every day now, starting at ~9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) was activated intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking. CDRA remains "yellow" on the ISS critical systems list.]*

Conjunction Event: Another close pass of a piece of debris of the Kosmos-2421 satellite is predicted for early tomorrow morning, at a TCA (Time of Closest Approach) of ~2:00am EDT, with a very low probability of collision ("Yellow" box; >13 km). More tracking is currently underway. Since a DAM (Debris Avoidance Maneuver) with the SM main propulsion cannot be performed under the current ground conditions, the crew would go to the Safe Haven scenario and retreat to the Soyuz crew return vehicle if necessary. *[For the shelter mode, the crew would relocate the Airlock PCS (Portable Computer System) laptop to the SM, then close out and egress the two Kibo modules (JLP, JPM), COL, Node-2, US Lab, Node-1/PMA-1, close all hatches to the RS, which contains ECLSS, and then spent a short time in the Soyuz until after TCA.]*

CEO (Crew Earth Observations) photo targets uplinked for today were **High Central Andean Glaciers, S. America** *(this morning pass over the central Andes Mountains provided an opportunity to photograph small glaciers and icefields near the summits. Some scattered clouds were likely present over the range. Overlapping nadir frames of the mountain peaks, taken along track, were*

*requested as the ISS traveled SE-ward along the range. This approach should have captured many of the glaciers of interest), and **Patagonian Glaciers, S. America** (Gregory had a morning pass over the ranges of Patagonia.*

Photography of glaciers and icefields near the mountain peaks along the west side of the mountains was requested. Some scattered clouds were expected to be present. Overlapping nadir frames of the mountain flanks and peaks, taken along track, were requested as ISS traveled E-SE over the mountains. This approach should have captured many of the glaciers of interest).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (as of this morning, 9:29am EDT [= epoch]):

Mean altitude -- 353.0 km

Apogee height -- 357.8 km

Perigee height -- 348.3 km

Period -- 91.60 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007018

Solar Beta Angle -- 43.1 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 40 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56212

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/29/08 -- ATV de-orbit (nighttime re-entry for observation from 2 NASA planes; 9:12pm)

10/01/08 -- **NASA 50 Years** (official)

10/10/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4) 12:33am

10/11/08 -- Progress M-65/30P undocking (from SM aft)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) & landing

11/12/08 -- STS-126/Endeavour/ULF2 launch -- MPLM Leonardo, LMC

11/14/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osp/iss_reports/index.htm

ISS On-Orbit Status 09/10/08

All ISS systems continue to function nominally, except those noted previously or below.

Upon wakeup, FE-1 Kononenko terminated his ninth SONOKARD experiment session for the long-term Russian sleep study MBI-12, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. Sergey Volkov's new MBI-12 session starts tonight (~5:20pm). *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

CDR Volkov set up the equipment for his fourth session with the Russian experiment MBI-18 DYKHANIE ("Respiration", "Breathing"), then undertook the session, controlled from the RSE-Med laptop, followed later by FE-1 Kononenko who also completed the approximately monthly experiment for the fourth time. The crewmembers took photographs of each other working the hardware, then closed down the payload and stowed it. *[Dykhane-1 uses two body belts (PG-T/thoracic, PG-A/abdominal), a calibrator, resistor, mouthpiece, etc., to study fundamental physiological mechanisms of the external breathing function of crewmembers under long-duration orbital flight conditions. During the experiment, physiological measurements are taken and recorded with a pneumotachogram, a thoracic pneumogram, an abdominal pneumogram, and pressure data in the oral cavity. All experimentally derived plus salient environmental data along with personal data of the subject are recorded on PCMIA card for return to the ground at end of the Expedition. Objectives include determining the dynamics of the relationship between thoracic (pectoral) and abdominal breathing function reserves and their*

realization potential during spontaneous breathing, the coordinated spontaneous respiratory movements in terms of thoracic and abdominal components of volumetric, time & rate parameters of spontaneous respiratory cycle, identification of the features of humoral-reflex regulation of breathing by dynamics of ventilation sensitivity of thoracic and abdominal components to chemoreceptor stimuli, etc. Overall, the experiment is intended to provide a better understanding of the basic mechanisms of pulmonary respiration/gas exchange gravitational relations of cosmonauts.]

Volkov's Dykhanie session was filmed by Kononenko with a video camcorder for public airing by the Russian Vesti 24 TV news channel in their "Kosmos" segment as part of several "Life aboard ISS" videos to be recorded in the next few days. *[Tomorrow's filming will feature the FE-1 exercising, followed over the weekend by scenes showing food preparation, having a meal, performing Diatomeya/Uragan experiments and other views of interest to "Kosmos" viewers.]*

Later in the day, Kononenko & Volkov undertook another session with the MedOps protocol MO-5, "Cardiovascular Evaluation during Graded Exercises" on the VELO cycle ergometer, a standard Russian fitness test, assisting each other as CMO (Crew Medical Officer). (Last time done: 7/3). *[The 50-min assessment, supported by ground specialist tagup via VHF and telemetry monitoring, uses the Gamma-1 ECG equipment with biomed harness, skin electrodes and a blood pressure and rheoplethysmograph cuff wired to the cycle ergometer's instrumentation panels. For the graded exercise, the subject works the pedals after a prescribed program at load settings of 125, 150, and 175 watts for three minutes each. Data output involves a kinetocardiogram, rheoplethysmogram, rheoencephalogram and a temporal pulsogram.]*

After recharging the SONY HVR-Z1J digital high-definition camcorder's battery yesterday, Volkov and FE-2 Chamitoff set up the usual equipment to downlink Russian analog video signals from the RS (Russian Segment) via streaming video on US Ku-band, and checked it out with a network ping test. The A31p laptop was then turned off. Purpose of the video setup is to cover the Progress M-65/30P arrival on 9/12. *[The equipment involves the KL-211 MPEG-2 Encoder, the RSS1 A31p laptop (for monitoring the digital video) and a U.S. SSC (Station Support Computer) laptop (for converting the analog TV from Russian PAL mode to U.S. NTSC). Transmission tests with the ground followed (7:30am – 8:00am EDT), checking out connections and the digital video transmission over JSL/Ethernet plus OCA/Ku-Band to MCC-Houston and from there to Moscow via the ESA Gateway for COL-CC/Oberpfaffenhofen transmission to at TsUP-Moscow, plus transfer of the USOS analog video of the RS ISS video downlink via Streambox 2 to NISN (i.e., the Moscow Ostankino communication hub).]*

Chamitoff disconnected the thermal control MTL (Moderate Temperature Loop) supply jumper which he attached yesterday in the US Lab to an ITCS (Internal Thermal Control System) Z-panel (LAB1O3) for filling with coolant. *[The activity is in preparation for the installation of the WRS-1 (Water Recovery System 1) of the new Regenerative ECLSS in the CHeCS rack during STS-126/ULF2. CHeCS rack relocation is scheduled tomorrow (9/11). All coolant lines need to be filled prior to mating them to their respective racks.]*

Using the standard O-OHA (on-orbit hearing assessment) equipment, the FE-2 took the periodic auditory test which he had to postpone yesterday due to time constraints. The O-OHA test is a 30-min NASA environmental health systems examination to assess the efficacy of acoustic countermeasures, using a special MEC (Medical Equipment Computer) laptop application. It was Greg's third O-OHA session. Sergey & Oleg conducted their fourth sessions yesterday.

In the SM (Service Module), Volkov performed Part 4 of the scheduled R&R (removal & replacement) of the renewable condensate removal lines (SMOK) of the Russian SOTR Thermal Control System, today replacing the hoses between the SK1 valve behind panel 131 and a connector (K-G3) of the SRVK-2M condensate processor behind panel 436.

Gregory Chamitoff conducted his first session with the BCAT-3/4 (Binary Colloidal Alloy Test-3/4) science payload, setting up the MWA WSA (Maintenance Work Area/ Work Surface Area) for BCAT operations, then taking photographs of the BCAT-3 samples 1-6 (undisturbed for six months) and restowing the BCAT-3 sample module. Afterwards, BCAT-4 samples were photographed. Homogenization of three BCAT-4 samples (8,9,10) was added to Greg's discretionary "job jar" task list. *[The BCAT equipment includes a DCS760 digital still camera run by the AAL (Alternate Applications Laptop) converted yesterday from an SSC (Station Support Computer) A31p, with "legacy" EarthKAM software for automatically taking flash photography of the sample every two hours over the next several days, a Mini-MagLite, and a camcorder for historical video. BCAT science in micro-G is a unique opportunity to explore fundamental physics and simultaneously develop important future technology, such as computers operating on light, complex biomolecular pharmaceuticals, clean sources of geothermal power, and novel rocket engines for interplanetary travel. The experiment itself is simple and elegant: photographing samples of colloidal particles with a digital camera onboard the ISS. Colloids are tiny nanoscale spheres of Plexiglas a thousand times smaller than the width of a human hair (submicron radius) that are suspended in a fluid. They are ubiquitous (e.g., milk, smoke, and paint) and therefore interesting to study directly. Colloids are also small enough that they behave much like atoms and so can be used to model all sorts of phenomena]*

because their size, shape, and interactions can be controlled.]

Oleg completed the periodic (about twice a month) replenishing of the Elektron's water supply for electrolysis, filling the KOV thermal loops' EDV container with purified water from CWC (Contingency Water Container, #1051, #1064) collected by the U.S. CCAA (Common Cabin Air Assembly) dehumidifier. *[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron micropump shutdown.]*

Sergey conducted the periodic checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the passageways SM PrK (Service Module Transfer Compartment) – RO (SM Working Compartment), PkhO (SM Transfer Tunnel) – RO, PkhO – DC1, PkhO – FGB PGO, FGB PGO – FGB GA, and FGB GA–Node-1.

The FE-2 ran the visual microbial (bacterial & fungal) "T+5 Day" analysis of microbiology air samples collected on 9/5 with the MAS (Microbial Air Sampler) from mid-module locations in the station, including the Kibo laboratory. Surface sampling with the SSK (Surface Sampling Kit) was not performed on 9/5 due to crew time constraints. *[MAS sampling is performed once every three months, taking bacterial and fungal air samples at each location, and there are two locations sampled in each module. The samples are analyzed after 5-days of incubation in four Petri dishes.]*

In the US Lab, Kononenko performed the regular controlled shut-down of the EHS VOA (Environmental Health System-Volatile Organic Analyzer), with the ground power-cycling its RPC-3 (Remote Power Controller 3) *[part of RPCM (RPC Module) LAD42B_A.]*

In the SM, Oleg completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Kononenko also took care of the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Additionally, the FE-1 completed the regular monthly & quarterly TVIS maintenance, inspecting the condition of harnesses, belt slats, corner bracket ropes, IRBAs

(Isolation Restorative Bungee Assemblies) and gyroscope wire ropes for any damage or defects, lubricating as required plus recording time & date values. *[Today's inspection included pulling the TVIS skirt back at the corners to verify that the stabilizer fasteners (two per corner) are still tight.]*

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (FE-2) and VELO bike with bungee cord load trainer (CDR/MO-5, FE-1/MO-5).

Later, Greg transferred the exercise data files to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working off the Russian at-crew's-discretion task list, Oleg conducted the regular status check of the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (barley) under spaceflight conditions in the Lada-13 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}).

As generally every day now, starting at ~9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) was activated intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking. CDRA remains "yellow" on the ISS critical systems list.]*

At ~10:25am, Sergey & Oleg conducted a telephone conversation with Ekaterina Beloglazova, editor of Rossiysky Kosmos Magazine. *["How did the ATV undocking go? What did you monitor?"; "Tell us about your next month activities. What else do you have to do?"; "Fire drill – what is that?"]*

Tonight at ~6:15pm EDT, Gregory Chamitoff is scheduled for a CDE (Crew Discretionary Event) via S-band/audio & Ku-band/video.

Hurricane Ike Update: As of Tuesday afternoon (yesterday), JSC/MCC-Houston is at pre-storm preparedness Level 4. Hurricane Ike is beginning to strengthen over the central Gulf of Mexico, headed WNW, with a currently predicted landfall near Matagorda Bay on Friday night, then taking a sharp turn north which could bring it directly into Houston. Preparations are underway at JSC for activating the BCC (Backup Control Center) at MSFC/Huntsville and the BAT (Backup Advisory Team). *[JSC Threat Level 4: Initiated when a storm poses a threat to JSC within*

72 hrs or a storm enters the Gulf and threatens JSC. Level 3: Storm poses a threat to JSC within 48 hrs. All non-flight MCC-H personnel are suspended and outlying facilities are powered down. Transfer to BCC operations is imminent. Level 2: Storm poses a threat to JSC within 36 hrs. One string of nominal S-band telemetry, command, and voice communications are retained with the ISS from MSFC and TsUP-Moscow. HRT (Hurricane Ride-Out Team) performs fire watch within MCC-H throughout the storm. Level 1: Storm poses a threat at JSC within 24 hrs. BAT will be prime for command & control of the ISS/US Segment. If BAT is unable to provide recommendations, BCC Deployment Team will be contacted. Initiation of the individual threat levels have to be authorized by the JSC Director.]

Progress M-65/30P Update: At Baikonur/Kazakhstan, the Soyuz-U rocket with the Progress M-65/30P resupply/cargo vehicle stands poised on Pad 1 for today's launch. Propellant loading preparations began this morning at 8:00am, followed by the usual meeting of the State Board at 11:20am, to approve initiation of the tanking process, starting at 12:00pm. After launch at 3:50pm EDT, orbital insertion is at 3:58:47pm, followed later by two corrective burns (DV1/14.86 m/s at ~7:30pm; DV2/16.81 m/s at ~8:16pm) and a third burn tomorrow (DV3/2.00 m/s at ~4:34pm). Docking at the ISS/SM aft port is on 9/12 at ~5:01pm.

*CEO (Crew Earth Observations) photo targets uplinked for today were **Antarctic Ice Pack, S. Indian Ocean** (sea ice and icebergs are beginning to move northwards from Antarctica, and breaks in the cloud cover may have allowed for photography of the sea surface. Looking to the right of track for holes in the cloud deck south of Madagascar. Images of ice are useful, both for tracking the motion of icebergs that may present a danger to shipping, and for study of ice breakup processes), and **Hurricane Ike, Gulf of Mexico** (Hurricane Ike was in the Gulf of Mexico at the time of the ISS overpass, and is predicted to be at Category 2 strength. Looking to the left of track towards Cuba for the storm. This will likely have been Greg's last opportunity to photograph the storm before illumination conditions become unfavorable for photography).*

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Week 21 Scheduled Main Activities:

- Thu. (9/11): MBI-11; JAXA Art video; TORU OBT r/w; CHeCS Rack relocate; SOTR-SMOK R&R; CWC audit; IWIS reprog.
- Fri. (9/12): Tekh-20 (PK-3) BSPN; Lulin-5 check; ICS umbilical mate; Progress 30P docking (SM aft port); Node-2 cleanout; NUTRITION setup.
- Sat. (9/13): NUTRITION w/blood collect; Progress SSVP-StM docking

system dismantle; US-21 install; BITS2-12 connect; 30P cargo transfers (BTKh-1,-2,-3,-4,-20, SOLO-PCBA); BTKh-29 trans./install; IWIS dwnld; ham pass; FFQ.

ISS Orbit (as of this morning, 7:34am EDT [= epoch]):

Mean altitude -- 353.1 km

Apogee height -- 357.8 km

Perigee height -- 348.4 km

Period -- 91.60 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006982

Solar Beta Angle -- 39.5 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 40 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56195

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/10/08 -- Progress M-65/30P launch (~3:50pm)

09/12/08 -- Progress M-65/30P docking (SM aft, ~5:01pm)

09/29/08 -- ATV de-orbit (nighttime re-entry for observation from 2 NASA planes; 9:12pm)

10/01/08 -- **NASA 50 Years** (official)

10/10/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4) 12:33am

10/11/08 -- Progress M-65/30P undocking (from SM aft)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) & landing

11/12/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/14/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking

02/26/09 -- STS-119/Discovery/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 09/09/08

All ISS systems continue to function nominally, except those noted previously or below.

Upon wakeup, FE-2 Chamitoff started the next part (3rd of 5) of the periodic acoustic measurement protocol by recording post-sleep data of the crew-worn acoustic dosimeters, later deploying the dosimeters statically (Part 4), one at the SM (Service Module) Central Post, one in Node-2 and the third in an empty rack bay in the Kibo JPM (JEM Pressurized Module). Tonight (~3:10pm EDT), Chamitoff will record the data taken by the three static dosimeters during the day (Part 5). *[Acoustic data must be taken twice per Increment, each time for the duration of the 16-hour crew workday.]*

CDR Volkov serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out"-to-vacuum cycle on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated tonight at ~4:30pm EDT. Filter bed #1 was regenerated yesterday. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently to remove any lingering Freon-218 from the cabin atmosphere (last time: 9/3 & 9/4).]*

In preparation for Progress M-65/30P docking on 9/12 (Friday), CDR Volkov & FE-1 Kononenko completed the standard three-hour training course with the TORU teleoperator system, which provides a manual backup mode to the Progress' KURS automated rendezvous radar system. Afterwards, Sergey & Oleg tagged up with a TORU instructor at TsUP/Moscow via S-band audio. *[The drill included procedure review, rendezvous, docking data and rendezvous math modeling data review, fly-around, final approach, docking and off-nominal situations (e.g., video or comm loss). Three modes were simulated on the RSK1 laptop: two with 30P from stationkeeping range (~150 m) in sunlight (insolation), and 30P in final approach (from 50 m) in darkness (eclipse). The TORU teleoperator control system lets a SM-*

based crewmember perform the approach and docking of automated Progress vehicles in case of KURS failure. Receiving a video image of the approaching ISS, as seen from a Progress-mounted docking television camera ("Klest"), on a color monitor ("Simvol-Ts", i.e. "symbol center") which also displays an overlay of rendezvous data from the onboard digital computer, the CDR would steer the Progress to mechanical contact by means of two hand controllers, one for rotation (RUO), the other for translation (RUD), on adjustable armrests. The controller-generated commands are transmitted from the SM's TORU control panel to the Progress via VHF radio. In addition to the Simvol-Ts color monitor, range, range rate (approach velocity) and relative angular position data are displayed on the "Klest-M" video monitor (VKU) which starts picking up signals from Progress when it is still approximately 8 km away. TORU is monitored in real time from TsUP over Russian ground sites (RGS) and via Ku-band from Houston, but its control cannot be taken over from the ground. On 9/12, Progress KURS will be activated at ~3:27pm EDT on Daily Orbit 1 (DO1), SM KURS two minutes later. Progress headlight will be switched on at a range of ~8 km (~4:20pm). Flyaround to the SM aft docking port (~400 m range, in sunlight) starts at 4:37pm. Start of final approach: ~4:52 (DO1) in sunlight, contact: ~5:01pm (in darkness).]

In the Kibo laboratory, Gregory Chamitoff set up and conducted two of JAXA's fascinating EPO (Educational Payload Observation) activities,- AQUASPHERE and INK BALL, each one requiring about one hour. For the session, SSIPC (Space Station Integration & Promotion Center/Tsukuba) temporarily shut down the IMV (Intermodular Ventilation) and SDs (smoke detectors) in the JPM (Greg serving as living SD). Afterwards, the experiments were closed out and IMV & SDs turn on again. [The Japanese EPO program consists of eight activities: Life in the Universe (study of space environment effects on living things for educational purpose); Space Poem Chain (poems by famous poets and general public composed & recorded before the launch on a DVD, played and stored on ISS); Microgravity Clay (sculpting in clay to express the inspiration of human space flight); Aquasphere (recording the motion of a water sphere after external oscillations in micro-G environment with an HDTV camera, making various water shapes by vibration); Ink Ball (creating ink flow patterns/"marbling" on the water sphere, then transferring the marbling from the water ball to handmade Japanese papers for recording); Art (images taken with the HDTV camera on the ISS); Space Clothes (studying new clothing designs in space); and Photographing the Moon (images taken of the Moon from the station).]

After the FE-2 broke out the standard auditory test equipment, the three crewmembers took the periodic O-OHA (on-orbit hearing assessment) test, a 30-min. NASA environmental health systems examination to assess the efficacy of acoustic countermeasures, using a special MEC (Medical Equipment Computer) laptop application. It was Greg's third O-OHA session, the fourth for Sergey &

Oleg. *[The O-OHA audiography test involves minimum audibility measurements for each ear over a wide range of frequencies (0.25-10 kHz) and sound pressure levels, with the crewmembers using individual-specific Prophonics earphones, Bose ANC headsets and the SLM (sound level meter). To conduct the testing, the experimenter is supported by special EarQ software on the MEC, featuring an up/down-arrow-operated slider for each test frequency that the crewmember moves to the lowest sound pressure level at which the tone can still be heard. The baseline test is required not later than about Flight Day 14 for each new Expedition and is then generally performed once per month. Note: There have been temporary hearing deficits documented on some U.S. and Russian crewmembers, all of which recovered to pre-mission levels.]*

Sergey Volkov performed Part 3 of the scheduled R&R (removal & replacement) of the renewable condensate removal lines (SMOK) of the Russian SOTR Thermal Control System in the SM, today replacing the hoses between the NOK-1 and NOK-2 condensate pumps.

Oleg Kononenko initiated recharging of the SONY HVR-Z1J high definition camcorder's battery.

Battery recharging was also on Chamitoff's schedule, who initiated the 85-day maintenance cycle on the first two EMU (Extravehicular Mobility Unit) batteries (#2072, #2067) in BCM3 (Battery Charger Module 3) and BCM4 in the US Airlock, to run till 9/12. Greg also checked BCM1 (which had exhibited a buzzing noise before and has never been used for charging since its launch on 1J), but found nothing wrong. *[The periodic battery maintenance consists of fully discharging and then recharging the storage units to prolong their useful life. After end of the maintenance cycle, Clay will restore the SSC laptop, which is used in DOS mode for the automated procedure, to nominal ops.]*

In preparation for installing, during STS-126/ULF2, the WRS-1 (Water Recovery System 1) of the new Regenerative ECLSS in the CHeCS rack, to be relocated on 9/11 (Thursday), the FE-2 filled the thermal control MTL (Internal Thermal Control System/Moderate Temperature Loop) supply jumper with coolant by connecting it to an ITCS (Internal Thermal Control System) Z-panel in the Lab (LAB1O3). *[All coolant lines need to be filled prior to mating them to their respective racks.]*

Kononenko took the periodic readings of potentially harmful atmospheric contaminants in the SM, using the CMS (Countermeasure System), a component of the SKDS GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, today using preprogrammed microchips to measure for Isopropanol ("rubbing alcohol", C_3H_8O), Methanol ("wood alcohol", CH_3OH) and Toluene (methylbenzene, C_7H_8).

In the COL (Columbus Orbital Laboratory), Gregory prepared the ESA FSL (Fluid Science Laboratory) facility, used for GEOFLOW, for the upcoming Progress docking acceleration/disturbance by ensuring a firm lock of the EC (Experiment Container) with the CEM-L (Central Experiment Module-Lower).

Greg had some time set aside to familiarize himself with BCAT-3/4 (Binary Colloidal Alloy Test-3/4) reference material from last year's session, in preparation of a new run scheduled to start tomorrow. *[BCAT-3/4 in micro-G is a unique opportunity to explore fundamental physics and simultaneously develop important future technology, such as computers operating on light, complex biomolecular pharmaceuticals, clean sources of geothermal power, and novel rocket engines for interplanetary travel. The experiment itself is simple and elegant: photographing samples of colloidal particles with a digital camera onboard the ISS. Colloids are tiny nanoscale spheres of Plexiglas a thousand times smaller than the width of a human hair (submicron radius) that are suspended in a fluid. They are ubiquitous (e.g., milk, smoke, and paint) and therefore interesting to study directly. Colloids are also small enough that they behave much like atoms and so can be used to model all sorts of phenomena because their size, shape, and interactions can be controlled.]*

Later, to prepare for tomorrow's BCAT science, Chamitoff set up an AAL (Alternate Applications Laptop) in the US Lab, by configuring a previous-loaded SSC (Station Support Computer) hard drive for use on the OpsLAN network with applications requiring older software & driver versions (specifically: to run the DCS760 digital cameras needed for BCAT). *[Any SSC could be used except for SSC-4 which is required to run IWIS (Internal Wireless Instrumentation System). The AAL hard drive swap will be reverted to nominal config on 9/12.]*

Oleg Kononenko performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The FE-1 also completed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew had their periodic PMCs (Private Medical Conferences) via S- & Ku-band audio/video, Greg at ~8:45am, Oleg at ~11:30am, Sergey at ~12:00pm EDT.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-1, FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR).

Later, Sergey transferred the exercise data files to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

The crew had some time set aside to review a "Readme" summary preparing them for the upcoming major software upgrades. *[Revisions will be R11 for the PCS (Portable Computer System) laptops, R7 for the CCS (Command & Control System) and GNC (Guidance, Navigation & Control) computers, and R3 for NCS (Node Control Software).]*

As generally every day now, starting at ~9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) was activated intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking. CDRA remains "yellow" on the ISS critical systems list.]*

At ~2:15pm EDT, Sergey, Oleg & Greg downlinked a 20-min. TV PAO message of greetings in English & Russian to TsUP/Moscow for replay at the 59th International Astronautical Congress (IAC), to be held 9/29-10/3 at Glasgow, Scotland, for the Russian delegation, consisting of A.N. Perminov, V.A. Lopota, and other representatives of Russia's space industry. *["The 17th ISS expedition crew would like to welcome the scientists, engineers and the heads of space industries from different countries participating in the 59th International Astronautical Congress. This year we celebrate the 10th anniversary of the launching of the International Space Station. The ISS is the greatest ever known successful international space project and the participants of the 59th International Astronautical Congress in Glasgow have been directly involved in it. Presently the elements of all the Partners are integrated into the ISS. The ISS Program is constantly expanding. Next year we will have six crew members on board. New modules, new vehicles and new crews will be arriving at the station. In the future we envisage new utilization programs up to 2020 and perhaps beyond. The ISS will become an international scientific test bed to verify procedures and technologies for the flights to the Moon and Mars..."]*

MT Translation: For today's return of the Mobile Transporter railcart from Worksite

7 (WS-7) to WS-4, using string-A IMCAs (Integrated Motor/Controller Assemblies) at 3:15pm-5:15pm, Russian thrusters will be inhibited for the period of 3:00pm-6:00pm EDT due to load constraints.

VolSci Preview: For next Sunday's Voluntary Science program, Gregory was offered only one option this time, -a 1:55-hr session with the SPHERE (Synchronized Position Hold, Engage, Reorient, Experimental Satellites) payload, to continue algorithm/software development..

Progress M-64/29P Orbit: Last night at 5:34pm, after its ~4:40pm EDT deorbit burn, Progress M-64/29P splashed down in the designated area of the Pacific ocean after destructive reentry. The cargo ship had undocked from the ISS on 9/1 and conducted a series of "Plasma-Progress" experiments during its autonomous flight. The TSNII Mash-developed experiment studies the plasma density in the Progress external environment, generated by the operations of the Progress liquid-propellant thrusters and observed with the incoherent dissipation radar of the Russian Institute of Solar & Earth Physics at Irkutsk. Similar experiments were conducted during the Progress M-60/25P & Progress M-62/27P independent-flight phases.

CEO (Crew Earth Observations) photo targets uplinked for today were **Hurricane Ike, Western Cuba** (*Hurricane Ike is currently traversing Cuba, and is predicted to be slightly south of the western half of the island at the time of the ISS overpass. Looking to the right of track for the storm; while it has been weakened by its passage over Cuba, it was likely at Category 2 strength when Greg viewed it*), and **Lake Poopo, Bolivia** (*weather was predicted to be mostly clear over Lake Poopo and the nearby Salar de Uyuni (salt flat). ISS had a near-nadir pass over the lake; photography of the lake shoreline was requested in order to assess change in water levels*).

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Week 21 Scheduled Main Activities:

- Wed. (9/10): MBI-18; MBI-12 term/dwnld; "Life on ISS" video; RS Video/MPEG-2 Ku-Band test; CGSE troubleshoot; SOTR-SMOK R&R; MAS microbial analyses (T+5); BCAT-3/-4; Progress 30P launch.
- Thu. (9/11): MBI-11; JAXA Art video; TORU OBT rvw; CHeCS Rack relocate; SOTR-SMOK R&R; CWC audit; IWIS reprog.
- Fri. (9/12): Tekh-20 (PK-3) BSPN; Lulin-5 check; ICS umbilical mate; Progress 30P docking (SM aft port); Node-2 cleanout; NUTRITION setup.

- Sat. (9/13): NUTRITION w/blood collect; Progress SSVP-StM docking system dismantle; US-21 install; BITS2-12 connect; 30P cargo transfers (BTKh-1,-2,-3,-4,-20, SOLO-PCBA); BTKh-29 trans./install; IWIS dwnld; ham pass; FFQ.

ISS Orbit (as of this morning, 8:43am EDT [= epoch]):

Mean altitude -- 353.1 km

Apogee height -- 357.9 km

Perigee height -- 348.4 km

Period -- 91.60 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007052

Solar Beta Angle -- 35.7 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 48 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56180

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/10/08 -- Progress M-65/30P launch (~3:50pm)

09/12/08 -- Progress M-65/30P docking (SM aft, ~5:01pm)

09/29/08 -- ATV de-orbit (nighttime re-entry for observation from 2 NASA planes; 9:12pm)

10/01/08 -- **NASA 50 Years** (official)

10/10/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4) 12:33am

10/11/08 -- Progress M-65/30P undocking (from SM aft)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) & landing

11/12/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/14/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking

02/26/09 -- STS-119/Discovery/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 – Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 09/08/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 21 of Increment 17. **Congratulations, Greg, on your 100th day in space today!***

Before breakfast, FE-2 Chamitoff began Part 1 (of 5) of the periodic acoustic measurement protocol by deploying crew-worn acoustic dosimeters, to be carried for 24 hours (with a microphone on the shirt collar). (Last time done: 7/12-13). *[Tonight, after about 15 hours of measurements, dosimeter data will be downloaded and the hardware power-cycled for another data take after 8.5-hr. sleep, starting tonight. At that point, the crew will deploy the dosimeters statically in the station for the duration of the day, record measurements tomorrow noon and stow the instruments. Acoustic data must be taken twice per Increment, each time for the duration of the 16-hour crew workday.]*

CDR Volkov performed the periodic maintenance of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The process will be terminated at ~4:45pm EDT and Bed #2 regeneration performed tomorrow. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently (last time: 9/3 & 9/4).]*

FE-1 Kononenko, with the CDR assisting as required, had ~6 hrs reserved for disassembling, removing, closing out and stowing the ATV PCE (Automated Transfer Vehicle/Proximity Communications Equipment, Russian: MBRL) hardware in the SM (Service Module), now no longer needed after "Jules Verne" departed last week. *[The main MBRL components are the space-to-space radio "monoblock" (PCE Z0000), the BUAP antenna switching control box (BUAP), and the ATV control panel (PU).]*

In the JAXA Kibo laboratory, the FE-2 activated the MMA (Microgravity Measurement Apparatus) and its laptop (MLT), by first powering up the MMA's NCU/RSU (Network Control Unit/Remote Sensor Unit) set from the Ryutai rack's UDC (Utility DC to DC Converter), then turning on both the NCU/RSU and MLT.

After reviewing uplinked POC DOUG (Portable Onboard Computers/Dynamic Onboard Ubiquitous Graphics) material for today's robotics activity, Volkov and Chamitoff operated the Canadian SSRMS (Space Station Remote Manipulator System) by maneuvering it to and grappling the ESP-3 (External Stowage Platform 3) at the zenith side of the P3 truss for a ground-controlled checkout of the EBCS (External Berthing Camera System). Later, the crew released the ESP-3 PDGF (Power & Data Grapple Fixture) and maneuvered the arm to the Stage park position.

CDR Volkov performed Part 2 of the scheduled removal & replacement of the renewable condensate removal lines (SMOK) of the Russian SOTR Thermal Control System in the SM, today replacing the hoses between the SKV-2 air conditioner's BTA heat exchanger-evaporator and the NOK-2 condensate pump.

After disconnecting a jumper (77-1), from the FSS (Fluid System Servicer) flow meter tube, Chamitoff torqued (tightened) the jumper's male QD (Quick Disconnect) to ensure continued secondary seal integrity.

In preparation for the upcoming rack relocations within the US Lab, Gregory performed functionality checks on low pressure QDs which need to be manipulated for the transfers. All QDs checked out nominal except for the ITCS (Internal Thermal Control, System) QDs for ER-5 (EXPRESS Rack 5) which still show leakage. ER-5 was transferred to the JAXA JPM on 8/26, (when the leakage was seen first) and remains unpowered and unconnected. *[If one or more of the QDs cannot be demated, thus preventing rack transfer, flight controllers will reconfigure the ITCS by depressurizing lines on the rack transfer day to allow QD removal, the goal being only to reconfigure the ITCS system once if possible. Depending on which QDs leak, this may or may not be possible.]*

The crew conducted the regular fire drill/OBT (on-board training), a mandatory periodic one-hour exercise (including ground debrief conference), deferred from 8/27 because of the DAM (Debris Avoidance Maneuver). *[Primary goal of this Russian-led interactive exercise is to provide the station residents with the most realistic emergency training possible. The drill is always conducted with the support of both MCCs in close coordination. It should be performed every 2.5 months, but not later than 1 month prior to end of Increment. OBT objectives are to (a) practice fire response procedures (FRPs) and all incorporated actions for the case of a software-detected fire to locate, extinguish, and verify extinguishing attempts; (b)*

browse through RS laptop and the Signal-VM fire detection system displays as well as the automated software (algorithms) response to the fire event; (c) practice crew communication necessary to perform emergency FRPs; (d) ensure familiarization with support equipment (CSA-CP compound specific analyzer-combustion products, PBAs portable breathing assemblies, PFE/OSP-4 portable fire extinguishers, and IPK-1M gas masks to be used for fire suppression. These exercises do not actually use any fire equipment but simulate such actions to the maximum extent possible. The Emergency Procedures OBT concluded with a 15-min. debrief with Russian/U.S. ground specialists at ~12:00pm EDT via S-band.]

Gregory conducted the periodic hatch seal inspection in all USOS (US segment), ESA & JAXA modules (Node-1 Forward, Aft & Starboard, Airlock, Lab Aft & Forward, Node-2 Aft, Starboard & Port, Columbus, Kibo JPM Starboard & Zenith, Kibo JLP Nadir) in support of ACS (Atmospheric Control System) maintenance, using a special vacuum cleaner and other tools (last time done: 7/8).

The FE-2 continued the JAXA CGSE (Common Gas Supply Equipment) CO₂ leak troubleshooting in the JPM (JEM Pressurized Module) begun last week, today preparing the Saibo rack with the CGSE for the planned leak check (which, as per JAXA report this morning, is still showing pressure decay on the CO₂ line).

[Preparations focused on isolating the SAIBO rack from the system CO₂ line by disconnecting the QD (Quick Disconnect) on the UIP (Utility Interface Panel/Z-Panel) and repressurizing the system CO₂ line, to be then monitored by SSIPC (Space Station Integration & Promotion Center) at Tsukuba/Japan for two days to determine if either the system or the payload is the CO₂ leak source. Background:

On 8/8, the CBEF (Cell Biology Experiment Facility) in the SAIBO rack exhibited a sudden unexpected pressure drop at the CGSE CO₂ high-pressure sensor, from 3000 kPa to 500 kPa within 1.5 minutes. Specialists believe that the SSV (Self Shut-off Valve) closed itself unexpectedly, making it a potential contributor to the sudden pressure decrease. Also suspected is leakage from the CO₂ supply line.]

Chamitoff also conducted another one of the periodic offloadings of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling a CWC (Contingency Water Container, #1070) with the collected water slated for processing. No samples were required. *[Estimated offload time before reaching the tank's neutral point (leaving ~6 kg in the tank): ~30 min.]*

For Sergey Volkov, it was time again for recharging the Motorola Iridium-9505A satellite phone brought up on Soyuz 16S, a monthly routine job and his fifth time. *[After retrieving it from its location in the TMA-12/16S descent module (BO),*

Sergey initiated the recharge of its lithium-ion battery, monitoring the process every 10-15 minutes as it took place. Upon completion at ~3:00pm, the phone was to be returned inside its SSSP Iridium kit and stowed back in the BO's operational data files (ODF) container. The satphone accompanies returning ISS crews on Soyuz reentry & landing for contingency communications with SAR (Search-and-Rescue) personnel after touchdown (e.g., after an "undershoot" ballistic reentry, as happened during the recent 15S return). The Russian-developed procedure for the monthly recharging has been approved jointly by safety officials. During the procedure, the phone is left in its fire-protective fluoroplastic bag with open flap. The Iridium 9505A satphone uses the Iridium constellation of low-Earth orbit satellites to relay the landed Soyuz capsule's GPS (Global Positioning System) coordinates to helicopter-borne recovery crews. The older Iridium-9505 phones were first put onboard Soyuz in August 2003. The newer 9505A phone, currently in use, delivers 30 hours of standby time and three hours of talk, up from 20 and two hours, respectively, on the older units.]

Working off the Russian at-crew's-discretion task list, Oleg Kononenko performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Also from the task list, the FE-1 completed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

As third "time permitting" task list job, Oleg conducted the regular status check of the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (barley) under spaceflight conditions in the Lada-13 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}).

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1).

Later, Sergey transferred the exercise data files to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

As generally every day now, starting at ~9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) was activated intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS (Internal Thermal Control System) cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking. CDRA remains "yellow" on the ISS critical systems list.]*

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Week 21 Scheduled Main Activities:

- Tue. (9/9): SLEEP; Acoustic Survey; BMP ch.2 regen; TORU OBT; O-OHA; EMU batt. maint.; BCAT-3 fam.; PMCs; JAXA AQUA-Ink Ball exp.; MBI-12.
- Wed. (9/10): SLEEP; MBI-18; MBI-12 term/dwnld; "Life on ISS" video; RS Video/MPEG-2 Ku-Band test; CGSE troubleshoot; SOTR-SMOK R&R; MAS microbial analyses (T+5); BCAT-3/-4; Progress 30P launch.
- Thu. (9/11): MBI-11; JAXA Art video; TORU OBT rvw; CHeCS Rack relocate; SOTR-SMOK R&R; CWC audit; IWIS reprog.
- Fri. (9/12): Tekh-20 (PK-3) BSPN; Lulin-5 check; ICS umbilical mate; Progress 30P docking (SM aft port); Node-2 cleanout; NUTRITION setup.
- Sat. (9/13): NUTRITION w/blood collect; Progress 30P SSVP-StM docking system dismantle; US-21 install; BITS2-12 connect; 30P cargo transfers (BTKh-1,-2,-3,-4,-20, SOLO-PCBA); BTKh-29 trans./install; IWIS dwnld; ham pass; FFQ.

ISS Orbit (as of this morning, 8:17am EDT [= epoch]):

Mean altitude -- 353.2 km

Apogee height -- 357.9 km

Perigee height -- 348.5 km

Period -- 91.60 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006424

Solar Beta Angle -- 31.6 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 20 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56164

Significant Events Ahead (all dates Eastern Time, some changes possible.):

09/08/08 -- Progress M-64/29P de-orbit (~4:47pm)
 09/10/08 -- Progress M-65/30P launch (~3:50pm)
 09/12/08 -- Progress M-65/30P docking (SM aft, ~5:01pm)
 09/29/08 -- ATV de-orbit (nighttime re-entry for observation from 2 NASA planes;
 9:12pm)
 10/01/08 -- **NASA 50 Years** (official)
 10/10/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
 12:33am
 10/11/08 -- Progress M-65/30P undocking (from SM aft)
 10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)
 10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)
 10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?
 11/12/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
 11/14/08 -- STS-126/Endeavour/ULF2 docking
 11/20/08 -- **ISS 10 Years**
 11/25/08 -- Progress M-65/30P undocking & deorbit
 11/26/08 -- Progress M-66/31P launch
 11/30/08 -- Progress M-66/31P docking
 02/09/09 -- Progress M-66/31P undocking & deorbit
 02/10/09 -- Progress M-67/32P launch
 02/12/09 -- Progress M-67/32P docking
 02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
 02/14/09 -- STS-119/Discovery/15A docking
 02/24/09 -- STS-119/Discovery/15A undocking
 02/26/09 -- STS-119/Discovery/15A landing (nominal)
 03/25/09 -- Soyuz TMA-14/18S launch
 03/27/09 -- Soyuz TMA-14/18S docking (DC1)
 04/05/09 -- Soyuz TMA-13/17S undocking
 04/07/09 -- Progress M-67/32P undocking & deorbit
 05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 05/25/09 -- Soyuz TMA-15/19S launch
 05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
 07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
 10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
 12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
 02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
 04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
 05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 09/07/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – rest day for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff. Ahead: Week 21 of Increment 17.*

The crew performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the SM (Service Module) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

As part of the house cleaning, the crew conducted regular maintenance inspection & cleaning on fan grilles in the FGB (TsV1), SM (VPkhO, VPrK, FS5, FS6 & FS9), DC1 (V3) screens, as well as in the COL (Columbus Orbital Laboratory).

Sergey Volkov performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP-Moscow. The CDR today also checked up on the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem, gathering weekly data on total operating time & "On" durations for reporting to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

In preparation for tomorrow's Robotics activities, Chamitoff set up the SSRMS (Space Station Remote Manipulator System) video camera connection by hooking up the UOP DCP (Utility Outlet Panel/Display & Control Panel) power bypass cable

at the CUP RWS (Cupola Robotic Work Station). *[Tomorrow's SSRMS operations require a maneuver & grapple to the ESP-3 (External Stowage Platform 3) by Chamitoff for an EBCS (External Berthing Camera System) checkout by the ground.]*

The station residents conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1).

As generally every day now, starting at ~9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) was activated intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS (Internal Thermal Control System) cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking. CDRA remains "yellow" on the ISS critical systems list.]*

Working off their discretionary "as time permits" task list, Sergey and Oleg ran another session with the Russian biomedical MBI-15 "Pilot-M"/NEURO signal response experiment, with Kononenko today's subject and Volkov assisting. Afterwards, the Pilot-M & Neurolab-2000M gear was torn down and stowed. *[MBI-15 requires a table, ankle restraint system, eyeball electrodes for an EOG (electrooculogram), and two hand controllers (RUO & RUD) for testing piloting skill in "flying" simulations on a laptop (RSK1) under stopwatch control, as well as for studying special features of the psychophysiologic response of cosmonauts to the effects of stress factors in flight.]*

Also from the discretionary task list, Oleg conducted the regular status check of the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (barley) under spaceflight conditions in the Lada-13 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}).

A third item on the Russian "job jar" list for the FE-1 was another run of the Russian DZZ-2 "Diatomeya" ocean observations program, using the NIKON-F5 DCS still camera with f85mm lens and the HDV camcorder from SM window #7 to record color field patterns in the target water areas and current cloud cover conditions above them. September is the time to observe the autumnal peak in development of phytoplankton at mid-latitudes associated with higher concentration of biogenic matter in the ocean due to its regeneration and continental runoff. *[Uplinked target zones in the Indian Ocean were the coastal area of South Africa and the area south-west of Australia, and in the Atlantic Ocean the US coastline and the area south of*

Africa.]

WiFi Switch Update: Congrats went up to the crew on yesterday's successful verification of the station's switch to WiFi: "It's very good to know that the new WAPs (Wireless Access Points) work so well—even reaching an unexpected location. How convenient!" *[When the ground could not connect to the WiFi-card equipped SSC-11 (Station Support Computer 11) A31p laptop to set up the wireless network with the appropriate "wizard", Chamitoff configured SSC-9 locally with a different WiFi card, and that fixed the problem, although the actual cause (card or transition difference) remains unclear. SSC-9 was later returned to normal OpsLAN ops.]*

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Week 21 Scheduled Main Activities:

- Mon. (9/8): SLEEP; Acoustic Survey; BMP ch.1 regen; POC-DOUG revw; SSRMS/ESP-3; Hatch seal inspect; CGSE troubleshoot; EMER OBT; ATV MBRL/PCE uninstall; Iridium phone recharge.
- Tue. (9/9): SLEEP; Acoustic Survey; BMP ch.2 regen; TORU OBT; O-OHA; EMU batt. maint.; BCAT-3 fam.; PMCs; JAXA AQUA-Ink Ball exp.; MBI-12.
- Wed. (9/10): SLEEP; MBI-18; MBI-12 term/dwnld; "Life on ISS" video; RS Video/MPEG-2 Ku-Band test; CGSE troubleshoot; SOTR-SMOK R&R; MAS microbial analyses (T+5); BCAT-3/-4; Progress 30P launch.
- Thu. (9/11): MBI-11; JAXA Art video; TORU OBT rvw; CHeCS Rack relocate; SOTR-SMOK R&R; CWC audit; IWIS reprog.
- Fri. (9/12): Tekh-20 (PK-3) BSPN; Lulin-5 check; ICS umbilical mate; Progress 30P docking (SM aft port); Node-2 cleanout; NUTRITION setup.

ISS Orbit (as of this morning, 8:05am EDT [= epoch]):

Mean altitude -- 353.2 km

Apogee height -- 357.9 km

Perigee height -- 348.5 km

Period -- 91.60 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006959

Solar Beta Angle -- 27.3 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 50 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 56148

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/08/08 -- Progress M-64/29P de-orbit (~4:47pm)
09/10/08 -- Progress M-65/30P launch (~3:50pm)
09/12/08 -- Progress M-65/30P docking (SM aft, ~5:01pm)
09/29/08 -- ATV de-orbit (nighttime re-entry for observation from 2 NASA planes; 9:12pm)
10/01/08 -- **NASA 50 Years** (official)
10/10/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
12:33am **[new target date]**
10/11/08 -- Progress M-65/30P undocking (from SM aft)
10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?
11/12/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC **[new target date]**
11/14/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 09/06/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – off duty day for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff.*

ATV Adieu: At 5:31pm EDT last evening, ATV1 (Automated Transfer Vehicle 1) “Jules Verne” successfully undocked from the ISS Service Module (SM) aft port, with Sergei Volkov and Oleg Kononenko standing by to monitor separation maneuvers and telemetry parameters. As planned, Kononenko recorded imagery of the ATV front cone during departure. As ATV2 is being assembled at Bremen/Germany, ATV1 performed nominal separation burns and is scheduled for re-entry on 9/29 at night time, to be observed from two high-flying NASA planes.

Due to the late-afternoon ATV undocking, the crew's sleeptime last night began 1.5 hours later than usual (7:00pm). Wake-up this morning was slipped to 3:30am. Tonight the cycle moves back to normal (5:30pm-2:00am EDT).

At ~9:45am, the crewmembers conducted their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-Houston and TsUP-Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

CDR Volkov downloaded the structural dynamics data collected by the IWIS NCU/RSUs (Internal Wireless Instrumentation System/Network Control Unit/Remote Sensor Units) last evening during the ATV undocking, for subsequent downlink via OCA. Later, Sergey deactivated the IWIS.

In the JAXA Kibo laboratory, FE-2 Chamitoff likewise powered off the MMA (Microgravity Measurement Apparatus) NCU/RSU at the Ryutai rack UDC (Utility DC-to-DC Converter) unit.

After transitioning the JSL (Joint Station LAN) network to the new Netgear wireless APs (Access Points, WAPs) which provide the ISS with WiFi (wireless+Ethernet) connectivity, Gregory today repeated functionality tests, abandoned earlier this week, in three Kibo JPM (JEM Pressurized Module) locations from the wireless SSC -11 laptop, and later also in the COL (Columbus Orbital Laboratory). Afterwards switching to "Proxim" APs, the new WiFi "Dolphin" BCRs (Barcode Readers) were also tested.

In the following 3-hr. VolSci (Voluntary Weekend Science) session, Chamitoff focused again on SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellites), performing algorithm/software development for the experiment as a stand-alone activity, i.e., with no ground support required from PD (Payload Developer) or POIC (Payload Operations & Integration Center/Huntsville) personnel.

Kononenko conducted the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Working off their discretionary "as time permits" task list, Sergey and Oleg ran another session with the Russian biomedical MBI-15 "Pilot-M"/NEURO signal response experiment, with Volkov today's subject and Kononenko assisting. Afterwards, the Pilot-M & Neurolab-2000M gear was left connected for the upcoming run for Oleg. *[MBI-15 requires a table, ankle restraint system, eyeball electrodes for an EOG (electrooculogram), and two hand controllers (RUO & RUD) for testing piloting skill in "flying" simulations on a laptop (RSK1) under stopwatch control, as well as for studying special features of the psychophysiologic response of cosmonauts to the effects of stress factors in flight.]*

The station residents conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1).

Later, Gregory transferred the exercise data files to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

SSK Update: After collecting the scheduled microbiological air samples with the

MAS (Microbial Air Sampler) kit yesterday, microbiological surface sampling with the SSK (Surface Sampling Kit), also scheduled, had to be deferred due to crew time constraints.

S1 Radiator Cover Sheet Debonding Update: Imagery confirms that a face sheet has peeled back on one panel (#7) of the S1 TRRJ (Thermal Radiator Rotary Joint) Radiator 3, for currently unknown reasons. Teams are looking for any changes and/or movement of the face sheet since the damage was discovered on 9/4. Forward plans to assess the root cause are being worked. Current heat rejection requirements are far below the ETCS (External Thermal Control System) heat rejection capability; therefore no operational impacts have been identified from a heat rejection standpoint. *[Each of the eight radiator panels has two thermal face sheets, one on each side, which are epoxy-glued and autoclaved to the honeycomb structure of the radiator. The face sheets have a thermal surface coating designed to maximize heat reflection & absorption transfer to space. Further investigation is underway, and specialists are currently keeping a camera on the panel for monitoring.]*

Conjunction Update: When a conjunction prediction last night (8:00pm EDT) for a piece of Kosmos 2421 debris showed a miss distance of 0.67 km at a TCA (Time of Closest Approach) of ~10:00am this morning, leaving insufficient time for calculating & executing a DAM (Debris Avoidance Maneuver) with SM propulsion, Safe Haven instructions were uplinked to the crew. Subsequent tracking data reduced the PC (Probability of Collision) drastically, and when it approached zero this morning, “Safe Haven” was called off. *[For the Safe Haven scenario, the crew would have relocated the Airlock PCS (Portable Computer System) laptop to the SM, then closed out and egressed the two Kibo modules (JLP, JPM), COL, Node-2, US Lab, Node-1/PMA-1, closing all hatches to the RS (Russian Segment), which contains ECLSS, and then retreating to the Soyuz crew return vehicle to await TCA.]*

Weekly Science Update (*Expedition Seventeen -- Week 20*)

3-D SPACE: In progress.

ALTCRISS (*Alteino Long Term monitoring of Cosmic Rays on the ISS*): Measurements continue in FGB module.

ANITA (*Analyzing Interferometer for Ambient Air*): Continuing.

BCAT-3 (*Binary Colloidal Alloy Test 3*): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System):
Samples returned on 1J.

CSI-2/CGBA-5 (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus 5): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): Due to safety concerns identified for the PLEGPAY instrument (when operated in Plasma Discharge mode), the entire EuTEF platform was put in survival mode on 9/1 at around 11:00am EDT (just prior to 29P undocking). Since then, the EuTEF power feeder#1 has been deactivated and no science acquisition is possible. Teams on the ground are closely monitoring the situation and assessing science impacts. EuTEF will be unable to stay in this situation for a long period of time. -- DEBIE-2: Inactive; -- DOSTEL: Inactive; -- EuTEMP: Inactive; -- EVC: Inactive; -- EXPOSE: Inactive; -- FIPEX: Inactive; -- MEDET: Inactive; -- PLEGPAY: Inactive; -- TRIBOLAB: Inactive.

FSL (Fluid Science Laboratory): FSL is nominal.

GEOFLOW: On 8/27, the Science Run#4 was interrupted in order to prepare the FSL Facility for the DAM (Debris Avoidance Maneuver) which took place on that day. GEOFLOW Science Run#1 to Run#4 data have been successfully downlinked and handed over to the science team in Germany. We have gotten very promising results for GEOFLOW so far! The FSL Facility Core Element (FCE) was locked on 8/27 and remains locked for the ISS vehicle traffic (29P undock, ATV undock, 30P docking). The FSL FCE will remain locked at least until after the Progress 30P docking planned on 9/12.

HDTV System Test DL (JAXA): The G1 camcorder function check using MPC was partially conducted on 9/05. Since the Earth view from JPM windows was not able to be performed, it will be rescheduled.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Planned.

Marangoni Experiment for ISS (JAXA Fluid Physics Experiment Facility): The second Marangoni experiment cycle is in progress and will be completed on 9/07.

Micro-G Clay (JAXA EPO): The Clay figures were retrieved from the JPM wall on 8/28 and stowed for return on ULF2.

MISSE (Materials ISS Experiment): Ongoing.

Moon Photography from ISS (JAXA EPO): Complete.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-1/-2 (Nitric Oxide Analyzer, ESA): Complete.

NUTRITION w/REPOSITORY: In progress.

PADLES (Passive Dosimeter for Lifescience Experiment in Space): In progress.

PCRF (Protein Crystallization Research Facility) Reconfiguration (JAXA): The PCRF reconfiguration was completed nominally on 8/28.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems):
Ongoing.

SAMPLE: Complete.

SHERE (Shear History Extensional Rheology Experiment): “Greg, you have almost completed all of the planned test points for SHERE. We thank you very much for all the fantastic science you have given us and all your hard work. You have given us science far beyond the original plan, and your results have sparked much discussion and excitement among the team. Thank you! We will send you more results as we analyze the data, and we hope to work with you again soon.”

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): “Greg, thanks for completing your Actiwatch download activity. Your data continues to look great. To avoid the no communication error you got, the stowage notes for the next Sleep activity will direct you to another Actiwatch Reader whose battery power functionality has been verified.”

SOLAR (Solar Monitoring Observatory): The current Sun visibility window opened on 8/25, but unfortunately due to high values of ISS Yaw, Pitch and Roll, it was not possible to track the Sun before 8/28. The science acquisition is currently taking place without any problems. SOLAR performed two crisscross measurements on 8/29 and on 9/01. The present Sun observation window should normally close on 9/06.-- SOVIM: continuously acquiring science; -- SOLSPEC: acquiring science, daily calibration and Sun spectrum measurements; -- SOLACES: acquiring science, regular command scripts performed.

SOLO: Planned.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite):
“Greg, thanks for supporting SPHERES for Voluntary Science. Test #12 went well!”

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels):
Teams on the ground continue to assess the results of the BIOLAB Rotor A Bellow

Test, which gave faulty signals for 4 out of 6 Reference ECs (Experiment Containers). The next troubleshooting step is currently planned on 9/5 with the Rotor B Actuator test and Rotor B bellow test, all performed from ground.

CEO (Crew Earth Observations): Through 9/04 the ground has received a total of 5,796 frames of CEO images for review and cataloging. "Photos acquired with times corresponding to our CEO target list request times are reviewed first and this week included: Santorini Volcanic Complex, Greece (acquired and under review); Kwanza Basin Angola (under review-more clouds and smoke than we expected); Hurricane Gustav (acquired, confirmed, and published by PAO); High Central Andean Glaciers (some acquired-under review); Cairo Egypt (not acquired); Yellowstone National Park (useful imagery acquired-under review); and Hurricane Ike (acquired, confirmed, and published by PAO). A good week's work! Thank you for the prompt downlink of dynamic events like hurricanes. Your dazzling high-oblique view, through breaks in the clouds, of the middle Amazon River basin will be published on NASA/GSFC's Earth Observatory Site this weekend. Sun glint-enhanced water features provide rare visual insight into the structures and processes of this great river system. Good eye!"

CEO photo targets uplinked for today were **Hurricane Ike, Atlantic Ocean** (*Dynamic Event. Hurricane Ike remains a well-formed storm. It has weakened slightly, but is predicted to regain strength as it continues westwards towards the Bahamas. Looking to the right of track for the storm*), **Red River Basin, TX** (*the Red River basin along the Texas/Oklahoma border is the focus of ongoing development, providing an opportunity to track land use/land cover change over time. Overlapping nadir frames - taken along track as ISS approached, crossed, and then departed the river channel almost directly to the north of the Dallas/Forth Worth, TX metro area - were requested*), and **Jarvis Island, equatorial Pacific** (*weather is predicted to be clear over Jarvis Island, providing an opportunity for high resolution imagery of the island and surrounding coral reefs. Greg had a nadir pass over the island. Images of the island are useful for mapping shoreline geomorphology and reef extent over time*).

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Week 21 Scheduled Main Activities:

- Sun. (9/7): Station cleaning; DCP video bypass cable install for Robotics; PFC (FE-2).
- Mon. (9/8): SLEEP; Acoustic Survey; BMP ch.1 regen; POC-DOUG revw; SSRMS/ESP-3; Hatch seal inspect; CGSE troubleshoot; EMER OBT; ATV MBRL/PCE uninstall; Iridium phone recharge.

- Tue. (9/9): SLEEP; Acoustic Survey; BMP ch.2 regen; TORU OBT; O-OHA; EMU batt. maint.; BCAT-3 fam.; PMCs; JAXA AQUA-Ink Ball exp.; MBI-12.
- Wed. (9/10): SLEEP; MBI-18; MBI-12 term/dwnld; "Life on ISS" video; RS Video/MPEG-2 Ku-Band test; CGSE troubleshoot; SOTR-SMOK R&R; SSK/MAS T+5 analyses; BCAT-3/-4.

ISS Orbit (as of this morning, 8:57am EDT [= epoch]):

Mean altitude -- 353.2 km

Apogee height -- 357.9 km

Perigee height -- 348.6 km

Period -- 91.60 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006956

Solar Beta Angle -- 23.0 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 89 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56133

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/08/08 -- Progress M-64/29P de-orbit (~4:45pm)

09/10/08 -- Progress M-65/30P launch (~3:49:45pm)

09/12/08 -- Progress M-65/30P docking (SM aft, ~5:08pm DM)

09/29/08 -- ATV de-orbit (nighttime re-entry for observation from 2 NASA planes; 9:12pm)

10/01/08 -- **NASA 50 Years** (official)

10/10/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4) 12:33am

10/11/08 -- Progress M-65/30P undocking (from SM aft)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?

11/12/08 -- STS-126/Endeavour/ULF2 launch -- MPLM Leonardo, LMC

11/14/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch -- S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 09/05/08

All ISS systems continue to function nominally, except those noted previously or below.

Sleep Cycle Shift: Due to the late-afternoon ATV (Automated Transfer Vehicle) undocking, the crew's sleep cycle shifted by 1.5 hrs: wake-up this morning was at 3:30am EDT, sleeptime begins tonight at 7:00pm. Wake-up tomorrow will also be at 3:30am, and the cycle then moves back to normal.

CDR Volkov started out on the first part of the scheduled replacement of the renewable condensate removal lines (SMOK) of the Russian SOTR Thermal Control System in the Service Module (SM), first verifying shutdown of the two condensate pumps (NOK-1 & NOK-2), then purging the SMOK hoses with air and installing the first set of them between the BTA heat exchanger-evaporator of the SKV-1 air conditioner and the NOK-1 pump.

Continuing the current anti-virus campaign of "cleaning" and reloading RS (Russian Segment) crew support laptops, flash memory cards and DVDs with new antivirus software, FE-1 Kononenko downlinked the results of yesterday's RSS-1 & RSE-med laptop scans to the ground via Regul BRI/Smart Switch Router telemetry channel.

In the JAXA Kibo laboratory, FE-2 Chamitoff worked on the CBEF (Cell Biology Experiment Facility) to troubleshoot the malfunctioning door lock of the incubator and to take digital photos of three indicated locations (total of ~9 photos). *[CBEF provides an incubation environment with controlled temperature, humidity and carbon dioxide (CO₂) level. CBEF also has a centrifuge chamber for generating "artificial gravity", thus enabling simultaneous experiments under both micro-G and controlled-G conditions.]*

After starting to troubleshoot the CGSE (Common Gas Supply Equipment) CO₂

leak in the Kibo JPM (JEM Pressurized Module) on 9/3, Gregory Chamitoff today was to wrap up Part 1 of the investigation and prepare the systems for the scheduled leak check which is to track down the source of the still unexplained CO₂ loss. *[Activities included isolating the Saibo rack from the system CO₂ line by disconnecting the QD (Quick Disconnect) on the UIP (Utility Interface Panel/Z-Panel), then repressurizing the system CO₂ line from the upper CGSE GBU (Gas Bottle Units), to be monitored by SSIPC (Space Station Integration & Promotion Center) at Tsukuba/Japan for two days to determine if either the system or the payload is the CO₂ leak source. Background: On 8/8, the CBEF in the Saibo rack exhibited a sudden unexpected pressure drop at the CGSE CO₂ high-pressure sensor, from 3000 kPa to 500 kPa within 1.5 minutes. Specialists believe that the SSV closed itself unexpectedly, making it a potential contributor to the sudden pressure decrease. Also suspected is leakage from the CO₂ supply line. Next steps of the troubleshooting will depend on the result of the two-day leak check.]*

For a scheduled checkout of the G1 video camcorder with MPC (Multipurpose Converter) and IPU (Image Processing Unit), set up in the Kibo JPM yesterday, Chamitoff configured the camcorder for playing back some recorded test scenes, then downlinked the data (camcorder footage plus file transfer from the MLT/Terminal Laptop) through the MPC and IPU. *[The MPC is part of the video equipment used for HDTV (High Definition TV) playback & downlink. While MPC has already been in general use in the Lab, this was the first MPC operation in Kibo, using JAXA-developed DC power supply, cables and a camera arm that are not used in the Lab. The IPU in the JPM's Ryutai rack can receive analog signals from the G1, and today's downlink of G1 data via IPU was to verify the integrity of both the G1 camcorder and IPU.]*

Oleg Kononenko had two hours set aside to conduct the periodic audit/inventory of RODF (Russian Operations Data File) procedures material. *[Going by an uplinked listing of ~48 ODFs, the audit was to verify whether RS procedures (Cue Cards) tabulated in the uplink are still available onboard, record the actual stowage location of them, take note of any discrepancies in their locations, ODF designations and number of copies, assess ODF conditions, and discard any ODF cue cards not listed in the uplink.]*

Later, the FE-1 went about taking the periodic readings of potentially harmful atmospheric contaminants in the SM, using the CMS (Countermeasure System).

[The CMS, a component of the GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, uses preprogrammed microchips to measure, normally, H₂CO (Formaldehyde, methanal), CO (Carbon Monoxide) and NH₃ (Ammonia), taking one

measurement per microchip.]

Oleg also conducted the periodic checkout/verification of IP-1 airflow sensors in the various RS (Russian Segment) hatchways, including the passageways SM PrK (Transfer Compartment)–SM RO (Working Compartment), SM PkhO (Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1, and skipping the Soyuz hatch today.

Greg used the MAS (Microbial Air Sampler) kit to obtain periodic microbiology air samples from ISS modules (mid-module locations), including the Kibo laboratory. *[MAS sampling is performed once every three months, taking bacterial and fungal air samples at each location, and there are two locations sampled in each module. The samples are analyzed after 5-days of incubation in four Petri dishes.]*

The FE-2 also collected microbiological surface samples with the SSK (Surface Sample Kit) in the SM, Node-1 (at the location where the crew dries their clothing) and Lab. *[As for MAS, bacterial and fungal air samples are usually taken at two locations in the module being checked. The samples are analyzed after 5-days of incubation. For onboard visual analysis of media slides, the crew has a procedure for visual inspection of samples for bacterial and fungal colony growths after appropriate incubation periods.]*

Chamitoff performed another standard sensor calibration on the new CSA-O₂ (Compound Specific Analyzer-Oxygen) units #1043 & #1059, delivered on 1J.

Continuing the current round of periodic preventive maintenance of RS ventilation systems, Kononenko worked in the DC1 (Docking Compartment), replacing the PF1 & PF2 filter cartridges and cleaning the V1 & V2 fan grilles and VD1 & VD2 air ducts.

As next step in transitioning the JSL (Joint Station LAN) network to the new Netgear wireless APs (Access Points, WAPs) which provide the JSL with Ethernet connectivity, Gregory powered off the RF (radio frequency) LAN “Proxim” AP in Node-1 & Node-2, then inserted a new wireless network card into the SSC-11 (Station Support Computer 11) laptop, in support of a subsequent remote wireless checkout by the ground.

Sergey Volkov conducted the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Oleg Kononenko completed the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

In the U.S. Lab, Volkov performed another controlled shut-down of the EHS VOA (Environmental Health System-Volatile Organic Analyzer), with the ground power-cycling its RPC (Remote Power Controller).

In preparation for tonight’s ATV undocking, Chamitoff closed the protective shutters of the science window in the JAXA JPM and in the U.S. Lab.

Later today, CDR Volkov & FE-1 Kononenko will be supporting the undocking and separation of “Jules Verne” by –

- Setting up and activating the KL-152 “Klest” television equipment in the SM with the ATV TV control console (BRTK-PU) *[with Ku-band downlink via OCA of the MPEG-2 (Moving Pictures Expert Group 2) “streaming video” packets, which MCC-Houston will then pass on to the ESA Gateway for COL-CC (Columbus Control Center) to forward the downlink to TsUP-Moscow; but NASA-TV will not be covering the undocking]*,
- Preparing the PCE (Proximity Communications Equipment) gear for the undocking, supported by ground specialist tagup via S-band (~3:55pm),
- Taking video and photography of the ATV forward cone at separation (~5:32pm), i.e., focusing the Nikon D2X still camera especially on the two TGM (Telegoniometer) sensor boxes and two VDM (Videometer) sensor boxes in front,
- Monitoring the fly-away from an SM window for situational awareness and safety,
- On TsUP Go, switching the PrK-to-aft port vestibule PEV (Pressure Equalization Valve, KVD) manually to its Closed position, and
- Observing proximity operations of the ATV from any aft window as “Jules Verne” ventures out on its independent flight phase.

At ~5:30am EDT, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU/*Glavnaya operativnaya gruppа upravleniya* = “Chief Operative Control Group”), including Shift Flight Director (SRP), at TsUP-Moscow via S-band/audio, phone-patched from Houston and Moscow.

At ~9:55am, Sergey & Oleg linked up with TsUP stowage specialists via S-band to conduct the weekly IMS tagup, discussing inventory & stowage issues, equipment locations and cargo transfers.

The station residents conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), and RED resistive exercise device (FE-2).

Later, Volkov transferred the exercise data files to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working from the Russian discretionary "time permitting" task list, Oleg performed the regular status check on the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (peas) under spaceflight conditions in the Lada-13 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}).

S1 Radiator Cover Sheet Debonding: Imagery shows that a face sheet has peeled back on one panel of the S1 radiator, for currently unknown reasons. The heat rejection capability of the radiator has not been impacted to any significant extent, and the debonding of the face sheet is no issue for ATV undocking. *[Each of the eight radiator panels has two thermal face sheets, one on each side, which are epoxy-glued and autoclaved to the honeycomb structure of the radiator. The face sheets have a thermal surface coating designed to maximize heat reflection & absorption transfer to space. Further investigation is underway, and specialists are currently keeping a camera on the panel for monitoring.]*

WRM Update: An updated WRM (Water Recovery Management) "cue card" was uplinked overnight for the crew's reference, updated with yesterday's water audit.

[The new card (17-0002Y) lists 30 CWCs (~1095.0 L total) for the four types of water identified on board: technical water (362.3 L, for flushing only because of Wautersia bacteria), potable water (706.7 L, incl. 174.6 L currently on hold), condensate water (9 L), waste/EMU dump and other (17 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]

ATV "Jules Verne" Undocking: Tonight, the ATV cargo ship, carrying ~900 kg (2,000 lbs) of dry waste and 254 kg (560 pounds) of liquid waste, will undock from the ISS SM aft port, according to the following summary flight plan:

- ISS mnvr to undocking attitude 3:10pm EDT
- ISS Free Drift 5:27pm
- Sunrise 5:27:36pm
- Undock Command 5:28pm
- Phys.Sep/hooks open (spring delta-V \approx 0.08m/s) **5:31pm**

- ATV departure burn (316 s, $\Delta V \approx 4.00$ m/s) 5:32pm
- ISS mnvr to TEA attitude 5:55pm
- Sunset 6:24pm
- *Independent flight until deorbit on 9/29 (Monday):*
- Deorbit Burn #1 (29.80 m/s) 6:14:39am
- Deorbit Burn #2 (70.28 m/s) 9:12:27am

CEO (Crew Earth Observations) photo targets uplinked for today were **Hurricane Ike, Atlantic Ocean** (*Dynamic Event. Hurricane Ike is now a strong Category 3 storm, and exhibits well-defined outflow banding and an eye feature. Greg was to look to the right of track for the hurricane. Current track predictions have Ike encountering the Bahamas by early next week*), **Madrean Sky Islands, SW USA/ Mexico** (*the Madrean Sky Islands are patches of forest near the summits of the high mountains of the southwestern USA and northwestern Mexico. These forests are remnants of much more extensive vegetation that once existed at lower elevations in cooler and wetter climates. Looking to the W as ISS passed over New Mexico and northern Mexico for views of the mountains. Oblique images of the mountains were requested to provide context for later high-resolution imagery*), and **Pilcomayo River dynamics, Northern Argentina** (*the Pilcomayo River rises in the Andes Mountains to the west. Images of the river course and adjacent floodplains – located to the right of track - were requested for investigation of river dynamics and land cover change near the banks*).

CEO photography can be studied at this “Gateway” website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Week 20/21 Scheduled Main Activities:

- Sat. (9/6): FFQ; IWIS deactivation.
- Sun. (9/7): Station cleaning; DCP video bypass cable install for Robotics; PFC (FE-2).
- Mon. (9/8): SLEEP; Acoustic Survey; BMP ch.1 regen; POC-DOUG revw; SSRMS/ESP-3; Hatch seal inspect; CGSE troubleshoot; EMER OBT; ATV MBRL/PCE uninstall; Iridium phone recharge.
- Tue. (9/9): SLEEP; Acoustic Survey; BMP ch.2 regen; TORU OBT; O-OHA; EMU batt. maint.; BCAT-3 fam.; PMCs; JAXA AQUA-Ink Ball exp.; MBI-12.
- Wed. (9/10): SLEEP; MBI-18; MBI-12 term/dwnld; “Life on ISS” video; RS Video/MPEG-2 Ku-Band test; CGSE troubleshoot; SOTR-SMOK R&R; SSK/ MAS T+5 analyses; BCAT-3/-4.

ISS Orbit (as of this morning, 8:49am EDT [= epoch]):

Mean altitude -- 353.3 km
Apogee height -- 358.0 km
Perigee height -- 348.7 km
Period -- 91.61 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0006899
Solar Beta Angle -- 18.5 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.72
Mean altitude loss in the last 24 hours -- 62 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 56117

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/08/08 -- Progress M-64/29P de-orbit (~4:45pm)
09/10/08 -- Progress M-65/30P launch (~3:49:45pm)
09/12/08 -- Progress M-65/30P docking (SM aft, ~5:08pm DM)
09/29/08 -- ATV de-orbit (nighttime re-entry for observation from 2 NASA planes; 9:12pm)
10/01/08 -- **NASA 50 Years** (official)
10/10/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
12:33am **[new target date]**
10/11/08 -- Progress M-65/30P undocking (from SM aft)
10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?
11/12/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC **[new target date]**
11/14/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 09/04/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Volkov serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out"-to-vacuum cycle on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated tonight at ~5:15pm EDT. Filter bed #1 was regenerated yesterday. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently to remove any lingering Freon-218 from the cabin atmosphere (last time: 8/28 & 29).]*

FE-1 Kononenko continued the current reloading and scanning of Russian crew support laptops and flash memory cards with new antivirus software from DVD, then downlinking the results and consulting with ground specialists via S-band tagup. Today's activity focused on the RSK2 and RSE-med laptops. Memory cards and DVDs are coming up next.

Kononenko also performed maintenance on the SRV-K2M condensate water processor, replacing both BRPK separators (Lines 1/2) with new spares. *[The BRPK-1 was recently reported to have lasted only about 80% of its expected life-time.]*

Volkov meanwhile worked on the Russian SOTR Thermal Control System in the SM (Service Module), repeating his earlier (8/15) attempt to drain coolant from the #1 loop (KOB-1) to conduct pressure readings at various valve settings and reposition the membrane separating loop gas & liquids to improve hardware function. After the tests, which included an air flow and leak test, the loop was to be restored to its initial configuration. *[Purpose of the coolant draining was to determine the volume of free air in KOB-1 and check the leak tightness of the KOB-1 accumulator bellows; also: to perform preventive maintenance on the SOTR loops' solenoid valves.]*

The CDR had an hour to collect and prepare new pipelines, connectors and all necessary tooling for tomorrow's scheduled removal & replacement of the renewable SMOK condensate removal lines in the SOTR.

FE-2 Chamitoff completed the weekly 10-min. CWC (Contingency Water Container) inventory as part of on-going WRM (Water Recovery & Management) assessment of onboard water supplies. Updated "cue cards" based on the crew's water calldowns are sent up every other week. *[The new card (17-0002X) lists 31 CWCs (~1163.8 L total) for the four types of water identified on board: technical water (385.0 L, for flushing only because of Wautersia bacteria), potable water (706.7 L, incl. 174.6 L currently on hold), condensate water (54.1 L), waste/EMU dump and other (17 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]*

The FE-2 worked on the MPC (Multi-Purpose Converter) to configure its data rate for upcoming Kibo JPM (JEM Pressurized Module) operations. *[The MPC is part of the video equipment used for HDTV (High Definition TV) playback & downlink by ground commanding.]*

In preparation for another run with the US SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment, Gregory first downloaded SLEEP data from his Actiwatch to the HRF-1 (Human Research Facility 1) laptop for subsequent downlink & verification by the support scientist, then re-initialized and donned the Actiwatch. *[To monitor his sleep/wake patterns and light exposure, Chamitoff now wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout this run. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

Chamitoff prepared six R11 HDDs (hard disk drives) for the upcoming upgrade to CCS (Command & Control System) software vers. R7 by "ghosting" them with the desired file structure/image from CD. *[One each of the HDDs (##1149, 1150, 1157, 1170, 1177, 1190) for the six deployed PCS laptops.]*

Volkov unstowed an electronic box of the German GTS (Global Timing System) payload from the FGB and transferred it to the COL (Columbus Orbital Laboratory) for temporary stowage in the EDT (European Drawer Rack, COL1F1_F1).

Preparatory to tomorrow's ATV undocking, CDR Volkov verified proper setup of the IWIS RSUs (Internal Wireless Instrumentation System Remote Sensor Units) in the Lab, Node-1, Node-2, FGB and SM, then programmed the timing of the IWIS ICU (Interface Control Unit) for the automated activation (start time 5:07pm EDT).

[IWIS will monitor dynamic/vibrational responses of the ISS structure during the ATV undocking, measured by RSUs which transmit their measurements via radio to the central NCU (Network Control Unit). Structural vibrational data will also be taken by the SDMS (Structural Dynamic Measurement System).]

After removing smoke detectors, GLA (General Luminaire Assembly) light fixtures and other useful equipment from the ATV on TsUP/Moscow Go for recycling, Volkov & Kononenko stepped through final preparations for tomorrow's undocking of "Jules Verne by –

- Removing the quick-release screw clamps which had rigidized the docking joint,
- Taking & downlinking ATV/SM interface photo/video documentation before hatch closure,
- Closing the ATV-SU (outer) and PrK-SU (inner) transfer vestibule hatches (~12:30pm EDT),
- Testing the TV downlink from the RS (Russian Segment) over the MPEG-2 (Moving Pictures Expert Group 2) encoder via U.S. OpsLAN and Ku-band in "streaming video" packets,
- Performing the usual one-hour leak check on both hatches, and
- Powering down the onboard Kenwood ham radio equipment to prevent RF (radio frequency) interference during ATV proximity operations.

Greg took measurements for the regular atmospheric status check for ppCO₂ (Carbon Dioxide partial pressure) in the Lab, SM at panel 449 and COL (Columbus Orbital Laboratory) plus battery ticks, using the hand-held CDMK (CO₂ Monitoring Kit, #1002). The unit was then deactivated and returned to its stowage location (LAB1S2). *[Purpose of the 5-min activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements.]*

The FE-1 conducted the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Oleg also completed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Kononenko also reformatted his TVIS treadmill physical exercise PCMCIA (Portable Computer Memory Card International Adapter) storage card on the MEC (Medical

Equipment Computer).

The station residents conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1).

Later, Volkov transferred the exercise data files to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

As generally every day now, starting at ~9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) was activated intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS (Internal Thermal Control System) cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking. CDRA remains “yellow” on the ISS critical systems list.]*

A new addition to Chamitoff’s voluntary “job jar” task list was to remove WAICO1 ECs (Experiment Containers) and exchange Reference ECs on Rotor B of the BLB (Biolab) incubator in the COL.

CGSE Troubleshooting Update: The first part of CGSE (Common Gas Supply Equipment) CO₂ leak troubleshooting in the JAXA JPM (JEM Pressurized Module) was initiated yesterday as reported, but not completed for lack of time. Teams plan to add the missing steps into Part 2 of the troubleshooting. *[On 8/8, the CBEF (Cell Biology Experiment Facility) in the SAIBO rack exhibited a sudden unexpected pressure drop at the CGSE CO₂ high-pressure sensor, from 3000 kPa to 500 kPa within 1.5 minutes. Specialists believe that the SSV (Self-Shutoff Valve) closed itself unexpectedly, making it a potential contributor to the sudden pressure decrease. Also suspected is a leak from the CO₂ supply line.]*

Reboost Planning Update: Teams are discussing reboost plans to meet Soyuz landing phasing and rendezvous conditions for ULF-2. Russia has proposed the reboost during a major U.S. software transition (to CCS Vers. R7), and teams are working to resolve this conflict.

CSA Personnel Announcement: Canadian Space Agency has elected Steven Glenwood MacLean as their new President. Dr. MacLean has flown twice on the

Shuttle (STS-52; STS-115), becoming the first Canadian Astronaut to operate the Canada-built SSRMS (Space Station Remote Manipulator System) on the ISS and the second Canadian to walk in space. Congratulations, Steve!

ATV "Jules Verne" Undocking Update: Tomorrow the ATV cargo ship, with ~900 kg (2,000 lbs) of dry waste and 254 kg (560 pounds) of liquid waste, will undock from the ISS SM aft port. The crew will undergo a slight sleep cycle shift to accommodate the event, viz., wake-up at 3:30am EDT (instead of 2:00am) and sleeptime at 7:00pm (instead of 5:30pm). The ATV summary flight plan is as follows (times are Eastern):

- ISS mnvr to undocking attitude 3:10pm EDT
- ISS Free Drift 5:27pm
- Sunrise 5:27:36pm
- Undock Command 5:28pm
- Phys.Sep/hooks open (spring delta-V \approx 0.08m/s) **5:31pm**
- ATV departure mnvr (316 s, delta-V \approx 4.00 m/s) 5:32pm
- ISS mnvr to TEA attitude 5:55pm
- Sunset 6:24pm
- *Independent flight until deorbit on 9/29 (Monday):*
- Deorbit Burn #1 (29.80 m/s) 6:14:39am
- Deorbit Burn #2 (70.28 m/s) 9:12:27am

CEO (Crew Earth Observations) photo targets uplinked for today were **Tin Bider Impact Crater, Algeria** (*ISS had a nadir pass over this well-exposed, 6-km diameter impact structure. The concentric ring structure of the crater is bordered on three sides by relatively flat desert*), **Hurricane Ike, Atlantic Ocean** (*looking to the left of track for this compact storm, predicted to be a Category 1 hurricane at the time of this overpass [9:41am EDT]. The storm is currently predicted to head westwards towards Cuba. Looking for outflow banding and an eye feature*), **Araguainha Impact Crater, Brazil** (*weather was predicted to be clear over central Brazil, providing an opportunity to photograph this impact structure. The expression of this 40-km diameter crater on the landscape is subtle, and is mainly defined by circular variations in vegetation patterns. Overlapping mapping frames, taken along-track, present the best technique for imaging the crater*), and **High Central Andean Glaciers, S. America** (*looking to the left of track as ISS began to parallel the South American coastline for views of the western slopes of the Andes Mountains. Oblique imagery of glaciers and icefields located near the summits and upper slopes of the mountains was requested*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Week 20/21 Scheduled Main Activities:

- Fri. (9/5): ATV Undock (5:31pm EDT); PCS reboot; Microbial water & surface sampling; CGSE troubleshoot?
- Sat. (9/6): FFQ; IWIS deactivation.
- Sun. (9/7): Station cleaning; DCP video bypass cable install for Robotics; PFC (FE-2).
- Mon. (9/8): SLEEP; Acoustic Survey; BMP ch.1 regen; POC-DOUG revw; SSRMS/ESP-3; Hatch seal inspect; CGSE troubleshoot; EMER OBT; ATV MBRL/PCE uninstall; Iridium phone recharge.
- Tue. (9/9): SLEEP; Acoustic Survey; BMP ch.2 regen; TORU OBT; O-OHA; EMU batt. maint.; BCAT-3 fam.; PMCs; JAXA AQUA-Ink Ball exp.

ISS Orbit (as of this morning, 8:03am EDT [= epoch]):

Mean altitude -- 353.4 km

Apogee height -- 358.0 km

Perigee height -- 348.7 km

Period -- 91.61 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006906

Solar Beta Angle -- 14.1 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 61 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56101

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/05/08 -- ATV1 undocking, from SM aft port (~5:31pm); independent flight

09/08/08 -- Progress M-64/29P de-orbit (~4:45pm)

09/10/08 -- Progress M-65/30P launch (~3:49:45pm)

09/12/08 -- Progress M-65/30P docking (SM aft, ~5:08pm DM)

09/29/08 -- ATV de-orbit (nighttime re-entry for observation from 2 NASA planes; 9:12pm)

10/01/08 -- **NASA 50 Years** (official)

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?

11/10/08 -- STS-126/Endeavour/ULF2 launch -- MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 09/03/08

All ISS systems continue to function nominally, except those noted previously or below.

Before breakfast, the CDR, FE-1 and FE-2 completed another periodic session of the Russian biomedical routine assessment PZeh-MO-7/Calf Volume Measurement (seventh for CDR & FE-1, fifth for FE-2). *[Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference pints, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures.]*

Volkov & Kononenko each spent ~1.5 hrs on the TVIS for the periodic Russian PZE-MO-3 test for physical fitness evaluation, their second time, using the TVIS in unmotorized (manual control) mode and wearing the Kardiokassette KK-2000 belt with three chest electrodes. *[The fitness test, controlled from the RSE-Med laptop, yields ECG (electrocardiogram) readings to the KK-2000 data storage device, later downlinked via the Regul (BSR-TM) payload telemetry channel. Before the run, the KK-2000 was synchronized with the computer date/time readings. For the ECG, the crewmembers worked out on the treadmill, first walking 3 min. up to 3.5 km/h, then running at a medium pace of 6.5 km/h, followed by the maximum pace not exceeding 10 km/h, then walking again at gradually decreasing pace.]*

Volkov also performed the periodic maintenance of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The process will be terminated at ~5:15pm EDT and Bed #2 regeneration performed tomorrow. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently to remove any lingering Freon-218 from the cabin atmosphere (last time: 8/28 & 29);]*

Chamitoff worked on the outfitting of the U.S. Regenerative ECLSS, to install the

new oxygen (O₂) port on the PD4 standoff in the Lab for the WRS (Water Recovery System), after venting the new CHeCS (Crew Health Care Systems) rack O₂ supply hose to prevent contamination, then relocating the umbilical to the new port, purging it and the CHeCS O₂ port and configuring the setup for an overnight leak check.

This activity was deferred on 8/25 when the FE-2 could not locate, for a while, the missing NOPA (N₂ O₂ Purge Adapter) hardware required for purging to evacuate any air in the system. *[The CHeCS rack will be relocated in the near future in the U.S. Lab from the D4 position to the S4 position in order to install the WRS-1 rack during STS-126/ULF2. Since there will be no O₂ connection to the CHeCS rack at the S4 location, the new O₂ port must be installed, also to interface with the Regenerative ECLSS system to maintain a functional O₂ port in the D4 bay of the Lab.]*

After filling the CHeCS, WRS-1 and WRS-2 MTL (Moderate Temperature Loop) supply jumpers with ITCS (Internal Thermal Control System) coolant at two Lab positions, set up yesterday, the FE-2 today disconnected and removed the remaining MTL jumper. *[The hoses need to be filled prior to mating them to their respective racks. The WRS will be used to recycle wastewater into potable water. The Regenerative ECLSS will be required for the future six-person occupancy of the station.]*

Kononenko and Volkov conducted an audit of free stowage space in the RS (Russian Segment), i.e., FGB, SM (Service Module) and DC1 (Docking Compartment), addressing specific questions uplinked in a questionnaire on 8/29.

The CDR also retrieved the three copies of the 1J Warning Book from Lab, SM and FGB, replaced two pages (on Loop A/B thermal pump outlet temperature limits) with new material, then restowed the books. The old pages were discarded as trash.

The FE-1 loaded the Russian laptops RSK1, RSK2, RSE-med, RSS1 and RSE1 with new antivirus software from DVD, scanned the hard disks, taking documentary Nikon photos of the resulting message displays, and consulted with ground specialists via S-band tagup.

The FE-2 initiated the ghost loading of the SAMS (Space Acceleration Measurement System) hard drive with new image structures, to be terminated about 7 hrs later before bedtime.

Oleg continued the current round of periodic preventive maintenance of cabin ventilation systems in the RS, today cleaning the "Group A" fan grilles in the SM.

Gregory had 2:10 hrs reserved for the first part of CGSE (Common Gas Supply Equipment) troubleshooting in the JAXA JPM (JEM Pressurized Module).

[Working on the SSV (Self-Shutoff Valve) in the CGSE Valve Unit, Chamitoff's task today was to recover the SSV, i.e., restore functionality, then isolate the SAIBO rack from the system CO₂ line by disconnecting the QD (Quick Disconnect) on the UIP (Utility Interface Panel/Z-Panel) and repressurize the system CO₂ line, to be monitored by SSIPC (Space Station Integration & Promotion Center) at Tsukuba/ Japan for two days to determine if either the system or the payload is the CO₂ leak source. On 8/8, the CBEF (Cell Biology Experiment Facility) in the SAIBO rack exhibited a sudden unexpected pressure drop at the CGSE CO₂ high-pressure sensor, from 3000 kPa to 500 kPa within 1.5 minutes. Specialists believe that the SSV closed itself unexpectedly, making it a potential contributor to the sudden pressure decrease. Also suspected is leakage from the CO₂ supply line. Part 2 of troubleshooting, on 9/5, will depend on the result of the overnight leak check.]

Later today (~3:30pm EDT), Oleg Kononenko will support a 20-min. systems test of the newly installed ATV PCE (Automated Transfer Vehicle/Proximity Communications Equipment, Russian: MBRL), specifically the BUAP Antenna Feeder Unit and the PU control console for the ATV, preparatory to Friday's undocking of "Jules Verne".

Sergey Volkov conducted the periodic audit/inspection of available photo/video equipment in the RS, in particular four camcorders (including three SONY HVR-Z1J digital high-definition video cameras), one DVCAM, adapter brackets and mounting plates.

Greg Chamitoff had ~1:50 hr set aside for continuing to unpack and stow cargo delivered on STS-124/1J/Discovery on 6/2.

Sergey took care of the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The CDR also completed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

On the Russian Matryoshka-R (RBO-3-2) radiation payload in the DC1, Oleg checked out a memory card and activated the AST Spectrometer for data takes.

[After retrieving a used PCMCIA (Portable Computer Memory Card International Adapter) card, ALC-951, from stowage, Oleg activated the AST twice to verify the card's labels and orientation, then re-inserted ALC-951 in the spectrometer and activated the AST again.]

The FE-1 took the periodic photographs of the plants growing in the BIO-5 Rasteniya-2 ("Plants-2") Lada-13 greenhouse, using the Nikon D2 photo camera with F=17-55 mm lens, then downlinked the images via Regul BSR-TM. The regular status check of the payload which researches growth and development of plants (barley) under spaceflight conditions was conducted as per suggestion by the discretionary "time permitting" task list.

In the U.S. Lab, Sergey Volkov performed a controlled shut-down of the EHS VOA (Environmental Health System-Volatile Organic Analyzer), with the ground power-cycling its RPC (Remote Power Controller).

Gregory completed another one of the periodic inspections of the RED (Resistive Exercise Device) canister cords and accessories, currently done every two weeks.

The station residents conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR/MO-3, FE-1/MO-3), RED resistive exercise device (FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1). Later, Kononenko transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

As generally every day now, starting at ~9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) was activated intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS (Internal Thermal Control System) cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking.]*

ISS Wireless LAN Transition: Yesterday, after beginning the transition of the JSL (Joint Station LAN) Network to the new WAPs (Wireless Access Points) in Node-1 & Node-2 and loading the PDAs (Personal Data Assistants) with new applications for wireless (RF) comm, hardware and software configuration issues prevented Greg Chamitoff from completing the scheduled survey of wireless LAN (Local Area

Network) connectivity aboard, intended to assess wireless LAN for Node-3 network interfaces (vs. wired interfaces). The survey will have to be re-scheduled.

JAXA Kibo GLA Failures: A total of six GLAs (General Luminaire Assemblies) have now been reported failed in the JPM. There are still ten GLAs functioning, and there is no impact for crew activity. In the JLP (JEM Logistics Pressurized Segment), two GLAs have failed, with only one GLA remaining. Removal of the failed light fixtures and replacement with spares is being planned for both Kibo modules.

CEO (Crew Earth Observations) photo targets uplinked for today were S. Mozambique, Africa (*ISS had a nadir pass over this site, and overlapping mapping frames taken along track were requested. The region is undergoing rapid development, and imagery of the existing state of land cover will be useful to track changes to regional ecosystems over time*), Hurricane Hanna, Atlantic Ocean (*Dynamic Event. This tropical cyclone was predicted to regain hurricane strength by the time of this pass [10:47am EDT]. Looking ahead and to the right of track for cloud banding and eye features. The storm will be passing over the Bahamas*), High Central Andean Glaciers, S. America (*weather was predicted to be mostly clear over the eastern slopes of the Andes. Looking to the right of track for glaciers and icefields on the upper mountain slope - imagery of these glaciers is useful for tracking changes in ice extent and volume. Overlapping mapping frames were requested as ISS paralleled the Andes from NW to SE*), and Beni River dynamics, Bolivia (*the Beni River rises in the eastern Andes range, and flows for almost 1600 km [994 miles] across Bolivia. General context imagery of the river was requested to guide later higher resolution imagery of the river channel and banks. The regional of interest for photography is east of the Andes. Greg was to look for Lake Titicaca as a landmark feature*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Week 20/21 Scheduled Main Activities:

- Thu. (9/4): SOTR-KOB1 maintenance; SRVK-BRPK maintenance; BMP ch.2 regen; CWC audit; SLEEP init.; PCS s/w load-ghosting; IWIS reprogram; ATV: activate/remove equipment & SSVP docking system/close hatches/take photo+video; TVS-MPEG Ku-band test.
- Fri. (9/5): ATV Undock (5:27pm EDT); PCS reboot; microbial sampling; CGSE troubleshoot.
- Sat. (9/6): FFQ; IWIS deact.
- Sun. (9/7): Station cleaning; DCP bypass cable install; PFC (FE-2).

- Mon. (9/8): SLEEP; Acoustic Survey; BMP regen ch.1; POC-DOUG revw; SSRMS/ESP-3; Hatch seal inspect; CGSE troubleshoot; EMER OBT; ATV MBRL/PCE uninstall; Iridium phone recharge.
- Tue. (9/9): SLEEP; Acoustic Survey; BMP regen ch.2; TORU OBT; O-OHA; EMU batt. maint.; BCAT-3 fam.; PMCs; JAXA AQUA-Ink Ball exp.

ISS Orbit (as of this morning, 7:36am EDT [= epoch]):

Mean altitude -- 353.5 km

Apogee height -- 358.0 km

Perigee height -- 348.9 km

Period -- 91.61 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006736

Solar Beta Angle -- 9.6 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 44 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56085

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/05/08 -- ATV1 undocking, from SM aft port (~5:27pm); independent flight

09/08/08 -- Progress M-64/29P de-orbit (~4:45pm)

09/10/08 -- Progress M-65/30P launch (~3:49:45pm)

09/12/08 -- Progress M-65/30P docking (SM aft, ~5:08pm DM)

09/29/08 -- ATV de-orbit (nighttime re-entry for observation)

10/01/08 -- **NASA 50 Years** (official)

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?

11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking

02/26/09 -- STS-119/Discovery/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 09/02/08

All ISS systems continue to function nominally, except those noted previously or below.

FE-1 Kononenko finished up the installation of ATV PCE (Automated Transfer Vehicle/Proximity Communications Equipment; Russian: MBRL) in the Service Module (SM), installing and connecting its BUAP antenna switching control box to the BKS onboard cabling system for ground-commanding. CDR Volkov then set up the ATV control panel (PU) in the SM and activated it. *[The main MBRL components are the space-to-space radio "monoblock" (PCE Z0000), the BUAP, and the PU.]*

After the installations, the temporarily disconnected BITS2-12 onboard telemetry system and VD-SU control mode (which also required the Elektron O₂ generator to be turned off) was re-connected and activated.

Elektron was then restarted in 32A mode by the ground, with Kononenko monitoring the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating.

Also, as a new regular activity after deactivation/reactivation of the VD-SU control mode, Oleg checked the BRI Smart Switch Router computer and its new Ethernet connection to assess any impact of these activities on Ethernet comm. *[BRI is part of the RS OpsLAN (Russian Segment/Operations Local Area Network), with connections to the three SSC clients, the Ethernet tie-in with the US network, and a network printer in the RS.]*

In preparation for the ATV "Jules Verne" undocking on Friday (9/5), Volkov and Kononenko tagged up with a ground specialist who took them through a special 45-min OBT (Onboard Training) exercise for Undocking & Departure, using an ATV OBT training tool on an SSC (Station Support Computer) laptop and a review of salient ODF (Operations Data File) tutorial material, wrapping up the exercise with a

joint debriefing.

FE-2 Chamitoff meanwhile performed the periodic water sampling, collecting chemical/archival post-flight potable water samples at the SRV-K Warm and SVO-ZV taps, using jointly approved Russian sampling procedures with the U.S. WS&A (Water Sampler & Archiver) kit for collection. The samples will be returned on the ULF2 flight. The water used for flushing the sampling equipment was then reclaimed from its collection bags and wet towels in the interest of water inventory conservation.

Volkov & Chamitoff completed another monthly session (Sergey's fourth, Gregory's second) of the CHeCS (Crew Health Care Systems) emergency medical operations OBT drill, a 30-min. exercise to refresh their CMO (Crew Medical Officer)'s acuity in a number of critical health areas. The proficiency drill today focused on airway management. *[The HMS (Health Maintenance Systems) hardware, including ACLS (Advanced Cardiac Life Support) equipment, may be used in contingency situations where crew life is at risk. To maintain proficiency, crewmembers some time each month reviewing HMS and ACLS equipment and procedures via the HMS and ACLS CBT (computer-based training). The training drill, each crewmember for him/herself, refreshes their memory of the on-orbit stowage and deployment locations, equipment etc. and procedures.]*

Oleg performed the periodic (monthly) functional closure test of the Vozdukh CO₂ (carbon dioxide) removal system's spare emergency vacuum valves (AVK), in the spare parts kit. *[The AVKs are crucial because they close the Vozdukh's vacuum access lines in the event of a malfunction in the regular vacuum valves (BVK) or a depressurization in the Vozdukh valve panel (BOA). Access to vacuum is required to vent CO₂ during the regeneration of the absorbent cartridges (PP).]*

Greg Chamitoff continued outfitting for the new Regenerative ECLSS, today installing CHeCS (Crew Health Care Systems), WRS-1 (Water Recovery System 1) and WRS-2 MTL (Moderate Temperature Loop) supply jumpers to fill them with ITCS (Internal Thermal Control System) coolant at two Lab positions. The supply lines were then removed. *[The jumpers need to be filled prior to mating them to their respective racks. The WRS will be used to recycle wastewater into potable water. The Regenerative ECLSS will be required for the future six-person occupancy of the station.]*

Sergey downloaded the accumulated structural dynamics data from yesterday's Progress undocking from the IWIS RSUs (Internal Wireless Instrumentation System/Remote Sensor Units).

Working in the Kibo laboratory on JAXA's CBEF (Cell Biology Experiment Facility), Greg installed special acoustic insulation/dampening material on the CBEF Incubator doors.

Afterwards, Chamitoff transitioned the ISS JSL (Joint Station LAN) network to a new Access Point in Node-1 and Node-2.

Greg then loaded three onboard PDAs (Personal Digital Assistants) with new applications,- two with BCR (Barcode Reader) software (replacing the previous "Dolphin" BCRs), the third with WINS (Windows Internet Name Service) software next week. *[WINS is Microsoft's implementation of NetBIOS Name Service (NBNS), a name server and service for NetBIOS computer names (equivalent to what DNS is to domain names).]*

Next, in the JPM (JEM Pressurized Module), the FE-2 activated the SSC-14 laptop with its new wireless capability, performed a functionality check on it from two different JPM locations and disconnected/removed its ISL Ethernet drag-through cable which had been plugged in in Node-2. SSC-14 was then temporarily moved to COL (Columbus Orbital Laboratory) for testing wireless functionality (e.g., signal strength) and later returned to JPM.

Gregory wrapped up the wireless LAN survey aboard ISS by using the PDA with WINS in similar fashion from the JPM, later the U.S. Airlock, to check out its wireless functionality and correlation with the SSC survey.

Sergey completed the periodic (about twice a month) replenishing of the Elektron's water supply for electrolysis, filling the KOV thermal loops' EDV container with purified water from CWC (Contingency Water Container, #1051) collected by the U. S. CCAA (Common Cabin Air Assembly). *[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron micropump shutdown.]*

On the Russian Matryoshka-R (RBO-3-2) radiation payload in the DC1 Docking Compartment, Oleg deactivated the AST Spectrometer, removed its ALC-949 PCMCIA (Portable Computer Memory Card International Adapter) and checked out its contents on the RSK-1 laptop. AST remains off.

In the FGB (*Funktsionalnyi-Grusovoi Blok*), Sergey replaced the two dust filters (PS1, PS2) and cleaned the mesh screens of the central ventilation fans (TsV1, TsV2), with the fans running.

Gregory performed the periodic routine maintenance on the four CSA-CP (Compound Specific Analyzer-Combustion Products) instruments, changing out the

battery in the prime unit and zero-calibrating all four units (to eliminate drift in the combustion sensors) before returning all CSA-CPs to their original locations (prime unit at SM Central Post).

The CDR took care of the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Volkov also completed the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew had their periodic PMCs (Private Medical Conferences) via S- & Ku-band audio/video, Sergey at ~11:55am, Oleg at ~12:10pm, Greg at ~1:10pm EDT.

The station residents conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-1, FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (CDR). Later, Kononenko transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

As generally every day now, starting at ~9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) was activated intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS (Internal Thermal Control System) cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking.]*

KURS Test: TsUP/Moscow has scheduled a test today of both strings of the KURS automated rendezvous radio command system for the SM aft port, in preparation for the ATV undocking on Friday (9/5).

IMMT to lose Toulouse: With the ATV “Jules Verne” slated to undock next Friday, its French ESA representative today sadly said goodbye to the globe-spanning ISS Mission Management Team (IMMT). ATV however remains a solid and important member of the ISS “family”, and Toulouse will always be welcomed back gladly.

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Week 20 Scheduled Main Activities:

- Wed. (9/3): MO-7 (all); RED inspection; BMP ch.1 regen; MO-3/FE-1 (TVIS); WRS O₂ purge/port install/leak check; SAMS s/w load; CGSE troubleshooting; BRTK-MBRL (PCE) test 1.
- Thu. (9/4): SOTR-KOB1 maintenance; SRVK-BRPK maintenance; BMP ch.2 regen; CWC audit; SLEEP init.; PCS s/w load-ghosting; IWIS reprogram; ATV: activate/remove equipment & SSVP docking system/close hatches/take photo+video; TVS-MPEG Ku-band test.
- Fri. (9/5): ATV Undock (5:27pm EDT); PCS reboot; microbial sampling; CGSE troubleshoot.
- Sat. (9/6): FFQ; IWIS deact.

ISS Orbit (as of this morning, 8:45am EDT [= epoch]):

Mean altitude -- 353.5 km

Apogee height -- 358.0 km

Perigee height -- 349.0 km

Period -- 91.61 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006673

Solar Beta Angle -- 5.1 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 54 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56070

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/05/08 -- ATV1 undocking, from SM aft port (~5:27pm); independent flight

09/09/08 -- Progress M-64/29P de-orbit (~5:19pm)

09/10/08 -- Progress M-65/30P launch (~3:49:45pm)

09/12/08 -- Progress M-65/30P docking (SM aft, ~5:08pm DM)

09/29/08 -- ATV de-orbit (nighttime re-entry for observation)

10/01/08 -- **NASA 50 Years** (official)

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 09/01/08

All ISS systems continue to function nominally, except those noted previously or below. *Labor Day – off duty for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff. Underway: Week 20 of Increment 17.*

Progress M-64/29P successfully undocked from the ISS FGB nadir port this afternoon at 3:47pm EDT. The first separation burn was on time at 3:49pm, as was sep burn #2 at 3:55pm. 29P will remain in orbit in independent flight until 9/9, continuing to phase out in front of the ISS (about 40 km per orbit) in order to support a Russian “Plasma” experiment. The ship will then deorbit for destructive reentry over the Pacific Ocean. *[The separation appeared smooth, with no anomalous behavior reported by the crew. After handing over attitude control to Russian MCS (Motion Control System) at 1:45pm EDT, the ISS will return to US Momentum Management (MM) at approximately 5:45pm.]*

As part of the crew’s regular morning inspection tour, CDR Volkov conducted the routine checkup of DC1 Docking Compartment circuit breakers and fuses. *[The monthly checkup in the “Pirs” module looks at AZS circuit breakers on the BVP Amp Switch Panel (they should all be On) and the LEDs (light-emitting diodes) of 14 fuses in fuse panels BPP-30 & BPP-36.]*

FE-2 Chamitoff performed visual & functional inspections on two CSA-CP (Compound Specific Analyzer-Combustion Products) probes and sampling pumps, one in Node-1, the other in Node-2. *[If both probes were found undamaged, they were to be reconnected to their pumps and deployed on the original panel. If only one CSA-CP probe is undamaged, its preferred deployment location is in Node-1.]*

Gregory also conducted ELPS (Emergency Lighting & Power Supply) inspections in the JAXA JPM (JEM Pressurized Module) and JLP (JEM Logistics Pressurized Section), as well as in the ESA COL (Columbus Orbital Facility).

FE-1 Kononenko took care of the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM (Service

Module). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Preparatory to today's Progress undocking, CDR Volkov set up the IWIS RSUs (Internal Wireless Instrumentation System Remote Sensor Units) in the Lab, Node-1, Node-2, FGB and SM. Afterwards, Sergey configured and programmed the timing of the IWIS ICU (Interface Control Unit) for the automated activation. *[IWIS monitored dynamic/vibrational responses of the ISS structure during the undocking, measured by RSUs which transmit their measurements via radio to the central NCU (Network Control Unit). Structural vibrational data were also taken by the SDMS (Structural Dynamic Measurement System) during the SARJ (Solar Array Rotary Joint) rotation (for solar array protection) and 29P undocking.]*

Chamitoff verified proper closure of the protective window shutters in the Kibo JPM and U.S. Lab for the duration of Progress departure.

Working off the Russian discretionary "time permitting" task list, Oleg conducted the regular status check of the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (barley) under spaceflight conditions in the Lada-13 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}).

At ~11:15am EDT, Gregory powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, & power supply) and conducted, at 11:20am, a ham radio exchange with the Challenger Learning Center of Lucas County, Oregon, Ohio. The Challenger Learning Center (CLC) is part of a network of over 51 Centers throughout the United States, the United Kingdom, and Canada. Each Center is owned and operated locally by a host institution, in this case the Lucas County Educational Service Center. These CLCs are the primary component of the Challenger Center for Space Science Education founded by the families of the astronauts tragically lost during the launch of the Challenger Space Shuttle in January 1986. Dedicated to the educational spirit of that mission, each CLC continues the mission through a unique hands-on learning experience in which students use math, science, teamwork, problem-solving, responsible decision-making, and communication skills to successfully complete a simulated space mission. Since their opening in the fall of 2003, the Lucas County CLC has trained over 400 teachers and has flown over 480 missions. The CLC mission focuses on students in grades 5 and above. Over 12,000 students have successfully accomplished missions to the moon or Mars; nearly 1,500 community members and corporate staff have flown. Questions were uplinked to Greg beforehand. *["What do you do for fun, and how much time do you have for fun?"; "What do you do for entertainment as a crew?"; "What one thing*

have you discovered from being on the space station that has surprised you the most?"; "Which college course prepared you the most for being an astronaut or aerospace engineer?"; "How eco-friendly is the ISS?"; "What do you like best about being an astronaut/cosmonaut?"; "What part of your astronaut/cosmonaut training helped you prepare for the mission the most?"; "What is the most unusual item that has been taken onboard the ISS?"; "What has been your greatest challenge in life?"; "What role could the ISS play in a crisis or is it inaccessible and why?"; "What is the closest the station has come to an emergency such as a fire or being hit by stray rocks from a passing comet?"; "How can we as students help NASA?"]

At Progress undocking, Sergey Volkov used the Nikon D2X camera with f80-400 zoom lens from an SM window to take the regular photographs of the cargo ship's docking system, checking for its cleanliness (i.e., to verify that no rubber seals are missing on the Progress docking interface and to assess seal integrity).

Oleg Kononenko meanwhile monitored the undocking and separation of the spacecraft on the VKU video monitor.

After 29P departure, the CDR completed the usual manual closing of the FGB GA docking compartment-to-vestibule PEV (Pressure Equalization Valve; Russian: KVD).

The station residents conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Greg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

As generally every day now, starting at ~9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) was activated intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS (Internal Thermal Control System) cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking.]*

Hurricane Gustav Update: As of this morning, JSC/MCC-Houston is open and remains at Level 4 until tomorrow morning (9/2) when the Center will begin backing out of Level 4 as employees arrive at work after the Labor Day holiday. The BAT team at Round Rock, TX, was able to work out some connectivity issues yesterday;

they plan to do a few additional tests this morning and will then start heading back to Houston. The BCC (Backup Control Center) team arrived in Huntsville last night. They also plan to do some BCC checkouts and then will start making plans to return to Houston tonight or tomorrow.

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Week 20 Scheduled Main Activities:

- Tue. (9/2): ATV Undock OBT; BUAP/MBRL (PCE) equipment install in SM (ATV hand controller, antenna switch box, prox comm unit); Elektron deact/act; Vozdukh AVK test; FGB PS1/PS2 filter & TsV1 screen cleaning; USOS water sampling; CMO profic.train.; FSL/FCE release.
- Wed. (9/3): MO-7 (all); RED inspection; BMP ch.1 regen; MO-3/FE-1 (TVIS); WRS O₂ purge/port install/leak check; SAMS s/w load; CGSE troubleshooting; BRTK-MBRL (PCE) test 1.
- Thu. (9/4): SOTR-KOB1 maintenance; SRVK-BRPK maintenance; BMP ch.2 regen; CWC audit; SLEEP init.; PCS s/w load-ghosting; IWIS reprogram; ATV: activate/remove equipment & SSVP docking system/close hatches/take photo+video; TVS-MPEG Ku-band test.
- Fri. (9/5): ATV Undock (5:27pm EDT); PCS reboot; microbial sampling; CGSE troubleshoot.
- Sat. (9/6): FFQ; IWIS deact.

ISS Orbit (as of this morning, 8:37am EDT [= epoch]):

Mean altitude -- 353.5 km

Apogee height -- 358.2 km

Perigee height -- 348.9 km

Period -- 91.61 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006909

Solar Beta Angle -- 0.7 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 53 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56054

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/05/08 -- ATV1 undocking, from SM aft port (~5:27pm); independent flight

09/09/08 -- Progress M-64/29P de-orbit (~5:19pm)

09/10/08 -- Progress M-65/30P launch (~3:49:45pm)
 09/12/08 -- Progress M-65/30P docking (SM aft, ~5:08pm DM)
 09/29/08 -- ATV de-orbit (nighttime re-entry for observation)
 10/01/08 -- **NASA 50 Years** (official)
 10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
 10/11/08 -- Progress M-65/30P undocking (from SM aft)
 10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)
 10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)
 10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?
 11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
 11/12/08 -- STS-126/Endeavour/ULF2 docking
 11/20/08 -- **ISS 10 Years**
 11/25/08 -- Progress M-65/30P undocking & deorbit
 11/26/08 -- Progress M-66/31P launch
 11/30/08 -- Progress M-66/31P docking
 02/09/09 -- Progress M-66/31P undocking & deorbit
 02/10/09 -- Progress M-67/32P launch
 02/12/09 -- Progress M-67/32P docking
 02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
 02/14/09 -- STS-119/Discovery/15A docking
 02/24/09 -- STS-119/Discovery/15A undocking
 02/26/09 -- STS-119/Discovery/15A landing (nominal)
 03/25/09 -- Soyuz TMA-14/18S launch
 03/27/09 -- Soyuz TMA-14/18S docking (DC1)
 04/05/09 -- Soyuz TMA-13/17S undocking
 04/07/09 -- Progress M-67/32P undocking & deorbit
 05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 05/25/09 -- Soyuz TMA-15/19S launch
 05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
 07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
 10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
 12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
 02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
 04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
 05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 08/31/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – rest day for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff. Ahead: Week 20 of Increment 17.*

Gregory Chamitoff had three hours reserved for the regular weekly station cleaning in the USOS (US Segment) which was not scheduled yesterday alongside the RS (Russian Segment) “uborka” housecleaning by his two crewmates.

Sergey Volkov conducted the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP-Moscow. The CDR also checked up on the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem, gathering weekly data on total operating time & “On” durations for reporting to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Gregory completed a run with the MedOps experiment WinSCAT (Windows Spaceflight Cognitive Assessment Tool), his third onboard session, by logging in on the MEC (Medical Equipment Computer) and performing the psychological evaluation exercise on the laptop-based WinSCAT application. *[WinSCAT is a monthly time-constrained questionnaire test of cognitive abilities, routinely performed by astronauts aboard the ISS every 30 days before or after the PHS (periodic health status) test or on special CDR's, crewmembers or flight surgeons request.]*

Afterwards, the FE-2 closed the protective window shutters in the Kibo JPM (JEM Pressurized Module) and U.S. Lab in preparation for the Russian Solar Array

Efficiency test tonight (see below). *[The shutters can be opened again after USOS has resumed attitude control authority with MM (Momentum Management) after the test.]*

The station residents conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1).

The CDR and FE-2 were scheduled for their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop), Sergey at ~8:00am, Greg at ~4:05pm EDT.

Russian Solar Array Efficiency Test: During crew sleep, at 7:30pm-11:00pm EDT, TsUP/Moscow will conduct the periodic SM Solar Array Efficiency Testing, with no crew involvement or onboard powerdowns required. Attitude control handover from USOS CMGs (Control Moment Gyros) to Russian thrusters is scheduled for 7:20pm, to return to CMGs after the test. *[At test begin, the SM solar arrays will be shunted for the last 10 minutes of three successive insolation passes to measure the total current being produced by the photovoltaics. Array output will be compared to earlier tests at the same Beta angle and wing positions. Background: Photovoltaic current (ampères) is measured with a shunt, i.e., a resistor of accurately-known resistance (ohms) placed in series so that all electricity to be measured flows through it. Because of Ohm's Law (Current = Voltage divided by Resistance), the current flowing can then be calculated by measuring the voltage drop across the resistor.]*

Hurricane Gustav Update: As of last night (11:00pm EDT), NASA-JSC remains in Level 4 status until at least 11:00pm tonight (8/31). Back-up NASA flight control teams (BAT) have been deployed to Round Rock, TX, and an advance team was sent to the BBC (Backup Control Center) at Huntsville, AL, in case MCC-Houston needs to be evacuated. As of now, JSC does not expect to transition to Level 3 unless the storm track shifts dramatically westward. Should a transition to Level 3 be required, it would occur tonight, followed by transition to Level 2 shortly afterwards (Level 2 on Sunday night or early Monday AM). Storm track, condition and speed changes are continuously being monitored, and the team will be notified of any changes ASAP. The storm is currently expected to make landfall in central Louisiana in the timeframe of Monday evening (9/1). NASA's SSC (Stennis Space Center) and MAF (Michoud Assembly Facility) are closed, except for essential personnel.

Progress M-64/29P Undocking (Monday, 9/1): Tomorrow the 29P cargo ship-

turned-trash can will undock from the ISS FGB nadir port, according to the following summary flight plan:

- ISS Free Drift – FGB hooks opening 2:10pm
- ISS mnvr to duty attitude 2:20pm
- ISS mnvr to undocking attitude 3:13pm
- ISS to free drift 3:42pm
- Undock Command 3:43:30pm
- Sunrise 3:44:34pm
- Phys.Sep/hooks open (spring delta-V \approx 0.12m/s) **3:46:30pm**
- Progress sep burn #1 (15 sec, \approx 0.635 m/s) 3:49:30pm
- ISS mnvr to TEA attitude 3:53:30pm
- Progress sep burn #2 (30 sec, \approx 1.8 m/s) 3:55:40pm
- Progress retrograde burn (3 m/s) 6:53:15pm
- Independent flight until deorbit on 9/9.

Progress M-65/30P Launch (Wednesday, 9/10):

- Launch 3:50pm
- Orbital Insertion 3:58:43pm
- DV1 (14.33 m/s) 7:25pm
- DV2 (17.08 m/s) 8:12pm
- DV3 (2.00 m/s) 4:34pm (9/11)
- ISS mnvr to dock attitude 2:40pm (9/12)
- Progress Kurs-A Activ. (T1) 3:27pm
- SM Kurs-P Activation (T1) 3:29pm
- Sunrise 3:53pm
- Good Kurs-P data at 80 km 3:54pm
- Range = 9 km (TORU cmd link) 4:19pm
- Range = 8 km (30P TV activ.) 4:21pm
- Sunset 4:53:34pm
- Docking (9/12) **5:01pm**
- Progress hooks closed 5:21pm.

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Week 20 Scheduled Main Activities:

- Mon. (9/1, Labor Day): Crew off duty; Progress 29P Undock (~3:47pm); CSA-CP probe replacement; ham session; FSL/FCE lock.
- Tue. (9/2): ATV Undock OBT; BUAP/MBRL (PCE) equipment install in

SM (ATV hand controller, antenna switch box, prox comm unit); Elektron deact/act; Vozdukh AVK test; FGB PS1/PS2 filter & TsV1 screen cleaning; USOS water sampling; CMO profic.train.; FSL/FCE release.

- Wed. (9/3): MO-7 (all); RED inspection; BMP ch.1 regen; MO-3/FE-1 (TVIS); WRS O₂ purge/port install/leak check; SAMS s/w load; CGSE troubleshooting; BRTK-MBRL (PCE) test 1.
- Thu. (9/4): SOTR-KOB1 maintenance; SRVK-BRPK maintenance; BMP ch.2 regen; CWC audit; SLEEP init.; PCS s/w load-ghosting; IWIS reprogram; ATV: activate/remove equipment & SSVP docking system/close hatches/take photo+video; TVS-MPEG Ku-band test.
- Fri. (9/5): ATV Undock (5:27pm EDT); PCS reboot; microbial sampling; CGSE troubleshoot.
- Sat. (9/6): FFQ; IWIS deact.

ISS Orbit (as of this morning, 7:52am EDT [= epoch]):

Mean altitude -- 353.6 km

Apogee height -- 358.2 km

Perigee height -- 349.0 km

Period -- 91.61 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006873

Solar Beta Angle -- -3.7 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 42 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56038

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/01/08 -- Progress M-64/29P undocking, FGB nadir (~3:47pm); independent flight w/"Plasma" exp.

09/05/08 -- ATV1 undocking, from SM aft port (~5:27pm); independent flight

09/09/08 -- Progress M-64/29P de-orbit (~5:19pm)

09/10/08 -- Progress M-65/30P launch (~3:49:45pm)

09/12/08 -- Progress M-65/30P docking (SM aft, ~5:08pm DM)

09/29/08 -- ATV de-orbit (nighttime re-entry for observation)

10/01/08 -- **NASA 50 Years** (official)

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?

11/10/08 -- STS-126/Endeavour/ULF2 launch -- MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 08/30/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – mostly off duty for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff.*

Sergey Volkov & Oleg Kononenko performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the SM (Service Module) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

As part of the house cleaning, the crew conducted regular maintenance inspection & cleaning on fan grilles in the FGB (TsV2) and SM (VPkhO, VPrK, FS5, FS6 & FS9) screens.

The CDR also checked up on the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem, gathering weekly data on total operating time & "On" durations for reporting to TsUP-Moscow. Afterwards, Volkov temporarily powered down the POTOK for the periodic cleaning of its pre-filter, using the vacuum cleaner with narrow-slit nozzle attachment.

At ~10:05am EDT the crewmembers conducted their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-Houston and TsUP-Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

In the Kibo JPM Laboratory, Greg Chamitoff supported ongoing Marangoni Surface

experimentation in the FPEF (Fluid Physics Experiment Facility), ground-commanded from the SSIPC (Space Station Integration & Promotion Center) at Tsukuba/Japan, by activating the MMA (Microgravity Measurement Apparatus) and its laptop (MLT), first powering up the MMA's NCU/RSU (Network Control Unit/Remote Sensor Unit) set from the Ryutai rack's UDC (Utility DC to DC Converter), then turning on both NCU/RSU and MLT.

Afterwards, after a brief familiarization review of reference material plus a ground specialist tagup, Gregory began his selected four-hour VolSci (Voluntary Weekend Science) session with the payload SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellites). In support of this interesting experiment, flight controllers at 9:00am EDT activated the CDRA (Carbon Dioxide Removal Assembly), to be turned off after an extended run tonight at ~8:00pm.

[The SPHERES experiment is a test bed for the development and testing of formation flying and other multi-spacecraft control algorithms. Today's 11:40am-3:10pm session concentrates on the ability of a single crewperson to deploy three satellites in two modes: "Position Hold" and "Closed Loop delta-V Control". SPHERES, done first by FE-1 Jeff Williams on Expedition 13, serves to mature autonomous satellite formation flight, rendezvous and docking algorithms in a long duration, microgravity environment. Single-satellite experiments test new thrusting algorithms utilizing onboard accelerometers and gyroscopes to more accurately apply velocity commands; they also use a new technique to more accurately estimate velocity. The two-satellite experiments introduce new controllers and path planning tools for purpose of docking to a tumbling satellite. Formation flight experiments test initialization of a formation, and obstacle avoidance. These tests help to develop the concept of a "fractionated spacecraft," which uses a loose formation of small satellites to perform the tasks of a single large spacecraft. Greg set up the Work Area, dimmed GLAs (General Luminaire Assemblies), programmed & deployed the three gas-propelled satellites (orange, red, blue), with five beacons, and used two PD-100 camcorders for video capture. Per applicable Flight Rule, SPHERES operations have no CO₂ (Carbon Dioxide) output constraints if the CDRA (CO₂ Removal Assembly) is operating in dual-bed or single-bed mode. The experiment run was time-critical since Ku-band is required for real-time video downlink.]

Chamitoff also filled out the regular FFQ (Food Frequency Questionnaire), his eleventh, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the*

previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]

At ~6:50am, Cosmonaut Kononenko had his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop).

At ~9:47am, the FE-2 powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, & power supply) and conducted, at 9:52am, a ham radio exchange with students and teachers at Schulhaus Feld 1 in Richterswil, Switzerland. Richterswil is situated at the lake of Zurich. Some of the approximately 11000 inhabitants of the township work in Zurich, about 30 kilometers away. Others are employed at one of the local firms or have jobs in the neighboring towns and villages. There are five schools and several kindergartens. Richterswil hosts its own museum and many different organizations such as sports clubs, a woman's club, a parent's organization, a theatre group, several choirs and more. At the school there are about 170 children aged 6 to 13 years, split up into eight classes (grades 1 to 6). Staff includes 15 teachers and 3 janitors. The school building includes a gym and a swimming hall, which is also used by the other schools in Richterswil. Questions to Greg were uplinked beforehand. *[“Is this your first mission on the ISS?”; “What do you feel when the rocket takes off? Are you happy, scared or just excited?”; “Do you miss your family? Are you homesick?”; “Is it comfortable to live in zero gravity or do you like it better on Earth?”; “How are you feeling psychologically in Space?”; “What does it smell like inside the ISS?”; “Do you sleep well in your sleeping bag? Is it comfortable?”; “How do you wash or shower?”; “What do you eat and how do you prepare and cook your food?”; “Is it difficult to live so closely together? Do you have any rules to help you?”; “Are there any sounds in Space or is it quiet?”; “Can you see other planets from the ISS?”.]*

Kononenko completed the routine daily servicing of the SOZh system (ECLSS/ Environment Control & Life Support System) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The station residents conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-

1). Later, Greg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Hurricane Gustav Update: MCC-Houston is at Level 4 (full team) since yesterday morning and continues preparations for the potential closure of JSC. Gustav's progress is being tracked, and JSC is planning on a tagup tonight at ~11:00pm EDT to determine the next course of action for Sunday. NASA's SSC (Stennis Space Center) are closed and MAF (Michoud Assembly Facility) will close at midnight tonight (except for essential personnel).

Weekly Science Update (*Expedition Seventeen -- Week 19*)

3-D SPACE: In progress.

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):
Measurements continue in FGB module.

ANITA (Analyzing Interferometer for Ambient Air): Continuing.

BCAT-3 (Binary Colloidal Alloy Test 3): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System):
Samples returned on 1J.

CSI-2/CGBA-5 (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus 5): Silicate Garden Hab Side 2 is complete and CGBA-5 has now been powered off awaiting its move to EXPRESS Rack 2 (ER2). The Hab along with other CSI-02 equipment will be removed and returned home on ULF2.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): EuTEF platform is nominal. -- DEBIE-2: IOPs (Instrument Operations Procedures) were performed successfully for 24 hrs duration from 8/22 to 8/26. Generic status: link error still in work; however a work-around allows for regular science data acquisition using an on-board Instrument Operations Procedure (IOP) (but not yet in conjunction with any FIPEX IOP). A final software patch, which will enhance the present instrument capabilities, is under finalization on the ground.-- DOSTEL: On-going science acquisition.-- EuTEMP: Currently inactive as planned.-- EVC: Currently no picture taking.-- EXPOSE: On-going science acquisition.-- FIPEX: IOPs) were performed from 8/27 until 8/29.-- MEDET: Continuous science acquisition.-- PLEGPAY: Currently in READY mode, no science data acquisition on-going.-- TRIBOLAB: The Ball-Bearing experiment #4 was paused on 8/27 for the DAM. After the DAM, TRIBOLAB was commanded again to Thermal Stabilization Mode (in order to restart the Ball-Bearing Experiment #4).-- MEDET: Continuous science acquisition.

FSL (Fluid Science Laboratory): FSL is nominal.

GEOFLOW: Science Run#1 and Run#2 were successfully downlinked and handed-over to science teams in Germany. "We have received very promising results for GEOFLOW so far!" After deletion of the FSL VMU (Fluid Science Laboratory Video Management Unit) hard-disk content, the Science Run#3 was successfully performed on 8/25. The temperature gradient set-point of 4.2K could not be reached (actual gradient showed 3.6K), but science team gave their go ahead to proceed. Run#3 data were successfully downlinked on 8/26). On 8/27, Science Run#4 had to be interrupted before its completion (9 out of 11 iterations completed) because the FSL Rack had to be readied and the FSL FCE (Facility Core Element) was locked prior to the DAM (Debris Avoidance Maneuver) at 12:11pm. Unfortunately, it was not possible to activate FSL Rack prior to crew wake up time, to create enough time margin to secure the full Run#4 processing. The actual temperature gradient is now much closer to the set-point value (6.1K vs 6.2K, respectively) after modification of the GEOFLOW hardware temperature regulation parameters. Run#4 data were downlinked on 8/28. Due to limited crew time for ESA, the FSL FCE will remain locked at least until after the Progress 30P docking planned on 9/12.

HDTV System Test DL (JAXA): This activity is now planned for next week (9/5).

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Planned.

Marangoni Experiment for ISS (JAXA Fluid Physics Experiment Facility): The first experiment cycle was completed successfully.

Micro-G Clay (JAXA EPO): The Clay figures were retrieved from the JPM wall on 8/28 and stowed for return on ULF2.

MISSE (Materials ISS Experiment): Ongoing.

Moon Photography from ISS (JAXA EPO): Complete.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-1/-2 (Nitric Oxide Analyzer, ESA): Complete.

NUTRITION w/REPOSITORY: In progress.

PADLES (Passive Dosimeter for Lifescience Experiment in Space): These continue to be exposed in JEM-PM and JLP until 15A.

PCRF (Protein Crystallization Research Facility) Reconfiguration (JAXA): The PCRF reconfiguration was completed nominally on 8/28.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems):

Ongoing.

SAMPLE: Complete.

SHERE (Shear History Extensional Rheology Experiment): “Greg, you have almost completed all of the planned test points for SHERE. We thank you very much for all the fantastic science you have given us and all your hard work. You have given us science far beyond the original plan, and your results have sparked much discussion and excitement among the team. Thank you! We will send you more results as we analyze the data, and we hope to work with you again soon.”

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): “Greg, next week you will have your next Sleep download activity. The Support team may or may not be verifying the file in between the download and initialization, based on whether hurricane Gustav decides to make an appearance. We are also working to start your next week of Sleep logging later in the week. Thanks for your participation.”

SOLAR (Solar Monitoring Observatory): With the Sun observation duration per orbit reaching its maximum (20 min), SOLAR has been put in Sun Pointing Mode at around 8/28, 4:20pm EDT. The first Criss-Cross maneuver was successfully performed on 8/29.-- SOVIM: Acquiring science;-- SOLSPEC: Acquiring science; -- SOLACES: Acquiring science.

SOLO: Planned.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): On 8/22, the BIOLAB Rotor A bellow test was performed by ground commanding. Unfortunately this test was not successful, as 4 out of the 6 Reference ECs (Experiment Containers) gave faulty results. Teams on ground are assessing the impact to the planned recovery activities

CEO (Crew Earth Observations): Through 8/26 the ground has received a total of 5,220 frames of CEO images for review and cataloging. Photos acquired with times

corresponding to the CEO target list request times were reviewed first and this week included: the Toshka Lakes, Egypt (acquired-under review) and West Hawk Impact Crater, Manitoba (acquired-under review). "We are pleased to report that your excellent imagery of Tunis, Tunisia satisfies our increment requirements for this target and we can strike it from our list. The composition and focus of your images continues to show much improvement. However, more effort is needed on improving your mapping technique (i.e. overlap of successive frames). Many of our targets have this requirement because of their size and the level of detail needed. Please keep in mind that sufficient overlap is especially important in long-lens sessions where center-point jumps (random walk views) either leave the target incomplete or acquire imagery that is difficult to impossible to locate. Your recent, detailed view of the Aeolian Islands off the north coast of Sicily will be published on NASA/GSFC's Earth Observatory website this weekend. It provides excellent detail and context of the variety of volcanic structures present on these small Mediterranean islands. Nice shot!"

CEO (Crew Earth Observations) photo targets uplinked for today were **Algerian megafan** (*a mapping swath was requested along this ideally located track. If Greg shot for 60 secs after crossing the prominent dune field just uptrack, he will have acquired significant portions of the target [overlapping images are important for researchers to be able to identify the area covered in these long-lens images]*), and **Hurricane Gustav, Caribbean** (*by the time of this pass Gustav will have strengthened to a Category 2 (and possibly 3) storm now that it is over warm water*).

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Week 20 Scheduled Main Activities:

- Sun. (8/31): Station cleaning (USOS); WINSCAT; PFC (FE-2).
- Mon. (9/1, Labor Day): Crew off duty; Progress 29P Undock (~3:47pm); CSA-CP probe replacement; ham session; FSL/FCE lock.
- Tue. (9/2): ATV Undock OBT; BUAP/MBRL (PCE) equipment install in SM (ATV hand controller, antenna switch box, prox comm unit); Elektron deact/act; Vozdukh AVK test; FGB PS1/PS2 filter & TsV1 screen cleaning; USOS water sampling; CMO profic.train.; FSL/FCE release.
- Wed. (9/3): MO-7 (all); RED inspection; BMP ch.1 regen; MO-3/FE-1 (TVIS); WRS O₂ purge/port install/leak check; SAMS s/w load; CGSE troubleshooting; BRTK-MBRL (PCE) test 1.
- Thu. (9/4): SOTR-KOB1 maintenance; SRVK-BRPK maintenance; BMP ch.2 regen; CWC audit; SLEEP init.; PCS s/w load-ghosting; IWIS reprogram;

ATV: activate/SSVP docking system remove/close hatches/take photo+video;
TVS-MPEG Ku-band test.

ISS Orbit (as of this morning, 8:55am EDT [= epoch]):

Mean altitude -- 353.6 km

Apogee height -- 358.3 km

Perigee height -- 349.0 km

Period -- 91.61 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006895

Solar Beta Angle -- -8.0 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 48 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56023

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/01/08 -- Progress M-64/29P undocking, FGB nadir (~3:47pm); independent flight w/"Plasma" exp.

09/05/08 -- ATV1 undocking, from SM aft port (~5:27pm); independent flight

09/09/08 -- Progress M-64/29P de-orbit (~5:19pm)

09/10/08 -- Progress M-65/30P launch (~3:49:45pm)

09/12/08 -- Progress M-65/30P docking (SM aft, ~5:08pm DM)

09/29/08 -- ATV de-orbit (nighttime re-entry for observation)

10/01/08 -- **NASA 50 Years** (official)

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?

11/10/08 -- STS-126/Endeavour/ULF2 launch -- MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch -- S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking

02/26/09 -- STS-119/Discovery/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 – Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 08/29/08

All ISS systems continue to function nominally, except those noted previously or below.

Before breakfast and exercise, FE-2 Chamitoff performed his second PHS (Periodic Health Status) w/Blood Labs examination, using the U.S. PCBA (Portable Clinical Blood Analyzer). The second part of PHS, Subjective Clinical Evaluation, was performed later in the day. CDR Volkov assisted in the assessment as CMO (Crew Medical Officer). All data were then logged on the MEC (Medical Equipment Computer) and the hardware stowed. *[The PHS exam, with PCBA analysis and clinical evaluation, is guided by special software (IFEP, In-Flight Examination Program) on the MEC laptop. While PCBA analyzes total blood composition, the blood's hematocrit is particularly measured by the Russian MO-10 protocol.]*

Sergey Volkov serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out"-to-vacuum cycle on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated tonight at ~5:15pm EDT. Filter bed #1 was regenerated yesterday. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently to remove any lingering Freon-218 from the cabin atmosphere (last time: 8/11 & 12).]*

FE-1 Kononenko took the periodic readings of potentially harmful atmospheric contaminants in the SM (Service Module), using the CMS (Countermeasure System), a component of the GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, which uses preprogrammed microchips to measure H₂CO (Formaldehyde, methanal), CO (Carbon Monoxide) and NH₃ (Ammonia), taking one measurement per microchip.

The CDR had several hours set aside for preparing the Progress-364/29P spacecraft for its undocking. To get the uncrewed cargo ship ready for departure, Volkov –

- Dismantled and removed the electronic LKT local temperature sensor commutator (TA251MB) of the BITS2-12 onboard telemetry measurement system and its PZU-1M ROM (read-only memory) unit from inside the ship for recycling,
- Salvaged a good two-light SD1-7 lighting fixture from 29P and replaced it with a failed (one-light) SD1-7 from ZIP stowage,
- Worked with Oleg Kononenko in the spacecraft to finish packing and tying down trash and excess cargo while logging moves in the IMS (Inventory Management System),
- Activated 29P and tore down the ventilation air duct to the FGB,
- Closed FGB-to-Progress transfer hatches (~2:00pm), and
- Started the usual one-hour hatch leak check on the connecting vestibule.

[Undocking is scheduled for ~3:47pm EDT on 9/1 (Monday). Progress 364 will remain in orbit on independent flight to conduct a “Plasma” experiment. Destructive reentry over the Pacific Ocean is scheduled for 9/9 (deorbit ~5:15pm).]

Chamitoff and Kononenko finished up on ATV (Automated Transfer Vehicle) cargo transfers and undock preparations. *[Documentary photography & video of the stowage arrangement are being examined on the ground for last-minute adjustments to ensure proper containment of all items and good CG (center-of-gravity) position for stable maneuvering during independent flight after undocking. “Jules Verne” is scheduled to de-orbit on 9/29 for a nighttime return timed for observing the fiery reentry and destruction from a high-flying observation plane and the ground.]*

The FE-1 completed another radiation data checkup for accumulated flux & dose rate data with the Matryoshka-R radiation payload (RBO-3-2) and its LULIN-5 electronics box.

Oleg also took the periodic photographs of the plants growing in the BIO-5 Rasteniya-2 ("Plants-2") Lada-13 greenhouse, using the Nikon D2 photo camera with F=17-55 mm lens, then downlinked the images via BSR-TM. The regular status check of the payload which researches growth and development of plants (barley) under spaceflight conditions was also conducted.

Afterwards, Kononenko continued preparations for the upcoming installation of ATV proximity ops control equipment by readying panels 226 & 227 in the SM for the outfitting and tagging up with ground specialists. *[The outfitting involved a remote hand controller with its stand, a BUAP antenna switch box with cabling and the PCE (Proximity Communications Equipment; Russian: MBRL) unit.]*

Meanwhile, Gregory spent several hours collecting fluid samples from ITCS (Internal Thermal Control System) loops in the

- JAXA Kibo module: one NH_3 (ammonia) sample from the LTL (Low Temperature Loop),
- U.S. Lab: a Triol return-to-ground sample plus an OPA (Ortho-Phthalaldehyde) sample,
- Node-2: an OPA or NH_3 sample from LTL and MTL (Moderate Temperature Loop) each,
- Columbus Laboratory: a Triol return-to-ground return and one NH_3 sample from MTL.

[Collecting and on-orbit analyzing (for ppm) of fluid specimen are done with a standard ITCS Sampling Adapter. Some samples will be returned to ground for analysis.]

Chamitoff also configured and recharged three PDAs (Personal Digital Assistant) units (via dual-USB cables) in preparation for their loading with new BCR (Bar Code Reader) and WINS (Windows Internet Name Service) software next week. *[WINS is Microsoft's implementation of NetBIOS Name Service (NBNS), a name server and service for NetBIOS computer names (equivalent to what DNS is to domain names).]*

The FE-2 conducted the regular bi-monthly reboot of the OCA Router and File Server SSC (Station Support Computer) laptops.

Greg took measurements for the regular atmospheric status check for ppCO_2 (Carbon Dioxide partial pressure) in the Lab, SM at panel 449 and COL (Columbus Orbital Laboratory) plus battery ticks, using the hand-held CDMK (CO_2 Monitoring Kit, #1002). The unit was then deactivated and returned to its stowage location (LAB1S2). *[Purpose of the 5-min activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements.]*

In the U.S. Lab, Oleg Kononenko performed a controlled shut-down of the EHS VOA (Environmental Health System-Volatile Organic Analyzer), with the ground power-cycling its RPC (Remote Power Controller).

The FE-1 also completed the routine daily servicing of the SOZh system (ECLSS/ Environment Control & Life Support System) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Afterwards, Oleg took care of the daily IMS maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The station residents conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Sergey will transfer the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~4:45am EDT, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU/*Glavnaya operativnaya gruppа upravleniya* = “Main Operative Control Group”), including Shift Flight Director (SRP), at TsUP-Moscow via S-band/audio, phone-patched from Houston and Moscow.

At ~5:00am, Sergey & Oleg linked up with TsUP stowage specialists via S-band to conduct the weekly IMS tagup, discussing inventory & stowage issues, equipment locations and ATV & Progress cargo transfers.

At ~2:55pm, the ISS crew will have their regular weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. [*S/G-2 (Space-to-Ground 2) phone patch via SSC (Station Support Computer)*].

As generally every day now, starting at ~9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) was activated intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS (Internal Thermal Control System) cooling loop. [*A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking.*]

WRM Update: An updated WRM (Water Recovery Management) “cue card” was uplinked overnight for the crew’s reference, updated with yesterday’s water audit.

[*The new card (17-0002X) lists 31 CWCs (~1163.8 L total) for the four types of water identified on board: technical water (385.0 L, for flushing only because of Wautersia bacteria), potable water (706.7 L, incl. 174.6 L currently on hold), condensate water (54.1 L), waste/EMU dump and other (17 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.*]

MT Translation Update: Today at ~3:10pm-4:40pm EDT, ground commanding will move the Mobile Transporter from WS-6 (Worksite 6) to WS-7 using string-A IMCAs (Integrated Motor/Controller Assemblies) to provide added MMOD (Micrometeoroid/Orbital Debris) protection of the TUS (Trailing Umbilical System) cable. During the move, Russian thrusters will be inhibited (2:55pm-5:55pm) due to loads constraints.

Conjunction Update: The conjunction with another Kosmos-2421 piece (#33248) tonight at 9:09pm EDT will not require a DAM (Debris Avoidance Maneuver).

Based on more tracking, the object's trajectory is quite stable, with a predicted miss distance of 20.789 km, yielding a collision probability of $3.84\text{E-}10$ (i.e., odds ~1:2,600,000,000), which moves the conjunction way out of the Red box (threshold 1:10,000).

Tropical Storm Gustav Update: In response to TS Gustav, JSC/Houston has transitioned to Level 4. As currently expected, the Center will go to Level 3 not earlier than Saturday evening, 8/30. Level 2 (Center Shutdown & relocation of the BCC/Backup Control Center deploy team to MSFC/Huntsville) would follow on Sunday evening unless changes in storm track, condition or speed alter this timeline. Gustav's landfall is still expected to be early on Tuesday morning, 9/2, somewhere on the Texas/Louisiana coast.

CEO (Crew Earth Observations) photo targets uplinked for today were **Cairo, Egypt** (*aiming at nadir and a touch left, and shooting margins of this rapidly expanding megalopolis on both banks of the Nile River in the green floodplain. Pyramids can be seen just west of the floodplain in the light-toned desert*), **South Tibesti Megafans, Chad** (*Greg was asked to shoot a swath of overlapping images just right of track. Two larger rivers from the Tibesti Mountains used to flow out onto the light-toned plains spreading enormous cones of sediment. The remnants of such cones in this target appear to be a good analog for the arid plains of Mars. Greg's visual cue was the light-toned plains directly at the foot of the black lava slopes of the Tibesti Mts.*), **Yellowstone National Park, Wyoming** (*detailed overlapping images just right of track were requested to document various features within the National Park, especially trails and remote roads that are best mapped from above*), and **Hurricane Gustav, Caribbean** (*Gustav has restrengthened into a Category 1 storm south off Cuba by the time of this pass [1:19pm EDT]*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Week 19/20 Scheduled Main Activities:

- Sat. (8/30): Station cleaning (RS); PFCs (CDR, FE-1); VolSci (SPHERES);

FFQ; Ham pass.

- Sun. (8/31): Station cleaning (USOS); WINSCAT; PFC (FE-2).
- Mon. (9/1, Labor Day): Crew off duty; Progress 29P Undock (~3:47pm); CSA-CP probe replacement; ham session; FSL/FCE lock.
- Tue. (9/2): ATV Undock OBT; BUAP/MBRL (PCE) equipment install in SM (ATV hand controller, antenna switch box, prox comm unit); Elektron deact/act; Vozdukh AVK test; FGB PS1/PS2 filter & TsV1 screen cleaning; USOS water sampling; CMO profic.train.; FSL/FCE release.
- Wed. (9/3): MO-7 (all); RED inspection; BMP ch.1 regen; MO-3/FE-1 (TVIS); WRS O₂ purge/port install/leak check; SAMS s/w load; CGSE troubleshooting; BRTK-MBRL (PCE) test 1.
- Thu. (9/4): SOTR-KOB1 maintenance; SRVK-BRPK maintenance; BMP ch.2 regen; CWC audit; SLEEP init.; PCS s/w load-ghosting; IWIS reprogram; ATV: activate/SSVP docking system remove/close hatches/take photo+video; TVS-MPEG Ku test.

ISS Orbit (as of this morning, 8:33am EDT [= epoch]):

Mean altitude -- 353.7 km

Apogee height -- 358.3 km

Perigee height -- 349.1 km

Period -- 91.61 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006797

Solar Beta Angle -- -12.2 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 71 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 56007

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/01/08 -- Progress M-64/29P undocking, FGB nadir (~3:47pm); independent flight w/"Plasma" exp.

09/05/08 -- ATV1 undocking, from SM aft port (~5:27pm); independent flight

09/09/08 -- Progress M-64/29P de-orbit (~5:19pm)

09/10/08 -- Progress M-65/30P launch (~3:49:45pm)

09/12/08 -- Progress M-65/30P docking (SM aft, ~5:08pm DM)

09/29/08 -- ATV de-orbit (nighttime re-entry for observation)

10/01/08 -- **NASA 50 Years** (official)

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?

11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 08/28/08

All ISS systems continue to function nominally, except those noted previously or below.

Upon wake-up, CDR Volkov terminated his ninth MBI-12 SONOKARD experiment session for the long-term Russian sleep study, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

Volkov also performed the periodic service of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The process will be terminated at ~5:15pm EDT and Bed #2 regeneration performed tomorrow. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently to remove any lingering Freon-218 from the cabin atmosphere (last time: 8/11 & 12)];*

After completing sampling of condensate water (KAV) from the SRVK-2M condensate processor upstream of the FGS gas-liquid mixture filter in drink bags, FE-1 Kononenko removed the processor's BKO multifiltration unit and replaced it with a spare, stowing the old unit for deorbiting on Progress 29P. *[BKO contains five purification columns to rid the condensate of dissolved mineral and organic impurities. It has a service lifetime of ~450 liters throughput. The water needs to be*

purified for proper electrolysis in the Elektron O₂ generator.]

Sergey Volkov conducted an inspection and photo-documentation of currently sunlit window panes in the RS (Russian Segment), specifically on windows 2 & 13 in the SM (Service Module) and VL1 (EV hatch 1) and VL2 (EV hatch 2) in the DC1 Docking Compartment. The observed defects were recorded in image and text files on the RSK1 laptop for subsequent downlink via U.S. OCA assets. *[Objective of the inspection, which uses a digital still camera (Nikon D1X w/SB-28DX flash) and voice recorder, was to assess the window pane surfaces for any changes (new cavities, scratches, new or expanded old stains or discolorations affecting transparency properties) since the last inspection. The new assessment will be compared to earlier observations. Defects on the currently are measured with the parallax method which uses eyeball-sighting with a ruler and a right isosceles triangle to determine the defects' size and position with respect to the window's internal surface (parallax being the apparent change in an object's position resulting from changing the observer's position).]*

In the FGB module, Volkov worked on the BR-9TsU-8 Radiotelemetry System (RTS), supporting the ground with another verification of the proper functioning of two temperature sensors (T97, T98) of the SIT-9L Temperature Measuring System.

Oleg Kononenko worked on the SM toilet systems (ASU), performing the monthly 30-min. maintenance/servicing of the facility, changing out replaceable ASU parts with new components, i.e., the urine receptacle (MP) and a filter insert (F-V). The old parts were discarded as trash.

Afterwards, the FE-1 had an hour in the FGB to search for and gather the necessary gear for the upcoming installation of ATV (Automated Transfer Vehicle) control equipment in the SM, i.e., an ATV hand controller with its stand, a BUAP antenna switch box with cabling and the PCE (Proximity Communications Equipment; Russian: MBRL) unit.

In the JAXA Kibo laboratory, Chamitoff powered down the MMA NCU/RSU (Microgravity Measurement Apparatus Network Control Unit/Remote Sensor Unit) at the Ryutai rack UDC (Utility DC-to-DC Converter) unit, without turning off the MLT (MMA Laptop Terminal) and its software. *[These systems were powered up by Greg on 8/19.]*

Also in the JPM (JEM Pressurized Module), Gregory had 1:15 h to reconfigure the PCRF (Protein Crystallization Research Facility).

After the recent (8/11) first Japanese payload activity in Kibo, an EPO (Educational

Payload Operation) experiment to model a piece of clay into a human-shaped form in micro-G, Gregory today prepared the clay form for return to Earth, packing it up carefully to protect it against breakage.

Pursuant to the discovery of a blacked out display on the CB (Clean Bench) subrack facility in the JPM during yesterday's Saibo CB checkout, Chamitoff today supported ground-commanded troubleshooting of the display by verifying cable connectivity (two cables, four plugs) and looking for possible bent connector pins. *[Ground commanding of JPM payloads is done by JAXA's SSIPC (Space Station Integration & Promotion Center) at Tsukuba/Japan. The CB provides a germ-free environment for life science and biotechnological experiments. It has a specially designed microscope that operates with bright-field, phase-contrast and fluorescence modes. The objective lens can be switched between four magnification levels (4x, 10x, 20x, 40x).]*

In the Lab, the FE-2 continued outfitting for the future U.S. Regenerative ECLSS (Environment Control & Life Support System) with the Modification Kit #1, Part 2. *[The work included installation of the OGS (Oxygen Generator System) secondary power jumper on its Utility Interface Panel (UIP, i.e., Z-panel LAB1PD1), connecting a MIL-Standard 1553 data bus for the WRS (Water Recovery System) on the PD2 Z-panel and retrieving equipment from stowage in the P1 volume.]*

FE-1 Kononenko had another ~3 hrs set aside for finishing up ATV cargo transfer activities and preparing the "Jules Verne" contents for ATV undocking next week (9/5).

At the TVIS treadmill, Kononenko did another inspection and documentary photography of the improvised patch of the running belt and four shifted belt plates above the patch for ground verification of belt integrity after its improvised repair conducted on 8/11.

The FE-2 completed the weekly 10-min. CWC (Contingency Water Container) inventory as part of on-going WRM (Water Recovery & Management) assessment of onboard water supplies. Updated "cue cards" based on the crew's water calldowns are sent up every other week. *[The new card (17-0002W) lists 31 CWCs (~1204.3 L total) for the four types of water identified on board: technical water (426.5 L, for flushing only because of Wautersia bacteria), potable water (706.7 L, incl. 174.6 L currently on hold), condensate water (54.1 L), waste/EMU dump and other (17 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]*

Gregory worked on the failed SSC-1 (Station Support Computer 1) laptop, replacing

its defunct shell (#1098; failed backlight) with an A31p shell (#1173) from stowage and equipping it with the HDD (hard disk drive) of the failed laptop, making #1173 the new SSC-1.

Sergey Volkov was scheduled to initiate, later terminate, an oxygen refresh of the cabin atmosphere with O₂ from Progress M-64/29P stores.

The CDR performed the routine daily servicing of the SOZh system (ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Afterwards, Sergey took care of the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Later today (~2:00pm), Greg Chamitoff will break out and set up the equipment for tomorrow’s scheduled U.S. PHS (Periodic Health Status) w/Blood Labs exam, a clinical evaluation of Chamitoff as subject, with Sergey Volkov assisting as CMO (Crew Medical Officer) for the blood sampling part. *[The task today included an electronic function test and control analysis of the blood lab equipment, viz., the PCBA (Portable Clinical Blood Analyzer), which was then temporarily stowed.]*

The station residents conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Sergey will transfer the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~9:35am EDT, Greg Chamitoff supported an interactive PAO TV event of ~20 min. with students from Sydney Girls High School at Australian Broadcasting Corporation’s “Catalyst” Science Program of the Royal Botanic Gardens “Seeds in Space” Project, Sydney, Australia.

Conjunction Update: Using ATV thrusters, the ISS performed a 1 m/s braking burn yesterday at 12:11pm EDT to remove the risk of collision with an orbital object, - #33246 (part of the Kosmos-2421 satellite). The retrograde firing of 5 min 2 sec duration resulted in a mean altitude loss of ~1.77 km. Propellant usage: ~98 kg of

ATV prop, leaving ~190 kg in “Jules Verne” prior to undock (possibly with some margin, to be assessed by ESA) and ~320 kg of Progress/SM props for attitude control of the stack. A **second possible conjunction** with another piece (#33248) of Kosmos-2421 has been identified for tomorrow (8/29) at 9:09pm EDT, currently predicted to be in the RED box. This would require another DAM (Debris Avoidance Maneuver), but more tracking is required for a burn decision. Estimated prime TIG (Time of Ignition): tomorrow 7:00pm. Prop strategy is currently under study. If a second DAM is necessary tomorrow, using ATV prop, the Progress 29P undocking on 9/1 (Monday) can be supported by SM thrusters. Ballistic calculations must continue to account for future Soyuz launch, Soyuz landing and Shuttle ULF2 launch/rendezvous constraints.

Tropical Storm Gustav Update: Gustav is approaching Jamaica, with a hurricane warning already issued for the island. JSC/Houston is currently in the potential zone for Hurricane Gustav. Predictions for the 5-day timeline still have significant uncertainty. JSC will go to Level 4 if the storm threatens within 72 hours. Landfall is currently predicted to be on Tuesday, 9/2.

CEO (Crew Earth Observations) photo target uplinked for today was **Gordion archaeological site, Turkey** (*looking left. Visual cues were a man-made lake and narrow wooded [green] ridges. Broad images of the area were requested to assist future focused imaging efforts*), **Algerian megafan** (*detailed overlapping images were requested along track and just right of track, of this newly identified feature. During wet phases in the Sahara Desert one major river repeatedly built up this large “cone” of river sediment. Of special interest is the apex zone where the sediment cone has partly engulfed several hills [dark spots within fan margin]. This process of sediment burial of hills is providing a new analog for landscape models on Mars [where “hills” are impact crater rims]*), **Hurricane Gustav, Caribbean** (*interacting with the mountains of Hispaniola, Gustav has declined to a tropical storm, but is expected to intensify again to hurricane status by the time of this pass. The center was predicted to lie between Jamaica and Cuba*), and **Beni River dynamics, Bolivia** (*the Beni River transports great quantities of sediment from the Andes Mts and deposits it as a vast fan [450 km in radius] in SW Amazonia. The river has swept across the entire surface of the fan in the process. Shooting right to obtain images of numerous prior river courses*).

CEO photography can be studied at this “Gateway” website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Week 19/20 Scheduled Main Activities:

- Fri. (8/29): BMP ch.2 regen; PHS w/blood (PCBA); 29P: LKT remove/

activate/hatch close/leak check; BRTK-MBRL prox.comm. prep; ITCS fluid sampling (JEM, Lab, Node-2, COL); OCA & FS laptop reboots.

- Sat. (8/30): Station cleaning (RS); PFCs (CDR, FE-1); VolSci (SPHERES); FFQ; Ham pass.
- Sun. (8/31): Station cleaning (USOS); WINSCAT; PFC (FE-2).
- Mon. (9/1, Labor Day): Crew off duty; Progress 29P Undock (~3:47pm); CSA-CP probe replacement; ham session; FSL/FCE lock.
- Tue. (9/2): ATV Undock OBT; BUAP/MBRL (PCE) equipment install in SM (ATV hand controller, antenna switch box, prox comm unit); Elektron deact/act; Vozdukh AVK test; FGB PS1/PS2 filter & TsV1 screen cleaning; USOS water sampling; CMO profic.train.; FSL/FCE release.

ISS Orbit (as of this morning, 8:05am EDT [= epoch]):

Mean altitude -- 353.8 km

Apogee height -- 358.1 km

Perigee height -- 349.4 km

Period -- 91.61 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006422

Solar Beta Angle -- -16.3 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.72

Mean altitude loss in the last 24 hours -- 1770 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55991

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/01/08 -- Progress M-64/29P undocking, FGB nadir (~3:47pm); independent flight w/"Plasma" exp.

09/05/08 -- ATV1 undocking, from SM aft port (~5:27pm); independent flight

09/09/08 -- Progress M-64/29P de-orbit (~5:19pm)

09/10/08 -- Progress M-65/30P launch (~3:49:45pm)

09/12/08 -- Progress M-65/30P docking (SM aft, ~5:08pm DM)

09/29/08 -- ATV de-orbit (nighttime re-entry for observation)

10/01/08 -- **NASA 50 Years** (official)

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?

11/10/08 -- STS-126/Endeavour/ULF2 launch -- MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 08/27/08

All ISS systems continue to function nominally, except those noted previously or below. *Today five years ago (2003), the planet Mars made its closest approach to Earth in nearly 60,000 years: 55,758,006 km (34,646,419 mi).*

Conjunction event: Using ATV thrusters, the ISS performed a DAM (Debris Avoidance Maneuver) burn at 12:11pm EDT (in lieu of the IWIS Thruster Firing Test originally planned) to remove the risk of collision with an orbital object, - #33246 (part of the Kosmos-2421 satellite). *[Miss distance of the object, tracked over several days, was predicted this morning to be 1.627 km, with a collision probability of 0.0139 (odds 1:72) which brought it over the ruled threshold into the RED box (FR B4-101, i.e., "greater than 1 in 10,000"), requiring a DAM. The burn, calculated to last 5 min 2sec, was performed with two thrusters of the ATV main propulsion system. Predicted delta-V was ~1 m/s, in retrograde direction, so that future Soyuz launch, Soyuz landing and Shuttle ULF2 launch constraints can be met. An automated timer-controlled confirmation check by the RS CCS (Command & Control System) software of the transition to the proper system configuration for the thruster burn did not take place and had to be done manually by MCC-H Flight Control in time for the burn. Note: The last DAM was performed on 5/30/03.]*

Upon wake-up, FE-1 Kononenko terminated his ninth MBI-12 SONOKARD experiment session for the long-term Russian sleep study, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground.

Sergey Volkov's new MBI-12 session starts tonight (~5:20pm). *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

In preparation for the ATV DAM burn at 12:11pm, FE-2 Chamitoff closed the protective shutters on the Lab science window, having verified shutter closure for the JPM (JEM Pressurized Module) window yesterday.

Also for the DAM, the FE-2 locked the FSL FCE (Fluid Science Laboratory/Facility Core Element) in the COL (Columbus Orbital Laboratory) with four locking bolts to fix it for the acceleration forces caused by the thrusters. *[The locking activity had to wait until after a ground-commanded GEOFLOW Single Experiment run in the FSL, ending at ~11:15am.]*

The originally scheduled installation of the IWIS (Internal Wireless Instrumentation System) and the periodic OBT (Onboard Training) Fire Emergency Drill by the crew were not conducted because of the concurrently scheduled DAM.

After turning on the four Pille dosimeters of the LULIN-ISS radiation complex on 8/21 to start data taking, Kononenko downlinked the post-exposure readings of each dosimeter and then deactivated the LULIN BUI Control & Measuring Unit, leaving the electrical connections in place.

Gregory was to use the electronic Velocicalc instrument to take the periodic THC IMV (Temperature & Humidity Control/Intermodule Ventilation) air flow measurements of relative humidity (dew point, wet bulb temp), temperature and air velocity (flow rate) between modules, but the activity was aborted due to false Velocicalc readings. *[The instrument was reading negative in the high 100's (ft/m) and did not vary when moved across the diffuser. Specialists are investigating the anomalous Velocicalc performance. The IMV flow measurements are used to determine when duct cleaning should be performed.]*

Oleg conducted the periodic checkout/verification of IP-1 airflow sensors in the various RS (Russian Segment) hatchways, including the passageways SM PrK (Service Module Transfer Compartment)–ATV, PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1.

More water samples were gathered by Kononenko in the RS, today from the BRP-M Water Distribution & Heating Unit (hot tap). The samples were stored in drinking bags and a sample container for return to the ground.

In the JAXA Kibo JPM, the FE-2 supported the Tsukuba flight controllers by verifying a ground-commanded checkout of the CB (Clean Bench) subrack facility (except its microscope). Video of the checkout was downlinked through VCU (Video Control Unit) and IPU (Image Processing Unit).

Greg performed the periodic maintenance of the CEVIS cycle ergometer, lubricating its guide pins and making sure that the exercise machine can still be rotated out of the way to the stowed position.

The CDR had 2 hrs set aside to perform the periodic Russian SPOPT (Fire Detection & Suppression System) maintenance in the DC1 "Pirs" Docking Compartment by dismantling its three IDZ-2 smoke detectors, cleaning their ionizing needles and then reinstalling the sensors. *[Part of the job is inspection and cleaning of surrounding areas behind panels.]*

Volkov, Kononenko & Chamitoff had another ~4:30 hrs reserved on today's timeline between them for ATV cargo unloading/loading, i.e., moving consumables to the ISS via the SM and loading trash & excessed equipment on "Jules Verne".

The FE-1 performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Afterwards, Oleg also took care of the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

As per the Russian voluntary "time permitting" task list, Kononenko conducted the regular status check on the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (barley) under spaceflight conditions in the Lada-13 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}), recharging its water tank as required.

The station residents conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Oleg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

ER-4/ER-5 Relocation Update: During yesterday's EXPRESS Rack 5 transfer, both the supply- and return-line QDs (Quick Disconnects) of the ITCS MTL (Internal

Thermal Control System/Moderate Temperature Loop) leaked some ITCS fluid (Triol, a water/glycerin mixture) upon disconnection. A 1.1% drop in accumulator quantity was observed, which equates to approximately 3-4 oz. of fluid. The return line leak was stopped. Since the supply side continued to leak despite prescribed QD leak troubleshooting, it was left connected to the Z-panel. ER-5 was relocated to the JPM but will remain unpowered until the ITCS jumper is installed. It is not scheduled for powered operations for several days. The supply line must be removed prior to the CHeCS (Crew Health Care Systems) rack relocation in two weeks. *[A "triol" is a chemical compound containing three hydroxyl groups (-OH), such as glycerol.]*

VolSci Preview: For next weekend's Voluntary Science program, Gregory has selected a 4-hr. session with the SPHERE (Synchronized Position Hold, Engage, Reorient, Experimental Satellites) payload, using all three satellites and requiring the CDRA to be running. Two additional candidate payloads were suggested for 8/31 (Sunday) & 9/1 (Monday, a holiday): (1) a LOCAD-PTS (Lab-On-A-Chip Application Development – Portable Test System) run, using Glucan LAL cartridges in COL (Columbus Orbital Laboratory) to look for fungus on surfaces, and (2) another SHERE (Shear History Extensional Rheology Experiment) session.

CEO (Crew Earth Observations) photo target uplinked for today was **Santorini Volcanic Complex, Greece** (*looking left at the tight circle of small islands nearest track for detailed images*), **Kwanza Basin, Angola** (*overlapping images along track at nadir were requested; handheld imagery is acting as baseline mapping data for expected new economic development in the Kwanza Basin as oil revenues from the coastal oilfields rise rapidly*), **Hurricane Gustav, Caribbean** (*Dynamic event. This hurricane is moving NW and expanding rapidly. It is expected to be a Category 2 storm centered just south of Cuba by the time of this ISS pass*), and **High Central Andean Glaciers** (*changes in glacier footprint are climate change indicators, and are ideally mapped by remote means. Tropical mountain glaciers are known to be melting fast in some areas. Looking roughly at nadir for bright white glaciers on mountain peaks [for ~2.5 minutes]*).

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Week 19/20 Scheduled Main Activities:

- Thu. (8/28): MBI-12/Sonokard (CDR); BMP ch.1 regen; Regen ECLSS Mod Kit 1 install; JAXA CB Microscope C/O; Clay EPO return; COL FSL FCE release; ATV cargo transfers; PHS w/blood set-up; ASU R&R; WRM audit.
- Fri. (8/29): BMP ch.2 regen; PHS w/blood (PCBA); 29P: LKT remove/

activate/hatch close/leak check; BRTK-MBRL prox.comm. prep; ITCS fluid sampling (JEM, Lab, Node-2, COL); OCA & FS laptop reboots.

- Sat. (8/30): Station cleaning (RS); PFCs (CDR, FE-1); VolSci (SPHERES); FFQ; Ham pass.
- Sun. (8/31): Station cleaning (USOS); WINSCAT; PFC (FE-2).
- Mon. (9/1, Labor Day): Crew off duty; Progress 29P Undock (~3:47pm); CSA-CP probe replacement; ham session; FSL/FCE lock.
- Tue. (9/2): ATV Undock OBT; BUAP/MBRL (PCE) equipment install in SM (ATV hand controller, antenna switch box, prox comm unit); Elektron deact/act; Vozdukh AVK test; FGB PS1/PS2 filter & TsV1 screen cleaning; USOS water sampling; CMO profic.train.; FSL/FCE release.

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/01/08 -- Progress M-64/29P undocking, FGB nadir (~3:47pm); independent flight w/"Plasma" exp.

09/05/08 -- ATV1 undocking, from SM aft port (~5:27pm); independent flight

09/09/08 -- Progress M-64/29P de-orbit (~5:19pm)

09/10/08 -- Progress M-65/30P launch (~3:49:45pm)

09/12/08 -- Progress M-65/30P docking (SM aft, ~5:08pm DM)

09/29/08 -- ATV de-orbit (nighttime re-entry for observation)

10/01/08 -- **NASA 50 Years** (official)

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?

11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking

02/26/09 -- STS-119/Discovery/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 08/26/08

All ISS systems continue to function nominally, except those noted previously or below.

Today's main activity for the crew was to transfer two Lab racks to the JAXA JPM (JEM Pressurized Module) – ER4 (EXPRESS Rack 4) and ER5, as part of a larger move of nine U.S. racks to Kibo as per international agreement. For the transfer, Gregory Chamitoff, assisted by CDR Volkov, had to –

- Disconnect the two ELCs (ER laptop computers) and stow them temporarily with their cables & support equipment,
- Rotate the CEVIS ergometer bicycle 90 deg out of the way to its stowed position (after having performed his one-hour physical exercise on it),
- Relocate ER4 from LAB1P2 to Kibo position JPM1F5,
- Relocate ER5 from LAB1S4 to Kibo position JPM1F1,
- Mate ER4's umbilicals at the JPMF5 UIP (Utility Interface Panel, "Z-panel");
- Mate ER5's umbilicals at the JPM1F1 UIP ("Z-panel"),
- Set up & connect each ELC at its respective ER, and
- Restow any items temporarily relocated before the transfers to their original locations.

[The EXPRESS (EXpedite the PProcessing of Experiments to the Space Station) Racks are standardized payload rack systems that transport, store and support science payloads aboard the ISS in several disciplines such as biology, chemistry, physics, ecology and medicine, including commercial activities. Each ER is housed in an ISPR (International Standard Payload Rack) - a refrigerator-size container that acts as the ER's exterior shell. Each rack can be divided into segments, whether as large as half the entire rack or as small as a breadbox.]

Volkov used an early RGS (Russian Groundsite) comm pass (DO4/~2:27am EDT) to downlink a Fialka UVC (Ultraviolet Video Camera) recording from the geophysical GFI-1 Relaksatsiya ("relaxation") experiment session on 8/20, which took images and radiation patterns of the Earth atmosphere & surface from spectra recorded

with the UV camera from SM window #9. *[Relaksatsiya normally deals with the study of the chemoluminescent chemical reactions and atmospheric light phenomena (emissions, i.e., molecular relaxation processes), including those that occur during high-velocity interaction between the exhaust products from space vehicles and the atmosphere at orbital altitude and during the entry of space vehicles into the Earth's upper atmosphere. "Relaxation", in Physics, is the transition of an atom or molecule from a higher energy level to a lower one, emitting radiative energy in the process as equilibrium is achieved.]*

After temporarily deactivating the Russian SKV-2 air conditioner, FE-1 Kononenko collected another set of condensate water (KAV) samples from the SRV-K2M Condensate Water Recovery System, upstream of its FGS Gas-Liquid Mixture Filter, in an empty drinking bag for return to Earth.

As part of regular preventive maintenance of RS (Russian Segment) ventilation systems, the FE-1 used a vacuum cleaner and soft brush for cleaning the detachable VT7 fan screens 1, 2 & 3 of the three SOTR (Thermal Control System) gas-liquid heat exchangers (GZhT4) In the FGB (Funktsionalnyi-Grusovoi Blok).

Volkov, Kononenko & Chamitoff had another ~8:40 hrs reserved on today's timeline between them for ATV (Automated Transfer Vehicle) cargo unloading/loading, i. e., moving consumables to the ISS via the SM (Service Module) and loading trash & excessed equipment on "Jules Verne".

Yesterday's scheduled O₂ (oxygen) refresh of the cabin atmosphere from Progress M-64/29P stores was aborted and moved to today's schedule for the CDR.

The crew had their regular weekly PMCs (Private Medical Conferences) via S- & Ku-band audio/video, Sergey at ~12:05pm, Oleg at ~1:20pm, Greg at ~2:30pm EDT.

The CDR performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Afterwards, Sergey also completed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

In preparation for the IWIS (Internal Wireless Instrumentation System) thruster test

scheduled tomorrow evening (~6:12pm), Gregory verified closure of the protective window shutter of the JAXA JLP.

The station residents conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Volkov transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~5:20pm EDT, just before sleep time, the FE-1 will again set up the Russian MBI-12 SONOKARD (Sonocard) payload and start his ninth experiment session, using a sports shirt from the SONOKARD kit with a special device in the pocket for testing a new method for acquiring physiological data without using direct contact on the skin. Measurements are recorded on a data card for return to Earth.

[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]

As generally every day now, starting at ~9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) was activated intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS (Internal Thermal Control System) cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking.]*

WRS (Water Recovery System) Update: Yesterday's scheduled installation of the O₂ port on the PD4 standoff in the Lab and the relocation of the CHeCS (Crew Health Care System) O₂ supply hose to the new port, followed by an overnight leak check, could not be completed by the FE-2 when an adapter required for umbilical and port purging could not be located. The activity has been deferred until the missing equipment is located. *[The CHeCS rack will be relocated next week in the U.S. Lab from the D4 position to the S4 position in order to install the WRS-1 rack during STS-126/ULF2. Since there will be no O₂ connection to the CHeCS rack at the S4 location, the new O₂ port must be installed, also to interface with the*

Regenerative ECLSS system to maintain a functional O₂ port in the D4 bay of the Lab.]

HRM Update: When Kononenko's exercise HRM2 (Heart Rate Monitor 2) #1001 stopped working yesterday, it was replaced by the available spare (#1002), pending further troubleshooting of #1001. *[The wireless POLAR S810 HRMs resemble sports wrist watches, with some of their features. They display the heart rate as BPM (beats per minute) and % of HRmax, average HR plus exercise duration, along with 7 different exercise profiles. The HR is radioed by the HRM transmitter, worn on an elastic belt around the chest, to the wrist receiver for subsequent downloading to the MEC and analysis by special software. Receiver settings are also uploaded from the laptop.]*

VolSci Preview: For next weekend's Voluntary Science program, Gregory has selected a 4-hr. session with the SPHERE (Synchronized Position Hold, Engage, Reorient, Experimental Satellites) payload, using all three satellites and requiring the CDRA to be running. Two additional candidate payloads were suggested for 8/31 (Sunday) & 9/1 (Monday, a holiday): (1) a LOCAD-PTS (Lab-On-A-Chip Application Development – Portable Test System) run, using Glucan LAL cartridges in COL (Columbus Orbital Laboratory) to look for fungus on surfaces, and (2) another SHERE (Shear History Extensional Rheology Experiment) session.

CEO (Crew Earth Observations) photo target uplinked for today was **West Hawk Impact Crater, Manitoba** *(looking right from track, West Hawk crater was a more circular lake situated on the near side of a set of many elongated lakes. This 4.5 km-diameter crater was formed 350 million years ago, and is still evident in the landscape despite several episodes of glacial erosion in the last 2 million years).*

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Week 19 Scheduled Main Activities:

- Wed. (8/27): MBI-12/Sonokard (FE-1); ATV cargo transfers; LULIN data dwnld.; DC1 IDZ-2 smoke detector cleaning; THC-IMV flow meas.; SVO BRP-M water sampling; IWIS setup; Emergency proc. OBT/drill; IWIS thruster test.
- Thu. (8/28): MBI-12/Sonokard (CDR); BMP ch.1 regen; Regen ECLSS Mod Kit 1 install; JAXA CB Microscope C/O; Clay EPO return; COL FSL FCE release; ATV cargo transfers; PHS w/blood set-up; ASU R&R; WRM audit.
- Fri. (8/29): BMP ch.2 regen; PHS w/blood (PCBA); 29P: LKT remove/activate/hatch close/leak check; BRTK-MBRL prox.comm. prep; ITCS fluid

sampling (JEM, Lab, Node-2, COL); OCA & FS laptop reboots.

- Sat. (8/30): Station cleaning (RS); PFCs (CDR, FE-1); VolSci (SPHERES); FFQ; Ham pass.
- Sun. (8/31): Station cleaning (USOS); WINSCAT; PFC (FE-2).

ISS Orbit (as of this morning, 8:35am EDT [= epoch]):

Mean altitude -- 355.6 km

Apogee height -- 361.5 km

Perigee height -- 349.6 km

Period -- 91.65 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0008817

Solar Beta Angle -- -23.8 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.71

Mean altitude loss in the last 24 hours -- 40 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55960

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

08/27/08 -- IWIS thruster test (~6:12pm)

09/01/08 -- Progress M-64/29P undocking, FGB nadir (~3:47pm); independent flight w/"Plasma" exp.

09/05/08 -- ATV1 undocking, from SM aft port (~5:27pm); independent flight

09/09/08 -- Progress M-64/29P de-orbit (~5:19pm)

09/10/08 -- Progress M-65/30P launch (~3:49:45pm)

09/12/08 -- Progress M-65/30P docking (SM aft, ~5:08pm DM)

09/29/08 -- ATV de-orbit (nighttime re-entry for observation)

10/01/08 -- **NASA 50 Years** (official)

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?

11/10/08 -- STS-126/Endeavour/ULF2 launch -- MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch -- S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osp/iss_reports/index.htm

ISS On-Orbit Status 08/25/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 19 of Increment 17.*

The crew got up an hour earlier this morning (1:00am EDT) to enable TORU testing over RGS (Russian Groundsite). Sleep time tonight will also begin an hour earlier (4:30pm), and end tomorrow at the regular time (2:00am).

For the purpose of testing the main TORU (Teleoperator Control System) receiver on the mated Progress M-64/29P, CDR Volkov & FE-1 Kononenko worked with ground specialists via VHF on DO3 (Daily Orbit 3, VHF coverage 2:15-2:22am) on the standard vehicle-to-vehicle TORU checkout between the Service Module (SM) and the Progress 29P cargo ship docked to the FGB nadir port. TORU was activated on 2:16am. Progress thrusters (DPO) were inhibited and not involved. *[Crew activities focused on TORU activation, inputting commands via the RUO Rotational Hand Controller and close-out ops. TORU lets an SM-based crewmember perform the approach and docking of automated Progress vehicles in case of failure of the automated KURS system. Receiving a video image of the approaching ISS, as seen from a Progress-mounted docking television camera ("Klest"), on a color monitor ("Simvol-Ts", i.e. "symbol center") which also displays an overlay of rendezvous data from the onboard digital computer, the crewmember steers the Progress to mechanical contact by means of two hand controllers, one for rotation (RUO), the other for translation (RUD), on adjustable armrests. The controller-generated commands are transmitted from the SM's TORU control panel to the Progress via VHF radio. In addition to the Simvol-Ts color monitor, range, range rate (approach velocity) and relative angular position data are displayed on the "Klest-M" video monitor (VKU) which starts picking up signals from Progress when it is still approximately 7 km away. TORU is monitored in real time from TsUP over Russian ground sites (RGS) and via Ku-band from Houston, but its control cannot be taken over from the ground.]*

FE-2 Chamitoff worked on reconditioning ITCS (Internal Thermal Control System) Flow Meter batteries, that is, charging them in the SMPA (SM Power Adapter) "Makita" battery charger through several cycles and checking charge level between cycles. *[The batteries have discharged due to a shelf-life issue and were unable to accept charge via nominal charging. The reconditioning required demating the battery (to reset its internal circuit) every hour, then remating it for more charging if necessary. The process included a confidence check, i.e., by determining how long a battery will power the Flow Meter when connected to it. The SMPA connects to the Russian power system with U.S. cables and transforms the Russian 28 volts direct current to 12VDC for the battery.]*

Kononenko conducted the periodic (about twice a month) replenishing of the Elektron oxygen generator's water supply for electrolysis, filling the KOV EDV container with water collected in a CWC (Contingency Water Container, #1021) from the Lab CCAA (Common Cabin Air Assembly) dehumidifier. *[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]*

Volkov & Kononenko had another ~5:45 hrs reserved between them for ATV cargo transfers, i.e., moving consumables to the ISS via the SM and loading trash & excessed equipment on "Jules Verne".

After the ATV D1 rack compartment was cleared of cargo items, the CDR performed a special deck inspection in the ESA freighter spacecraft to check on possible condensate and to measure shell temperature. Afterwards, Sergey & Oleg installed a TSR (Temporary Stowage Rack) in the D1 space and modified it to accept large trash items. *[The shell inspection was motivated by the shifting of several layers of MLI (Multi-Layer Insulation) during launch, exposing the hull in several locations without thermal insulation. The goal of the inspection and temperature measurements with the Scopemeter with thermal probe was to evaluate the impact(s) of the insulation loss for the future.]*

The FE-1 "harvested" plants grown in the long-term BIO-5 Rasteniya-2 ("Plants-2") micro-G growth payload, photographing and collecting barley seedlings and inserted them into a MELFI (Minus Eighty Degree Laboratory Freezer for the ISS) box module (Dewar 3/Tray A) for return to Earth. Oleg then planted two BIO-5 root modules with fresh Mizuna seeds (*Brassica juncea* var. *japonica*, Japanese Mustard Greens, also known as California Peppergrass). Working off his discretionary "time permitting" task list, Oleg additionally performed the daily status check of the hardware. *[Rasteniya researches growth and development of plants (currently Mizuna) under spaceflight conditions in the Lada-13 greenhouse. MELFI's cooling system is using the Reverse Brayton Thermodynamic Cycle with nitrogen as working fluid. The cooling engine, a Brayton Machine (BM), working*

with a compression wheel and expansion wheel on the same shaft supported by a gas bearings system, can rotate at speeds up to 96,000 rpm depending on the cooling requirements.]

In preparation for tomorrow's relocation of ER-4 (EXPRESS Rack 4) & ER-5 from the US Lab to the JAXA Kibo JPM (JEM Pressurized Module), Gregory made room for the transfers by clearing stowage from the future site of the racks in the JPM and prepared the translation path for "flying" the ERs over to Kibo. As an additional voluntary job on his "job jar" list, Greg also was to take photographs of any items protruding into the 50 in x 72 in. translation path needed for the various rack transfers.

Later, the three crewmembers reviewed tomorrow's transfer activities and also the upcoming cabling modification tasks on the Regenerative ECLSS (Environment Control & Life Support System) in the Lab. *[The ER rack transfers will involve only two of nine US rack relocations prior to STS-126/ULF2, with the remaining transfers scheduled in September, viz.: MELFI plus two ZSRs (Zero-G Stowage Racks) to Kibo, HRF-1 (Human Research Facility 1) & HRF-2 to COL (Columbus Orbital Laboratory), and CHeCS (Crew Health Care Systems) plus one RSR (Resupply Stowage Rack from Node-2) to Lab positions. The CHeCS rack transfer will lead over to completion of the Regenerative ECLSS modifications.]*

Chamitoff completed the retrieval of eight US grounding straps from the JLP (JEM Logistics Pressurized Section), originally scheduled 8/20 but then postponed. The straps will be required for tomorrow's rack relocations (four each for ER-4 & ER-5).

In the Lab, the FE-2 also performed corrective maintenance on the Avionics Rack 1 (LAB1D5), removing and replacing an RPCM (Remote Power Control Module). *[The RPCM (LAD52B-A) exhibited anomalous behavior some time ago, probably because of a FET (Field Effect Transistor) Hybrid failure in one of the RPCs, causing a spontaneous power on reset which switched the INT MDM (Interior Multiplexer/Demultiplexer) computer system from Primary INT-2 to INT-1 and thereby removed some heaters from RPC control.]*

CDR Volkov set up the IWIS (Internal Wireless Instrumentation System) and connected its NCU (Network Control Unit) to the SSC-4 (Station Support Computer 4) laptop to enable ground-commanded testing of the IWIS structural vibrations dynamics measuring & data recording system.

FE-1 Kononenko took care of the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV*

waste water and EDV-U urine containers.]

Oleg also completed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Greg Chamitoff continued outfitting for the new Regenerative ECLSS, today working on its WRS (Water Recovery System) by installing the oxygen (O₂) port, venting the new CHeCS O₂ supply hose to prevent contamination, then relocating the umbilical to the new port, purging it and the CHeCS rack O₂ port and configuring the setup for an overnight leak check. *[The WRS will be used to recycle wastewater into potable water. The Regenerative ECLSS will be required for the future six-person occupancy of the station.]*

Sergey set up the Fialka-UVC hardware in preparation for downlinking the video recording from last Wednesday's (8/20) session with the geophysical GFI-1 Relaksatsiya ("relaxation") experiment which took images and radiation patterns from the Earth atmosphere & surface from spectra recorded with the UV (ultraviolet) camera from SM window #9. The TV recording will be downlinked tomorrow on DO4. *[Relaksatsiya normally deals with the study of the chemoluminescent chemical reactions and atmospheric light phenomena (emissions, i.e., molecular relaxation processes), including those that occur during high-velocity interaction between the exhaust products from space vehicles and the atmosphere at orbital altitude and during the entry of space vehicles into the Earth's upper atmosphere.]*

The three station residents conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Volkov transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Sergey initiated, later terminated, an oxygen refresh of the cabin atmosphere with O₂ from Progress M-64/29P stores.

At ~12:35pm EDT, Dr. Chamitoff supported a live interactive PAO/Educational event of ~20 min with the Columbia Mission Project at Buchanan High School in Clovis, CA. This was the third annual Simulated Space Station Experience at that

location. The project involved a simulated total NASA experience, from rocket fabrication to astronaut selection, training in Mission Control, and station operations. The highlight was students spending 48 hours in mockups of the ISS and Mission Control for a space station mission. Questions from the K-12 students were uplinked to the crew beforehand. [*“What inspired you to be an astronaut?”; “What was the greatest obstacle you had to overcome in your astronaut training? For example, did you have to overcome any fears?”; “What was the most interesting psychological test you experienced during the astronaut application process?”; “You revolutionized the game of chess and took a chess board into space. Have any of the Mission Control Centers been able to beat you?”; “Where you able to watch or follow the Beijing Olympics and what event do you think would be most fun in space?”*]

As generally every day now, today starting at ~9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) was activated intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS (Internal Thermal Control System) cooling loop. [*A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking.*]

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this “Gateway” website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Week 19 Scheduled Main Activities:

- Tue. (8/26): SRVK KAV sample; ATV cargo transfers; ER4/ER5 stow; ER4 relocate to JPM; ER5 relocate to JPM; ER4/ER5 umbilicals mate; ER4/ER5 restow.
- Wed. (8/27): MBI-12/Sonokard (FE-1); ATV cargo transfers; LULIN data dwnld.; DC1 IDZ-2 smoke detector cleaning; THC-IMV flow meas.; SVO BRP-M water sampling; IWIS setup; Emergency proc. OBT/drill; IWIS thruster test.
- Thu. (8/28): MBI-12/Sonokard (CDR); BMP ch.1 regen; Regen ECLSS Mod Kit 1 install; JAXA CB Microscope C/O; Clay EPO return; COL FSL FCE release; ATV cargo transfers; PHS w/blood set-up; ASU R&R; WRM audit.
- Fri. (8/29): BMP ch.2 regen; PHS w/blood (PCBA); 29P: LKT remove/activate/hatch close/leak check; BRTK-MBRL prox.comm. prep; ITCS fluid sampling (JEM, Lab, Node-2, COL).

ISS Orbit (as of this morning, 8:30am EDT [= epoch]):
Mean altitude -- 355.6 km

Apogee height -- 361.6 km
Perigee height -- 349.6 km
Period -- 91.65 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0008866
Solar Beta Angle -- -27.2 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.71
Mean altitude loss in the last 24 hours -- 44 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 55944

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/01/08 -- Progress M-64/29P undocking, from FGB nadir; de-orbit/re-entry ~9/8
09/05/08 -- ATV1 undocking, from SM aft port (loiter until 9/29 for nighttime reentry/observation)
09/10/08 -- Progress M-65/30P launch
09/12/08 -- Progress M-65/30P docking (SM aft)
10/01/08 -- **NASA 50 Years** (official)
10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
10/11/08 -- Progress M-65/30P undocking (from SM aft)
10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation

10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 08/24/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – rest day for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff. Ahead: Week 19 of Increment 17.*

Sleep/Wake Cycle Change: Crew sleep begins an hour earlier tonight (4:30pm EDT) to accommodate tomorrow's TORU testing with a one-hour earlier wake-up (1:00am). Tomorrow evening, sleep will begin also earlier, at 4:30pm, and end at the regular time of 2:00am on Tuesday.

Gregory Chamitoff had three hours reserved for the regular weekly station cleaning in the USOS (US Segment) which wasn't scheduled yesterday alongside the RS (Russian Segment) "uborka" housecleaning by his two crewmates.

Oleg Kononenko serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out"-to-vacuum cycle on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated tonight at ~4:00pm EDT. Filter bed #1 was regenerated yesterday. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently to remove any lingering Freon-218 from the cabin atmosphere (last time: 8/11&12).]*

Sergey Volkov conducted the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The CDR also checked up on the Russian POTOK-150MK (150 micron) decontamination filter unit of the SM's SOGS air revitalization subsystem, gathering weekly data on Total Operating Time & "On" durations for reporting to TsUP-Moscow.

Chamitoff completed the periodic relocation of the TEPC (Tissue Equivalent Proportional Counter), the primary radiation measurement tool in the ISS, from the SM starboard crew quarters (panel 449) to the JAXA JPM (JEM Pressurized Module) 1A5 location. *[The FE-2 also photo documented the current state of the TEPC power/data cable, then covered the peeling Kapton tape on the degraded cable with fresh tape to contain any FOD (Foreign Object/Debris). TEPC had been relocated to the SM by Greg on 6/24.]*

Working off the Russian discretionary "time permitting" task list, Kononenko performed the regular status check of the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (peas) under spaceflight conditions in the Lada-13 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}).

As time permitted, Oleg was also to conduct another run of the Russian DZZ-2 "Diatomeya" ocean observations program, using the NIKON-F5 DCS still camera with f85mm lens and the HDV camcorder from SM window #7 to record color field patterns in target water areas and current atmospheric conditions above them.

[Uplinked target zones in the Indian Ocean were the coastal area of Oman and the area west of Australia, and in the Atlantic Ocean Newfoundland Island and the Bay of Biscay.]

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-2), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1).

As generally every day now, today starting at ~9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) was activated intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS (Internal Thermal Control System) cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking.]*

Preparatory to ATV "Jules Verne" undocking on 9/5, TsUP-Moscow downlinked several hours worth of test data of the ASN-M Satellite Navigation System from ~9:05am-1:40pm via S-band.

SHERE Update: "Greg: wonderful work on SHERE yesterday! Once again, we've gotten more than we had hoped for, and thank you for the test repeats. Also, thank you for your observations and comments in the crew notes, especially on the uniformity and symmetry of the fluid column. It has started us thinking about the effects of fluid overflow on the Force Transducer end and optical effects in our camera field of view."

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Week 19 Scheduled Main Activities:

- Mon. (8/25): RPCM LAB1D5/AvRack R&R; O₂ port install on WRS; ATV cargo transfers; SVO EDV condensate fill; TEPC relocate; Flowmeter battery maint.; ER5 rack transfer preps.
- Tue. (8/26): SRVK KAV sample; ATV cargo transfers; ER4/ER5 stow; ER4 relocate to JPM; ER5 relocate to JPM; ER4/ER5 umbilicals mate; ER4/ER5 restow.
- Wed. (8/27): MBI-12/Sonokard (FE-1); ATV cargo transfers; LULIN data dwnld.; DC1 IDZ-2 smoke detector cleaning; THC-IMV flow meas.; SVO BRP-M water sampling; IWIS setup; Emergency proc. OBT/drill; IWIS thruster test.
- Thu. (8/28): MBI-12/Sonokard (CDR); BMP ch.1 regen; Regen ECLSS Mod Kit 1 install; JAXA CB Microscope C/O; Clay EPO return; COL FSL FCE release; ATV cargo transfers; PHS w/blood set-up; ASU R&R; WRM audit.
- Fri. (8/29): BMP ch.2 regen; PHS w/blood (PCBA); 29P: LKT remove/activate/hatch close/leak check; BRTK-MBRL prox.comm. prep; ITCS fluid sampling (JEM, Lab, Node-2, COL).

ISS Orbit (as of this morning, 8:01am EDT [= epoch]):

Mean altitude -- 355.7 km

Apogee height -- 361.6 km

Perigee height -- 349.7 km

Period -- 91.65 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0008791

Solar Beta Angle -- -30.2 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.71

Mean altitude loss in the last 24 hours -- 42 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55928

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

08/25/08 -- Progress M-64/29 SORR (Stage Operations Readiness Review) @ NASA/JSC

09/01/08 -- Progress M-64/29P undocking, from FGB nadir; de-orbit/re-entry ~9/8

09/05/08 -- ATV1 undocking, from SM aft port (loiter until 9/29 for nighttime reentry/ observation)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft)

10/01/08 -- **NASA 50 Years** (official)

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?

11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking

02/26/09 -- STS-119/Discovery/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress M-67/32P undocking & deorbit

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

05/25/09 -- Soyuz TMA-15/19S launch

05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**

07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation

10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A – MPLM(P)

04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1

05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at

http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 08/23/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – mostly off duty for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff.*

Volkov & Kononenko performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the SM (Service Module) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

The CDR conducted the periodic service of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The process will be terminated at ~5:15pm EDT and Bed #2 regeneration completed tomorrow. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently to remove any lingering Freon-218 from the cabin atmosphere (last time: 8/11&12)];*

At ~9:45am EDT the crewmembers conducted their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP-Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

For today's VolSci (Voluntary Weekend Science) program, another session with SHERE (Shear History Extensional Rheology Experiment), FE-2 Chamitoff –

- Activated the MSG (Microgravity Science Glovebox) from the A31p laptop,
- Powered on the SHERE hardware,
- Accessed the CGBA (Commercial Generic Bioprocessing Apparatus) to install the SHERE FM (Fluid Module) #9;
- Supported the first SHERE experiment run (Test Point 16);
- Transferred the module with the fluid sample,
- Installed FM #19 for the second experiment run (Test Point 2);
- Repeated the procedure (TP 5);
- Transferred the module with the fluid sample,
- Installed FM #7 for the third experiment run (Test Point 12);
- Repeated the procedure (TP 10);
- Removed the FM from the CGBA, followed by SHERE data transfer;
- (Had the option of a fourth run if time allowed, with FM #21 (TP 7), plus repeat (TP 13);
- Turned off the SHERE/CGBA equipment;
- Transferred the data files to the MSG laptop for subsequent downlink, and
- Powered down the MSG.

[Background: Rheology is the study of the deformation and flow of matter under the influence of an applied stress ("preshearing" = rotation) which might be, for example, a shear stress or extensional stress. In practice, rheology is principally concerned with extending the "classical" disciplines of elasticity and (Newtonian) fluid mechanics to materials whose mechanical behavior cannot be described with the classical theories. SHERE is designed to study the effect of preshear (rotation) on the transient evolution of the microstructure and viscoelastic tensile stresses for solutions with long chains of monodisperse dilute polymer molecules in the MSG.

Collectively referred to as "Boger fluids," these polymer solutions have become a popular choice for rheological studies of non-Newtonian fluids and are the non-Newtonian fluid used in this experiment. The SHERE hardware consists of the Rheometer, Camera Arm, Interface Box, Cabling, Keyboard, Tool Box, Fluid Modules, and Stowage Tray.]

Kononenko completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Gregory filled out the regular FFQ (Food Frequency Questionnaire), his tenth, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is*

performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]

The two cosmonauts had their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop), Oleg at ~6:40am, Sergey at ~8:15am EDT.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Sergey transferred the exercise data file to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

As generally every day now, today starting at ~9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) was activated intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS (Internal Thermal Control System) cooling loop. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking.]*

JEMRMS Update: Yesterday's Checkout #4 of the JEM Robotic Manipulator System (RMS) was completed for Stage 1 (TVC & Joint Angle Encoder Calibration). Stage 2 (Inching in Manual Mode) had to be aborted due to an emergency stop caused by a time overrun in the ACU (Arm Computer Unit). Investigation by JAXA is underway.

Weekly Science Update (*Expedition Seventeen -- Week 18*)

3-D SPACE: In progress.

ALTCRISS (*Alteino Long Term monitoring of Cosmic Rays on the ISS*):
Measurements continue in FGB module. Last memory card exchange performed on 8/13.

ANITA (*Analyzing Interferometer for Ambient Air*): Continuing.

BCAT-3 (*Binary Colloidal Alloy Test 3*): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System):
Samples returned on 1J.

CSI-2/CGBA-5 (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus 5): Silicate Garden Hab Side 2 is complete and CGBA-5 has now been powered off awaiting its move to EXPRESS Rack 2 (ER2). The Hab along with other CSI-02 equipment will be removed and returned home on ULF2.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): EuTEF platform is nominal. A DHPU (Data Handling Processing Unit) software patch is currently being developed to fix the link error issues encountered with DEBIE-2 and FIPEX instruments. On 8/14, EUTEF stayed on feeder#2 (survival heaters) during the duration of the COL S/W Cycle 11 update. The power-up sequence in the evening of 8/14 had some initial problems but could be completed upon a power cycle of the facility. All instruments were subsequently powered up. -- DEBIE-2: IOP (Instrument Operations Procedures) performed for 24 hrs duration, after COL S/W Cycle 11 power-down on 8/14-25 and on 8/19-20. Generic status: link error still in work. However a work-around allows for regular science data acquisition using an on-board Instrument Operations Procedure (IOP), but not yet in conjunction with any FIPEX IOP -- a final software patch, which will enhance the present instrument capabilities, is under finalization on ground;-- DOSTEL: On-going science acquisition;-- EuTEMP: Currently inactive as planned;-- EVC: Currently no picture taking;-- EXPOSE: On-going science acquisition;-- FIPEX: IOPs run from 8/15 until 8/18. A new run started on 8/20 and will end on 8/22; -- MEDET: Continuous science acquisition; -- PLEGPAY: Currently in READY mode, no science data

acquisition on-going;-- TRIBOLAB: The Ball-Bearing experiment #4 was restarted on 8/18 after thermal stabilization confirmation. This run will be paused for the thruster firing currently planned for 8/27.

FSL (Fluid Science Laboratory): FSL is nominal.

GEOFLOW: The second GEOFLOW run on FSL was performed on 8/19. The temperature gradient set-point of 2.2K could not be reached; actual gradient showed 1.8K. The run, however, was completed nominally with this temperature gradient. Impact on future runs to be assessed by science team. Data downlinking and ground data transfer experienced some difficulties, leading to a delay and cancellation of runs foreseen on 8/19-20. The difficulties are under further investigation, but it is expected that the next GEOFLOW run can be performed on 8/25 upon go-ahead from the science team to erase the data of the first two runs from the FSL hard disk.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Planned.

Marangoni Experiment for ISS (JAXA Fluid Physics Experiment Facility): First Marangoni Experiment on FPEF started on 8/21 during Orbit 2.

Micro-G Clay (JAXA EPO): On 8/11, Greg performed JAXA's first EPO experiment, Micro-G Clay. The clays are in the drying process.

MISSE (Materials ISS Experiment): Ongoing.

Moon Photography from ISS (JAXA EPO): Crew performed moon photo activity on 8/19. PI is checking the downlinked images.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-1/-2 (Nitric Oxide Analyzer, ESA): The fourth and last NOA-1 session for both CDR and FE-1 was nominally performed on 8/19.

NUTRITION w/REPOSITORY: In progress.

PADLES (Passive Dosimeter for Lifescience Experiment in Space): In progress.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SAMPLE: Complete.

SHERE (Shear History Extensional Rheology Experiment): “Greg, thus far, you have processed 14 Fluid Modules. The minimum number of SHERE test points for this investigation was 9. The preferred number is 20. We also have a significant level of success at 16 Fluid Modules, of which we are short by 2 test points.”

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): In progress.

SOLAR (Solar Monitoring Observatory): Previous Sun observation window closed on 08/08 (GMT221). On 8/14, SOLAR stayed on feeder#2 (survival heaters) during the duration of the COL S/W Cycle 11 update. The power-up sequence in the evening of 8/14 experienced difficulties. Upon a COL LAN switch cycle and SOLAR power cycle, the SOLAR instruments were activated on power feeder#1 again on 8/15. Next sun visibility window to open on 8/25.-- SOVIM: out of Sun visibility, so no science data acquisition; -- SOLSPEC: out of Sun visibility, so no science data acquisition; -- SOLACES: out of Sun visibility, so no science data acquisition.

SOLO: Planned.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): During the BLB (BIOLAB) checkout after COL S/W (Columbus Orbital Laboratory Software) Cycle 11 update, the Incubator TCS (Thermal Control System) could not be activated. It was suspected that some of the switches on one of the BIOLAB-ESEM (Exchangeable Standard Electronic Modules) boards were out of config. On 8/21, the crew corrected the BLB-ESEM switch positions. This will allow a troubleshooting plan to be developed to recover all the BIOLAB functionalities, following the BIOLAB Rotor A bellow test by ground commanding on 8/22. The next steps in the recovery of all the BIOLAB functionalities will be the replacement of 6 Reference ECs (Experiment Containers) on Rotor B and subsequent test of Rotor B. Planning for these activities is currently TBD.

CEO (Crew Earth Observations): Through 8/21 the ground has received a total of 4,958 frames of CEO images for review and cataloging. "Photos acquired with times corresponding to our CEO daily target list request times are reviewed first and this week included: Mount Rainier (not acquired); Mount Etna (acquired, too cloudy); Mauna Loa, Hawaii (acquired-too cloudy); Andrew Forest (partial acquisition, soft); Santorini Volcanic Complex, Greece (acquired-still under review); Slate Island Impact (acquired); Tunis, Tunisia (acquired-still under review); Libyan megafan (to be reviewed); Algerian megafan (to be reviewed); and Tropical Storm Fay (acquired-captioned and released by PAO). We are seeing improvement in the focus and consistency of your long-lens photos; please continue with more practice when you can. Your rare, striking view of the southern tip of Greenland will be published on NASA/GSFC's Earth Observatory website this weekend. Your high-oblique, panoramic view was shot as the ISS passed over Newfoundland and offers a great perspective the ice field, glaciers, and topography of part of the Earth's largest island. Nice shot!"

CEO (Crew Earth Observations) photo targets uplinked for today were **Barringer Impact Crater, Arizona** (*this well-known crater is so young [~50,000 years] that its circular rim has not yet been eroded away. Recent calculations suggest that the impactor was a meteorite ~50m in diameter traveling at 12.8 km/sec [28,600 mph]. Looking right: visual cues are a winding river and the forest line*), **Jornada Basin, New Mexico** (*nadir pass. If Greg shot overlapping images of the Rio Grande floodplain [green, vegetated zone] he will have gotten this site. Desertification of local soils, as interpreted from changing vegetation patterns, is the research interest*), and **Gulf of Fonseca, Central America** (*looking left for images of this major embayment in the coastline. Three countries meet along the shoreline of the gulf. Heavy use of the coastline includes numerous newly constructed aquaculture basins*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Week 19 Scheduled Main Activities:

- Sun. (8/24): Station cleaning (USOS); BMP ch.2 regen; PFC (FE-2).
- Mon. (8/25): RPCM LAB1D5/AvRack R&R; O₂ port install on WRS; ATV cargo transfers; SVO EDV condensate fill; TEPC relocate; Flowmeter battery maint.; ER5 rack transfer preps.
- Tue. (8/26): SRVK KAV sample; ATV cargo transfers; ER4/ER5 stow; ER4 relocate to JPM; ER5 relocate to JPM; ER4/ER5 umbilicals mate; ER4/ER5 restow.
- Wed. (8/27): MBI-12/Sonokard; ATV cargo transfers; LULIN data dwnld.; DC1 IDZ-2 smoke detector cleaning; THC-IMV flow meas.; SVO BRP-M water sampling; IWIS setup; Emergency proc. OBT/drill.

ISS Orbit (as of this morning, 8:50am EDT [= epoch]):

Mean altitude -- 355.7 km

Apogee height -- 361.6 km

Perigee height -- 349.8 km

Period -- 91.65 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.000874

Solar Beta Angle -- -32.9 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.71

Mean altitude loss in the last 24 hours -- 31 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55913

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

08/25/08 -- Progress M-64/29 SORR (Stage Operations Readiness Review) @ NASA/JSC

09/01/08 -- Progress M-64/29P undocking, from FGB nadir; de-orbit/re-entry ~9/8

09/05/08 -- ATV1 undocking, from SM aft port (loiter until 9/29 for nighttime reentry/observation)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft)

10/01/08 -- **NASA 50 Years** (official)

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at

ISS On-Orbit Status 08/22/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Volkov began his day by downlinking yesterday's Norton AntiVirus (NAV) data from the RSK-1 laptop scan. Later in the day, FE-2 Chamitoff also ran the scan on the SSC (Station Support Computer) to be used for downloading today's 1553-bus comm files of the JEMRMS (Japanese Experiment Module/Robotic Manipulator System) Checkout #4 from the RLT (RMS Laptop Terminal) to the OpsLAN for downlinking. *[All A31p laptops onboard are currently being loaded with latest NAV software and updated definition files for increased protection.]*

FE-1 Kononenko continued (and wrapped up) the installation of the two new Zveno-B ("Link-B") modems plus their stand-alone RSE2 laptop, plus their integration into the BKS onboard cabling and the TVS LIV television system, with the BITS2-12 onboard telemetry measurement system and VD-SU monitoring mode deactivated during the outfitting activities (which also required the Elektron oxygen generator to be turned off). TVS LIV was then reconfigured and the worksites cleaned up.

Later, the Elektron electrolysis machine was activated at 32 amps, supported by Volkov monitoring the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating. In support of the reactivation, at ~7:12am EDT the ground temporarily switched the ATV (Automated Transfer Vehicle) to autonomous power (i.e., disconnected it electrically from ISS) and later reconfigured it to ISS power, with its lights back on at ~8:12am. *[The gas analyzer used on the Elektron during nominal operations for detecting hydrogen (H₂) in the O₂ line (which could cause overheating) is not included in the control algorithm until 10 minutes after Elektron startup.]*

As is usual after deactivation/reactivation of VD-SU monitoring mode, Sergey

performed a quick checkout of the SUBA Ethernet connection between OpsLAN and the BRI Smart Switch Router in the SM.

Volkov also conducted the periodic maintenance/checkout of the spare BZh Liquid Unit (#056) for the Elektron generator, *[Objective of the checkout of the BZh, which has been in stowage for 1.5 years, was to check for leakage and good water passage through the feed line inside of the BZh (from ZL1 connector to the buffer tank) and to check the response of the Electronics Unit's micro switches (signaling "Buffer Tank is Empty" & "Buffer Tank is Full". The last test pressurization to monitor for leakage was on 7/20. During Elektron operation, the inert gas locked up in the BZh has the purpose to prevent dangerous O₂/H₂ mixing. A leaking BZh cannot be used.]*

Working closely with JAXA flight controllers on the ground, FE-2 Chamitoff conducted the JEMRMS Checkout #4 which featured more motions of its MA (Main Arm) in space. The maneuvers were observed by the SSRMS (Space Station Remote Manipulator System) video cameras via SSC-14 near the JEMRMS workstation and ISL (Integrated Station OpsLAN) Ethernet cable. *[After activating the RLT (RMS Laptop Terminal), CCP (Camera Control Panel) and RMS Monitors, and adjusting settings including updating the DOUG (Dynamic Onboard Ubiquitous Graphics) laptop application with realtime data, Greg "flew" the MA around the EFU13 (Exposed Facility Unit 13) on the JLP (JEM Logistics Pressurized Section) module to capture target images using the television camera on the MA EE (End Effector) for calibration purposes, followed by so-called "inching" operations, as a crew-in-the-loop demonstration to verify how small a command the crewmember can input using the hand controllers in Manual Mode (this inching operation is expected to be used on Flight 2J/A and subsequent flights if the RTL (Ready-to-Latch) judgment for a P/L (payload) berthing is not OK and the operator is requested to get the P/L closer to an EFU.)]*

Also in the Kibo JPM, Gregory retrieved the MEU (Measurement Experiment Unit) with its Bs cultivation chamber from the CBEF (Cell Biology Experiment Facility) incubator, where he had installed MEU-Bs on 8/8.

Sergey Volkov continued the current round of periodic preventive maintenance of ventilation systems in the RS (Russian Segment), today cleaning the ventilation screens of panels 201, 301, 401, 116, 316, 231 & 431 in the FGB.

Sergey also checked out the Russian AOK GANK-4M Real-Time Harmful Contaminant Gas Analyzer system with the objective of troubleshooting a potential zero-sensor shift or damage of its cassette tape.

Chamitoff took measurements for the regular atmospheric status check for ppCO₂ (Carbon Dioxide partial pressure) in the Lab, SM (at panel 449) and COL (Columbus Orbital Laboratory) plus battery ticks, using the hand-held CDMK (CO₂ Monitoring Kit, #1002). The unit was then deactivated and returned to its stowage location (LAB1S2). *[Purpose of the 5-min activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements.]*

The CDR conducted the monthly FDS PEP (Fire Detection & Suppression/Portable Emergency Provisions) safety inspection/audit in the ISS modules. *[The IMS-supported inspection involves verification that PFEs (Portable Fire Extinguishers), PBAs (Portable Breathing Apparatus), QDMAs (Quick-Don Mask Assemblies) and EHTKs (Extension Hose/Tee Kits) are free of damage to ensure their functionality, and to track shelf life/life cycles on the hardware. QDMA harness inspection was not required today.]*

In the US Lab, Oleg powered down the EHS VOA (Environmental Health System-Volatile Organic Analyzer).

In preparation for the Progress M-64/29P undocking on 9/1, the CDR & FE-1 worked in the transfer tunnel to install the SSVP StM docking mechanism (Stykovochnovo mekhanizma) between the cargo ship and the FGB, a one-hour routine activity. *[The StM is the "classic" probe-and-cone type, consisting of an active docking assembly (ASA) with a probe (SSh), which fits into the cone (SK) on the passive docking assembly (PSA) for initial soft dock and subsequent retraction to hard dock. The ASA is mounted on the Progress' cargo module (GrO), while the PSA sits on the docking ports of the SM, FGB and DC1.]*

Oleg performed another run of the Russian DZZ-2 "Diatomeya" ocean observations program, using the NIKON-F5 DCS still camera to record color field patterns in highly productive waters of the Pacific and Atlantic oceans. *[Uplinked target zones in the Atlantic Ocean were along the track from Gulf of Saint Lawrence to the NW of Azores, and in the Pacific the Californian upwelling area.]*

Sergey conducted the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The CDR also took care of the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations,

for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Working off the Russian discretionary “time permitting” task list, Kononenko conducted the regular status check of the BIO-5 Rasteniya-2 (“Plants-2”) experiment which researches growth and development of plants (peas) under spaceflight conditions in the Lada-13 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}).

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Oleg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~4:00am EDT, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU/*Glavnaya operativnaya gruppа upravleniya* = “Main Operative Control Group”), including Shift Flight Director (SRP), at TsUP-Moscow via S-band/audio, phone-patched from Houston and Moscow.

At ~4:30am, Sergey & Oleg linked up with TsUP stowage specialists via S-band to conduct the weekly IMS tagup, discussing inventory & stowage issues, equipment locations and ATV & Progress cargo transfers.

At ~9:55pm, Dr. Chamitoff supported two live interactive PAO interviews of ~10 minutes each, with WKYC-TV, Cleveland, OH, and Fox Business News, New York, NY.

At ~2:22pm, the ISS crew will have their regular weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. [*S/G-2 (Space-to-Ground 2) phone patch via SSC (Station Support Computer)*].

As generally every day now, today starting at ~5:00am and running until 11:00am, the US CDRA (Carbon Dioxide Removal Assembly) was activated intermittently for two half-cycles to control ppCO₂ levels. This configuration for the daily ops does not require connecting & disconnecting the ITCS (Internal Thermal Control System) cooling loop. [*A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking.*]

Grounding Straps Update: The retrieval of ten US grounding straps from the JLP (JEM Logistics Pressurized Section) reported on 8/20 has been delayed until 8/25 (Monday). The straps will be required for the HRF rack relocations next week (two for the MELFI rack and four each for the ER-4 & ER-5 racks).

SRVK-2M Correction: The failed separator in the Russian SRVK-2M condensate water processor lasted ~80% of its expected life-time, not 20% as reported yesterday.

VolSci Preview: For tomorrow's Voluntary Weekend Science program, Gregory has selected another session with the SHERE (Shear History Extensional Rheology Experiment) payload. Planned are three runs (which would bring the total for this Increment to 17), plus two repeats, and one run will have changed parameter settings.

CEO (Crew Earth Observations) photo targets uplinked for today were **Gordion, Turkish archaeological site** (*requested were generalized images of the area around this famous archeological site. The site is near a wooded mountain range. Looking right: lead-in cues were three lakes*), **Toshka Lakes, Egypt** (*general views of the entire lake system were requested for comparison with prior images when lake levels were higher*), and **Ile Rouleau Impact Crater, Quebec** (*this 4-km diameter crater now forms an island at the south end of one of Quebec's largest lakes, Lake Mistassini. ISS had a nadir pass*).

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Week 18/19 Scheduled Main Activities:

- Sat. (8/23): Station cleaning (RS); BMP ch.1 regen; PFCs (CDR, FE-1); VolSci (SHERE); FFQ.
- Sun. (8/24): Station cleaning (USOS); BMP ch.2 regen; PFC (FE-2).
- Mon. (8/25): RPCM LAB1D5/AvRack R&R; O₂ port install on WRS; ATV cargo transfers; SVO EDV condensate fill; TEPC relocate; Flowmeter battery maint.; ER5 rack transfer preps.
- Tue. (8/26): SRVK KAV sample; ATV cargo transfers; ER4/ER5 stow; ER4 relocate to JPM; ER5 relocate to JPM; ER4/ER5 umbilicals mate; ER4/ER5 restow.

ISS Orbit (as of this morning, 8:31am EDT [= epoch]):

Mean altitude -- 355.7 km

Apogee height -- 361.5 km

Perigee height -- 350.0 km
Period -- 91.66 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0008547
Solar Beta Angle -- -35.2 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.71
Mean altitude loss in the last 24 hours -- 45 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 55897

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

08/25/08 -- Progress M-64/29 SORR (Stage Operations Readiness Review) @ NASA/JSC
09/01/08 -- Progress M-64/29P undocking, from FGB nadir; de-orbit/re-entry ~9/8
09/05/08 -- ATV1 undocking, from SM aft port (loiter until 9/29 for nighttime reentry/ observation)
09/10/08 -- Progress M-65/30P launch
09/12/08 -- Progress M-65/30P docking (SM aft)
10/01/08 -- **NASA 50 Years** (official)
10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
10/11/08 -- Progress M-65/30P undocking (from SM aft)
10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**

07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osp/iss_reports/index.htm

ISS On-Orbit Status 08/21/08

All ISS systems continue to function nominally, except those noted previously or below.

After configuring the PFE-OUM (Periodic Fitness Evaluation - Oxygen Uptake Measurement) equipment at the HRF-2 (Human Research Facility 2) rack, Gregory Chamitoff conducted his first PFE-OUM session on the CEVIS (Cycle Ergometer with Vibration Isolation) while wearing an HRM (Heart Rate Monitor), with Sergey Volkov as operator to obtain measurements of the subject. *[The equipment includes the HRF PFM/PAM (Pulmonary Function Module/Photoacoustic Analyzer Module), Mixing Bag System and GDS (Gas Delivery System). Today's session used GDS tanks 1, 2 & 5. After calibration of the DPFM (Differential Pressure Flowmeter), Greg, assisted by Sergey, worked through the protocol, changing the loads on the ergometer and recording data. Later, the FE-2 updated the evaluation protocol, deactivated & stowed the gear, and powered down the PFE-OUM laptop. Purpose of PFE-OUM is to measure aerobic capacity during exercise within 14 days after arrival on ISS, and once monthly during routine PFEs. The data allows exercise physiologists & flight doctors to assess the crew's health & fitness and to provide data for modifying & updating crew-specific exercise regimes. By hooking up a special cable, continuous oxygen uptake measurements can now be taken while riding the CEVIS without requiring access to the CEVIS control panel as before. PFE-OUM is a collaborative effort between NASA and ESA (European Space Agency).]*

Volkov and Kononenko continued communications outfitting activities in the SM (Service Module) by finishing the installation of two new "Zveno-B" (Link-B) modems with their cabling behind panel 437, connecting one to a BSK-1B Common Power Switching Timer, the other to an LKTs Local Digital Commutator (switch) and both to a controlling A31p laptop, RSE2. *[The modems link the RSE2 to the SM REGUL comm system, enabling data to be uplinked/downlinked and commands to be uplinked directly. Regul provides for two-way voice*

communication, digital command/program information as well as telemetry transmission via RGS (Russian Groundsites). It also has the capability to receive and transmit range, radial velocity, and time-referenced information. It is the nominal uplink path for all Russian commands and is the only subsystem that operates using the Command Radio Link (KRL). Operating at a low data rate, it is equivalent to the U.S. S-band system. There is no Russian equivalent of the U.S. high data rate Ku-band system, based on the TDRS satellites.]

The FE-1 took the periodic readings of potentially harmful atmospheric contaminants in the SM, using the CMS (Countermeasure System), a component of the SKDS GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, today using preprogrammed microchips to measure for Isopropanol (“rubbing alcohol”, C_3H_8O), Methanol (“wood alcohol”, CH_3OH) and Toluene (methylbenzene, C_7H_8).

In the COL (Columbus Orbital Laboratory), in support of ground-commanded FSL (Fluid Science Laboratory)/GeoFlow checkout ops, Chamitoff inserted an SDLT-II digital line tape in the FSL’s VMU (Video Management Unit) tape recorder. About 6.5 hrs later, the tape was removed, labeled “GeoFlow-234” and stowed.

Also in COL, the FE-2 had ~10 min reserved for a status check of the BLB ESEM3-2 (Biolab Exchangeable Standard Electronic Module 3-2) power board.

ESA ground controllers continued the “Cycle 11” software transition aboard COL, today focusing on PWS-1 (Portable Work Station 1) laptop, supported by Chamitoff as he did last week for PWS-2. The CDs with the new software were stowed afterwards. *[After the transition, COL will gradually be powered back on, including external payloads.]*

In the JAXA Kibo/JPM (JEM Pressurized Module), Gregory activated the RLT (Robotics Laptop Terminal) of the JEMRMS (JEM Robotic Manipulator System) to set up/enable a new database uplinked by flight controllers, then turned it off again, later reviewing & checking the DOUG (Dynamic Onboard Ubiquitous Graphics) files for tomorrow’s scheduled RMS C/O-4 (Checkout #4). *[During C/O-4, Greg will “fly” the JEMRMS MA (Main Arm) around the EFU13 (Exposed Facility Unit 13) on the JLP (JEM Logistics Pressurized Section) module to capture target images using the television camera on the MA EE (End Effector) for calibration purposes, followed by so-called “inching” operations, as a crew-in-the-loop demonstration to verify how small a command the crewmember can input using the hand controllers in Manual Mode (this inching operation is expected to be used on Flight 2J/A and subsequent flights if the RLT (Ready-to-Latch) judgment for a P/L (payload) berthing is not OK and the operator is requested to get the P/L closer to an EFU.)]*

Conducting periodic EHS CSA-CP (Environmental Health System - Compound Specific Analyzer-Combustion Products) maintenance, Gregory removed the battery of the prime CSA-CP unit and replaced it with a fresh one (#1198). *[The US CSA-CP is a passive cabin atmosphere monitor that provides quick response capability during a combustion event (fire). Its collected data are stored on a logger. After replacing the prime unit's battery, Gregory zero-calibrated the instrument (to eliminate drift in the combustion sensors). Following zero calibration, prime unit was deployed again at the SM Central Post.]*

Sergey Volkov completed the TVIS treadmill part of the onboard preventive health maintenance fitness test "Profilaktika" (MBI-8, "Countermeasures"), which could not be performed on 8/5 as per original plan due to the TVIS repair activities. Kononenko took the MBI-8 test yesterday. *[Test procedure for MBI-8, which requires workouts on the VELO and TVIS, is identical to the Russian MO-5 assessment, but in addition to the nominal procedure it uses the TEEM-100M gas analyzer with breathing mask, a blood lactate test with the ACCUSPORT analyzer and REFLOTRON-4 accessories, and a subjective evaluation of physical exertion levels during the test (using the Borg Perceived Exertion Scale, viz., 10 steps from very light over hard and very hard to maximum). Results are entered on a log sheet. TEEM and ECG (electrocardiograph) data are transferred to the RSE-Med laptop, also on a tape cassette (Cardiocassette-2000), and prepared for later downlink via Regul-Packet comm. Results are also called down to specialists standing by at TsUP.]*

In the US Airlock (A/L), the FE-2 terminated the second recharge/discharge maintenance cycle on EMU (Extravehicular Mobility Unit) battery #2073, started on 8/19. *[Since the due date for the regular 85-day maintenance was expired, an additional maintenance cycle was required after the battery's discharge. The periodic maintenance consists of fully discharging (and later recharging) the storage units to prolong their useful life. After end of the maintenance cycle, Greg restored the SSC laptop, which is used in DOS mode for the automated procedure, to nominal ops.]*

Gregory completed another one of the periodic (monthly) inspections of the RED (Resistive Exercise Device) canister cords and accessories.

FE-1 Kononenko activated the four Pille dosimeters of the Lulin-ISS radiation complex to start data taking, after having set them up yesterday with their ICU (Interface Control Unit, Russian: BUI) for battery recharging.

The FE-2 completed the weekly 10-min. CWC inventory as part of on-going WRM (Water Recovery & Management) assessment of onboard water supplies. *[The new card (17-0002V) lists 34 CWCs (Contingency Water Containers, ~1204.3 L*

total) for the four types of water identified on board: technical water (426.5 L, for flushing only because of Wautersia bacteria), potable water (706.7 L, incl. 174.6 L currently on hold), condensate water (54.1 L), waste/EMU dump and other (17 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]

Sergey checked another Russian laptop, today RSK-1, for software virus by scanning its hard drives and a photo disk with the Norton AntiVirus application.

The CDR also conducted the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Oleg Kononenko took care of the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The three station residents conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-1, FE-2/OUM), TVIS treadmill (CDR), RED resistive exercise device (FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Oleg transferred the exercise data file to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~12:35pm EDT, the two cosmonauts downlinked a TV message of greetings for replay at Gidroaviasalon-2008 (Hydro-Aviation Show 2008) on 9/3 in Gelendzhik.

Gidroaviasalon is a one-of-a-kind annual international hydro-aviation show with increasing popularity, with the prime objective to showcase Russia as a major space and aviation market player and to initiate new international projects. *[“... The Expedition 17 crew of the International Space Station is extending their heartfelt greetings to the participants and guests of the Seventh International Hydro-Aviation Show, the Third Russian Song Festival Krylia Rossyi (Wings of Russia), and all citizens of the resort town Gelendzhik...”]*

VHF Comm Check Update: The periodic VHF-1 emergency communications check conducted by Gregory Chamitoff on 8/18 over NASA’s VHF (Very High Frequency) stations could not be completed successfully when calls from the Control Centers could not be heard by the crew and COL-CC did not get uplink or

downlink calls. Troubleshooting is in work.

SRVK Update: Yesterday TsUP-Moscow observed the failure of a separator in the SRVK-2M condensate water processor, which apparently lasted only about 20% of its expected life-time. Spares are available onboard and planning is underway to replace failed separator, using Line 3 which has a new one.

CBEF Update: JAXA specialists are continuing to assess the CO₂ leak in the CBEF CGSA (Cell Biology Experiment Facility/Common Gas Support Assembly) in the JPM. Troubleshooting is planned on 9/5.

NODE-2 SD-2 Update: The failure of the Smoke Detector #2 in Node-2 is still under investigation, because it exhibited previously not seen signatures. Meanwhile, SD-1 is active and nominal, and there is a spare SD available onboard.

CEO (Crew Earth Observations) photo targets uplinked for today were **Urumqi, China** (*shooting overlapping nadir views of China's booming oil city which lies at the foot of the mountains. City margins are of greatest interest*), **Typhoon Nuri, South China Sea** (*Dynamic event. This storm is still moving NW, and is expected to make landfall on the Chinese coast on Friday. ISS passed almost directly over the eye. Nuri is a Category 3 storm*), **Libyan Megafans** (*looking left for detailed images of the vast inland deltas north of the Tibesti Mountains. Widespread stream channel networks are the object interest*), and **Tropical Storm Fay, Florida** (*Dynamic event. Fay is moving slowly up Florida's east coast and is expected to pass over Jacksonville*).

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Week 18/19 Scheduled Main Activities:

- Fri. (8/22): EMU batt. #2073 maint.; BKS cabling for Zveno (Link); Zveno-B unit install in ZVK LIV exp. video complex; RSE-2 laptop set-up for Zveno-B; PEPS inspect/checkout; Elektron BZh unit #56 leak check; Elektron On; JEMRMS Checkout #4; GANK & CDMK reading; Progress M-64 SSVp-StM docking mechanism install.
- Sat. (8/23): Station cleaning (RS); BMP ch.1 regen; PFCs (CDR, FE-1); VolSci.; FFQ.
- Sun. (8/24): Station cleaning (USOS); BMP ch.2 regen; PFC (FE-2).
- Mon. (8/25): ATV cargo transfers; SVO EDV condensate fill; TEPC relocate; Flowmeter battery maint.; ER5 rack transfer preps.

ISS Orbit (as of this morning, 9:39am EDT [= epoch]):

Mean altitude -- 355.8 km

Apogee height -- 361.5 km

Perigee height -- 350.1 km

Period -- 91.66 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.000848

Solar Beta Angle -- -36.9 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.71

Mean altitude loss in the last 24 hours -- 60 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55882

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

08/25/08 -- Progress M-64/29 SORR (Stage Operations Readiness Review) @ NASA/JSC

09/01/08 -- Progress M-64/29P undocking, from FGB nadir; de-orbit/re-entry ~9/8

09/05/08 -- ATV1 undocking, from SM aft port (loiter until 9/29 for nighttime reentry/observation)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft)

10/01/08 -- **NASA 50 Years** (official)

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?

11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking

02/26/09 -- STS-119/Discovery/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking

04/07/09 -- Progress M-67/32P undocking & deorbit

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 08/20/08

All ISS systems continue to function nominally, except those noted previously or below.

Before breakfast and exercise, all crewmembers completed a 10-min session with the periodic Russian MedOps test "Hematokrit" (MO-10), which measures the red cell count of the blood, with CDR Volkov acting as CMO (Crew Medical Officer, Russian: Examiner). It was the third session for Volkov & Kononenko, the second for Chamitoff. *[The blood samples were drawn from a finger with a perforator lancet, then centrifuged in two microcapillary tubes in the M-1100 kit's minicentrifuge, and its hematocrit value was read off the tubes with a magnifying glass. It is a well-known phenomenon of space flight that red blood cell count (normal range: 30-45%) tends to go down over time. After the exam, the data were saved in the IFEP software (In-Flight Examination Program) on the MEC (Medical Equipment Computer), and Kononenko stowed the equipment.]*

The CDR performed the periodic accuracy check on four RS (Russian Segment) vacuum pressure gauges (MV). *[Two in the Service Module (SM), one in the DC1 Docking Compartment, and one in the Soyuz TMA-12 Orbital Compartment (BO).]*

After activating the RS2 laptop, Volkov configured the new A31p laptop set up in the US Lab as SM Central Post (CP) Remote Workstation and ran functional tests between it and the Central Post Computer 1 (KTsP1), in "Slave" mode, via the RS1 laptop. *[Meanwhile KTsP2, with the RS2 laptop, was online in "Master" mode. Afterwards, KTsP1 was switched back to Master mode and RS2 was shut down.]*

In the SM, Kononenko & Volkov readied equipment, cabling and behind-panel space for the upcoming installation of new Zveno-B (Link) hardware and the RSE2 laptop, tagging up with ground specialists via S-band as required.

FE-2 Chamitoff made further preparations for the planned relocation of ER-4 (EXPRESS Rack 4) & ER-5 from the Lab to the Kibo JPM (JEM Pressurized

Module), today by relocating

- the Ku-band Forward Transmitter from ER-4 to ER-2 and testing it,
- the CGBA-4 (Commercial Generic Bioprocessing Apparatus 4) payload from ER-4 to ER-1, and
- the CGBA-5 payload from ER-4 to ER-2.

Also in preparation for the upcoming US rack installations in Kibo, the FE-2 retrieved ten US grounding straps from the JLP (JEM Logistics Pressurized Section), two for the MELFI (Minus Eighty Degree Laboratory Freezer for the ISS) rack and four each for the ER-4 & ER-5 racks.

Afterwards, Gregory had another 2h 15m for moving cargo from and to the ATV (Automated Transfer Vehicle), including ~1h 15m for transferring ESA equipment to the COL (Columbus Orbital Laboratory).

In support of ISS science, Sergey Volkov assembled the geophysical GFI-1 Relaksatsiya ("relaxation") experiment from six GFI-1 hardware kits, reconfigured the Payload Laptop 3 for the experiment and mounted the UV (ultraviolet) camera with SP spectrometer unit at SM window #9. Purpose of the following ~15 min (9:20am – 9:35am EDT) data take was to contribute to a hyperspectral space/time study of images and radiation patterns from the Earth atmosphere and surface from spectra recorded with the UV camera, spectrometer, Laptop 3 and camcorder. Afterwards the equipment was stowed again. *[Relaksatsiya normally deals with the study of the chemoluminescent chemical reactions and atmospheric light phenomena (emissions, i.e., molecular relaxation processes), including those that occur during high-velocity interaction between the exhaust products from space vehicles and the atmosphere at orbital altitude and during the entry of space vehicles into the Earth's upper atmosphere.]*

Kononenko completed the TVIS treadmill part of the onboard preventive health maintenance fitness test "Profilaktika" (MBI-8, "Countermeasures"), which he could not perform on 8/5 pending the TVIS repair activities. *[Test procedure for MBI-8, which requires workouts on the VELO and TVIS, is identical to the Russian MO-5 assessment, but in addition to the nominal procedure it uses the TEEM-100M gas analyzer with breathing mask, a blood lactate test with the ACCUSPORT analyzer and REFLOTRON-4 accessories, and a subjective evaluation of physical exertion levels during the test (using the Borg Perceived Exertion Scale, viz., 10 steps from very light over hard and very hard to maximum). Results are entered on a log sheet. TEEM and ECG (electrocardiograph) data are transferred to the RSE-Med laptop, also on a tape cassette (Cardiocassette-2000), and prepared for later downlink via Regul-Packet comm. Results are also called down to specialists standing by at TsUP.]*

In the FGB module, Volkov worked on the BR-9TsU-8 Radiotelemetry System (RTS), supporting the ground in verifying temperature measurements by two sensors (T97, T98) of the SIT-9L Temperature Measuring System.

Gregory unstowed and set up the PFE-OUM (PFE-Oxygen Uptake Measurement) equipment on the HRF-2 (Human Research Facility 2) rack, including the PFM/PAM (Pulmonary Function Module/Photoacoustic Analyzer Module), Mixing Bag System and GDS (Gas Delivery System), for his and Sergey's first PFE-OUM protocol session tomorrow. *[The PFE-OUM experiment, using the CEVIS ergometer for workout, demonstrates the capability of crewmembers to perform periodic fitness evaluations with continuous oxygen consumption measurements within 14 days after arrival on ISS, and once monthly during routine PFEs. Once the capability of the pulmonary function system (PFS) to perform PFEs is verified, crewmembers will be able to integrate their monthly PFE with oxygen consumption measurements to fulfill the requirement for cardiovascular fitness evaluations during long-duration space flight.]*

Starting a new round of preventive maintenance on the RS ventilation system, Oleg Kononenko replaced the four dust collector filters (PF1-4) in the SM.

Oleg also conducted the periodic checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the passageways SM PrK (Transfer Compartment)–ATV, PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1.

The FE-1 took and called down the periodic dosage readings of the Russian “Pille-MKS” (MKS = ISS) radiation dosimetry experiment, which has ten sensors placed at various locations in the RS (DC1, SM starboard & port cabin windows, ASU toilet facility, control panel, etc.). Afterwards, two dosimeters were transferred from inside the ATV (near FE-1 sleep station) to a stowage pouch, and one sensor was relocated in the SM. *[Nine of the ten dosimeters are read manually.]*

Kononenko also set up the four Pille dosimeters of the Lulin-ISS radiation complex with its ICU (Interface Control Unit, Russian: BUI) turned on for recharging their batteries, preparatory to tomorrow's activation for data taking.

Oleg took the periodic photographs of the plants growing in the BIO-5 Rasteniya-2 ("Plants-2") Lada-13 greenhouse, using the Nikon D2 photo camera with F=17-55 mm lens, then downlinked the images via BSR-TM. The regular status check of the payload which researches growth and development of plants (peas) under spaceflight conditions, was also conducted, from the Russian discretionary “time permitting” task list.

Later, Kononenko conducted the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Oleg also performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The three station residents conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (CDR). Later, the FE-1 transferred the exercise data file to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~4:20pm EDT, Greg Chamitoff is scheduled for his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop),

As generally every day now, starting at ~9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) was activated intermittently for two half-cycles to control ppCO₂ levels. In this configuration for the daily ops, connecting & disconnecting the ITCS (Internal Thermal Control System) cooling loop is not required. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking.]*

“Job jar” Update: Task suggestions in Chamitoff’s discretionary “job jar” list today involve for JAXA, additional postlaunch reconfiguration on CBEF (Cell Biology Experiment Facility), and for ESA/Columbus, checkout of the BLB ESEM3-2 (Biolab Exchangeable Standard Electronic Modules) power board, removal of four WAICO1 ECs (Waving & Coiling of Arabidopsis Roots at Different g-levels Experiment Containers) from Rotor B, followed by installation of six RECs (Reference ECs) on Rotor B.

CEO (Crew Earth Observations) photo targets uplinked for today were **Typhoon Nuri, Philippines** *(this hurricane is moving NW across the northern Philippines*

*[projected to lie just north of the Philippines by the time of this pass]. Aiming right. Nuri is expected to be a Category 3 storm by the time it reaches the Chinese coast), **Mount Vesuvius, Italy** (looking left at the head of Naples Bay for this famous volcano), **Mt. Etna, Sicily** (looking right for the smoking Etna volcano at the near point of the island of Sicily), and **Lake Nasser, Toshka Lakes, Egypt** (water levels in Egypt's southern lake system are starting to decline. Shooting right of track [west of the Nile] for these string of lakes).*

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Week 18 Scheduled Main Activities:

- Thu. (8/21): LULIN dosimeter placement; EMU Battery maint.; PFE-OUM ops; BKS cable outfitting for Zveno-B (Link B) unit; DOUG revw/prep for JEMRMS Checkout #4; COL Cycle 11 transition for PWS-1; WRM/CWC water audit.
- Fri. (8/22): EMU batt. #2073 maint.; BKS cabling for Zveno (Link); Zveno-B unit install in ZVK LIV exp. video complex; RSE-2 laptop set-up for Zveno-B; PEPS inspect/checkout; Elektron BZh unit #56 leak check; Elektron On; JEMRMS Checkout #4; GANK & CDMK reading; Progress M-64 SSVP-StM docking mechanism install.
- Sat. (8/23): Station cleaning (RS); BMP ch.1 regen; PFCs (CDR, FE-1); VolSci.
- Sun. (8/24): Station cleaning (USOS); BMP ch.2 regen; PFC (FE-2).

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

09/01/08 -- Progress M-64/29P undocking, from FGB nadir; de-orbit/re-entry ~9/8

09/05/08 -- ATV1 undocking, from SM aft port (loiter until 9/29 for nighttime reentry/observation)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft)

10/01/08 -- **NASA 50 Years** (official)

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?

11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at

ISS On-Orbit Status 08/19/08

All ISS systems continue to function nominally, except those noted previously or below.

Before breakfast & first exercise, CDR Volkov, FE-1 Kononenko and FE-2 Chamitoff completed a full session with the Russian crew health monitoring program's medical assessment MO-9/Biochemical Urinalysis. Afterwards, the FE-1 closed out and stowed the Urolux hardware. *[MO-9 is conducted every 30 days (and also before and after EVAs) and is one of five nominal Russian medical tests adopted by NASA for U.S. crewmembers for IMG PHS (Integrated Medical Group/Periodic Health Status) evaluation as part of the "PHS/Without Blood Labs" exam. The analysis uses the sophisticated in-vitro diagnostic apparatus Urolux developed originally for the Mir program. Afterwards, the data are entered in the MEC (Medical Equipment Computer)'s special IFEP software (In-Flight Examination Program).]*

Kononenko performed the periodic extensive audit/inventory of all lights (SD1-7) in the RS (Russian Segment), supported by an uplinked detailed listing of 42 deployed lamps (SM: 24; FGB: 12; DC1: 4+2 portable) and another 42 spare lamps in FGB stowage bags.

Later, Volkov conducted an audit/inventory of SVO Water Supply System equipment in the RS, checking three containers with undocumented contents, i.e., not detailed in the IMS (Inventory Management System).

After the CDR set up the equipment for the NOA/Nitric Oxide Analyzer (MBI-21) payload, both he and the FE-1 undertook the experiment session (Sergey's fifth, Oleg's fourth), filling in the electronic log book on the RSE1 laptop for downlink and restowing the hardware. Each subject took two NO (Nitric Oxide) measurements in exhaled air. Afterwards, the hardware was re-stowed. *[Purpose of the ESA experiment ESANO1, consisting of the "Platon" analyzer and its power supply, is to*

monitor expired NO in the subject's exhaled air to detect signs of airway inflammation and indications of venous gas emboli (bubbles) that may be caused by inhalation of pollutants in the closed environment of the ISS cabin and increased risk of decompression sickness.]

After configuring the JAXA FPEF MS (Fluid Physics Experiment Facility/ Marangoni Surface) hardware last week, FE-2 Chamitoff today continued JMP (JEM Pressurized Module) preparations for Kibo's first experiment by completing several FPEF post-launch reconfigurations plus checkout, preparatory to the scheduled start of the Marangoni experiment on 8/21 (Thursday).

[Reconfiguration proceeded in six steps: Installing MS in FPEF, installing the IR (Infrared) camera on FPEF & connecting harnesses, installing FPEF experiment cover body, connecting the 1553B cable & silicone hoses between FPEF and the silicone filter, with rack power switch set on normal, and removing MS MWA I/F A & B (Maintenance Work Area Interface A & B) from MWA, plus relocating the MWA.]

Afterwards, Chamitoff configured the required cables connections for CBEF (Cell Biology Experiment Facility) and FPEF, removing the video cables between CBEF and the IPU Image Processing Unit) as well as between the SCOF (Solution Crystallization Observation Facility) and the IPU, also the payload bus cable between SCOF and its ISPR UIP (International Standard Payload Rack Utility Interface Panel), then connecting the FPEF by video cables to the IPU and by payload bus cable to the ISPR UIP.

Also in the JPM, the FE-2 activated the MMA (Microgravity Measurement Apparatus) and its laptop (MLT), by first powering up the MMA's NCU/RSU (Network Control Unit/Remote Sensor Unit) set from the Ryutai rack's UDC (Utility DC to DC Converter), then turning on both the NCU/RSU and MLT.

CDR Volkov set up the geophysical GFI-1 Relaksatsiya ("relaxation") payload's SONY DCR camcorder at Service Module (SM) window #1 (port crew cabin). Purpose of today's ~2.5hr exercise was to calibrate the LCD (Liquid Crystal Display)-equipped camcorder with known observation targets, viz., stars of the constellation Cygnus (Swan). Afterwards the camcorder battery was re-charged and the equipment re-stowed. *[Relaksatsiya normally deals with the study of the chemoluminescent chemical reactions and atmospheric light phenomena (emissions, i.e., molecular relaxation processes), including those that occur during high-velocity interaction between the exhaust products from space vehicles and the atmosphere at orbital altitude and during the entry of space vehicles into the Earth's upper atmosphere.]*

The FE-2 performed CSA-CP (Compound Specific Analyzer-Combustion Products)

maintenance, first replacing the battery of the prime CSA-CP unit with a fresh spare, then performing visual & functional inspections of the CSA-CP probes for damage, using the sampling pumps in Node-1 and -2 for the checkup.

After yesterday's equipment preparations in the US Lab for setting up an A31p laptop that can be used as a remote RS CP (Central Post) computer, Volkov & Kononenko today installed the laptop and connected it to the RS Command & Data Handling System (SUBA). The new Ethernet connection was tested by Oleg afterwards, and a system test of the A31p setup is scheduled tomorrow. *[The Remote RS A31p laptop in the Lab is now connected via Ethernet and the BRI Smart Switch Router to the RS1 laptop and thus to the KTSP1 (Central Post Computer 1) in the SM. BRI is part of the RS OpsLAN network with connections to the three RS SSC (Station Support Computer) clients, the Ethernet tie-in with the US network, a network printer in the RS, and now also to the Remote US CP client.]*

For the external VSPLESK ("Burst") science payload installed during EVA-20 by Volkov & Kononenko on 7/15, Oleg connected two jumper cables to two array matching devices (USM) for the onboard data/telemetry system, with the BITS2-12 onboard telemetry measurement system temporarily deactivated (which also required the Elektron oxygen generator to be turned off). *[VSPLESK, along with the BTN-M1 "NEUTRON" science payload, will create a physical model of charged and neutral particles generated during solar bursts and of the neutron albedo of the Earth atmosphere considering solar and geophysical aspects.]*

Afterwards, the Elektron O₂ generator was activated at 32 amps, supported by Oleg monitoring the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there is no overheating. In support of the reactivation, at ~6:22am EDT the ground temporarily switched the ATV (Automated Transfer Vehicle) to autonomous power (i.e., disconnected it electrically from ISS) and later reconfigured it to ISS power. *[During nominal Elektron operations a gas analyzer is utilized to detect hydrogen (H₂) in the O₂ line (which could cause overheating) but is not included in the control algorithm until 10 minutes after Elektron startup.]*

Sergey Volkov installed newly delivered extension springs on spare quick-release screw clamps (ZVB) for the standard Russian SSVP-StM docking mechanism.

In the U.S. Airlock (A/L), Chamitoff terminated the maintenance discharge on the second of two EMU (Extravehicular Mobility Unit) batteries (#2073) and started its recharge. *[Since the due date for the regular 85-day maintenance has expired, an additional maintenance cycle is required after the battery's discharge. The periodic*

maintenance consists of fully discharging (and later recharging) the storage units to prolong their useful life. After end of the maintenance cycle, Greg restored the SSC laptop, which is used in DOS mode for the automated procedure, to nominal ops. Yesterday's OCV (Open Circuit Voltage) check on EMU battery #2071 showed 13.4 volts, indicating a shorted cell within the battery. As a result of this finding, the formerly suspect BCM-4 (Battery Charger Module 4) has been cleared for nominal use.]

Gregory also completed the regular 30-day inspection of the new AED (Automated External Defibrillator) in the CHeCS (Crew Health Care Systems) rack. *[The AED is a portable electronic device that automatically diagnoses the potentially life threatening cardiac arrhythmias of ventricular fibrillation and ventricular tachycardia in a patient. It then can treat them through defibrillation, i.e., the application of electrical therapy which stops the arrhythmia, allowing the heart to reestablish an effective rhythm. AEDs are generally either held by trained personnel who will attend events or are public access units which can be found in places including corporate and government offices, shopping centers, airports, restaurants, casinos, hotels, sports stadiums, schools and universities, community centers, fitness centers, health clubs and any other location where people may congregate.]*

As a JAXA EPO (Educational Payload Operation) task, at ~11:00am EDT, at the moment of moonrise for the ISS, the FE-2 watched the Moon from the JPM window and took photography as it rose, including briefly through the upper atmosphere layers. *[As per Greg: In the future, this should be timed a bit earlier to allow for preparation of the shoot.]*

Sergey conducted the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Oleg performed the daily IMS maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Gregory had another 55 min reserved for ATV cargo transfers, i.e., moving consumables to the ISS via the SM and loading trash & excessed equipment on "Jules Verne".

Kononenko unstowed and installed the equipment for the periodic Russian PZE-MO-10 "Hematokrit" testing which is scheduled for him and CDR Volkov tomorrow. *[MO-10 measures the hematocrit (red blood cell mass) value of the blood (it is a*

well-known phenomenon of space flight that red blood cell mass {normal range: 30-45%} tends to go down over time).]

The crew had their periodic PMCs (Private Medical Conferences) via S- & Ku-band audio/video, Oleg at ~11:20am, Sergey at ~11:50am, Greg at ~2:30pm EDT.

The three station residents conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Oleg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

As generally every day now, starting at ~9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) was activated intermittently for two half-cycles to control ppCO₂ levels. In this configuration for the daily ops, connecting & disconnecting the ITCS (Internal Thermal Control System) cooling loop is not required. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking.]*

At ~11:35am, the FE-2 powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, & power supply) and conducted, at 11:40am, a ham radio exchange with the Los Padres Council Boy Scouts Troop 105 of Santa Barbara, CA. Troop 105 is based in Goleta, California, founded in 1967. The troop belongs to the South Coast District of the Los Padres Council. Its monthly program includes weekly meetings and monthly outings, participation in the annual district Camporee and attendance at a week-long summer camp. It also performs service for its community and its sponsor, the St. Raphael Catholic Church and the Knights of Columbus. Questions to Greg were uplinked beforehand. *[“What is your favorite experiment on the space station?”; “What kind of computer do you have available to use on the space station?”; “How long do plants live in a space environment?”; “Can you tell us what weightlessness is like?”; “What does the food taste like?”; “What kind of shapes can you make with liquids in weightlessness?”; “How much sleep do you get?”; “What do you do when you get bored?”; “How did scouting help you in your career?”]*

SHERE Feedback: “Greg, once again, outstanding work on SHERE! Getting four test points done plus the three repeats was really, really exciting. Thank you very much for the excellent science!”

VolSci Program Preview: For the weekend of August 23, Greg Chamitoff was offered two choices for the Voluntary Weekend Science program: (1) an “operations improvement” session with SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellites) with all three satellites, requiring ~4 hrs crew time; and (2) a LOCAD PTS (Lab-On-A-Chip Application Development – Portable Test System) surface sampling session in COL (Columbus Orbital Laboratory) using Glucan LAL cartridges, targeting fungus on ISS surfaces, requiring ~1h 45m crew time.

CEO (Crew Earth Observations) photo targets uplinked for today were **Hurricane Fay, Florida** (*Dynamic event. Fay was expected to be a minimal hurricane by the time of this pass, tracking north up the west coast of Florida. Second opportunity at 4:40pm. The earlier opportunity may have had the better viewing angle, with sunrise back-lighting. ISS passed close to the expected center over Fort Myers. Looking forward on the approach from the Yucatan peninsula*), **Tunis, Tunisia** (*shooting left at the head of a major bay for this ancient city. City margins are of greatest interest*), **Libyan megafans** (*overlapping images at nadir were requested as ISS passed directly above this site. A network of streams has created a vast plain of sediments deriving from the Tibesti Mountains hundreds of kilometers to the south. These streams stopped flowing at the end of the last wet period in the Sahara ~6000 years ago. Megafans are proving to be a feasible model for several regional Martian landscapes*), and **Algerian megafan** (*detailed overlapping images along track and just left of track were requested [immediately after ISS crossed a prominent field of parallel sand dunes] to allow researchers to understand more about the behavior of streams on this large, recently discovered feature. Visual cues are networks of parallel dry stream beds*).

CEO photography can be studied at this “Gateway” website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Week 18 Scheduled Main Activities:

- Wed. (8/20): Ku-Band Forward Receiver Relocation & Checkout; Ground Strap/Pivot Fitting install in JPM; MO-10 (all); CGBA-4/CGBA-5 subrack relocation; PFE-OUM setup & prep.
- Thu. (8/21): LULIN dosimeter placement; EMU Battery maint.; PFE-OUM ops; BKS cabling outfit for Zveno (Link) unit; DOUG revw/prep for JEMRMS Checkout #4; COL Cycle 11 transition for PWS-1; WRM/CWC water audit.
- Fri. (8/22): EMU batt. #2073 maint.; BKS cabling for Zveno (Link); Zveno unit install in ZVK LIV exp. video complex; RSE-2 laptop set-up for Zveno; PEPS inspect/checkout; Elektron BZh unit #56 leak check; Elektron On; JEMRMS

Checkout #4; GANK & CDMK reading; Progress M-64 SSVP-StM docking mechanism install.

- Sat. (8/23): Station cleaning (RS); BMP ch.1 regen; PFCs (CDR, FE-1); VolSci.
- Sun. (8/24): Station cleaning (USOS); BMP ch.2 regen; PFC (FE-2).

ISS Orbit (as of this morning, 8:56am EDT [= epoch]):

Mean altitude -- 355.9 km

Apogee height -- 361.6 km

Perigee height -- 350.2 km

Period -- 91.66 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0008394

Solar Beta Angle -- -38.7 deg (magnitude peaking)

Orbits per 24-hr. day -- 15.71

Mean altitude loss in the last 24 hours -- 45 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55850

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/01/08 -- Progress M-64/29P undocking, from FGB nadir; de-orbit/re-entry ~9/8

09/05/08 -- ATV1 undocking, from SM aft port (loiter until 9/29 for nighttime reentry/observation)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft)

10/01/08 -- **NASA 50 Years** (official)

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?

11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking

02/26/09 -- STS-119/Discovery/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 08/18/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 18 of Increment 17.*

Volkov, Kononenko and Chamitoff began their workday before breakfast with the periodic session of the Russian biomedical routine assessments PZEh-MO-7/Calf Volume Measurement & PZEh-MO-8/Body Mass Measurement, using the IM mass measurement device which Sergey Volkov broke down afterwards for stowage.

[Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference points, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures. For determining body mass in zero-G, where things are weightless but not massless, the Russian IM "scales" measure the inertial forces that arise during the oscillatory motion of a mass driven by two helical metering springs with known spring constants. By measuring the time period of each oscillation of the unknown mass (the crewmember) and comparing it to the period of a known mass, the crewmember's mass is calculated by the computer and displayed.]

FE-1 Kononenko serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out"-to-vacuum cycle on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated tonight at ~5:15pm EDT. Filter bed #1 was regenerated yesterday. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently to remove any lingering Freon-218 from the cabin atmosphere (last time: 8/5 & 8/6).]*

Sergey & Oleg undertook their fourth periodic (generally monthly) health test with the cardiological experiment PZEh MO-1 ("Study of the Bioelectric Activity of the Heart at Rest") on the TVIS (Treadmill with Vibration Isolation System). *[During the 50-min. test, the crewmembers tagged up with ground specialists on an RGS*

(Russian ground site) pass (~6:52am EDT) via VHF and downlinked data from the Gamma-1M ECG (electrocardiograph) for about 5-6 minutes.]

Chamitoff retrieved an RF cable from stowage and readied it in the Lab for Wednesday's relocation of the Ku-band forward receiver. *[The Ku receiver will be relocated on 8/20 from ER-4 (EXPRESS Rack 4) to ER-2 and checked out. ER-4 & ER-5 will be relocated in the near future.]*

On ER-4, Gregory also terminated ANITA (Analyzing Interferometer for Ambient Air) sampling mode, deactivated the ANITA hardware and stowed it for return to the ground on ULF2 (STS-126/Endeavour), preparatory to the planned ER-4/ER-5 relocation. *[Note: CGBA-4 (Commercial Generic Bioprocessing Apparatus 4) in ER-4 was deactivated by the ground for its relocation to ER-1 on Wednesday. CGBA-5 will also be relocated on 8/20, to ER-2.]*

The CDR & FE-1 prepared the worksites, equipment and cabling for tomorrow's installation and connecting of an A31p laptop in the U.S. Lab as Remote RS (Russian Segment) Central Post computer. *[Software to enable the laptop to operate with Russian software Vers. 7.05 has already been installed.]*

At the TVIS treadmill, the FE-2 took additional documentary photography of the improvised patch repair of the running belt and four shifted belt plates above the patch, for the ground to verify integrity of the IFM (Inflight Maintenance) conducted last week.

In the U.S. Airlock (A/L), Chamitoff initiated maintenance discharge on the first of two EMU (Extravehicular Mobility Unit) batteries (#2071) and ran the process later also on the second (#2073). *[The periodic maintenance consists of fully discharging (and later recharging) the storage units to prolong their useful life. After end of the maintenance cycle, Greg restored the SSC laptop, which is used in DOS mode for the automated procedure, to nominal ops.]*

After Saturday's VolSci (Voluntary Weekend Science) program featuring SHERE (Shear History Extensional Rheology Experiment), Chamitoff today conducted another SHERE session, by –

- Activating the MSG (Microgravity Science Glovebox),
- Powering on the SHERE hardware,
- Accessing the CGBA (Commercial Generic Bioprocessing Apparatus) to install the SHERE FM (Fluid Module) #4;
- Supporting the first SHERE experiment run (Test Point 18);
- Transferring the module with the fluid sample,
- Installing FM #17 for the second experiment run (Test Point 10);
- Repeating the procedure on TP 10;

- Transferring the module with the fluid sample;
- Installing FM #2 for the third experiment run (Test Point 20) if time permitted;
- Removing the FM from the CGBA, followed by SHERE data transfer;
- Turning off the SHERE/CGBA equipment;
- Transferring the data files to the MSG laptop, and
- Powering down the MSG.

[Background: Rheology is the study of the deformation and flow of matter under the influence of an applied stress ("preshearing" = rotation) which might be, for example, a shear stress or extensional stress. In practice, rheology is principally concerned with extending the "classical" disciplines of elasticity and (Newtonian) fluid mechanics to materials whose mechanical behavior cannot be described with the classical theories. SHERE is designed to study the effect of preshear (rotation) on the transient evolution of the microstructure and viscoelastic tensile stresses for solutions with long chains of monodisperse dilute polymer molecules in the MSG.

Collectively referred to as "Boger fluids," these polymer solutions have become a popular choice for rheological studies of non-Newtonian fluids and are the non-Newtonian fluid used in this experiment. The SHERE hardware consists of the Rheometer, Camera Arm, Interface Box, Cabling, Keyboard, Tool Box, Fluid Modules, and Stowage Tray.]

CDR Volkov conducted the periodic (about twice a month) replenishing of the Elektron oxygen generator's water supply for electrolysis, filling the KOV EDV container with water collected in a CWC (Contingency Water Container) from the Lab CCAA (Common Cabin Air Assembly) dehumidifier. *[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]*

In preparation for tomorrow's planned session with the geophysical GFI-1 Relaksatsiya ("relaxation") experiment, Sergey started (later terminated) battery charging for the SONY DCR digital camcorder. *[Relaksatsiya normally deals with the study of the chemoluminescent chemical reactions and atmospheric light phenomena (emissions, i.e., molecular relaxation processes), including those that occur during high-velocity interaction between the exhaust products from space vehicles and the atmosphere at orbital altitude and during the entry of space vehicles into the Earth's upper atmosphere.]*

At ~9:10am EDT, the crew held a teleconference with ground specialists to discuss ATV (Automated Transfer Vehicle) cargo transfers, to be occurring primarily this week and next week. Today's schedule provided for ~2h 50m of transfer time. *[Originally estimated to require ~41 hrs of crew time, MCC-H specialists have been able to scrub the time for the transfers down to ~31 hrs, including moving major consumables to the ISS besides loading trash & excessed equipment on*

“Jules Verne”.]

For a ground-controlled checkout of the JAXA FPEF (Fluid Physics Experiment Facility) and the upcoming Marangoni convection experiments, Gregory turned on the gas supply from the CGSE (Common Gas Support Equipment) in the JPM (JEM Pressurized Module). *[The CGSE consists of a valve unit and four CO₂ & Argon GBUs (gas bottle units).]*

Sergey conducted the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The CDR also performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Oleg Kononenko performed the periodic recharge of the water tank for the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (peas) under spaceflight conditions in the Lada-13 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}). The regular status check was also conducted, from the Russian discretionary “time permitting” task list.

At 2:30pm EDT, Greg is scheduled to support the periodic VHF-1 emergency communications check over NASA’s VHF (Very High Frequency) stations, today at the Wallops (2:34pm-2:40pm), talking with Houston/Capcom, MSFC/PAYCOM (Payload Operation & Integration Center Communicator), Moscow/GLAVNI (TsUP Capcom), EUROCOM and JCOM in the normal fashion via VHF radio from a handheld microphone and any of the USOS ATUs (Audio Terminal Units). *[Purpose of the test is to verify signal reception and link integrity, improve crew proficiency, and ensure minimum required link margin during emergency (no TDRS) and special events (such as a Soyuz relocation).]*

The three station residents conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1). Later, Oleg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure

on the HRM storage medium (done six times a week).

As generally every day now, starting at ~9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) was activated intermittently for two half-cycles to control ppCO₂ levels. In this configuration for the daily ops, connecting & disconnecting the ITCS (Internal Thermal Control System) cooling loop is not required. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking.]*

SOTR KOB-1 Maintenance Update: Volkov's attempt to drain coolant from the #1 loop (KOB-1) of the Russian Thermal Control System (SOTR) in the SM failed last Friday (8/15). The intended pressure check at various valve settings could not be performed. The issue is being investigated. *[Purpose of the attempted coolant draining was to determine the volume of free air in KOB-1 and check the leak tightness of the KOB-1 accumulator bellows; also: to perform preventive maintenance on the SOTR loops' solenoid valves.]*

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Week 18 Scheduled Main Activities:

- Tue. (8/19): AED Defib inspect; 85 Day Maint Initiate for EMU Battery 2071; VHF Emergency Comm Checkout; Rack Hardware Installation Prep; MO-9; NOA1; CSA-CP maint.; SM CP laptop install in USOS Lab; Extension springs install on spare ZVB quick-release screw clamps;
- Wed. (8/20): Ku-Band Forward Receiver Relocation & Checkout; Ground Strap/Pivot Fitting install in JPM; MO-10 (all); CGBA-4/CGBA-5 subrack relocation; PFE-OUM setup & prep.
- Thu. (8/21): LULIN dosimeter placement; EMU Battery maint.; PFE-OUM ops; BKS cabling outfit for Zveno (Link) unit; DOUG revw/prep for JEMRMS Checkout #4; COL Cycle 11 transition for PWS-1; WRM/CWC water audit.
- Fri. (8/22): EMU batt. #2073 maint.; BKS cabling for Zveno (Link); Zveno unit install in ZVK LIV exp. video complex; RSE-2 laptop set-up for Zveno; PEPS inspect/checkout; Elektron BZh unit #56 leak check; Elektron On; JEMRMS Checkout #4; GANK & CDMK reading; Progress M-64 SSVP-StM docking mechanism install.

ISS Orbit (as of this morning, 6:51am EDT [= epoch]):

Mean altitude -- 356.0 km

Apogee height -- 361.6 km
Perigee height -- 350.3 km
Period -- 91.66 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0008343
Solar Beta Angle -- -38.7 deg (magnitude peaking)
Orbits per 24-hr. day -- 15.71
Mean altitude loss in the last 24 hours -- 45 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 55833

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/02/08 -- Progress M-64/29P undocking, from FGB nadir
09/07/08 -- ATV1 undocking, from SM aft port (loiter until 9/29 for nighttime reentry/observation)
09/10/08 -- Progress M-65/30P launch
09/12/08 -- Progress M-65/30P docking (SM aft)
10/01/08 -- **NASA 50 Years** (official)
10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
10/11/08 -- Progress M-65/30P undocking (from SM aft)
10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation

10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 08/17/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – rest day for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff. Ahead: Week 18 of Increment 17.*

Gregory Chamitoff started out with the week-long experiment SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight), using payload software for data logging and filling in questionnaire entries in the SLEEP session file on the HRF-1 laptop. *[To monitor the crewmember's sleep/wake patterns and light exposure, Chamitoff wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

The FE-2 had three hours reserved for the regular weekly station cleaning in the USOS (US Segment) which wasn't scheduled yesterday alongside the RS (Russian Segment) "uborka" housecleaning by his two crewmates.

Greg repeated the "ghosting" of the SAMS ICU (Space Acceleration Measurement System/Interim Control Unit) laptop hard drive in the LAP2 Rack with new software image/structure. *[The ICU stalled out yesterday during the uploading, and new instructions were uplinked overnight.]*

CDR Volkov meanwhile performed the periodic service of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system, and to terminate the process at ~3:30pm EDT, with Bed #2 regeneration to follow tomorrow *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed more frequently to remove any lingering Freon-218 from the cabin atmosphere (last time: 8/5 & 8/6)];*

Sergey conducted the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The CDR also checked up on the Russian POTOK-150MK (150 micron) decontamination filter unit of the SM's SOGS air revitalization subsystem, gathering weekly data on Total Operating Time & "On" durations for reporting to TsUP-Moscow.

The three station residents conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1).

As per the Russian voluntary "time permitting" task list, Oleg performed the regular status check on the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (peas) under spaceflight conditions in the Lada-13 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}) and recharged its water tank.

A new suggested job for Gregory on the U.S. crewmember's-choice "job jar" task list was to check out the BIOLAB ESEM3-2 (Exchangeable Standard Electronic Module 3-2) power board in the Columbus laboratory preparatory to the troubleshooting activities planned by ESA to recover all BIOLAB functionalities.

Meanwhile, "Cycle 11" software transition checkouts of Columbus systems are continuing, by ground control only.

As generally every day now, starting at ~9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) was activated intermittently for two half-cycles to control ppCO₂ levels. In this configuration for the daily ops, connecting & disconnecting the ITCS (Internal Thermal Control System) cooling loop is not required. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking.]*

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Week 18 Scheduled Main Activities:

- Mon. (8/18): MO-7/MO-8 (all); BMP ch.2 regen; MO-1; ATV transfers; SHERE session; RED+Accessories inspect; EMU Battery 2071 discharge (BSA Ops).
- Tue. (8/19): AED Defib inspect; 85 Day Maint Initiate for EMU Battery 2071; VHF Emergency Comm Checkout; Rack Hardware Installation Prep; MO-9; NOA1; CSA-CP maint.; SSVP BZV docking & internal transfer system/screw clamps ops.
- Wed. (8/20): ANITA deactivation & stow; Ku-Band Forward Receiver Relocation & Checkout; Ground Strap/Pivot Fitting install in JPM; MO-10 (all); PFE-OUM setup & prep.
- Thu. (8/21): LULIN dosimeter placement; EMU Battery maint.; PFE-OUM ops; BKS cabling outfit for Zveno (Link) unit; DOUG revw/prep for JEMRMS Checkout #4; COL Cycle 11 transition for PWS-1; WRM/CWC water audit.
- Fri. (8/22): EMU batt. #2073 maint.; BKS cabling for Zveno (Link); Install new Zveno unit in ZVK LIV exp. video complex; RSE-2 laptop set-up for Zveno; PEPS inspect/checkout; Elektron BZh unit #56 leak check; Elektron On; JEMRMS Checkout #4; GANK & CDMK reading; Progress M-64 SSVP-StM docking mechanism install.

ISS Orbit (as of this morning, 9:18am EDT [= epoch]):

Mean altitude -- 356.0 km

Apogee height -- 361.6 km

Perigee height -- 350.4 km

Period -- 91.66 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0008351

Solar Beta Angle -- -38.1 deg (magnitude increasing, approaching peak)

Orbits per 24-hr. day -- 15.71

Mean altitude loss in the last 24 hours -- 31 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55819

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/02/08 -- Progress M-64/29P undocking, from FGB nadir

09/07/08 -- ATV1 undocking, from SM aft port (loiter until 9/29 for nighttime reentry/observation)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft)

10/01/08 -- **NASA 50 Years** (official)
 10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
 10/11/08 -- Progress M-65/30P undocking (from SM aft)
 10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)
 10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)
 10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?
 11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
 11/12/08 -- STS-126/Endeavour/ULF2 docking
 11/20/08 -- **ISS 10 Years**
 11/25/08 -- Progress M-65/30P undocking & deorbit
 11/26/08 -- Progress M-66/31P launch
 11/30/08 -- Progress M-66/31P docking
 02/09/09 -- Progress M-66/31P undocking & deorbit
 02/10/09 -- Progress M-67/32P launch
 02/12/09 -- Progress M-67/32P docking
 02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
 02/14/09 -- STS-119/Discovery/15A docking
 02/24/09 -- STS-119/Discovery/15A undocking
 02/26/09 -- STS-119/Discovery/15A landing (nominal)
 03/25/09 -- Soyuz TMA-14/18S launch
 03/27/09 -- Soyuz TMA-14/18S docking (DC1)
 04/05/09 -- Soyuz TMA-13/17S undocking
 04/07/09 -- Progress M-67/32P undocking & deorbit
 05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 05/25/09 -- Soyuz TMA-15/19S launch
 05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
 07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
 10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
 12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
 02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
 04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
 05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at

ISS On-Orbit Status 08/16/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – mostly off duty for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff.*

Chamitoff began his day with the week-long experiment SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight), using payload software for data logging and filling in questionnaire entries in the experiment's session file on the HRF-1 laptop. *[To monitor the crewmember's sleep/wake patterns and light exposure, Greg wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

Volkov & Kononenko performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the SM (Service Module) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

The FE-1 also checked up on the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem, gathering weekly data on Total Operating Time & "On" durations for reporting to TsUP-Moscow. Later, CDR Volkov temporarily powered down the POTOK for the periodic cleaning of its pre-filter, using the vacuum cleaner with narrow-slit nozzle attachment.

Working on the SAMS ICU (Space Acceleration Measurement System/Interim Control Unit) in LAP2 Rack, Gregory initiated, and about three hours later

terminated, the software “ghosting” of the SAMS hard drive, i.e., loading it with new images/structure.

At ~10:05am EDT, the crewmembers conducted their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP-Moscow timeline planners) via S-band/ audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

For today's VolSci (Voluntary Weekend Science) program, another session with SHERE (Shear History Extensional Rheology Experiment), FE-2 Chamitoff –

- Activated the MSG (Microgravity Science Glovebox),
- Powered on the SHERE hardware,
- Accessed the CGBA (Commercial Generic Bioprocessing Apparatus) to install the SHERE FM (Fluid Module) #15;
- Supported the first SHERE experiment run (Test Point 11);
- Repeated the procedure on TP 11 (the first repetition, suggested by Greg last week);
- Transferred the module with the fluid sample,
- Installed FM #18 for the second experiment run (Test Point 21) , but with reduced preshear duration, now TP 26;
- Transferred the module with the fluid sample,
- Installed FM #22 for the third experiment run (Test Point 8);
- Repeated the procedure on TP 8;
- Removed the FM from the CGBA, followed by SHERE data transfer;
- Turned off the SHERE/CGBA equipment;
- Transferred the data files to the MSG laptop, and
- Powered down the MSG.

[Background: Rheology is the study of the deformation and flow of matter under the influence of an applied stress (“preshearing” = rotation) which might be, for example, a shear stress or extensional stress. In practice, rheology is principally concerned with extending the “classical” disciplines of elasticity and (Newtonian) fluid mechanics to materials whose mechanical behavior cannot be described with the classical theories. SHERE is designed to study the effect of preshear (rotation) on the transient evolution of the microstructure and viscoelastic tensile stresses for solutions with long chains of monodisperse dilute polymer molecules in the MSG.

Collectively referred to as “Boger fluids,” these polymer solutions have become a popular choice for rheological studies of non-Newtonian fluids and are the non-Newtonian fluid used in this experiment. The SHERE hardware consists of the Rheometer, Camera Arm, Interface Box, Cabling, Keyboard, Tool Box, Fluid Modules, and Stowage Tray.]

Kononenko performed the routine daily servicing of the SOZh system (Environment

Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Gregory filled out the regular FFQ (Food Frequency Questionnaire), his ninth, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

The three station residents conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Greg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

The two cosmonauts had their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop), Oleg at ~7:00am EDT, Sergey at ~8:10am.

Working from the voluntary "time permitting" task list, Oleg performed the regular status check on the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (peas) under spaceflight conditions in the Lada-13 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}) and recharged its water tank.

As generally every day now, starting at ~9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) was activated intermittently for two half-cycles to control ppCO₂ levels. In this configuration for the daily ops, connecting & disconnecting the ITCS (Internal Thermal Control System) cooling loop is not required. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking.]*

Weekly Science Update (*Expedition Seventeen -- Week 17*)

3-D SPACE: In progress.

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):
Measurements continue in FGB module.

ANITA (Analyzing Interferometer for Ambient Air): Continuing.

BCAT-3 (Binary Colloidal Alloy Test 3): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System):
Samples returned on 1J.

CSI-2/CGBA-5 (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus 5): Silicate Garden Hab Side 2 is complete and CGBA-5 has now been powered off awaiting its move to EXPRESS Rack 2 (ER2). The Hab along with other CSI-02 equipment will be removed and returned home on ULF2.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): EuTEF platform is nominal. A (DHPU) Data Handling Processing Unit software patch is currently being developed to fix the link error issues encountered with DEBIE-2 and FIPEX instruments. On 8/14, a graceful shutdown has been performed of EUTEF instruments in preparation of the S/W "Cycle 11" transition. EUTEF will stay on feeder#2 (survival heaters) for about 10 hours. Power-up sequence will be performed in the evening

of 8/14. - DEBIE-2: IOPs (Instrument Operations Procedures) performed for 24 hrs duration, from 8/9 until S/W "Cycle 11" power-down. Generic status: link error still in work. However a work-around allows for regular science data acquisition using an on-board IOP, but not yet in conjunction with any FIPEX IOP – a final software patch, which will enhance the present instrument capabilities, is under finalization on ground; - DOSTEL: On-going science acquisition until S/W Cycle 11 power-down; - EuTEMP: Currently inactive as planned; - EVC: Currently no picture taking; - EXPOSE: On-going science acquisition until S/W Cycle 11 power-down; - FIPEX: Science acquisition until 8/9. New FIPEX IOP currently planned to start on 8/15; - MEDET: Continuous science acquisition until S/W Cycle 11 power-down; - PLEGPAY: Currently in READY mode, no science data acquisition on-going, powered down for S/W Cycle 11; - TRIBOLAB: The instrument was in Stand-By Mode, now powered down for S/W Cycle 11. Currently planned to bring TRIBOLAB to Stand-By Mode on 8/17 and restart the Ball-Bearing experiment on 8/18.

FSL (Fluid Science Laboratory): FSL is back. Further FSL commissioning activities remain to be done (see following item).

GEOFLOW: After the very first Science Run on 8/7, data have been downlinked, and initially these files were corrupted. This could be resolved by downlinking at a lower data rate. The data have been transferred on 8/13 from COL-CC to MARS USOC and will be made available for science team assessment. Next GEOFLOW run is currently planned for 8/19.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Planned.

Micro-G Clay (JAXA EPO): On 8/11, Greg performed JAXA's first EPO experiment, Micro-G Clay. The clays are in the drying process.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in

DC1 "Pirs".

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-1/-2 (Nitric Oxide Analyzer, ESA): Next NOA-1 session for CDR and FE-1 currently planned for 8/19.

NUTRITION w/REPOSITORY: In progress.

PADLES (Passive Dosimeter for Lifescience Experiment in Space): In progress.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SAMPLE: Complete.

SHERE (Shear History Extensional Rheology Experiment): "Greg, you completed test points TP#3, 13, 23, 5, 15, 25, and 1. We are two test points away from our minimum science of nine, which should be met during VolSci on 8/16. You have gotten very adept at deploying the Fluid Modules and performing the science runs. We would like you to continue to provide feedback on what you observe and to take advantage of repeat test points when the opportunity is available. Outstanding work!"

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): "Greg, thanks for completing your Sleep download and initialization. Your data continues to look great. Also, thanks for the crew note that you are removing your watch. That will help the PI with the analysis. After completing this week of sleep logging, you will have one more week of logging, three more monthly downloads, and then doffing the Actiwatch on the Shuttle. Additional sleep logging is above and beyond and greatly appreciated by the PI."

SOLAR (Solar Monitoring Observatory): Previous Sun observation window closed on 8/8. On 8/14, a shutdown has been performed of SOLAR instruments in preparation of the S/W Cycle 11 transition. SOLAR will stay on feeder#2 (survival heaters) for about 10 hours. Power-up will be performed in the evening of 8/14. Next Sun visibility window to open on 8/25.

SOLO: Planned.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): A troubleshooting plan has been developed to recover all the BIOLAB functionalities. On 8/4, BIOLAB has been activated from ground for about 5 hours, in order to get telemetry about the Smoke Detector sensor and perform a series of BIT (Built-In Test) sequences. This test was positive and we can confirm the full functionality of the Smoke Detector sensor. Next steps will be resumed in the next coming weeks, starting with the BIOLAB Rotor A bellow test (ground only) and later on the remaining WAICO-#1ECs (Experiment Containers) will be disposed and replaced by 6 Reference ECs on Rotor B. Planning for this last activity is currently TBD.

CEO (Crew Earth Observations): Through 8/7 the ground has received a total of 4,220 frames of CEO images for review and cataloging. Photos acquired with camera times corresponding to those of the CEO daily target list requests, included: S. Mozambique (Mount Vesuvius – good context views as requested); and Haze SE USA (this dynamic event apparently was not as discernible as was hoped). “We encourage you to continue to practice with the long lens settings to improve consistency in the sharpness/focus of your images. Coastlines, urban, and other high-contrast areas shot in high sunlight conditions make good practice targets, especially when near-nadir. This week we will publish on NASA/GSFC’s Earth Observatory website an excellent, rare photo of the Dry Tortugas, Florida that was on 5/29. The image area is part of remote national park located west of Key West and includes a recognizable view of Fort Jefferson, a hexagonal-shaped, Civil War era, fortification.”

CEO (Crew Earth Observations) photo targets uplinked for today were **Algerian megafan** (*a large river-formed fan-shaped inland delta/megafan [210 km radius], formed by a river during wetter climates, was recently identified in the western Sahara Desert. Detailed overlapping images along track and just right of track were requested to allow researchers to understand more about the behavior of streams on these large features. Visual cues are: numerous parallel dry stream beds right of track; and a field of linear sand dunes left of track. The significance of megafans has only recently been appreciated since more than 150 have been identified worldwide. Large fans are being tested as new analogs for many landscapes on*

*Mars), **Northern Temperate Lakes, Wisconsin** (this Long-Term Ecological Research [LTER] site concerns the ecology of lakes in relation to seasonal changes and nearby human processes. Detailed overlapping images along track at nadir [starting shortly after ISS crossed the Mississippi River] acquire the several lakes and their surrounding landscapes as a high-summer data point), and **West Hawk Impact Crater, Manitoba, Canada** (this 2.5-km-diameter crater is occupied by a lake. Visual cues: this is the only roughly circular lake in the region, and it lies just north of a long narrow lake).*

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Week 17/18 Main Activities:

- Sun. (8/17): Rest; BMP ch.1 regen; Weekly house cleaning (USOS).
- Mon. (8/18): MO-7/MO-8 (all); BMP ch.2 regen; MO-1; ATV transfers; SHERE session; RED + Accessories inspect; EMU Battery 2071 discharge (BSA Ops).
- Tue. (8/19): AED Defib inspect; 85 Day Maint Initiate for EMU Battery 2071; VHF Emergency Comm Checkout; Rack Hardware Installation Prep; MO-9; NOA1; CSA-CP maint.; SSVP BZV docking & internal transfer system/screw clamps ops.
- Wed. (8/20): ANITA deactivation and stow; Ku-Band Forward Receiver Relocation & Checkout; Ground Strap/Pivot Fitting install in JPM; MO-10 (all); PFE-OUM setup & prep.
- Thu. (8/21): LULIN dosimeter placement; EMU Battery maint.; PFE-OUM ops; BKS cabling outfitting; DOUG revw/prep for JEMRMS Checkout #4; COL Cycle 11 transition for PWS-1; WRM/CWC water audit.

ISS Orbit (as of this morning, 9:07am EDT [= epoch]):

Mean altitude -- 356.0 km

Apogee height -- 361.6 km

Perigee height -- 350.4 km

Period -- 91.66 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.000829

Solar Beta Angle -- -36.9 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.71

Mean altitude loss in the last 24 hours -- 50 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55803

Significant Events Ahead (all dates Eastern Time, some changes possible.):

09/02/08 -- Progress M-64/29P undocking, from FGB nadir
09/07/08 -- ATV1 undocking, from SM aft port (loiter until 9/29 for nighttime reentry/ observation)
09/10/08 -- Progress M-65/30P launch
09/12/08 -- Progress M-65/30P docking (SM aft)
10/01/08 -- **NASA 50 Years** (official)
10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
10/11/08 -- Progress M-65/30P undocking (from SM aft)
10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT; Lonchakov, Fincke, Garriott)
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 08/15/08

All ISS systems continue to function nominally, except those noted previously or below.

Gregory Chamitoff began his day with the week-long experiment SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight), using payload software for data logging and filling in questionnaire entries in the experiment's session file on the HRF-1 laptop. *[To monitor the crewmember's sleep/wake patterns and light exposure, Greg wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

Working closely with the ground, FE-2 Chamitoff conducted the JAXA JEMRMS (Japanese Experiment Module/Robotic Manipulator System) Checkout #3 which featured the first motion of its Main Arm in space. The maneuvers were observed by the SSRMS (Space Station Remote Manipulator System) video cameras.

[After activating the RLT (RMS Laptop), CCP (Camera Control Panel) and RMS Monitors, and adjusting settings including updating the DOUG (Dynamic Onboard Ubiquitous Graphics) laptop application with realtime data, RMS function was checked out for manual operation in vernier mode, with the EE (End Effector) in stowed position. Following these checkouts, the RMS was to be moved to the JLP GP (JEM Logistics Pressurized Section Grapple Fixture) for EE checkout and verification of RMS characteristics when in Limp Mode. Afterwards, data were to be prepared for downlink, the Arm Bus Monitor turned off, MDP (Management Data Processor) set to Standby and all systems deactivated. Background: The externally mounted JEMRMS is composed of two arms: the 10-m-long MA (Main Arm) and a 2-m-long small fine arm (the latter to be delivered on a future mission). Both arms have six independent joints, to provide dexterity very similar to the human arm. The internal robotic control workstation, known as JEMRMS Console, is used for manipulating the RMS. Remote television cameras are mounted on both

arms, enabling the crew to control the arms from inside the JPM.]

In preparation for an upcoming JEM rack relocation, Chamitoff also had an hour set aside (plus additional time called out on his discretionary "job jar" task list) for an extensive Kibo cleanup, guided by an uplinked listing with specific items, instructions and locations. *[The activities include relocating JAXA items from COL (Columbus Orbital Laboratory) and Node-2 to JPM (JEM Pressurized Module) and JLP, unpacking or stowing numerous bags, configuring the stowage in JPM & JLP locations and taking documentary photography of all areas involved.]*

CDR Volkov set up the hardware for the Russian MBI-21 PNEVMOKARD experiment and conducted the session, his third, which does not allow moving or talking during data recording. The experiment is controlled from the RSE-Med A31p laptop, equipped with new software, and uses the TENZOPLUS sphygmomanometer to measure arterial blood pressure. Kononenko's third session was on 8/11. *[PNEVMOKARD (Pneumocard) attempts to obtain new scientific information to refine the understanding about the mechanisms used by the cardiorespiratory system and the whole body organism to spaceflight conditions. By recording (on PCMCIA cards) the crewmember's electrocardiogram, impedance cardiogram, low-frequency phonocardiogram (seismocardiogram), pneumotachogram (using nose temperature sensors), and finger photoplethysmogram, the experiment supports integrated studies of (1) the cardiovascular system and its adaptation mechanisms in various phases of a long-duration mission, (2) the synchronization of heart activity and breathing factors, as well as the cardiorespiratory system control processes based on the variability rate of physiological parameters, and (3) the interconnection between the cardiorespiratory system during a long-duration mission and the tolerance of orthostatic & physical activities at the beginning of readaptation for predicting possible reactions of the crewmembers organism during the their return to ground.]*

In the Lab, FE-1 Kononenko worked on ER4 (EXPRESS Rack 4), troubleshooting the ANITA (Analyzing Interferometer for Ambient Air) payload, to recover its laptop. *[The ANITA air sampling equipment will be returned on STS-126/ULF-2.]*

It was Oleg's turn today for his first session with the Russian biomedical "Pilot-M"/NEURO signal response experiment, assisted by Volkov (who underwent the assessment yesterday) and ground specialist tagup via S-band. Afterwards, the Pilot-M & Neurolab-2000M gear was torn down and stowed away. *[MBI-15 requires a table, ankle restraint system, electrodes, and two hand controllers (RUO & RUD) for testing piloting skill in "flying" simulations on a laptop (RSK1) under stopwatch control, as well as for studying special features of the psychophysiological response of cosmonauts to the effects of stress factors in flight.]*

Sergey Volkov performed maintenance on the #1 loop (KOB-1) of the Russian Thermal Control System (SOTR) in the Service Module (SM), using a manual pump, hose adapters and a pressure gauge (VK-316M) to drain coolant and check pressures at various valve settings. Afterwards, the loop's initial status was restored. Last time done: 5/30. *[Purpose: to determine the volume of free air in KOB-1 and check the leak tightness of the KOB-1 accumulator bellows; also: to perform preventive maintenance on the SOTR loops' solenoid valves.]*

The FE-2 took measurements for the regular atmospheric status check for ppCO₂ (Carbon Dioxide partial pressure) in the Lab, SM (at panel 449) and COL, using the hand-held CDMK (CO₂ Monitoring Kit, #1002). *[The battery pack was to be replaced with the one from unit #1009 if necessary. Purpose of the 5-min activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements.]*

Kononenko had another 3 hrs for transferring and loading excessed equipment and trash in Progress M-64/29P.

For today's physical workouts by all crewmembers on the RED (Resistive Exercise Device), Chamitoff set up the video camcorder for filming and recording the sessions via ground commanding. Afterwards, the video equipment was put back in stowage, and the video was to be downlinked from the VTR (Video Tape Recorder) by ground commanding. *[The RED video, showing the apparatus on the "ceiling" hatch of the Node, is periodically required to support biomechanical evaluation of the exercising crewmember and assessment of the on-orbit setup of equipment during data collection.]*

As a follow-up to the TVIS repair/maintenance activities earlier this week, Kononenko was requested to take documentary photography of several running belt slats under tension, to be used as baseline for future weekly status checks to track possible changes in the repaired area of the treadmill belt.

The crew performed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Volkov transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week). *[The wireless POLAR S810 HRMs resemble sports wrist watches, with some of their features. They display the heart rate as BPM (beats per minute) and % of HRmax, average HR plus exercise duration, along with 7 different exercise*

profiles. The HR is transmitted from an elastic belt around the chest to the wrist receiver for subsequent downloading to the MEC and analysis by special software. Receiver settings are also uploaded from the laptop.]

After the ground performed the monthly reboots of the SM, Lab and JEM PCS (Portable Computer System) laptops today, Chamitoff closed their ISP Health Monitor Windows and configured them for nominal operations.

In the ESA COL, Gregory activated the PCDF EU (Protein Crystallization Diagnostic Facility/Electronics Unit) in support of the ongoing ground-commanded Columbus "Cycle 11" software transition. *[ESA ground controllers are currently monitoring the performance of Columbus systems with the new software. The remaining MMU (Mass Memory Unit) and PWS-1 (Portable Workstation) will be upgraded to Cycle 11 next week after a successful transition for all functionality has been verified.]*

The CDR conducted the routine daily servicing of the SM's SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Later, Sergey also performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Working from the voluntary "time permitting" task list, Oleg performed the regular status check on the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (peas) under spaceflight conditions in the Lada-13 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}) and recharged its water tank.

At ~4:20am EDT, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU/*Glavnaya operativnaya gruppa upravleniya* = "Main Operative Control Group"), including Shift Flight Director (SRP), at TsUP-Moscow via S-band/audio, phone-patched from Houston and Moscow.

At ~4:35am, Sergey & Oleg linked up with TsUP stowage specialists via S-band to conduct the weekly IMS tagup, discussing inventory & stowage issues, equipment locations and ATV & Progress cargo transfers.

At ~2:15pm, Greg Chamitoff is scheduled for an interactive PAO TV event with students at Outer Space Base (OSB) of the Pima County Public Library in Tucson,

AZ, attended also by U.S. Rep. Gabrielle Giffords (D-AZ) and STS-124 Commander Mark Kelly. Questions were uplinked beforehand. [*“When you were chosen for Expedition 17, how did you feel?”; “In the year 2050 what would be your ideal goal for NASA?”; “Do you think children will ever be allowed to travel into space?”; “Will the space station ever be able to give supplies to the upcoming moon base?”*]

At ~3:35pm, the ISS crew will have their regular weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. [*S/G-2 (Space-to-Ground 2) phone patch via SSC (Station Support Computer)*].

As generally every day now, starting at ~9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) was activated intermittently for two half-cycles to control ppCO₂ levels. In this configuration for the daily ops, connecting & disconnecting the ITCS (Internal Thermal Control System) cooling loop is not required. [*A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking.*]

Node-2 SD-2 Update: Smoke detection in Node-2 has lost redundancy when Smoke Detector #2 in the module failed last night. SD-1 remains stable and nominal.

WRM Update: An updated WRM (Water Recovery Management) “cue card” was uplinked overnight for the crew’s reference, updated with yesterday’s water audit. [*The new card (17-0002V) lists 34 CWCs (Contingency Water Containers, ~1204.3 L total) for the four types of water identified on board: technical water (426.5 L, for flushing only because of Wautersia bacteria), potable water (706.7 L, incl. 174.6 L currently on hold), condensate water (54.1 L), waste/EMU dump and other (17 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.*]

CEO (Crew Earth Observations) photo targets uplinked for today were **Tropical Storm Fay, Caribbean Sea** (*Dynamic event. This storm is growing rapidly, moving WNW, and is expected to be over Puerto Rico, left of ISS track by the time of this pass. Reconnaissance aircraft was en route*), **Slate Islands Impact Crater, Lake Superior** (*the crater is in the form of a tight cluster of islands just off the north shore of L. Superior. A recent [8/4] CEO image was taken in low light, and another attempt was requested, this time for noon lighting*), and **Andrews Forest, Oregon** (*looking right of track for this long term monitoring site. Seasonal vegetation color and health are the topics of interest.*)

CEO photography can be studied at this “Gateway” website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the

Earth from space, with 314,000 from the ISS alone).

Week 17/18 Main Activities:

- Sat. (8/16): SAMS Ghosting; Weekly house cleaning; VolSci.
- Sun. (8/17): Rest; BMP ch.1 regen; Weekly house cleaning (USOS).
- Mon. (8/18): MO-7/MO-8 (all); BMP ch.2 regen; MO-1; ATV transfers; SHERE session; RED + Accessories inspect; EMU Battery 2071 discharge (BSA Ops).
- Tue. (8/19): AED Defib inspect; 85 Day Maint Initiate for EMU Battery 2071; VHF Emergency Comm Checkout; Rack Hardware Installation Prep; MO-9; NOA1; CSA-CP maint.; SSVP BZV docking & internal transfer system/screw clamps ops.
- Wed. (8/20): ANITA deactivation and stow; Ku-Band Forward Receiver Relocation & Checkout; Ground Strap/Pivot Fitting install in JPM; MO-10 (all); PFE-OUM setup & prep.
- Thu. (8/21): LULIN dosimeter placement; EMU Battery maint.; PFE-OUM ops; BKS cabling outfitting; DOUG revw/prep for JEMRMS Checkout #4; COL Cycle 11 transition for PWS-1; WRM/CWC water audit.

ISS Orbit (as of this morning, 5:15am EDT [= epoch]):

Mean altitude -- 356.1 km

Apogee height -- 361.7 km

Perigee height -- 350.5 km

Period -- 91.66 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0008274

Solar Beta Angle -- -35.2 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.71

Mean altitude loss in the last 24 hours -- 12 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55785

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/02/08 -- Progress M-64/29P undocking, from FGB nadir

09/07/08 -- ATV1 undocking, from SM aft port (loiter until 9/29 for nighttime reentry/observation)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft)

10/01/08 -- **NASA 50 Years** (official)

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 08/14/08

All ISS systems continue to function nominally, except those noted previously or below.

Upon wake-up, CDRB Volkov terminated his eighth MBI-12 SONOKARD experiment session for the long-term Russian sleep study, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

FE-2 Chamitoff started his day with the week-long experiment SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight), using the payload software for data logging and filling in questionnaire entries in the experiment's session file on the HRF-1 laptop. *[To monitor the crewmember's sleep/wake patterns and light exposure, Greg wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

Volkov and FE-1 Kononenko had about half an hour for cargo transfer activities from and to the ATV1 "Jules Verne" spacecraft. Based on an updated transfer list and return cargo schematics ("maps") as stowage guides, the activities include emptying dry cargo storage bags in the ATV and moving as many resupply items to the ISS as possible in the remaining time.

Later, Volkov and Kononenko also continued loading excessed equipment and trash in Progress M-64/29P.

In the JAXA Kibo JPM (JEM Pressurized Module), FE-2 Chamitoff made preparations for tomorrow's planned functional checkout #3 of the JEMRMS (Robotic Manipulator System), by –

- Activating the JEMRMS RLT (Robotics Laptop) to enable its new database uplinked earlier by controllers,
- Relocating SSC-14 (Station Support Computer 14) near the JEMRMS workstation and connecting it to the ISL (Integrated Station OpsLAN) via Ethernet cable for video ops during the checkout activities,
- Deactivating the RLT when the new database was enabled,
- Reconnecting the Robotics BDS (Backup Drive System) to the JEMRMS Bus Monitor laptop via cable from the BUC (Backup Controller),
- Connecting the BDS to UOP (Utility Outlet Panel) and configure it for BUC activation, and
- Conducting a DOUG review for the JEMRMS Checkout #3.

[Tomorrow's RMS checkout by Chamitoff will include a Manual Mode test, an EE (End Effector) test, a capture & release test of the JLP GF (JEM Logistics Pressurized Section/Grapple Fixture), and acquisition of data to characterize JEMRMS Limping Dynamics. Checkout #1 has been moved to September.]

Gregory also relocated the MMA (Microgravity Measurement Apparatus), removing its RSU (Remote Sensor Unit) from the Ryutai Rack AAA (Avionics Air Assembly) front surface and relocating the NCU (Network Control Unit), connected to the MLT (MMA Laptop Terminal), from the Saibo Rack to Ryutai.

In the ESA COL (Columbus Orbital Laboratory), the FE-2 worked on the FPEF (Fluid Physics Experiment Facility) to complete the assembly of the upcoming MS (Marangoni Surface) convection experiment (see yesterday's report for background details).

CDR Volkov, with FE-1 assisting, performed his first session of the Russian biomedical "Pilot-M"/NEURO experiment which he set up yesterday. The Pilot-M & Neurolab-2000M gear was left in place, to be used tomorrow by Oleg Kononenko.

[MBI-15 requires a table, ankle restraint system, electrodes, and two hand controllers (RUO & RUD) for testing piloting skill in "flying" simulations on a laptop (RSK1) under stopwatch control, as well as for studying special features of the psychophysiology response of cosmonauts to the effects of stress factors in flight.]

Kononenko conducted the periodic/long-term inspection of the SM RO (Service Module Working Compartment)'s pressure hull and ring, looking for any moisture, deposits, mold, corrosion and pitting behind panels 130, 134, 135, 138, 139, 454,

also underneath the TVIS treadmill (where deposit was discovered earlier) and the cold plates (where SNT and STR lines are installed). Last time done: 6/3. *[The inspection of the hull surface, which is coated with a primer and dark-green enamel, is done using cleaning napkins to wipe the area in question if required and reporting results to the ground. The hull inspection looks for changed color and cavities; if cavities are found, they are to be measured for depth (with chewing gum) after cleaning. Digital photographs of the shell before and after the removal of deposits were to be made for documentation.]*

After setting up the LULIN-ISS radiation complex yesterday for a 24-hr exposure period, Oleg today took readings from each of the four PILLE dosimeters and downlinked them successively, afterwards deactivating the equipment and closing out the activity.

Later, Kononenko also completed another radiation data monitoring & logging session for flux & dose rate data with the Matryoshka-R radiation payload (RBO-3-2) and its LULIN-5 electronics box. *[Accumulated readings were recorded on a log sheet for subsequent downlink to TsUP/Moscow via the BSR-TM payload data channel.]*

The COL "Cycle 11" software transition continues to go well. After performing stages 2 & 3 of the MMU (Mass Memory Unit) software load for the COL PWS-2 (Portable Work Station 2) laptop yesterday, Chamitoff today supported COL flight controllers in transitioning to Cycle 11 software by connecting & activating PWS-2 and assisting the ground with a TM & TC (telemetry & telecommanding) check.

[After the transition, COL will gradually be powered back on, including external payloads.]

Working on the Russian RSS-2 laptop, Sergey Volkov ran digital photo flash cards from stowage through a virus check with the Norton AntiVirus application.

Gregory conducted another one of the periodic offloadings of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling a CWC (Contingency Water Container, #1054) with the collected water slated for processing. No samples were required.

The FE-2 also completed the weekly 10-min. CWC inventory as part of on-going WRM (Water Recovery & Management) assessment of onboard water supplies.

[Updated "cue cards" based on the crew's water calldowns are sent up every other week. The current card (17-0002U) lists 34 CWCs (Contingency Water Containers, ~1314.1 L total) for the four types of water identified on board: technical water (535.2 L, for Elektron, flushing & hygiene, incl. 487.2 L flushing-only water because of Wautersia bacteria), potable water (706.7 L, incl. 174.6 L currently for flushing

only), condensate water (64.3 L), waste/EMU dump and other (7.9 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]

In the US Airlock (A/L), Chamitoff performed the yearly inspection of the SCU (Service & Cooling Umbilical) O₂ poppets on two EMUs (Extravehicular Mobility Units, #3018 & #3004) to verify they are secure. Afterwards, Greg dumped and filled the EMU feedwater tanks, a regular maintenance requirement for on-orbit stowage.

Greg's A/L activities included a checkout of an HHM (Hand-Held Microphone) connected to the ATU-6 (Audio Terminal Unit 6), with the Space-to-Space Radio and an EMU radio powered on. Good voice results were obtained.

CDR Volkov performed monthly maintenance on the deactivated Russian IK0501 GA (Gas Analyzer) of the SOGS Pressure Control & Atmospheric Monitoring System by replacing its CO₂ filter assembly (BF) with a new unit from FGB stowage (done last: 7/2), then reactivating the unit. The old filter was discarded.

Later, Sergey performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Volkov also took care of the routine daily servicing of the SM's SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Kononenko meanwhile conducted the periodic checkout/verification of IP-1 airflow sensors in the various RS (Russian Segment) hatchways, including the passageways SM PrK (Service Module Transfer Compartment)–ATV, PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1.

The crew performed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Sergey transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate

Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week). *[The wireless POLAR S810 HRMs resemble sports wrist watches, with some of their features. They display the heart rate as BPM (beats per minute) and % of HRmax, average HR plus exercise duration, along with 7 different exercise profiles. The HR is transmitted from an elastic belt around the chest to the wrist receiver for subsequent downloading to the MEC and analysis by special software. Receiver settings are also uploaded from the laptop.]*

Yesterday's scheduled OCA (Orbital Communications Adapter) checkout for the BCC HOSC (Backup Control Center/Huntsville Operations Support Center) setup, supported by Gregory, had to be deferred due to network configuration issues. The test, which is intended to verify OCA capabilities at the new BCC/Huntsville, was rescheduled for today for 2:15pm.

At ~3:25pm, Dr. Chamitoff also had his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop),

BCC Dry Run: Early this morning, starting at 1:00am EDT and running for seven hours, MCC-Houston and its Moscow support group (HSG) conducted another BCC (Backup Control Center) dry run in test mode, with no involvement of the ISS crew or vehicle, with TsUP playing back ACT (American Contingency Telemetry) from the last BCC Checkout as test. *[Purpose of this periodic exercise is to demonstrate BCC functionality under Russian assets while providing proficiency training for HSG personnel at the HSR (Houston Support Room) and TsUP-Moscow specialists. The ISS EMCC (Emergency Mission Control Center), located in Russia, comprises TsUP/Moscow as the Lead Control Center, coupled with HSR at TsUP. The BCC facility provides a command and control capability from TsUP if the EMCC must be activated. This is the case in situations that render MCC-Houston unable to provide telemetry, voice, and command capability for extended periods. EMCC is also used when the threat of severe weather results in evacuation of the MCC-H building for extended periods. In such an emergency, both Russian servers (CMD/command & TM/telemetry) are transitioned from MCC-H connectivity to BCC configuration, after which only the BCC can connect to the CMD and TM ports.]*

CEO (Crew Earth Observations) photo targets uplinked for today were **Teide Volcano, Canary Islands** (looking right of track for detailed images of the flanks and inner walls of the large and active Teide Volcano. This volcano makes up most of the island of Tenerife. Tenerife was perhaps observed in eruption by Christopher Columbus), **Santorini Volcanic Complex, Greece** (looking close to nadir for this circular set of islands. The Santorini volcanic eruption of 3,600 years ago may have

*led indirectly to the collapse of the Minoan civilization on the island of Crete, 110 km to the south, by releasing a gigantic tsunami. The eruption may be the source of the legend of Atlantis), and **Johnston Island reef, central Pacific** (this six-mile-long reef lied right of track. An airstrip occupies the small 2-mile-long island. Detailed images of the coral reef were requested).*

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Week 17/18 Main Activities:

- Fri. (8/15): MBI-15/Neuro ops, MBI-21/Pneumocard, JEMRMS checkout, CDMK check, VOA power down, 29P stow, KOB-1 maintenance.
- Sat. (8/16): SAMS Ghosting, Weekly house cleaning.
- Mon. (8/18): MO-7/MO-8 (all), BMP ch. 2 regen, MO-1, ATV transfers, SHERE session, RED + Accessories inspect, EMU Battery 2071 discharge (BSA Ops),
- Tue. (8/19): AED inspect, Initiate 85 Day Maint for EMU Battery 2071, VHF Emergency Comm Checkout, Rack Hardware Installation Prep, MO-9, NOAA1, CSA-CP maintenance, SSVP BZV docking & internal transfer system/screw clamps ops.
- Wed. (8/20): ANITA deactivation and stow, Ku-Band Forward Receiver Relocation & Checkout, Ground Strap/Pivot Fitting install in JPM, MO-10 (all), PFE-OUM setup & prep.

ISS Orbit (as of this morning, 8:16am EDT [= epoch]):

Mean altitude -- 356.1 km

Apogee height -- 361.5 km

Perigee height -- 350.7 km

Period -- 91.66 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0008059

Solar Beta Angle -- -32.9 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.71

Mean altitude loss in the last 24 hours -- 172 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55758

Significant Events Ahead (all dates Eastern Time, some changes possible.):

09/02/08 -- Progress M-64/29P undocking, from FGB nadir

09/07/08 -- ATV1 undocking, from SM aft port (loiter until 9/29 for nighttime reentry/observation)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft)
10/01/08 -- **NASA 50 Years** (official)
10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
10/11/08 -- Progress M-65/30P undocking (from SM aft)
10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT)
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at

ISS On-Orbit Status 08/13/08

All ISS systems continue to function nominally, except those noted previously or below.

FE-2 Chamitoff started his day with the week-long experiment SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight), using the payload software for data logging and filling in questionnaire entries in the experiment's session file on the HRF-1 laptop. *[To monitor the crewmember's sleep/wake patterns and light exposure, Greg wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

Upon wake-up, FE-1 Kononenko terminated his eighth MBI-12 SONOKARD experiment session for the long-term Russian sleep study, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. Sergey Volkov's new MBI-12 session starts tonight (~5:20pm). *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

Using the Russian PLASMA-ISS (KORONA) experiment, prepared yesterday, Oleg Kononenko had ~30 min to conduct measurement operations, recording images and spectra from the Soyuz TMA-12 surfaces during the ATV reboost firing. Later, the video cassette and memory flash card with spectrometer data were removed, camcorder & laptop turned off and the hardware dismantled for stowage. *[Using Russian Laptop 3 and the "Relaksatsiya" (Relaxation) spectrometer & video camera*

at SM (Service Module) window 9, the experiment registered luminosity values of the spacecraft surface from the plasma created by the thruster jets.]

After yesterday's successful replacement of all 36 treadmill RBAs (Roller Bearing Assemblies), CDR Volkov & Gregory Chamitoff today worked through the final steps of maintenance activities on the TVIS (Treadmill with Vibration Isolation & Stabilization) by completing activation and checkout of the treadmill along with a video filming of the a noise capture & speed characterization test to verify TVIS operation and ensure that the belt repair activity has resolved the contact noises. Afterwards, the crew was given the Go for TVIS operations by the ground.

Later, Chamitoff completed the regular monthly & quarterly TVIS maintenance, inspecting the condition of harnesses, belt slats, corner bracket ropes, IRBAs (Isolation Restorative Bungee Assemblies) and gyroscope wire ropes for any damage or defects, lubricating as required plus recording time & date values.

Continuing his preparations of payload operations in the JAXA JPM (JEM Pressurized Module), Gregory also completed the remaining two (of three) setups of the FPEF (Fluid Physics Experiment Facility) for the planned MS (Marangoni Surface) convection experiment by assembling FPEF MS core and cassette, checking them for leaks and completing FPEF MS assembly. *[In microgravity, fluids react differently to stresses when compared to the same stresses on Earth. Understanding the responses to the stressors allows for improved fluid flow models to be designed. Mass transfer on or in a liquid due to surface tension differences is called the Marangoni Effect (which, for example, stabilizes a soap film). The Marangoni convection experiment in the FPEF examines fluid tension flow in micro-G: first, a liquid bridge of silicone oil is formed into a pair of disks. Then, using temperature differences imposed on the disks, convection is induced causing the silicone oil to move and transition through different types of flows because of its fluid instability: successively from laminar to oscillatory, chaos, and turbulence flows as the driving force increases. The flow and temperature fields are observed in each stage and the transition conditions and processes are investigated.]*

In preparation for the upcoming Kibo JEMRMS (Robotic Manipulator System) checkout later this week, Greg disconnected the RLT (Robotics Laptop) from its RIP (Remote Interface Panel) and hooked it up the JEMRMS UOP (Utility Outlet Panel) after verifying that the MDP (Management Data Processor) was powered off.

In the COL (Columbus Orbital Laboratory, Gregory unlocked the FSL FCE (Fluid Science Laboratory/Facility Core Element) which he had secured on 8/8 with four locking bolts against the acceleration forces caused by this morning's ISS reboost.

In the SM, Oleg unstowed the LULIN-ISS radiation complex kit and set up its ICU

(Interface Control Unit, Russian: BUI) with four PILLE radiation dosimeters, connecting it to a power outlet (PPS-26) and RSE-Med laptop. The dosimeters were then activated for a duration of 24 hours. *[Done before on 6/20.]*

Kononenko also serviced the running Matryoshka-R (RBO-3-2) radiation payload which has taken over the ESA/RSC-Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS/ALC) with its Spectrometer (AST) and ALC equipment on DC1 panel 429. *[Oleg retrieved the ALC-949 PCMCIA (Portable Computer Memory Card International Adapter) from stowage, installed it for a checkout run of several minutes in the AST, then checked the card in the RSK-1 laptop, before re-inserting the #949 card into the AST PCMCIA slot for operation.]*

A major activity for the FE-2 today was to support the COL Cycle 11 software transition on the POCs (Portable Onboard Computers). *[Today's activity focused on PWS (Portable Workstation) A31p software partition transfers (4) to the MMU (Memory Mass Unit), disconnecting PWS-2 from the LAN (Local Area Network) and completing the reload on PWS-2 with the software upgrade from CD (compact disk). More to come tomorrow.]*

Chamitoff retrieved and stowed the four passive FMK (Formaldehyde Monitoring Kit) sampling assemblies deployed by him on 8/11 in the Lab (at P3, below CEVIS) and SM (at the most forward handrail, on panel 307), to catch any atmospheric formaldehyde on a collector substrate for subsequent analysis on the ground.

[Two monitors each are usually attached side by side, preferably in an orientation with their faces perpendicular to the direction of air flow.]

CDR Volkov unstowed and configured the Russian biomedical "PILOT-M"/NEURO experiment (MBI-15), which requires a table, operator ankle restraint system, electrodes, and two hand controllers (RUO & RUD) for testing piloting skill in "flying" simulations on the RSK1 laptop under stopwatch control, and Neurolab-2000M sensors. Operation of the experiment by Sergey is scheduled tomorrow, by Oleg on Friday.

The CDR also conducted ground tagup-supported checkout tests of the VShTV Wide-Angle Vertical Sighting Device on the television screen showing Earth terrain. Screen shots were then downlinked to the ground via OCA. *[Purpose of the routine VShTV tests was to verify proper operation and optical quality of the device after being exposed to spaceflight conditions over a long period.]*

The FE-1 performed another session of the Russian GFI-8 "Uragan" (hurricane) earth-imaging program, today "hard" scheduled, using the D2X digital camera with

the F800 telephoto lens, then immediately downlinking photographs via the BSR-TM channel. *[Uplinked target area was the upper section of the Inguri river valley in the Greater Caucasus Mountain Range from the mountain ridge to a hydropower plant to the south of Mt. Elbrus.]*
