Oleg also supported the BIO-5 Rasteniya-2 ("Plants-2") experiment, which researches growth and development of plants (peas) under spaceflight conditions in the Lada-13 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}), by checking up on status, monitoring the greenhouse, taking pictures and downloading them to the ground,

The CDR had another 1h 35m reserved for more trash/equipment transfers to Progress 29P and loading it aboard, keeping the IMS (Inventory Management System) updated with the disposal transfers.

Later, Sergey performed the daily IMS maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Meanwhile, the FE-1 took care of the routine daily servicing of the SM's SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Oleg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~10:25am EDT, Dr. Chamitoff supported live interactive PAO interviews of ~10 minutes each with two clients, - KRIV-TV, Houston, TX and The Pearland Journal, Pearland, TX.

At ~12:05pm, Gregory powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply) and at 12:10pm conducted a ham radio exchange with young campers at the Summer Playground Camp of the town of Berkeley Heights, NJ. *[Berkley Heights sponsors an annual summer playground camp at one of the town's parks. Each year the*

New Providence Amateur Radio Club sets up its station, N2 XJ, at the camp as an educational opportunity for the children attending the camp. The camp is open to all grades of school students, but most campers are in grades from kindergarten to sixth grade. Questions to the crew were uplinked beforehand. "Do you have any plants growing on the Space Station, and can you bring them back to Earth to study them?"; "Have you ever worked with a female astronaut?"; "What can a girl do to become an astronaut?"; "Have you done a spacewalk, and what is it like?"; "I've heard that Jeff Williams liked spicy foods in space. Do you have the same experience?"; Can you see an eclipse from the Space Station despite the station's high speed?"; "Can you see aurora from the Space Station?"; "How do you eat and drink while floating?"; "Can you see meteors from the Space Station, and do they look the same as here on Earth?"; "Do you think that children will go into space someday?"; "Will you be home in time to vote, and what state do you vote in?"

At ~3:10pm, the FE-2 supported a real-time audio/video & software checkout of the new BCC (Backup Control Center) setup at the HOSC (Huntsville Operations Support Center). Gregory is required only to check out the NetMeeting SSC (Station Support Computer) portion, including a short video exchange with the ground.

ATV Reboost Update: The ISS reboost with two ATV1 "Jules Verne" OCS (main propulsion) thrusters was successful. The maneuver started this morning at 3:58am EDT for 16 min 35 s and completed nominally. Actual Delta-V was 3.3 m/s vs. 3.3 m/s (10.8 ft/s) planned, resulting in a mean altitude increase of 5.8 km (3.1 nmi), as planned. The reboost consumed 325.4 kg of propellant for the maneuver and 195 kg of propellant for attitude control. Purpose of the maneuver was altitude maintenance and to set up phasing for upcoming visiting vehicles. *"Bon spectacle, Monsieur Verne!"*

CEO (Crew Earth Observations) photo targets uplinked for today were **Santorini Volcanic Complex, Mediterranean** (*Santorini [aka Thera], with its steep-walled caldera rim, is easy to detect from low earth orbit as a circular island group—looking left of track after crossing the large Mediterranean island of Crete. Santorini is composed of overlapping shield volcanoes cut by at least four partially overlapping collapse calderas. The youngest caldera formed about 3600 years BP during the Late-Bronze-Age that forced abandonment of the thriving island. Subsequent eruptions occurred in 197 BC, 1650 AD [submarine eruption] and 1950*), **Tropical depression Hernan, E. Pacific** (*Dynamic event. This well structured storm may still have been photogenic when ISS passed by to the east*), **Mauna Loa, Hawaii** (*detailed images left of track of volcanic features on the crest and flanks of the largest volcano on Earth are requested. Mauna Loa comprises most of the island of Hawaii, and rises 56,000 feet from its base on the sea floor, with 13,680 feet visible above sea level. Mauna Loa is among Earth's most active volcanoes, having*

*erupted 33 times since its first well-documented historical eruption in 1843. Its most recent eruption was in 1984), and **Andrews Forest, Oregon** (nadir pass. Detailed, overlapping images at nadir acquired this target. Documentation of seasonal vegetation change is the rationale for this LTER [Long Term Ecological Research] site on the slopes of the Cascade Range in Oregon).*

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Remaining Week 17 Main Activities:

- Thurs. (8/14): MBI-15/Neuro ops, JAXA JEMRMS checkout review, 29P stow, COL Cycle 11 software transition.
- Fri. (8/15): MBI-15/Neuro ops, MBI-21/Pneumocard, JEMRMS checkout, CDMK check, VOA power down, 29P stow, KOB-1 maintenance.
- Sat. (8/16): SAMS Ghosting, Weekly house cleaning.

ISS Orbit (as of this noon, 12:12pm EDT [= epoch]):

Mean altitude -- 356.3 km

Apogee height -- 362.3 km

Perigee height -- 350.2 km

Period -- 91.67 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0008987

Solar Beta Angle -- -30.2 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.71

Mean altitude gain in the last 24 hours -- 5800 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55758

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

09/02/08 -- Progress M-64/29P undocking, from FGB nadir

09/07/08 -- ATV1 undocking, from SM aft port (loiter until 9/29 for nighttime reentry/observation)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft)

10/01/08 -- **NASA 50 Years** (official)

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?

11/10/08 -- STS-126/Endeavour/ULF2 launch -- MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 08/12/08

All ISS systems continue to function nominally, except those noted previously or below.

FE-2 Chamitoff started his day with the week-long SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment, using the payload software for data logging and filling in questionnaire entries in the experiment's session file on the HRF-1 laptop. *[To monitor the crewmember's sleep/wake patterns and light exposure, Greg wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

FE-1 Kononenko serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out"-to-vacuum cycle on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated tonight at ~4:15pm EDT. Filter bed #1 was regenerated yesterday. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently to remove any lingering Freon-218 from the cabin atmosphere (last time done: 7/28 & 7/30).]*

CDR Volkov & Gregory Chamitoff performed Day 2 maintenance activities on the TVIS (Treadmill with Vibration Isolation & Stabilization), removing and replacing the remaining RBAs (Roller Bearing Assemblies), 36 total, and checking out the treadmill. *[Yesterday's task of manufacturing and installing a tread belt patch was successfully accomplished, after some initial problems in getting the correct running torque settings after re-installing the belt slats. Today, the CDR & FE-2 finished the RBA R&R and returned the belt and chassis to the original configuration. Afterwards, the two crewmembers were to run a Noise Capture & Speed Characterization Test similar to the activity performed on 7/29 during TVIS]*

troubleshooting. This data will be used to compare to the first video once the maintenance is complete.]

Kononenko completed the periodic collection of air samples in the SM (Service Module) & FGB using the AK-1M sampler kit, recording date, time & location. A second sample for Freon-210 was taken in the SM with the AK-1M-F. Kits and pouches were then restowed.

Afterwards, the FE-1 also conducted the periodic atmospheric sampling in the center of the Lab, SM and JPM (JEM Pressurized Module) with the U.S. GSC (Grab Sample Container). *[GSC #1041 was not to be used.]*

Working briefly on the Matryoshka-R (RBO-3-2) radiation payload, which includes the ESA/RSC-Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS/ALC) with its Spectrometer (AST) and ALC equipment, Kononenko turned off the AST, checked out its PCMCIA (Portable Computer Memory Card International Adapter) card ALC-953 on the RSK-1 laptop and then downlinked the zipped data file via OCA. The AST was not reactivated.

Later, Oleg had another 1h 45m reserved for more trash/equipment transfers to Progress 29P and loading it aboard, keeping the IMS (Inventory Management System) updated with the disposal transfers.

In preparation for tomorrow morning's ISS reboost with the ATV (Automated Transfer Vehicle) "Jules Verne", the FE-2 supported SAMS (Space Acceleration Measurement System) ground commanding by activating its ICU (Interim Control Unit) in Rack LAP2/Drawer 1. *[The reboost is scheduled tomorrow at 3:58am EDT, for 16min 35 sec. SAMS acquires acceleration data relevant to characterization of the dynamic vibratory environment on the ISS.]*

Also for the reboost maneuver, Kononenko unstowed the PLASMA-ISS hardware and installed it at SM window #9 and aligned its sight for the KORONA experiment, which will record the luminosity of the surface of the Soyuz TMA-12 during the ATV reboost thruster (KD) firing. Oleg will be operating the equipment during the firing. *[Plasma-ISS uses a UV (ultraviolet) camera, spectrometer (SP), camcorder (VS) with a video cassette, and accessories, mounted on a bracket adapter.]*

To protect the science windows of the JAXA JPM and U.S. Lab from the thruster blast, Greg Chamitoff closed their external shutters.

Kononenko performed the routine daily servicing of the SM's SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities,*

replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

The FE-1 also completed the daily IMS maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-1, FE-2) and RED resistive exercise device (CDR, FE-1, FE-2). Later, Oleg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

The crew is having their regular periodic PMCs (Private Medical Conferences) via S- & Ku-band audio/video, Oleg at ~10:00am, Sergey at ~1:25pm, Greg at ~4:05pm EDT.

At ~4:45pm, Chamitoff is also scheduled for his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop),

At ~5:20pm EDT, just before sleep time, the FE-1 will again set up the Russian MBI-12 SONOKARD (Sonocard) payload and start his eighth experiment session, using a sports shirt from the SONOKARD kit with a special device in the pocket for testing a new method for acquiring physiological data without using direct contact on the skin. Measurements are recorded on a data card for return to Earth.

[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]

A new discretionary task added on the U.S. “job jar” list for Greg Chamitoff for today is to work on the Columbus Biolab Incubator (BLB INC), removing WAICO-1 (Waving & Coiling of Arabidopsis Roots at Different g-levels) experiment containers (ECs) from Rotor B and to install & remove Reference ECs.

VolSci Program Preview: For the weekend of 8/16, Gregory was offered three choices for the Voluntary Weekend Science program: (1) SHERE (Shear History

Extensional Rheology Experiment) science runs in the CGBA; (2) an “operations improvement” session with SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellites) with all three satellites; and (3) a Space Careers Demo EPO (Education Payload Operations), creating an educational video discussing different careers found at NASA, to be used to produce an educational product to enhance existing education resources for students in grades 9-12.

SPDM Checkout Update: Ground-commanded checkout activities of the Special Purpose Dexterous Manipulator (SPDM) continued today, including a Brake Run-In Test. *[Yesterday, controllers checked the FMS (Force Moment Sensors) on both OTCMs (On-orbit Tool Change-out Mechanisms), as well as the OTCM gripper and socket advance mechanism using manual hard stop commands, a check of the gripper, socket advance and torquer mechanisms using the BDU (Back-up Drive Unit) in low and high voltage modes and a check of the brakes on all the joints on both arms.]*

ATV1 Reboost: Tomorrow’s ISS reboost by two of the four ATV main engines is scheduled for a TIG (Time of Ignition) of 3:58am EDT. Burn duration: 16 m 35 s, to yield a delta-V of 3.3 m/s (10.8 ft/s). The expected altitude gain (delta-H) is 5.8 km (3.1 nm). Purpose of the reboost is for altitude maintenance and to set up phasing for upcoming visiting vehicles.

KURS Test: TsUP/Moscow has scheduled a test today of both strings of the KURS automated rendezvous radio command system for the FGB port, in preparation for the Progress M-64/29P undocking on 9/2.

CEO (Crew Earth Observations) photo targets uplinked for today were **Mt. Etna, Sicily** (*looking left for Etna volcano which is almost always smoking*), and **Yellowstone National Park, Wyoming** (*Greg was to shoot overlapping nadir views of the park where trails are being mapped*).

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Remaining Week 17 Main Activities:

- Wed. (8/13): ATV reboost, FMK stow, TVIS quarterly maintenance, Columbus Cycle 11 software transition, Plasma-ISS experiment, JAXA FPEF setup, 29P stow.
- Thurs. (8/14): MBI-15/Neuro setup, JAXA JEMRMS checkout review, 29P stow.
- Fri. (8/15): MBI-15/Neuro, MBI-21/Pneumocard, JEMRMS checkout,

CDMK check, VOA power down, 29P stow, KOB-1 maintenance.

- Sat. (8/16): SAMS Ghosting, Weekly house cleaning.

ISS Orbit (as of this morning, 8:57am EDT [= epoch]):

Mean altitude -- 350.4 km

Apogee height -- 357.4 km

Perigee height -- 343.3 km

Period -- 91.55 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0010433

Solar Beta Angle -- -27.0 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.73

Mean altitude loss in the last 24 hours -- 85 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55740

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

08/13/08 -- ATV Reboost (~3:58am EDT, 3.3 m/s delta-V)

09/02/08 -- Progress M-64/29P undocking, from FGB nadir

09/07/08 -- ATV1 undocking, from SM aft port (loiter until 9/29 for nighttime reentry/observation)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft)

10/01/08 -- **NASA 50 Years** (official)

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?

11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking

02/26/09 -- STS-119/Discovery/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch

03/27/09 -- Soyuz TMA-14/18S docking (DC1)

04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Attachments:

ISS On-Orbit Status 08/11/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 17 of Increment 17.*

FE-2 Chamitoff started out with his second week-long session of the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment, using payload software for data downloading and filling in questionnaire entries in the experiment's session file on the HRF-1 laptop. *[To monitor the crewmember's sleep/wake patterns and light exposure, Greg wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

FE-1 Kononenko performed the periodic service of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The process will be terminated at ~5:15pm EDT and Bed #2 regeneration completed tomorrow. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently to remove any lingering Freon-218 from the cabin atmosphere (last time: 8/5&6)];*

Volkov & Chamitoff had several hours set aside for working through a major two-day IFM (Inflight Maintenance) on the TVIS treadmill, first to repair the torn tread belt with an improvised patch & shim and later to undertake the periodic R&R (removal & replacement) of the TVIS roller bearings. *[During their TVIS chassis inspection on 8/1, the crew discovered a one-inch tear in the tread belt on the port edge. This necessitated repair since a torn belt could raise a belt slat resulting in a tread belt jam and subsequent motor box failure. A procedure was developed on the ground for a patch to be created and installed on both sides of the belt and for a hole to be punched at the end of the tear. Shims were then to be added to the rear*

and forward deck so that the likelihood of the belt slats, with patch installed, scraping the deck is minimized.]

The FE-2 also completed the periodic deployment of four passive FMK (Formaldehyde Monitoring Kit) sampling assemblies in the Lab (at P3, below CEVIS) and SM (at the most forward handrail, on panel 307) for two days, to catch any atmospheric formaldehyde on a collector substrate for subsequent analysis on the ground. *[Two monitors each are usually attached side by side, preferably in an orientation with their faces perpendicular to the direction of air flow.]*

FE-1 Kononenko set up the hardware for the Russian MBI-21 PNEVMOKARD experiment and conducted the session, his third, which forbids moving or talking during data recording. The experiment is controlled from the RSE-Med A31p laptop, equipped with new software, and uses the TENZOPLUS sphygmomanometer to measure arterial blood pressure. *[PNEVMOKARD (Pneumocard) attempts to obtain new scientific information to refine the understanding about the mechanisms used by the cardiorespiratory system and the whole body organism to spaceflight conditions. By recording (on PCMCIA cards) the crewmember's electrocardiogram, impedance cardiogram, low-frequency phonocardiogram (seismocardiogram), pneumotachogram (using nose temperature sensors), and finger photoplethysmogram, the experiment supports integrated studies of (1) the cardiovascular system and its adaptation mechanisms in various phases of a long-duration mission, (2) the synchronization of heart activity and breathing factors, as well as the cardiorespiratory system control processes based on the variability rate of physiological parameters, and (3) the interconnection between the cardiorespiratory system during a long-duration mission and the tolerance of orthostatic & physical activities at the beginning of readaptation for predicting possible reactions of the crewmembers organism during their return to ground.]*

In preparation for the first Japanese payload activity, a JAXA Educational Payload Operation (EPO) session, Gregory unstowed and set up the Microgravity Clay Experiment (MCE) in the Kibo JPM (JEM Pressurized Module), attaching the MCE box on the CBEF (Cell Biology Experiment Facility) micro-G door and forming clay in a human shape, while videotaping the activity.

Also in the JPM, Greg Chamitoff completed the first (of three) setups of the FPEF (Fluid Physics Experiment Facility) for the planned Marangoni Surface experiment by readying the MWA (Maintenance Work Area) for operation.

Meanwhile, Oleg performed routine preventive maintenance in the Soyuz TMA-12/16S by cleaning the screen of the BVN fan/heater assembly in the spacecraft's Orbital Module (BO) at the DC1 nadir port.

Later, Kononenko took the periodic readings of potentially harmful atmospheric contaminants in the SM (Service Module), using the CMS (Countermeasure System), a component of the GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, which uses preprogrammed microchips to measure H₂CO (Formaldehyde, methanal), CO (Carbon Monoxide) and NH₃ (Ammonia), taking one measurement per microchip.

The FE-1 also had 2h 15m set aside for more trash/equipment transfers to Progress 29P and loading it aboard, guided by an uplinked cargo transfer list and stowage map to ensure proper center-of-gravity positioning for post-undocking control.

The FE-2 had 1h 20m reserved for transferring and unpacking cargo delivered on the ATV-1 (Automated Transfer Vehicle).

Kononenko performed the routine daily servicing of the SM's SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Oleg also completed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-1, FE-2), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Kononenko transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~2:20pm EDT, the crew will convene for their standard bi-weekly teleconference with the JSC Astronaut Office (Steve Lindsey), via S-band S/G-2 audio & phone patch.

Working from the Russian discretionary "time permitting" task list, the FE-1 conducted the regular status check on the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (peas) under

spaceflight conditions in the Lada-13 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}).

JAXA CGSE Update: On 8/8, when the CBEF internal solenoid valves supplying CO₂ (carbon dioxide) to the incubator were opened & closed, an anomalous pressure drop was observed which may indicate a potential CO₂ leak of the CGSE (Common Gas Support Equipment). Investigation is underway on the ground. In case of an actual leak, the volume of gas in the bottles is very small and would not bring the atmosphere to the toxic limit; also, with the cabin ventilation running, any hazard from this leak is controlled. There is no impact on payload operations until end of Inc-17 since no experiment requiring CO₂ is planned in this Increment.

[CBEF is a CO₂ gas incubator with controlled temperature and humidity, to be used for various life science experiments such as cultivating cells, plants, and so on in the JPM. It consists of an incubator and control equipment for CBEF control & communication.]

SPDM Checkout Update: Postponed from last week (8/5-6), the ground-commanded checkout of the Special Purpose Dexterous Manipulator “Dextre” today and tomorrow focuses on OTCM (ORU Tool Mechanism) socket in manual & automatic mode. *[Checkout steps are in summary: (1) Pre-motion survey using ISS and SPDM cameras to verify SPDM arm & body workspace prior to ground control operations, (2) ground-controlled positioning of OTCM1 & OTCM2 in view of the SPDM CLPA2 (Camera, Light & Pan/Tilt Assembly 2) to allow controllers to observe OTCM mechanism motion, (3) calibration of the OTCM mechanisms in preparation for checkout, and (4) performing OTCM mechanism checkout in automatic mode.]*

O₂ Repress Update: The repress last Friday (8/8) added 7 mmHg partial pressure of oxygen from Progress M-64/29P to the cabin atmosphere.

TsVM Update: Lane 3 of the Russian Central Computer in the SM failed over the weekend. The other two lanes are up and nominal. Teams are analyzing.

COL Update: The data of the first GEOFLOW experiment run in the Columbus laboratory are on the ground. Engineers are still working to resolve an issue with the insertion of a tape in the FSL (Fluid Science Laboratory).

Kibo Commissioning Update: Successfully completed by Gregory Chamitoff were MMA (Microgravity Measurement Apparatus) checkout, RYUTAI and SAIBO rack installation & check out, and JEMRMS (Robotic Manipulator System) Backup Drive checkout. JEMRMS main arm checkout is planned later this week.

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Remaining Week 17 Main Activities:

- Tues. (8/12): TVIS roller bearing R&R, TVIS speed characterization, SPDM "Dextre" ops, BMP regen, 29P stow.
- Wed. (8/13): FMK stow, TVIS quarterly maintenance, ATV reboost, Columbus Cycle 11 software transition, Plasma-ISS experiment, JAXA FPEF setup, 29P stow.
- Thurs. (8/14): MBI-15/Neuro setup, JAXA JEMRMS checkout review, 29P stow.
- Fri. (8/15): MBI-15/Neuro, MBI-21/Pneumocard, JEMRMS checkout, 29P stow, KOB-1 maintenance.

ISS Orbit (*as of this morning, 6:39am EDT [= epoch]*):

Mean altitude -- 350.5 km

Apogee height -- 357.5 km

Perigee height -- 343.4 km

Period -- 91.55 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0010419

Solar Beta Angle -- -23.6 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.73

Mean altitude loss in the last 24 hours -- 76 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55722

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

08/13/08 -- ATV Reboost (~3:30am EDT, 3.45 m/s delta-V)

09/02/08 -- Progress M-64/29P undocking, from FGB nadir

09/07/08 -- ATV1 undocking, from SM aft port (loiter until 9/29 for nighttime reentry/observation)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft port)

10/01/08 -- **NASA 50 Years** (official)

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?

11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 08/10/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – rest day for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff. Ahead: Week 17 of Increment 17.*

FE-2 Chamitoff had three hours reserved for the regular weekly station cleaning in the USOS (US Segment) which wasn't scheduled yesterday alongside the RS (Russian Segment) "uborka" housecleaning by his two crewmates.

For CDR Volkov, it was time again for the recharging of the Motorola Iridium-9505A satellite phone brought up on Soyuz 16S, a monthly routine job and his fourth time.

[After retrieving it from its location in the TMA-12/16S descent module (BO), Sergey initiated the recharging of its lithium-ion battery, monitoring the process every 10-15 minutes as it took place. Upon completion at ~12:55pm, the phone was returned inside its SSSP Iridium kit and stowed back in the BO's operational data files (ODF) container. The satphone accompanies returning ISS crews on Soyuz reentry & landing for contingency communications with SAR (Search-and-Rescue) personnel after touchdown (e.g., after an "undershoot" ballistic reentry, as happened during the recent 15S return). The Russian-developed procedure for the monthly recharging has been approved jointly by safety officials. During the procedure, the phone is left in its fire-protective fluoroplastic bag with open flap. The Iridium 9505A satphone uses the Iridium constellation of low-Earth orbit satellites to relay the landed Soyuz capsule's GPS (Global Positioning System) coordinates to helicopter-borne recovery crews. The older Iridium-9505 phones were first put onboard Soyuz in August 2003. The newer 9505A phone, currently in use, delivers 30 hours of standby time and three hours of talk, up from 20 and two hours, respectively, on the older units.]

FE-1 Kononenko completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including the weekly collection of the toilet flush (SP) counter and water supply

(SVO) readings for calldown to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The FE-1 also checked up on the Russian POTOK-150MK (150 micron) decontamination filter unit of the SM's SOGS air revitalization subsystem, gathering weekly data on Total Operating Time & "On" durations for reporting to TsUP-Moscow.

As generally every day now, starting at ~9:00am and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) was activated intermittently for two half-cycles to control ppCO₂ levels. In this configuration for the daily ops, connecting & disconnecting the ITCS cooling loop is not required. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking.]*

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-1, FE-2), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1).

A voluntary task for Gregory and Sergey for today was to print out and review uplinked procedures for tomorrow's and Tuesday's TVIS treadmill repair.

Working off his suggested "time permitting" task list, Volkov conducted another session for Russia's Environmental Safety Agency (EKON), making observations and taking KPT-3 aerial photography with the NIKON D2X camera of environmental conditions near the Baikonur launch site and Lake Balkash.

Also working from the Russian discretionary task list, Oleg Kononenko conducted another session of the Russian GFI-8 "Uragan" (hurricane) earth-imaging program, using the D2X digital camera with the F800 telephoto lens and the HVR-Z1J SONY video camera. *[Uplinked target areas were oil contamination of the Caspian sea surface and drilling platforms near the Dagestan shore, the coastal strip of the Aral Sea in overlapping shots, the Ob and Bia river valleys, forest conditions (logging & burnt out areas) near populated areas in the Altai and Sayan mountains in nadir, the Irkut river valley from the northern point of Lake Hubsugul to the south point of Lake Baikal, the confluence of the Desna tributaries with the Desna river falling into the Dnepr river near Kiev, gully and ravine landscapes of Central Russia up to Volga river, the steppe on the left shore of the Volga river to the south of Saratov (Y. A. Gagarin's landing site) in nadir, and former Soviet Army firing ranges in Germany and coal pits after reclamation.]*

A third activity suggested on the “time permitting” job roster for Oleg was another run of the Russian DZZ-2 "Diatomeya" ocean observations program, using the NIKON-F5 DCS still camera and the HDV (high-definition) video camcorder from SM window 8 for ~20 min to record high production water areas for obtaining data on color field composition in dynamic regions of the ocean and in near-estuary areas of large rivers, plus the current cloud cover above these waters, its rating, and special forms of cloud formation. *[Uplinked target zones in the Atlantic Ocean were the coastal areas of Brazil and Panama, the Strait of Gibraltar and the offshore area of Great Britain.]*

Also working from the discretionary task list, the FE-1 conducted the regular status check on the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (peas) under spaceflight conditions in the Lada-13 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}).

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this “Gateway” website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Week 17 Main Activities:

- Mon. (8/11): TVIS belt maintenance, TVIS roller bearing R&R, SPDM “Dextre” ops, FMK deploy, BMP regen, MBI-21/Pneumocard, 29P stow.
- Tues. (8/12): TVIS roller bearing R&R, TVIS speed characterization, SPDM “Dextre” ops, BMP regen, 29P stow.
- Wed. (8/13): FMK stow, TVIS quarterly maintenance, ATV reboost, Columbus Cycle 11 software transition, Plasma-ISS experiment, JAXA FPEF setup, 29P stow.
- Thurs. (8/14): MBI-15/Neuro s/u, JAXA JEMRMS ops review, 29P stow.
- Fri. (8/15): MBI-15/Neuro, MBI-21/Pneumocard, JEMRMS ops, 29P stow, KOB-1 maintenance.

ISS Orbit *(as of this morning, 6:16am EDT [= epoch]):*

Mean altitude -- 350.5 km

Apogee height -- 357.5 km

Perigee height -- 343.5 km

Period -- 91.55 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0010381

Solar Beta Angle -- -19.9 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.73

Mean altitude loss in the last 24 hours -- 55 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 55707

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

08/13/08 -- ATV Reboost (~3:30am EDT)
09/02/08 -- Progress M-64/29P undocking, from FGB nadir
09/07/08 -- ATV1 undocking, from SM aft port (loiter until 9/29 for nighttime reentry/ observation)
09/10/08 -- Progress M-65/30P launch
09/12/08 -- Progress M-65/30P docking (SM aft port)
10/01/08 -- **NASA 50 Years** (official)
10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT)
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/25/08 -- Progress M-65/30P undocking & deorbit
11/26/08 -- Progress M-66/31P launch
11/30/08 -- Progress M-66/31P docking
02/09/09 -- Progress M-66/31P undocking & deorbit
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/24/09 -- STS-119/Discovery/15A undocking
02/26/09 -- STS-119/Discovery/15A landing (nominal)
03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 08/09/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – mostly off duty for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff.*

The crew performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the SM (Service Module) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

As part of the house cleaning, the crew also conducted regular maintenance inspection & cleaning on fan grilles in the FGB (TsV2) and SM (VPkhO, VPrK) plus in the COL (Columbus Orbital Laboratory).

For today's VolSci (Voluntary Weekend Science) program, another session with SHERE (Shear History Extensional Rheology Experiment), FE-2 Chamitoff –

- Activated the MSG (Microgravity Science Glovebox),
- Powered on the SHERE hardware,
- Accessed the CGBA (Commercial Generic Bioprocessing Apparatus) to install the SHERE FM (Fluid Module) #8,
- Supported the first SHERE experiment run (Test Point 15),
- Transferred the module with the fluid sample,
- Installed FM #11 for the second experiment run (Test Point 25) ,
- Removed the FM from the CGBA, followed by SHERE data transfer,
- Turned off the SHERE/CGBA equipment,
- Transferred the data files to the MSG laptop, and
- Powered down the MSG.

[Background: Rheology is the study of the deformation and flow of matter under the influence of an applied stress which might be, for example, a shear stress or extensional stress. In practice, rheology is principally concerned with extending the "classical" disciplines of elasticity and (Newtonian) fluid mechanics to materials whose mechanical behavior cannot be described with the classical theories. SHERE is designed to study the effect of preshear on the transient evolution of the microstructure and viscoelastic tensile stresses for monodisperse dilute polymer solutions in the MSG. Collectively referred to as "Boger fluids," these polymer solutions have become a popular choice for rheological studies of non-Newtonian fluids and are the non-Newtonian fluid used in this experiment. The SHERE hardware consists of the Rheometer, Camera Arm, Interface Box, Cabling, Keyboard, Tool Box, Fluid Modules, and Stowage Tray.]

The FE-2 performed another standard calibration on the new CSA-O₂ (Compound Specific Analyzer-Oxygen) units #1043 & #1059, delivered on 1J.

Supporting ground-commanded commissioning preparations in the JAXA Kibo JPM (JEM Pressurized Module), Gregory turned off power output from the Saibo & Ryutai Rack UDCs (Utility DC-to-DC Converters) to the MMA NCU & RSUs (Microgravity Measurement Apparatus/Network Control Unit & Remote Sensor Units), then deactivated the NCU/RSUs themselves.

FE-1 Kononenko completed the routine daily servicing of the SM's SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The FE-2 took measurements for the regular atmospheric status check for ppCO₂ (Carbon Dioxide partial pressure) in the Lab, SM (at panel 449) and COL, using the hand-held CDMK (CO₂ Monitoring Kit, #1002). *[The battery pack was to be replaced with the one from unit #1009 if necessary. Purpose of the 5-min activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements. Greg's CDMK reading in the SM was 0.49; in Lab 0.46, and in COL 0.50.]*

Gregory also filled out the regular FFQ (Food Frequency Questionnaire), his ninth, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The*

FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-1, FE-2), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Greg transferred the exercise data file to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~10:15am EDT, the crewmembers conducted their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP-Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

The two cosmonauts had their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop), Oleg at ~6:30am, Sergey at ~8:10am.

Working off his suggested "time permitting" task list, Volkov conducted another session for Russia's Environmental Safety Agency (EKON), making observations and taking KPT-3 aerial photography with the NIKON D2X camera of environmental conditions near Tskhinvala and the Baikonur launch site.

Also working from the discretionary task list, Oleg Kononenko conducted another session of the Russian GFI-8 "Uragan" (hurricane) earth-imaging program, using the D2X digital camera with the F800 telephoto lens and the HVR-Z1J SONY video camera. *[Uplinked target areas were glaciers on the north slope of the main Caucasus Ridge, the Dombai region, after-effects of border conflict operations in the Caucasus, the Kalmyk steppe, the main stem stream of the Volga river (west-most) from Astrakhan to Caspian Sea, a series of overlapping shots of the Ob and Bia river valleys (Bia river head stream, Teletsk lake, confluence of Katun and Bia rivers form Ob river), general photography of Carpathian region on both sides of track and of the river valleys in Moldova, gully and ravine topography of Central Russia up to Volga river, steppe on the left shore of Volga river to the south of Saratov including Y. A. Gagarin's landing site in nadir, petroleum deposits along both shores of the Ural river and oil drilling fields, former Soviet Army fire ranges in Germany and coal pits after reclamation, scenic shots of Central America and Caribbean basin for educational purposes, and the Gulf Stream.]*

Weekly Science Update (*Expedition Seventeen -- Week 16*)

3-D SPACE: In progress.

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):

Measurements continue in FGB module. Last memory card exchange and data downlink have been successfully performed on 8/4.

ANITA (Analyzing Interferometer for Ambient Air): Continuing.

BCAT-3 (Binary Colloidal Alloy Test 3): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System):

Samples returned on 1J.

CSI-2/CGBA-5 (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus 5): Continuing.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): EuTEF platform is nominal, with temperatures now steadily reaching normal levels after high beta angles period. A DHPU (Data Handling Processing Unit) software patch is currently being developed to fix the link error issues encountered with DEBIE-2 and FIPEX instruments. - DEBIE-2: Instrument Operations Procedures (IOP's) performed for 24hrs duration, from 8/2 to 8/5. Generic status: link error still in work. However a

work-around allows for regular science data acquisition using an on-board IOP, but not yet in conjunction with any FIPEX IOP – a final software patch, which will enhance the present instrument capabilities, is under finalization on ground; - DOSTEL: On-going science acquisition; - EuTEMP: Currently inactive as planned; - EVC: Activities pending for 8/7; - EXPOSE: On-going science acquisition; - FIPEX: Science acquisition from 7/30 to 8/2. New FIPEX IOP started on 8/6 for 2.5 days; - MEDET: Continuous science acquisition since 7/30; - PLEGPAY: Currently in READY mode, no science data acquisition on-going; - TRIBOLAB: The instrument is currently in Stand-By Mode. The Ball-Bearing experiment would be restarted towards mid-Aug (i.e. Week#18). Analysis is on-going on ground.

FSL (Fluid Science Laboratory): FSL is back. Further FSL commissioning activities remain to be done (see following item).

GEOFLOW: On 8/5, Greg managed to fix the FSL Feedthrough Panel minor problem which prevented the continuation of activities since 7/28. On 8/6, the GEOFLOW EC (Experiment Container) check-out tests have been performed flawlessly. On 8/7, the very first Science Run was performed – exciting times! Thanks a lot, Greg, for your great help to fix FSL mechanical setup.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Planned.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 “Pirs”.

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer, ESA): In progress.

NUTRITION w/REPOSITORY: In progress.

PADLES (Passive Dosimeter for Lifescience Experiment in Space): In progress.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems):
Ongoing.

SAMPLE: Complete.

SHERE (Shear History Extensional Rheology Experiment): In progress.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): “Greg, thanks for completing your Actiwatch download initialization session. We are targeting next week, the 11th–17th, for your second week of Sleep logging. Thanks for your participation.”

SOLAR (Solar Monitoring Observatory): Present Sun observation window started on 7/31 and will continue until 8/12. All the instruments are nominal, and 2 criss-cross manoeuvres have been successfully performed on 8/4 and 8/6 (GMT219), respectively. - SOVIM: Sun irradiance measurements on-going during Sun observation window; - SOLSPEC: Solar mode and Lamps calibration measurements on-going on a daily basis during Sun observation window; - SOLACES: Sun measurements on-going with the various spectrometers (with and without Ionization Chambers).

SOLO: Planned.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite):
In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): A troubleshooting plan has been developed to recover all the BIOLAB functionalities. On 8/4, BIOLAB has been activated from ground for about 5 hours, in order to get telemetry about the Smoke Detector sensor and perform a series of BIT (Built-In

Test) sequences. This test was positive and we can confirm the full functionality of the Smoke Detector sensor. Next steps will be resumed in the next coming weeks, starting with the BIOLAB Rotor A bellow test (ground only) and later on the remaining WAICO-#1ECs (Experiment Containers) will be disposed and replaced by 6 Reference ECs on Rotor B. Planning for this last activity is currently TBD.

CEO (Crew Earth Observations): Through 8/4 the ground has received a total of 4,002 frames of CEO images for review and cataloging. Photos this week had camera times corresponding to target list times for the following requests: Western Pamirs (34 frames-hazy, soft), Mount Rainier (single frame-clouds), Coast Mountains (10 frames of target area-mostly cloudy), and Slate Island Impact Crater (single frame-target not acquired). "Preliminary review indicates that we will require additional imagery for all of these targets. We'd like to acknowledge your nice oblique views of Tropical Storm Edouard, acquired in two sessions during the afternoon of 8/4. The storm-precautionary closure of JSC that day and the next precluded any timely processing and release of your images. The hurricane season is still young and you will likely have more chances to photograph these dynamic events. An Increment 17 image acquired on 5/29 will be posted on NASA/GSFC's Earth Observatory website this weekend. The photo is a rare, striking view of the Pyramids of Dashur, Egypt (almost all good photos to date of pyramids are of the ones at Giza). Good illumination and focus accentuate the location and shape of these ancient structures.

CEO photo targets uplinked for today were **Kwanza Basin, NW Angola** (*good pass across the center of this site. Mapping swath of overlapping images at nadir was requested as a basic mapping tool for this rapidly changing area. Visual cues were the linear forested ridges at right-angles to track*), **East Libya megafans** (*ancient rivers sourced in the Tibesti Mountains when the climate of the Sahara was wet [> 8000 years ago] have laid down vast spreads of sediment as a series of large fans ["megafans"] hundreds of km long and wide. With more than 150 megafans recently discovered worldwide, the significance of megafans has only recently been understood. A continuous pattern of criss-crossing stream channels, large and small, covers the entire surface of megafans. Looking right beyond the black Namus volcano, Greg's visual cue, for detailed overlapping images of the flat channel-covered plains*), **Gordion, Turkey archaeological site** (*a close repeat of a prior pass on 8/7 put this archeological left of track. A mapping swath looking ~ 45 degrees left should have captured this famous site*), **Mount Vesuvius, Italy** (*a close repeat pass puts Vesuvius right of track at the head of the prominent Bay of Naples*), **Palmyra Atoll, central Pacific** (*this 6 mile-long atoll is surrounded by a continuous reef which is the scientific feature of interest. Detailed handheld images of coral reefs are being widely used*), and **Kingman Reef, equatorial Pacific Ocean** (*this 4 mile-long, V-shaped atoll appeared left of track. Handheld imagery is a major component in the effort to map coral reefs worldwide*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 7:24am EDT [= epoch]*):

Mean altitude -- 350.6 km

Apogee height -- 357.6 km

Perigee height -- 343.6 km

Period -- 91.55 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0010411

Solar Beta Angle -- -15.9 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.73

Mean altitude loss in the last 24 hours -- 53 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55692

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

08/13/08 -- ATV Reboost (~3:30am EDT)

09/02/08 -- Progress M-64/29P undocking, from FGB nadir

09/07/08 -- ATV1 undocking, from SM aft port (loiter until 9/29 for nighttime reentry/observation)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft port)

10/01/08 -- **NASA 50 Years** (official)

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch (~3:03am EDT)

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port, ~4:51am)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir) or 10/24?

11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/25/08 -- Progress M-65/30P undocking & deorbit

11/26/08 -- Progress M-66/31P launch

11/30/08 -- Progress M-66/31P docking

02/09/09 -- Progress M-66/31P undocking & deorbit

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/24/09 -- STS-119/Discovery/15A undocking

02/26/09 -- STS-119/Discovery/15A landing (nominal)

03/25/09 -- Soyuz TMA-14/18S launch
03/27/09 -- Soyuz TMA-14/18S docking (DC1)
04/05/09 -- Soyuz TMA-13/17S undocking
04/07/09 -- Progress M-67/32P undocking & deorbit
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
05/25/09 -- Soyuz TMA-15/19S launch
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking)**
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at

ISS On-Orbit Status 08/08/08

All ISS systems continue to function nominally, except those noted previously or below. *Light-duty day for the crew of CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff.*

In continuing support of the COL FSL (Columbus Orbital Laboratory/Fluid Science Lab) facility, the FE-2 completed the insertion of a blank DLT (Digital Line Tape) cartridge in the FSL VMU (Video Management Unit) tape recorder. *[The activity, scheduled (and reported) yesterday (when FSL was powered off), was aborted and rescheduled for today since VMU tape insertion can only be done with the FSL powered on and tape removal only before FSL deactivation.]*

Also in the COL, Chamitoff locked the FSL FCE (Facility Core Element) to fix it for the acceleration forces caused by the ATV reboost next week (scheduled for 8/13, ~3:430am EDT).

The CDR terminated the discharge/charge cycle on the second pair of NiMH (Nickel Metal Hydride) batteries for the Russian BMD (Biomedical Device) PZE STIMUL-01 experiment, in preparation for an upcoming training session of physical stimulation/conditioning of the two cosmonauts. The first battery set was charged yesterday. *[The neuromuscular myostimulator suit STIMUL-1, which uses electrical stimulation to contract and relax leg muscle fibers for conditioning, is part of the suite of BMS (Biomedical Support) systems under development at the Moscow IBMP (Institute for Biomedical Problems) for long-duration spaceflights including piloted Mars missions.]*

In support of upcoming JAXA payload operations in the Kibo JPM (JEM Pressurized Module), Gregory prepared the MEU (Measurement Experiment Unit) for activation & checkout, inserting its cultivation chamber Bs and installing the MEU Bs in the CBEF (Cell Biology Experiment Facility) incubator. Later, after CBEF control start by ground commanding, Greg performed a visual inspection of the CBEF 1G door

lock.

FE-1 Kononenko performed a controlled shut-down of the US EHS VOA (Environmental Health System-Volatile Organic Analyzer), leaving inlet & exhaust caps plus power switch in the same configuration. The VOA RPC (Remote Power Controller) was power-cycled from the ground.

Meanwhile, the CDR initiated (later terminated) an oxygen refresh of the cabin atmosphere with O₂ from Progress M-64/29P.

The FE-2 conducted the regular bi-monthly reboot of the File Server SSC (Station Support Computer) laptop. *[Rebooting the SSC requires about 15 sec of waiting between shutdown and turning it back on. It may take up to 15 minute for the File Server to fully complete the startup.]*

Working from the Russian discretionary task list, Kononenko conducted the regular status check on the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (peas) under spaceflight conditions in the Lada-13 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}).

Sergey performed the routine daily servicing of the SM (Service Module)'s SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-1, FE-2), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Oleg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~8:15am EDT, Sergey, Oleg and Greg held the periodic crew conference with the Expedition 18 crew, via S-band/audio space-to-ground (S/G2) and Private 2. *[This conference is scheduled once every two weeks, between the ISS crewmembers and Steve Lindsey, Head of the Astronaut Office.]*

TVIS Update: Replacement of the treadmill roller bearings is still scheduled next week on 8/11 & 8/12. Ground engineers are working on a repair method for the belt

tear that is durable and won't cause further hardware damage. Before the roller bearing R&R and belt repair, to be performed in conjunction, the crew will be scheduled for a Repair Procedures Printout & Review activity. Delivery of a new tread belt has been proposed for manifesting on Progress 30P.

SPDM Update: Yesterday, the Special Purpose Dexterous Manipulator "Dextre" had its first successful ground-commanded motion. Both arms' OTCMs (ORU Tool Changeout Mechanisms) were satisfactorily checked out. Next SPDM checkout is planned for 8/11 (Monday).

MT Update: Today at ~2:05-3:35pm EDT, after inhibition of Russian thrusters, ground commanding will move the Mobile Transporter from WS-4 (Worksite 4) to WS-6 to provide additional views from the SSRMS (Space Station Remote Manipulator System) during the planned JEM RMS (Robotic Manipulator System) checkout planned for next week. Thrusters will be re-enabled at ~4:45pm. Later (time frame 8/27-29), the MT will be translated from WS-6 to WS-7 for performing grapple & power checkouts on the ESP-3 (External Stowage Platform 3), mounted on the zenith side of the P3 truss element. *[ESP-3 is an external pallet that can securely hold up to seven ORUs (Orbital Replacement Units).]*

CEO (Crew Earth Observations) photo targets uplinked for today were **Nile delta, Egypt** (*left of track, shooting a mapping swath of overlapping images following the line where the green agricultural lands meet the yellow desert sands*), **Saharan Dust, W Atlantic** (*Dynamic event. Visible Saharan dust reaching the western hemisphere is a relatively rare event [although diffuse Saharan dust is transported the Americas every month of the year]. Aiming left toward the horizon for images of the dust front. Best views were looking rearward roughly along the line of the dust front after ISS crossed cross the islands. Greg was to try to get any landmass into the views, such as Cuba or neighboring islands*), **Georgia Coastal Ecosystems** (*mapping swath of overlapping images was requested following along the Georgia coastline at nadir, to document several processes operating in these wetlands [the dynamic event haze front, off Florida, could be imaged looking right]*), and **Mount Rainier, WA** (*Mt. Rainer is the largest volcano visible right of track and lies immediately inland of Tacoma and Seattle. Detailed images were requested*).

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 6:59am EDT [= epoch]*):

Mean altitude -- 350.6 km

Apogee height -- 357.6 km

Perigee height -- 343.7 km

Period -- 91.55 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0010312
Solar Beta Angle -- -11.7 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.73
Mean altitude loss in the last 24 hours -- 40 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 55676

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

08/13/08 -- ATV Reboost (~3:30am EDT)
08/30/08 -- Progress M-64/29P undocking, from FGB nadir
09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/ observation)
09/10/08 -- Progress M-65/30P launch
09/12/08 -- Progress M-65/30P docking (SM aft port)
10/01/08 -- **NASA 50 Years** (official)
10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
03/25/09 -- Soyuz TMA-14/18S launch
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 08/07/08

All ISS systems continue to function nominally, except those noted previously or below.

As part of the crew's regular morning inspection tour, CDR Volkov began his workday with the routine checkup of DC1 (Docking Compartment) circuit breakers and fuses. *[The monthly checkup in the "Pirs" module looks at AZS circuit breakers on the BVP Amp Switch Panel (they should all be On) and the LEDs (light-emitting diodes) of 14 fuses in fuse panels BPP-30 & BPP-36.]*

For the Russian KPT-2 science payload BAR-RM, the CDR terminated battery charging for the "Kelvin-Video" instrument and started the process on the TTM-2 anemometer/thermometer's power pack. After about 4 hrs, the charging was terminated. *[Objective of the payload is to experiment with ISS leak detection based on environmental data anomalies (temperature, humidity, and ultrasound emissions) at leak locations. The payload uses a remote infrared thermometer (Kelvin-Video), a thermohygrometer (Iva-6A), a heat-loss anemometer/thermometer (TTM-2), an ultrasound analyzer (AU-01), and a leak detector (UT2-03) to determine physical background signs of loss of ISS pressure integrity which could be indicative of leaks in the working compartments of the station. Measurements are taken in specific zones (13 in SM PkhO and 4 in DC1), both with lights & fans turned on and off.]*

Later, in preparation for an upcoming training session of physical stimulation/conditioning of the two cosmonauts with the Russian BMD (Biomedical Device) PZE STIMUL-01, the CDR removed the first pair of freshly charged NiMH (Nickel Metal Hydride) batteries from the payload's charger device and initiated the discharge/charge cycle on the second pair. *[The neuromuscular myostimulator suit STIMUL-1, which uses electrical stimulation to contract and relax leg muscle fibers for conditioning, is part of the suite of BMS (Biomedical Support) systems under development at the Moscow IBMP (Institute for Biomedical Problems) for long-*

duration spaceflights including piloted Mars missions.]

FE-1 Kononenko completed outfitting the FGB module with new stowage structures, transferring additional enclosures from the ATV (Automated Transfer Vehicle) for installation in FGB zones 35B, V (panel 407) to provide more efficient stowage spaces behind panels and improve airflow/circulation;

Afterwards, Oleg stowed a variety of equipment in the new FGB enclosures, such as two CTBs (Cargo Transfer Bags) with IVA (Intravehicular Activity) Seal Kits from Node-2 and an IFHX (Interface Heat Exchanger).

Sergey Volkov set up the equipment for his third session with the Russian experiment MBI-18 DYKHANIE (“Respiration”, “Breathing”), then undertook the session, controlled from the RSE-Med laptop, followed later by Oleg Kononenko who also completed the experiment for the third time. The crewmembers took photographs of each other working the hardware, then closed down the payload and stowed it. *[Dykhaniye-1 uses two body belts (PG-T/thoracic, PG-A/abdominal), a calibrator, resistor, mouthpiece, etc., to study fundamental physiological mechanisms of the external breathing function of crewmembers under long-duration orbital flight conditions. During the experiment, physiological measurements are taken and recorded with a pneumotachogram, a thoracic pneumogram, an abdominal pneumogram, and pressure data in the oral cavity. All experimentally derived plus salient environmental data along with personal data of the subject are recorded on PCMIA card for return to the ground at end of the Expedition. Objectives include determining the dynamics of the relationship between thoracic (pectoral) and abdominal breathing function reserves and their realization potential during spontaneous breathing, the coordinated spontaneous respiratory movements in terms of thoracic and abdominal components of volumetric, time & rate parameters of spontaneous respiratory cycle, identification of the features of humoral-reflex regulation of breathing by dynamics of ventilation sensitivity of thoracic and abdominal components to chemoreceptor stimuli, etc. Overall, the experiment is intended to provide a better understanding of the basic mechanisms of pulmonary respiration/gas exchange gravitational relations of cosmonauts.]*

FE-2 Chamitoff conducted another lengthy session with the SHERE (Shear History Extensional Rheology Experiment) payload, proceeding through the individual experiment steps by –

- Activating the MSG (Microgravity Science Glovebox) in the US Lab,
- Powering on the SHERE hardware,
- Accessing the CGBA (Commercial Generic Bioprocessing Apparatus) to install the SHERE FM (Fluid Module) #1,
- Supporting the first SHERE experiment run (Test Point 23),
- Transferring the module with the fluid sample,

- Installing FM #26 for the second experiment run (Test Point 5),
- Removing the FM from the CGBA and transferring SHERE data,
- Turning off the SHERE/CGBA equipment,
- Transferring the data files to the MSG laptop, and
- Powering down the MSG.

[Background: Rheology is the study of the deformation and flow of matter under the influence of an applied stress which might be, for example, a shear stress or extensional stress. In practice, rheology is principally concerned with extending the "classical" disciplines of elasticity and (Newtonian) fluid mechanics to materials whose mechanical behavior cannot be described with the classical theories. SHERE is designed to study the effect of preshear on the transient evolution of the microstructure and viscoelastic tensile stresses for monodisperse dilute polymer solutions in the MSG. Collectively referred to as "Boger fluids," these polymer solutions have become a popular choice for rheological studies of non-Newtonian fluids and are the non-Newtonian fluid used in this experiment. The SHERE hardware consists of the Rheometer, Camera Arm, Interface Box, Cabling, Keyboard, Tool Box, Fluid Modules, and Stowage Tray.]

The FE-2 completed the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WRM (Water Recovery & Management) assessment of onboard water supplies. *[Updated "cue cards" based on the crew's water calldowns are sent up every other week. The current card (17-0002U) lists 34 CWCs (Contingency Water Containers, ~1314.1 L total) for the four types of water identified on board: technical water (535.2 L, for Elektron, flushing & hygiene, incl. 487.2 L flushing-only water because of Wautersia bacteria), potable water (706.7 L, incl. 174.6 L currently for flushing only), condensate water (64.3 L), waste/EMU dump and other (7.9 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]*

In preparation for another run with the US SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment, Gregory first downloaded SLEEP data from his Actiwatch to the HRF-1 (Human Research Facility 1) laptop for subsequent downlink and verification by the support scientist, then re-initialized and donned the Actiwatch. *[To monitor his sleep/wake patterns and light exposure, Chamitoff now wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout this run. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

Sergey performed the routine daily servicing of the SM's SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities,*

replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

Oleg conducted the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

In continuing support of the COL FSL (Columbus Orbital Laboratory/Fluid Science Lab) facility, Greg inserted a blank DLT (Digital Line Tape) cartridge in the FSL VMU (Video Management Unit) tape recorder.

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-1, FE-2), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Volkov transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~4:15am EDT, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU/*Glavnaya operativnaya gruppа upravleniya* = “Main Operative Control Group”), including Shift Flight Director (SRP), at TsUP-Moscow via S-band/audio, phone-patched from Houston and Moscow.

At ~8:45am, Sergey & Oleg linked up with TsUP stowage specialists via S-band to conduct the weekly IMS tagup, discussing stowage issues, equipment locations and ATV & Progress cargo transfers.

At ~10:15am, the crew supported two interactive PAO TV interviews with US media of ~10 min each: KHOU-TV, Houston, TX (Jeremy Desel), and Cal Pol Magazine, San Luis Obispo, CA (Scott Roark).

TVIS Update: Replacement of the treadmill roller bearings is scheduled next week on 8/11 & 8/12. Before the change-out, the torn belt must be repaired with a patch, to be created and installed by the crew. Only after this procedure is completed, the scheduled roller bearing change-out can be performed, since it involves manipulation and stretching of the tread belt during the change-out, which could propagate the tear. Delivery of a new tread belt is proposed on Progress 30P.

SPDM Update: The Special Purpose Dexterous Manipulator “Dextre” was powered-up on Monday for installation of an Arm-2 Shoulder Joint software patch.

After patch installation, the polarity inversion error that occurred initially during the 1J/A mission (3/19/08) re-occurred. Preliminary analysis indicates the problem is in an ambiguity switch returning an inconsistent value. This ambiguity switch is only used during power-up and for a specific range of angles. In the near term, parking the arm at a specific angle can work around the issue. In the long term, this problem can be resolved through software updates.

MT Update: Tomorrow (8/8, ~2:05-3:35pm EDT), the Mobile Transporter will be moved from WS-4 (Worksite 4) to WS-6 to support JEM RMS (Japanese Experiment Module Robotic Manipulator System) checkouts.

CEO (Crew Earth Observations) photo targets uplinked for today were **Kwanza Basin, Angola** (*the Kwanza basin is undergoing rapid economic development, especially around the capital city Luanda, as Angola becomes a major oil exporter. ISS CEO imagery will be used as "baseline" imagery against which to measure future growth [settlements, railroads, highways, etc.]. A mapping swath looking obliquely left will ensure capturing the site. Visual cues are straight ridges extending away from track*), **Gordion, Turkish archaeological site** (*this rich archeological site was a city [capital of Phrygia] 800 years BCE where King Midas reigned. It is also the city where Alexander the Great cut the Gordion knot with his sword. For the last century Turkish and US researchers have excavated here. They have requested oblique views to illustrate publications and presentations. Shooting left for context views. A mapping swath will ensure capturing the site*), **Mount Vesuvius, S. Italy** (*looking near nadir. Visual cues are [1] the peninsula leading out to the Isle of Capri; and [2] Vesuvius's volcanic cone itself which is a prominent dark circular feature in the coastal plains just south of Naples*), and **Haze SE USA** (*looking left after crossing Cuba for the margin of a hazy airmass moving offshore from Georgia. Recent high pressure conditions have concentrated "aerosols" [smog, smoke, dust and other materials] in the lower atmosphere. These are especially visible from space as Greg looked obliquely through the atmosphere [giving a longer "line of sight" through the pollution]. Images of haze are effective if the margin/front between clear and hazy air can be detected. The smog front was expected to be approximately over southern Florida during the overflight*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 3:59am EDT [= epoch]*):

Mean altitude -- 350.7 km

Apogee height -- 357.6 km

Perigee height -- 343.8 km

Period -- 91.55 min.

Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0010247
Solar Beta Angle -- -7.4 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.73
Mean altitude loss in the last 24 hours -- 40 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 55658

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

08/13/08 -- ATV Reboost
08/30/08 -- Progress M-64/29P undocking, from FGB nadir
09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/observation)
09/10/08 -- Progress M-65/30P launch
09/12/08 -- Progress M-65/30P docking (SM aft port)
10/01/08 -- **NASA 50 Years** (official)
10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
03/25/09 -- Soyuz TMA-14/18S launch
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 08/06/08

All ISS systems continue to function nominally, except those noted previously or below. *Today is FE-2 Chamitoff's 46th birthday. **Happy Birthday, Gregory!***

FE-1 Kononenko serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out"-to-vacuum cycle on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated tonight at ~5:15pm EDT. Filter bed #1 was regenerated yesterday. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently to remove any lingering Freon-218 from the cabin atmosphere (last time done: 7/28 & 7/30).]*

FE-2 Chamitoff continued commissioning preparations in the JAXA Kibo JPM (JEM Pressurized Module). *[Activities included first turning off power supply from the Saibo & Ryutai Rack UDCs (Utility DC-to-DC Converters) to the MMA NCU & RSUs (Microgravity Measurement Apparatus/Network Control Unit & Remote Sensor Units), then reconfiguring the FPEF (Fluid Physics Experiment Facility) in two steps from launch to operational configuration, including securing the 3-D camera at a temporary position and verifying its focus setting. Later, power from Saibo & Ryutai was turned on again and the NCU/RSUs and MLT (MMA Laptop Terminal) activated.]*

Kononenko performed scheduled IFM (in-flight maintenance) on the Service Module (SM)'s condensate water processor (SRV-K2M) by removing and replacing its water-conditioning unit purification columns (BK BKV). The old unit was disposed of in Progress 29P. (Last time done: 3/23/08). *[The SRV-K2M, with its BKO multifiltration unit, converts collected condensate into drinking water by removing dissolved mineral and organic impurities from the condensate. Downstream from it the condensate water is treated in the BKV water conditioning unit with salts for taste and silver ions for preservation, before it flows to the KPV potable water container from which the reclaimed water is dispensed warm or hot for drinking and*

preparation of food and beverages.]

CDR Sergey Volkov performed maintenance on the SM's Internal Thermal Loop 2 (KOB2) to determine the technical condition of the filled hydraulic loop by assembling and leak-checking pump and pressure gauge equipment, then using it to measure the free volume (of air) in the loop, adjusting the operational pressure in KOB2 accordingly, and finally disassembling the equipment. *[There are two SOTR KOB cooling loops in the SM, each equipped with two redundant pump panels with two redundant pumps each.]*

Oleg initiated discharge/charge cycle on the first pair of four NiMH (Nickel Metal Hydride) batteries for the Russian BMD (Biomedical Device) PZE STIMUL-01 payload in the payload's charger device in preparation for the upcoming physical stimulation/conditioning training of the two cosmonauts with the device. *[The neuromuscular myostimulator suit STIMUL-1, which uses electrical stimulation to contract and relax leg muscle fibers for conditioning, is part of the suite of BMS (Biomedical Support) systems under development at the Moscow IBMP (Institute for Biomedical Problems) for long-duration spaceflights including piloted Mars missions.]*

With the FGB solar arrays partially retracted and no longer in use, Kononenko continued the dismantling of the SOSB Solar Array Orientation System in the FGB, today removing a static converter (B15, one of two), the communications unit (B01) and the amplifier unit (B03) from behind panel 407, placing the blocks in temporary storage for recycling. The logic & control unit (B14) was removed earlier and used to replace the failed B14 block in the SM. *[The FGB SOSB comprises Sun sensors, amplifier-converter unit, amplifier unit, logic & control unit, communications unit, static converter, and solar array drive.]*

Gregory had an hour reserved to relocate & rearrange stowage items in Node-2 for more efficient ops and to create more space for additional crew provisions (food) from the "Jules Verne" ATV (Automated Transfer Vehicle).

The FE-2 also checked out the U.S. SLM (Sound Level Meter) instrument and then used it to conduct the periodic (once every two months) noise level measurement program in all modules of the station for a 2-hr acoustic survey, followed by transfer of the recorded data to the MEC (Medical Equipment Computer). *[A total of 45 acoustic measurements were obtained at four locations in the ATV1, six locations in Node-2, 11 locations in the SM, eight locations in the COL, nine locations in the Kibo JPM, and four locations in the Kibo JLP. The survey also includes three crew preference locations taken at their perceived loudest locations in the station. The SLM gives instantaneous noise levels and their frequency spectra, which are transferred to the MEC laptop via an RS232 cable and later downlinked with regular*

CHeCS (Crew Health Care Systems) data dump or via OCA.]

Volkov set up the TTM-2 and "Kelvin-Video" batteries for charging for another operational run of the Russian KPT-2 science payload BAR-RM. Charging will be terminated tomorrow (8/7), followed by closeout ops and re-stowing. *[Payload objective is to experiment with ISS leak detection based on environmental data anomalies (temperature, humidity, and ultrasound emissions) at leak locations. The payload uses a remote infrared thermometer (Kelvin-Video), a thermohygrometer (Iva-6A), a heat-loss anemometer/thermometer (TTM-2), an ultrasound analyzer (AU-01), and a leak detector (UT2-03) to determine physical background signs of loss of ISS pressure integrity which could be indicative of leaks in the working compartments of the station. Measurements are taken in specific zones (13 in SM PkhO and 4 in DC1), both with lights & fans turned on and off.]*

Kononenko performed the routine daily servicing of the SM's SOZh system (Environment Control & Life Support System, ECLSS). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Later, working off the discretionary "time permitting" task list, Oleg also performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

An additional job on the Russian voluntary task list for Kononenko was the regular status check on the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (peas) under spaceflight conditions in the Lada-13 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}).

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-1, FE-2) and RED resistive exercise device (CDR, FE-1, FE-2). Later, Oleg transferred the exercise data file to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

The station residents were scheduled for their regular periodic PMCs (Private Medical Conferences) via S- & Ku-band audio/video, Sergey at ~1:00pm, Oleg at ~2:15pm, Gregory at ~3:30pm EDT.

At ~3:10pm, the ISS crew is scheduled for their regular weekly tagup with the Lead

Flight Director at JSC/MCC-H via S-band/audio. *[S/G-2 (Space-to-Ground 2) phone patch via SSC (Station Support Computer)]*.

At ~4:25pm, Chamitoff will hold his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop) , undoubtedly to enjoy best birthday wishes from his family.

VolSci Program Preview: For the weekend of August 9, Greg Chamitoff was offered two choices for the Voluntary Weekend Science program: (1) an “operations improvement” session with SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellites) with all three satellites; and (2) a LOCAD PTS (Lab-On-A-Chip Application Development – Portable Test System) surface sampling session in COL (Columbus Orbital Laboratory) using Glucan LAL cartridges, targeting fungus on ISS surfaces.

No CEO (Crew Earth Observations) photo targets uplinked for today due to yesterday’s JSC stand-down.

CEO photography can be studied at this “Gateway” website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 7:43am EDT [= epoch]):*

Mean altitude -- 350.7 km

Apogee height -- 357.6 km

Perigee height -- 343.8 km

Period -- 91.55 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0010245

Solar Beta Angle -- -2.9 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.73

Mean altitude loss in the last 24 hours -- 40 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55645

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

08/13/08 -- ATV Reboost

08/30/08 -- Progress M-64/29P undocking, from FGB nadir

09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/observation)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft port)

10/01/08 -- **NASA 50 Years** (official)

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
03/25/09 -- Soyuz TMA-14/18S launch
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 08/05/08

All ISS systems continue to function nominally, except those noted previously or below.

Due to the threat from Tropical Storm/Hurricane Edouard, NASA JSC closed down yesterday at ~1:00pm EDT and currently remains closed until tomorrow (8/6) morning. ISS Mission Control Center is operating on a reduced weekend support ("GEMINI") level. Onboard schedules will be re-planned as necessary. Crew activities as timelined in the original work schedules are summarized in the following, and actual task completions will be statused as soon as available.

CDR Volkov's timeline for today called for Sergey to –

- Perform the periodic service of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system, and to terminate the process at ~4:20pm EDT, with Bed #2 regeneration to follow tomorrow *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently to remove any lingering Freon-218 from the cabin atmosphere (last time: 6/23&24)]*;
- Work in the DC1 Docking Compartment to mate the BNP telemetry connector;
- Replace the DC1's PF1 & PF2 dust filters and clean the V1 & V2 fan grilles;
- Conduct the periodic checkout/verification of IP-1 airflow sensors in the various RS (Russian Segment) hatchways, including the passageways SM PrK (Service Module Transfer Compartment)–ATV, PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1;
- Take care of the routine daily servicing of the SOZh system (Environment

- Control & Life Support System, ECLSS) in the SM;
- Conduct a teleconference (at ~7:55am) with ground specialists to discuss the RS1 laptop;
 - Support a telephone interview (at ~8:05am) with an editor of the magazine Rossiyskiy Kosmos (Russian Space);
 - Transfer US condensate water, collected from the US CCAA (Common Cabin Air Assembly) air conditioner in a CWC (Contingency Water Container), to a Russian EDV container for processing as technical water for the Elektron oxygen (O₂) generator;
 - Perform the periodic (monthly) functional closure test of the Vozdukh CO₂ removal system's spare emergency vacuum valves (AVK), in the spare parts kit *[The AVKs are critical because they close the Vozdukh's vacuum access lines in the event of a malfunction in the regular vacuum valves (BVK) or a depressurization in the Vozdukh valve panel (BOA). Access to vacuum is required to vent CO₂ during the regeneration of the absorbent cartridges (PP). During nominal operation, the AVK valves remain open.];*
 - Install thermal insulation on the newly repaired SKV-2 air conditioner; and
 - Take the periodic readings of potentially harmful atmospheric contaminants in the SM, using the CMS (Countermeasure System), a component of the GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, which uses preprogrammed microchips to measure H₂CO (Formaldehyde, methanal), CO (Carbon Monoxide) and NH₃ (Ammonia), taking one measurement per microchip.

FE-1 Kononenko's timeline for today called for Oleg to –

- Remove the B13 logic unit of the FGB Solar Array Orientation System, with the latter powered down;
- Transfer more enclosures from the ATV for installation in the FGB in zone 35A (panel 403) to provide more efficient stowage spaces behind FGB panels and improve airflow/circulation;
- Conduct the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur);
- Restow selected items in the FGB; and
- Support the BIO-5 Rasteniya-2 ("Plants-2") experiment, which researches growth and development of plants (peas) under spaceflight conditions in the Lada-13 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}), by monitoring the greenhouse, taking pictures and downloading them to the ground.

FE-2 Chamitoff's work schedule for today called for Gregory to –

- Continue preparing the JAXA Kibo JPM (JEM Pressurized Module) for payload operation by setting up and checking out the Robotics BDS (Backup Drive System);
- Connect and turn on the MMA (Microgravity Measurement Apparatus) and MLT (MMA Laptop Terminal) on the RYUTAI Rack;
- Configure and activate the MMA/MLT on the SAIBO Rack;
- Activate and check out the JEM Robotics System (RMS) power switch;
- Start the gas supply on the CGSE (Common Gas Support Equipment), with its valve unit and four CO₂ & Argon GBUs (gas bottle units); and
- Prepare and conduct the POC (Portable Onboard Computer) Software Cycle 11 transition, including the COL PWS (Columbus Orbital Laboratory Portable Workstations), from CDs (Compact Disks) after retrieving and auditing them.

Volkov & Kononenko had three hours set aside for more trash cargo transfers to Progress 29P.

The station residents were scheduled for their regular periodic PMCs (Private Medical Conferences) via S- & Ku-band audio/video, Gregory at ~10:25am, Oleg at ~12:05pm, Sergey at ~12:40pm.

The three crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-1, FE-2), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Sergey transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

08/4-6/08 -- MCC-Houston closed due to Tropical Storm (TS)/Hurricane Edouard

08/13/08 -- ATV Reboost

08/30/08 -- Progress M-64/29P undocking, from FGB nadir

09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/observation)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft port)

10/01/08 -- **NASA 50 Years** (official)

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
03/25/09 -- Soyuz TMA-14/18S launch
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 08/04/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 16 of Increment 17.*

Tropical Storm/Hurricane Edouard: At ~1:00pm EDT, NASA JSC (Johnson Space Center) closed down today in preparation for TS Edouard, which is expected to make landfall near Houston/Galveston around 8:00am tomorrow morning after forming rapidly over the weekend in the Gulf of Mexico. MCC(Mission Control Center)-Houston is being kept active, powered and with S-band command & telemetry capability, but at the GEMINI level (essentially nominal Houston weekend support) until Wednesday morning (8/6). BCC (Backup Control Center) in Moscow will not be activated. Tomorrow's onboard timeline will be scrubbed to reduce the need for FCT (Flight Control Team) support. The Center is expected to return to nominal operations sometime Wednesday morning. Nominal, full team console support will resume on Wednesday, Orbit 3. On today's timeline, TVIS treadmill repair and SPDM (Special Purpose Dexterous Manipulator) "Dextre" commissioning activities have been deferred and will be rescheduled in the future. Any changes during today's crew activities will be reported ASAP.

Before breakfast, the CDR, FE-1 and FE-2 completed another periodic session of the Russian biomedical routine assessment PZEh-MO-7/Calf Volume Measurement (fifth for CDR & FE-1, third for FE-2). *[Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference points, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures.]*

Gregory Chamitoff ended his third session with the NASA/JSC experiment NUTRITION w/Repository by collecting a final urine sample upon wakeup for storage in the MELFI (Minus-Eighty Laboratory Freezer for ISS). The sampling kit was then stowed away. *[The current NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

Later in the day, Volkov & Kononenko also completed the first part of the onboard "Profilaktika" (MBI-8, "Countermeasures") preventive health maintenance fitness test on the VELO bicycle ergometer, assisting each other in turn. Part 2, on the TVIS treadmill, is scheduled later this week (pending TVIS repair). *[Test procedure for MBI-8, which requires workouts on the VELO and TVIS, is identical to the Russian MO-5 assessment, but in addition to the nominal procedure it uses the TEEM-100M gas analyzer with breathing mask, a blood lactate test with the ACCUSPORT analyzer and REFLOTRON-4 accessories, and a subjective evaluation of physical exertion levels during the test (using the Borg Perceived Exertion Scale, viz., 10 steps from very light over hard and very hard to maximum). Results are entered on a log sheet. TEEM and ECG (electrocardiograph) data are transferred to the RSE-Med laptop, also on a tape cassette (Cardiocassette-2000), and prepared for later downlink via Regul-Packet comm. Results are also called down to specialists standing by at TsUP.]*

After deactivating the BITS2-12 onboard telemetry measurement system (which also required the Elektron oxygen generator to be turned off), Sergey Volkov performed major IFM (Inflight Maintenance) on the SM SA (Service Module Solar Array) system by removing its logic unit (B14M) and replacing it with the B14M removed earlier from the FGB. Later, BITS2-12 was turned back on.

While the Elektron was off, Oleg Kononenko conducted routine IFM on the SRVK-2M condensate water processor, removing its BKO multifiltration unit which has reached its service life limit. The old BKO was replaced with a new unit and stowed for deorbiting on Progress 29P. *[BKO contains five purification columns to rid the condensate of dissolved mineral and organic impurities. It has a service lifetime of ~450 liters throughput. The water needs to be purified for proper electrolysis in the Elektron O₂ generator.]*

At 7:36am EDT, the ground disconnected the ATV (Automated Transfer Vehicle)

electrically from the ISS while the Elektron was re-activated. This caused the lights to turn off in the ATV. ATV power was reconnected to the ISS at ~8:41am, and the lights came back on.

The FE-2 continued his activation & checkout work in the JAXA Kibo JPM (JEM Pressurized Module), preparing a sample for cultivation on the CBEF (Cell Biology Experiment Facility) Incubator Unit front surface for CBEF checkout.

Also in the Kibo laboratory, Chamitoff continued preparations for payload operations on RYUTAI and SAIBO racks, installing MMA (Microgravity Measurement Apparatus) equipment with two RSUs (Remote Sensor Units) and the MLT (MMA Laptop Terminal).

On SCOF (Solution Crystallization Observation Facility), the FE-2 installed the reference cell cartridge and MMA.

Chamitoff also conducted the periodic (monthly) CSA-CP (Compound Specific Analyzer-Combustion Products) maintenance/checkout, today on all four units.

[The CSA-CP is a passive cabin atmosphere monitor that provides quick response capability during a combustion event (fire). Its collected data are stored on a logger. Gregory replaced batteries on all units, then zero-calibrated all instruments (to eliminate drift in the combustion sensors). Following zero calibration, the backup units were stowed in the Node, along with the sampling pump, while the prime unit was deployed at the SM Central Post.]

FE-1 Kononenko unstowed the three copies of the SODF (Systems Operation Data File) Emergency Books located in the SM, FGB and Lab and updated them with new/changed information.

CDR Volkov set up the equipment for transferring TEKh-20 PK-3+ (Plasma Crystal-3+) experiment digital video data to the Russian BSPN Payload Server. After the transfer, the Telescience hardware was torn down for stowage.

Afterwards, Sergey began a new round of periodic preventive maintenance of cabin ventilation systems in the RS (Russian Segment), today cleaning the "Group A" fan grilles in the SM, while Oleg cleaned the protective TsV1 fan screen in the FGB.

Kononenko serviced the Matryoshka-R (RBO-3-2) radiation payload which has taken over the ESA/RSC-Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS/ALC) with its Spectrometer (AST) and ALC equipment on DC1 panel 429. *[Oleg downlinked data from PCMCIA (Portable Computer Memory Card International Adapter) cards ALC-949, ALC-951 and ALC-952, then activated the AST with the ALC-953 card.]*

The CDR performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The FE-1 conducted the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Gregory completed the periodic (monthly) inspection of the RED (Resistive Exercise Device) canister cords and accessories.

The three crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), RED resistive exercise device (FE-2), and VELO bike with bungee cord load trainer (CDR/MBI-8, FE-1/MBI-8). Later, Oleg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

TVIS Noise/Failure Update: After anomalous noise was noted during TVIS (Treadmill with Vibration Isolation & Stabilization), downlinked audio & video troubleshooting files, followed by crew inspection on 8/1 & 8/2 revealed a tear in the belt, probably caused by FOD (Foreign Object Debris) that got lodged between two of the belt slats. Teams are working to develop a repair/tear propagation mitigation procedure, which should be ready tomorrow. Also, preparations are underway to launch a spare belt on Progress 30P. There are other exercise device options available on board, and TVIS functionality will be recovered ASAP.

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

08/4-6/08 -- MCC-Houston closed due to Tropical Storm (TS)/Hurricane Edouard

08/13/08 -- ATV Reboost

08/30/08 -- Progress M-64/29P undocking, from FGB nadir

09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/ observation)
09/10/08 -- Progress M-65/30P launch
09/12/08 -- Progress M-65/30P docking (SM aft port)
10/01/08 -- **NASA 50 Years** (official)
10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
03/25/09 -- Soyuz TMA-14/18S launch
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 08/03/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – rest day for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff. Ahead: Week 16 of Increment 17.*

Gregory Chamitoff started out on Part 2 of his session with the NASA/JSC experiment NUTRITION w/Repository. This is an all-day session, the third for Greg, of collecting urine samples several times for 24 hrs through first void tomorrow morning. *[The NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by supercold MELFI dewars), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

Sergey Volkov conducted the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1).

Working off his suggested "time permitting" task list, FE-1 Kononenko conducted

another session of the Russian GFI-8 "Uragan" (hurricane) earth-imaging program, using the D2X digital camera with the F800 telephoto lens. *[Uplinked target areas were Patagonian glaciers and icebergs near South Georgia Island.]*

Also working from the discretionary task list, Oleg conducted another run of the Russian DZZ-2 "Diatomeya" ocean observations program, using the NIKON-F5 DCS still camera and the HDV (high-definition) video camcorder from SM window 8 for ~20 min to record high production water areas for obtaining data on color field composition in dynamic regions of the ocean and in near-estuary areas of large rivers, plus the current cloud cover above these waters, its rating, and special forms of cloud formation.

For the CDR, a discretionary task list job was another session for Russia's Environmental Safety Agency (EKON), making observations and taking KPT-3 aerial photography of environmental conditions of the Indian Ocean (Chagos Archipelago) and the New Zealand islands coastal area.

An additional job on the Russian voluntary task list for Kononenko was to perform the regular status check on the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (peas) under spaceflight conditions in the Lada-13 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}).

SHERE VolSci Update: Note to Gregory: "Magnificent! The SHERE team is ecstatic about your two successful test runs yesterday. As far as the team knows, you are the first person to successfully deploy a rheological fluid column in space. Congratulations!"

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

08/13/08 -- ATV Reboost

08/30/08 -- Progress M-64/29P undocking, from FGB nadir

09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/observation)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft port)

10/01/08 -- **NASA 50 Years** (official)

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

ISS On-Orbit Status 08/02/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – mostly off duty for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff.*

Gregory Chamitoff had Part 1 of his third session with the NASA/JSC experiment NUTRITION w/Repository, for blood collection only, for which he had to forego exercising and food intake since yesterday for eight hours. Later today, the FE-2 will also set up the equipment for the 24-hour urine collections which start with the first void early tomorrow morning. *[After performing self-phlebotomy, i.e., drawing blood samples (from an arm vein), the samples were first allowed to coagulate in the Repository for 20-30 minutes, then spun in the HRF RC (Human Research Facility/Refrigerated Centrifuge) and finally placed in MELFI (Minus-Eighty Laboratory Freezer for ISS). No thruster activity was allowed during the blood drawing. The RC was later powered off after a temperature reset to limit wear on the compressor, and cleaned.]*

The crew performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the SM dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

As part of the house cleaning, the crew also conducted regular maintenance inspection & cleaning on fan grilles in the FGB (TsV2), SM (VPkhO, VPrK, FS5, FS6 & FS9), DC1 (V3) screens and PF1/PF2 dust filters, as well as in the COL (Columbus Orbital Laboratory).

The FE-1 also checked up on the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem, gathering weekly data on Total Operating Time & "On" durations for reporting to TsUP-Moscow. Later, CDR Volkov temporarily powered down the POTOK air filtration system for the periodic cleaning of its pre-filter, using the vacuum cleaner with narrow-slit nozzle attachment.

Gregory filled out the regular FFQ (Food Frequency Questionnaire), his eighth, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

Chamitoff also had about half an hour reserved to work on the CMRS (Crew Medical Restraint System), stowed in the CHeCS (Crew Health Care Systems) rack, performing the periodic checkout and inspection of the system for upcoming standard CMO (Crew Medical Officer) proficiency training. *[The FE-2 inspected the CMRS for cracks in the board and/or metal fastener exposed on top of CMRS (found on the ground units), either of which could provide a high-voltage defibrillation ground path from the patient to ISS structure. The board-like CMRS allows strapping down a patient on the board with a harness for medical attention by the CMO who is also provided with restraints around the device. The device can be secured to the ISS structure within two minutes to provide a patient restraint surface for performing emergency medical procedures, such as during ACLS (Advanced Cardiac Life Support). It can also be used to transport a patient between the station and the Orbiter middeck. It isolates the crew and equipment electrically during defibrillations and pacing electrical discharges, accommodates the patient in the supine zero-G positions, provides cervical spine stabilization and, for a three-person crew, can also restrain two CMOs during their delivery of medical care.]*

At ~10:00am EDT, the crewmembers conducted their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP-Moscow timeline planners) via S-band/ audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

For today's VolSci (Voluntary Weekend Science) program featuring SHERE (Shear

History Extensional Rheology Experiment), FE-2 Chamitoff –

- Activated the MSG (Microgravity Science Glovebox),
- Powered on the SHERE hardware,
- Accessed the CGBA (Commercial Generic Bioprocessing Apparatus) to install the SHERE FM (Fluid Module) #25,
- Supported the first SHERE experiment run (Test Point 3),
- Transferred the module with the fluid sample,
- Installed FM #24 for the second experiment run (Test Point 13), ,
- Removed the FM from the CGBA, followed by SHERE data transfer,
- Turned off the SHERE/CGBA equipment,
- Transferred the data files to the MSG laptop, and
- Powered down the MSG.

Later, Chamitoff completed a run with the MedOps experiment WinSCAT (Windows Spaceflight Cognitive Assessment Tool), his second onboard session, by logging in on the MEC (Medical Equipment Computer) and performing the psychological evaluation exercise on the laptop-based WinSCAT experiment. *[WinSCAT is a monthly time-constrained questionnaire test of cognitive abilities, routinely performed by astronauts aboard the ISS every 30 days before or after the PHS (periodic health status) test or on special CDR's, crewmembers or flight surgeons request.]*

Kononenko performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The three crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Oleg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~6:35am EDT, the FE-1 had his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop).

Weekly Science Update (*Expedition Seventeen -- Week 15*)

3-D SPACE: Third session by Greg Chamitoff has been successfully performed on 7/30.

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): Measurements continue in the FGB module.

ANITA (Analyzing Interferometer for Ambient Air): Continuing.

BCAT-3 (Binary Colloidal Alloy Test 3): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System): Samples returned on 1J.

CSI-2/CGBA-5 (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus 5): “On 7/31, we had a successful activation of Silicate Garden Hab Side 2 in the afternoon and the crystals looked great at the start of the growth period. Images are being taken once per 90 seconds and will be decreased to once per 5 minutes at 7:00pm EDT today.”

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): On 7/16, EuTEF encountered a MIL-Bus error (this happened similarly in the past). The platform has to be power-cycled and the entire EuTEF facility re-initiated. The instruments have been re-activated with some delay due to some minor mismatch in the sequence of commands sent from ground. Although this recurrent DHPU (Data Handling Processing Unit) problem does not prevent EuTEF to function, ground teams are

working hard to characterize it and find a fix. A DHPU software patch is currently being developed to fix the link error issues encountered with DEBIE-2 and FIPEX instruments.-- DEBIE-2: Instrument could not be restarted immediately after the DHPU problem on 7/27, and was finally re-activated on 7/28 for 2 x 24hrs science runs. Generic status: link error still in work. However, a work-around allows for regular science data acquisition using an on-board IOP (Instrument Operations Procedure), but not yet in conjunction with any FIPEX IOP – a final software patch, which will enhance the present instrument capabilities, is under finalization on ground;-- DOSTEL: On-going science acquisition;-- EuTEMP: Currently inactive as planned;-- EVC: Inactive this week;-- EXPOSE: On-going science acquisition;-- FIPEX: Instrument re-activated after DHPU problem on 7/27. Science acquisition since 7/30; -- MEDET: Instrument re-activated after DHPU problem on 7/27. Science acquisition since 7/30; - PLEGPAY: Currently in READY mode, no science data acquisition on-going;--TRIBOLAB: The instrument is currently in Stand-By Mode. The Ball-Bearing experiment would be restarted towards mid-Aug. Analysis is on-going on ground.

FSL (Fluid Science Laboratory): FSL is back but off. Further FSL commissioning activities remain to be done (see following item).

GEOFLOW: Thanks, Greg. for inserting the GEOFLOW Experiment Container on 7/28. However, it was not possible to activate FSL, as some laser switch inhibit did not seem to be positively engaged. That prevents to power on GEOFLOW and later on to proceed with check-out routines and finally first science runs. Ground teams are finalizing a corrective procedure for the crew.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Planned.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer, ESA): In progress.

NUTRITION w/REPOSITORY: In progress.

PADLES (Passive Dosimeter for Lifescience Experiment in Space): In progress.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems):
Ongoing.

SAMPLE: Complete.

SHERE (Shear History Extensional Rheology Experiment): The SHERE team thanks Greg for selecting SHERE for Voluntary Science checkout activities performed on GMT 202. The checkout tests were a great success and showed that the SHERE hardware is functioning properly. The SHERE team looks forward to working with Greg again tomorrow, GMT 208, to perform the SHERE Dry Run. The recent fit problem with the Fluid Module Stowage Tray is being worked and will not affect the Dry Run.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): The HRP team thanks Greg for completing his first week of Sleep logs and his Actiwatch download initialization session. HRP is currently targeting the week of 8/4 for Greg's next week of Sleep logging and the week of 8/11 for his next Actiwatch download. Additional Sleep logging on non-targeted weeks is above and beyond and greatly appreciated by the PI.

SOLAR (Solar Monitoring Observatory): On 7/28, SOLAR experienced a spontaneous reboot, which was recovered on 7/29. It looks like SOLAR does not communicate anymore with the Columbus LAN network when under Columbus LAN switch#2 (CLSW#2) configuration. With the platform connected to the Columbus LAN switch #1 (CLSW#1), the SOLAR team is confident that everything works now for the next Sun observation window which starts on 7/31.-- SOVIM: Instrument confirmed fully functional; awaiting the Sun; -- SOLSPEC: Instrument confirmed fully functional; awaiting the Sun;-- SOLACES: Instrument confirmed fully functional; awaiting the Sun.

SOLO: Planned.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): The four ECs (Experiment Containers) of Rotor B are yet to be retrieved by the crew from the blocked Rotor B. BIOLAB could not be activated from ground yet; pending resolution of the Smoke Detector issue. A troubleshooting plan has been developed to recover all the BIOLAB functionalities. The first step of the BIOLAB recovery plan was to exchange an ESEM Power Board and this activity has been successfully performed on 7/25. On 7/26, BIOLAB was activated from ground for about 1 hour, in order to get telemetry about the Incubator Smoke Detector sensor. This test was positive, but engineering team would like to gather additional data during a longer activation test to confirm full functionality of the sensor. Next steps will follow, starting with the BIOLAB Rotor A bellow test (ground only) and later on the remaining WAICO-#1 ECs will be disposed and replaced by six Reference ECs on Rotor B. Planning for this last activity is currently TBD.

CEO (Crew Earth Observations): Through 7/15 the ground has received a total of 3,734 frames of CEO images for review and cataloging. "We have received some additional imagery this past week, but none with camera times corresponding to our CEO target request times. Most of these appear to be in South America and of good quality. One of your more striking Polar Mesospheric Cloud (PMC) photos, acquired last week, in a pass over central Asia will be published on NASA/GSFC's Earth Observatory webpage. Your PMC photos a welcome addition to our growing collection of images relevant to ISS program support of the International Polar Year (IPY). Thanks for your diligence in acquiring them!"

CEO (Crew Earth Observations) photo targets uplinked for today were **Red River Basin, TX** (*documenting the land use change and water levels of this meandering river boundary between Texas and Oklahoma, using the long lens settings and map along the river westward from Lake Texoma. This was a fair-weather nadir pass in mid-afternoon with an approach from the SW*), **Santa Barbara Coast, California** (*this target is a Long Term Ecological Research [LTER] site centered near Santa Barbara, CA. On this nadir, late-afternoon pass, clear skies were expected over the land areas as ISS approached from the SW. Using the long lens settings for a*

*detailed mapping of the Santa Inez Mountains from Lompoc in the west to just north of Ventura to the east), and **Slate Islands Impact Crater** (this 450 million year old impact is about 30-km in diameter and is revealed as a small cluster of island near the north coast of Lake Superior. As ISS tracked ENE- ward to the north of Lake Superior in late afternoon, Greg was to look for the target just right of track, using the long lens settings for detail).*

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

08/13/08 -- ATV Reboost
08/30/08 -- Progress M-64/29P undocking, from FGB nadir
09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/ observation)
09/10/08 -- Progress M-65/30P launch
09/12/08 -- Progress M-65/30P docking (SM aft port)
10/01/08 -- **NASA 50 Years** (official)
10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
03/25/09 -- Soyuz TMA-14/18S launch
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 08/01/08

All ISS systems continue to function nominally, except those noted previously or below.

FE-2 Chamitoff began his workday with the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. *[Updated "cue cards" based on the crew's water calldowns are sent up every other week. The current card is #17-0002T.]*

In preparation for today's Robotics activities, Chamitoff set up the SSRMS (Space Station Remote Manipulator System) videocamera connection by hooking up the UOP DCP (Utility Outlet Panel/Display & Control Panel) power bypass cable at the CUP RWS (Cupola Robotic Work Station).

Later, the FE-2 took the SSRMS through a prescribed maneuver sequence to allow close-up inspection & photography of the capture & retention snare in the arm's LEE B (Latching End Effector B). The bypass cable will be disconnected again later tonight.

Instead of conducting Greg's first session with the PFE-OUM (Periodic Fitness Evaluation - Oxygen Uptake Measurement) equipment at the HRF-2 (Human Research Facility 2) rack, Gregory & Sergey performed troubleshooting on the TVIS (Treadmill with Vibration Isolation & Stabilization), closely inspecting its chassis to track down the unusual noises developed by it on 7/30.

Preparatory to transferring more water from ATV (Automated Transfer Vehicle/ Water Delivery System) Tank #1, FE-1 Kononenko set up and conducted a leak check of the tank's internal expulsion bladder.

Chamitoff terminated the 24-hr NODE-2/JPM (JEM Pressurized Module) Vestibule depress & leak check started yesterday. *[During the leak check after*

depressurization to ~250 mmHg, the air pressure in the vestibule increased slowly to ~325 mmHg, which could be indicative of a leak from one of the adjacent modules into the vestibule. If this is the case, it would of course be impossible during a subsequent rapid depress event to completely isolate both adjacent modules from the vestibule. The decision was made that if the vestibule pressure remains steady close to 546 mmHg, the leak check will be considered successful. If not, Greg will still be GO to re-ingress the JPM. It was recommended to re-schedule additional troubleshooting and repeat of the leak check for a later date.]

After ingressing the JPM, Chamitoff did more outfitting by installing an IMV (Intermodular Ventilation) jumper from Node-2 to the JPM through the vestibule.

Gregory also transferred the disconnected PCS/PWS (Portable Computer System/ Portable Workstation) A31p laptops to the JPM after the leak check, followed by activating and rebooting them (except for the PLT/Payload Laptop which has developed some hard drive trouble).

Oleg completed another radiation data monitoring & logging session for flux & dose rate data with the Matryoshka-R radiation payload (RBO-3-2) and its LULIN-5 electronics box. *[Accumulated readings were recorded on a log sheet for subsequent downlink to TsUP/Moscow via the BSR-TM payload data channel.]*

The CDR worked on the Progress M-64/29P by transferring more collected discarded equipment and stowing it in the cargo ship-turned-trash can.

Kononenko had ~90 min set aside for the periodic equipment servicing in the SM's ASU toilet facility, changing out replaceable parts with new components, e.g., a filter insert (F-V), the pretreat container (E-K), and the E-K's hose. All old parts were discarded as trash. *[E-K contains five liters of pre-treat solution, i.e., a mix of H_2SO_4 (sulfuric acid), CrO_3 (chromium oxide, for oxidation and purple color), and H_2O (water). The pre-treat liquid is mixed with water in a dispenser (DKiV) and used for toilet flushing.]*

Continuing the latest round of preventive maintenance on the Russian Segment (RS) ventilation system, Volkov replaced the two dust filters PS1 & PS2 in the *Funktsionalnyi-Grusovoi Blok* (FGB), registering the change in the IMS (Inventory Management System).

Greg took measurements for the regular atmospheric status check for ppCO₂ (Carbon Dioxide partial pressure) in the Lab, SM (at panel 449) and COL (Columbus Orbital Laboratory), using the hand-held CDMK (CO₂ Monitoring Kit,

#1002), then deactivating it and returning it to its LAB1S2 stowage position.

The FE-2 conducted another one of the periodic offloadings of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling a CWC (Contingency Water Container, #1062) with the collected water slated for processing. No samples were required. *[Estimated offload time before reaching the tank's neutral point (leaving ~6 kg in the tank): ~30 min.]*

Kononenko performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Afterwards, working off the discretionary "time permitting" task list, Oleg also performed the daily IMS maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The three crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Sergey transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Before sleeptime tonight, Chamitoff is to set up NASA's NUTRITION/Repository experiment hardware for his second session scheduled tomorrow. For the phlebotomy (blood sample draw), Greg has to start fasting 8 hrs before, i.e., tonight, with only water consumption allowed. *[The NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by supercold MELFI dewars), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

At ~4:25am EDT, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU/*Glavnaya operativnaya gruppa upravleniya* =

“Main Operative Control Group”), including Shift Flight Director (SRP), at TsUP-Moscow via S-band/audio, phone-patched from Houston and Moscow.

At ~4:50am, Sergey & Oleg linked up with TsUP stowage specialists via S-band to conduct the weekly IMS tagup, discussing stowage issues, equipment locations and ATV & Progress cargo transfers.

At ~5:05am, the CDR & FE-1 conducted a teleconference with ground specialists to discuss the replacement of the failed SM SA (Solar Array) B14M unit with the unit removed from the FGB on 7/30.

At ~3:45pm, the ISS crew is scheduled for their regular weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. *[S/G-2 (Space-to-Ground 2) phone patch via SSC (Station Support Computer)].*

At ~12:10pm, Chamitoff powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, & power supply) and conducted, at 12:15pm, a ham radio exchange with parties in Montreal, via CSA (Canadian Space Agency) ground station.

CEO (Crew Earth Observations) photo targets uplinked for today were **Bigach Impact Crater** *(this small impact site [8-km in diameter] is located in a remote region of southern Russia, northeast of Lake Balkhash not far from the Chinese border. Researchers have no useful photos of the site or the surrounding region. Therefore, on this fair-weather pass in late afternoon sun Greg was asked for a mapping strip from Lake Balkhash to Lake Zysan using the short lens settings. The site is a small, weathered feature variously estimated between 2 and 8 million years old),* **South Tibesti Megafans** *(once more Chamitoff was asked for a context mapping of the area of these subtle features in the desert to the south of the rugged volcanics of the Tibesti Mountains in northern Chad, using the short lens settings as Greg looked right of track in early afternoon light. As ISS tracked NE-ward, noting Lake Chad on the right, Greg was to begin a mapping strip all the way to the southern flanks of the mountains, marked by dark lava flows),* and **Tunis, Tunisia** *(the Tunisian capital is also a large port situated on a sheltering bay in the northeastern corner of the country. On this mid-afternoon, most of the city lied at nadir. Trying for a nadir mapping strip of the northwestern and northern urban margins and using the long lens settings for detail).*

CEO photography can be studied at this “Gateway” website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

08/13/08 -- ATV Reboost
08/30/08 -- Progress M-64/29P undocking, from FGB nadir
09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/ observation)
09/10/08 -- Progress M-65/30P launch
09/12/08 -- Progress M-65/30P docking (SM aft port)
10/01/08 -- **NASA 50 Years** (official)
10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
03/25/09 -- Soyuz TMA-14/18S launch
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 07/31/08

All ISS systems continue to function nominally, except those noted previously or below.

Upon wake-up, Sergey Volkov terminated his seventh MBI-12 SONOKARD experiment session for the long-term Russian sleep study, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

FE-2 Chamitoff closed the hatches between the Kibo JPM (JEM Pressurized Module) and Node-2 for a vestibule leak check and left them closed overnight. The ground shut down the Inter/Intra Module Ventilation and the Smoke Detectors in the JPM and JLP (JEM Logistics Pressurized Section) prior to the leak check and it may occur when you are still in the JEM.

The TVIS treadmill has not been used for exercise since the crew reported hearing unusual noises yesterday. Audio, video, and still imagery were taken by the crew and downlinked for ground team analysis. The PFE w/OUM (Periodic Fitness Evaluation with Oxygen Uptake Measurement) activities are being deferred from tomorrow to accommodate an inspection of the TVIS chassis.

FE-1 Oleg Kononenko installed enclosures in FGB zones 16 & 19 (panels 224 & 225). He called down that he only had three small panels left to install and those would be done next week.

CDR Sergei Volkov conducted his monthly body fitness training using HMS (Health Maintenance System) hardware including ACLS (Advanced Cardiac Life Support) equipment which may be used in contingency situations where crew life is at risk.

[To maintain proficiency, the CMOs spend one hour per month reviewing HMS and ACLS equipment and procedures via the HMS CBT, and CBT (Computer Based Training (CBT) and the ACLS CBT. Maintaining proficiency with the HMS hardware and procedures is essential to successful ISS operations and well-being of the crew.]

Volkov and FE-2 Greg Chamitoff performed a POC DOUG (Portable Onboard Computers/Dynamic Onboard Ubiquitous Graphics (DOUG) Software Review: this review for upcoming robotics activities on Friday when they are scheduled to fulfill their recurring proficiency requirements by maneuvering the arm's Latching End Effector (LEE) B above the Node 2 Zenith hatch window for diagnostic photography.

A scheduled leak check of the Node-2 to JPM vestibule was initiated this morning. The vestibule has been partially evacuated (to 325 mmHg) and the check will continue for eight hours. In preparation for the check which isolates the JPM, all laptops in the JPM were turned off due to the power to those units being disabled.

Chamitoff prepared two messages, the first for ARC (Ames Research Center) for a 'NASA Night' in August with the San Francisco Giants, who are also celebrating their 50th anniversary, and the second for a cancer research benefit endorsed by NASA.

Gregory also filled out the regular FFQ (Food Frequency Questionnaire), his seventh, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

In the SM, Volkov took the periodic readings of potentially harmful atmospheric contaminants with the CMS (Countermeasure System) component of the GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite which uses preprogrammed microchips to measure H₂CO (Formaldehyde, methanal), CO (Carbon Monoxide) and NH₃ (Ammonia), taking one measurement per microchip. *[CMS is a*

subsystem of the Russian SKDS Pressure Control & Atmosphere Monitoring System.]

Kononenko conducted the periodic checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the passageways PrK (SM Transfer Compartment)–ATV, PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1.

Oleg also took the periodic readings of potentially harmful atmospheric contaminants with the CMS (Countermeasure System) component of the GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite which uses preprogrammed microchips to measure H₂CO (Formaldehyde, methanal), CO (Carbon Monoxide) and NH₃ (Ammonia), taking one measurement per microchip. *[CMS is a subsystem of the Russian SKDS Pressure Control & Atmosphere Monitoring System.]*

Later, the FE-1 used the SOGS GANK-4M system for taking and recording atmospheric readings. *[GANK tests for Methane (CH₄), NH₃, CO, H₂CO, Nitrogen Oxides (NO, NO₂), Hydrogen Chloride (HCl), Hydrogen Fluoride (HF), and Hydrogen Cyanide (HCN).]*

The Elektron was activated this morning and is currently performing nominally. An O₂ repress from Progress was also conducted to supplement the Elektron due to the ppO₂ level approaching lower flight rule levels.

A scheduled leak check of the Node 2 to JPM vestibule was initiated this morning. The vestibule has been partially evacuated (to 325 mmHg) and the check will continue for eight hours. In preparation for the check which isolates the JPM, all of the laptops therein were turned off due to the power to those units being disabled.

Working on the SHERE experiment payload, Chamitoff performed a SHERE Fluid Module Insert.

Kononenko performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Afterwards, Oleg performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations,

for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The three crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2, FE1), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Oleg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

TVIS Noise Update: The TVIS treadmill has not been used for exercise since the crew reported hearing unusual noises yesterday. Audio, video, and still imagery were taken by the crew and downlinked for ground team analysis. The PFE w/OUM (Periodic Fitness Evaluation with Oxygen Uptake Measurement) activities are being deferred from tomorrow to accommodate an inspection of the TVIS chassis.

Analysis of the increasing noise of the treadmill led to a requirement last evening to stand down on TVIS operations until further inspections of the unit could be conducted. The engineering team has speculated that the noise could be the result of a belt slat making contact with the chassis or another slat. This conclusion is based on the frequency (twice per belt revolution) and increasing magnitude of a percussive noise with increasing speeds. Recommendations on a forward plan are being developed.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS On-Orbit Status 07/30/08

All ISS systems continue to function nominally, except those noted previously or below.

Upon wake-up, Oleg Kononenko terminated his seventh MBI-12 SONOKARD experiment session for the long-term Russian sleep study, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. Sergey Volkov's new MBI-12 session starts tonight (~5:20pm). *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

CDR Volkov began his workday again by supporting the Russian TEKh-20 Plazmennyi-Kristall/PK-3+ (Plasma Crystal-3+) experiment on its final day, first activating the turbopump in the Service Module (SM)'s Transfer Compartment (PkhO) for keeping the vacuum chamber (ZB) in the SM Work Compartment (RO) evacuated, then starting the experiment, terminating it later and performing close-down ops. Sergey copied the data to USB stick for subsequent downlinking via OCA, deactivated all the hardware, and disassembled and stowed it. *[Main objective of PK-3 is to study non-linear dust plasma wave propagation and dispersion ratio at a specified power of an alternating electric field, pressure, and a varied number of particles, controlled by the experimenter. The research experiment was performed in semi-automatic mode with particles having a diameter of 9.19 μm under pressures of 20, 40, and 80 Pa (Pascal).]*

FE-1 Kononenko performed more FGB outfitting with new stowage enclosures

delivered by the ATV, built in Russia to provide more efficient stowage spaces behind FGB panels and improve airflow/circulation. *[Today's installations involved the spaces behind panel 409 (from which the B14M unit was removed first) in zone 35G, and two panels (424, 425) in zones 10 & 12.]*

The FE-1 also supported the ground's activation of the Elektron O₂ generator at 32 amps by monitoring the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there is no overheating. In support of the reactivation, at ~4:42am EDT the ground temporarily switched the ATV (Automated Transfer Vehicle) to autonomous power (i.e., disconnected from ISS) and later reconfigured it to ISS power. *[During nominal Elektron operations a gas analyzer is utilized to detect hydrogen (H₂) in the O₂ line (which could cause overheating) but is not included in the control algorithm until 10 minutes after Elektron startup.]*

In the JAXA Kibo JPM (JEM Pressurized Module), FE-2 Chamitoff continued preparations for payload operation, today continuing reconfiguring/reconnecting the CB (Clean Bench) subrack facility.

Chamitoff later set up the payload equipment for his third session with the 3D-Space (Mental Representation of Spatial Cues During Space Flight) experiment and then performed the protocol, with all three exercises (distance, illusion, handwriting). After all data were stored on PCMCIA memory card, the ESA multipurpose laptop was shut down and the hardware disconnected & stowed away. *[3D-SPACE, a collaboration of ESA and the French space agency CNES (Centre National de la Recherche Scientifique), is designed to identify accurate visual perception & localization of objects in the space environment as prerequisites for spatial orientation & reliable performance of motor tasks in microgravity.*

Humans have mental representations of their surroundings based on sensory information & experience. It is hypothesized that depth & distance perception of objects could be altered in space due to the absence of gravitational reference and ambiguous perspective cues. 3D-SPACE investigates (a) depth perception & the role of perspective cues using geometric illusions, (b) distance perception using both standard psychophysics tests & natural three-dimensional scenes presented on a virtual reality head-mounted display, and (c) the effects of cognitive vs. perceptual-motor changes using handwriting & drawing tests.]

The CDR performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS *replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Afterwards, Sergey also conducted the daily IMS (Inventory Management System)

maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

CDR Volkov set up the hose & electric pump assembly and initiated (later closed out) transfer of water from the ATV WDS (Automated Transfer Vehicle/Water Delivery System) tank #1 to three EDV containers in the SM.

In the JAXA Kibo JPM (JEM Pressurized Module), Gregory Chamitoff removed temporary stowage from the Ryutai rack and installed a silicone filter. *[RYUTAI (“fluid”) is a Japanese multipurpose experiment/payload rack system to support the FPEF (Fluid Physics Experiment Facility), SCOF (Solution Crystallization Observation Facility), PCRF (Protein Crystallization Research Facility) and the IPU (Image Processing Unit) by providing structural interfaces, power, data, cooling, water and other items needed to operate science experiments in micro-G.]*

FE-1 Kononenko used the Russian MedOps SZM-MO-21 “Ecosfera” air sampler & incubation equipment for another check on the station’s sanitary-hygiene status, conducting the standard 45-min. microbial analysis (T+7 days) on the air samples collected on 7/23 and incubated since then in the MO-21 equipment in Medium 2 (MON-2). *[MO-21 determines microbial contamination of the ISS atmosphere, specifically the total bacterial and fungal microflora counts and microflora composition according to morphologic criteria of microorganism colonies.]*

The three crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Oleg transferred the exercise data file to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~5:20pm, getting ready for sleep time, the CDR again set up the Russian MBI-12 SONOKARD (Sonocard) payload and started his seventh experiment session, using a sports shirt from the SONOKARD kit with a special device in the pocket for testing a new method for acquiring physiological data without using direct contact on the skin. Measurements are recorded on a data card for return to Earth.

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

07/29/08 -- **NASA 50 Years** (Pres. Eisenhower signs)

08/13/08 -- ATV Reboost

08/30/08 -- Progress M-64/29P undocking, from FGB nadir

09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/ observation)
09/10/08 -- Progress M-65/30P launch
09/12/08 -- Progress M-65/30P docking (SM aft port)
10/01/08 -- **NASA 50 Years** (official)
10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
03/25/09 -- Soyuz TMA-14/18S launch
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 07/29/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Volkov began his workday again by attending to the current experiment session with the Russian/German TEKh-20 Plasma Crystal-3+ (Plazmennyyi-Kristall/PK-3+) payload, activating the turbopump in the Service Module (SM)'s Transfer Compartment (PkhO) for keeping the vacuum chamber (ZB) in the SM Work Compartment (RO) evacuated. The turbopump will be deactivated again tonight at ~5:25pm EDT before sleeptime. *[The research experiment is being performed with particles having a diameter of 9.19 μm under pressures of 20, 40, and 80 Pa (Pascal). The primary objective of the experiment is to study the behavior of structures when exposed to a low-frequency alternating electrical field of varying amplitudes as produced by an RF generator at various power output settings. The experiment is being performed in semi-automatic mode.]*

FE-1 Kononenko configured gas transfer and initiated (later terminated) an oxygen refreshing of the cabin atmosphere with the remaining O₂ supplies in the ATV1 cargo carrier "Jules Verne".

Sergey serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out"-to-vacuum cycle on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated tonight at ~3:45pm EDT. Filter bed #1 was regenerated yesterday. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently to remove any lingering Freon-218 from the cabin atmosphere (last time done: 7/16&17).]*

In the JAXA Kibo JPM (JEM Pressurized Module), FE-2 Chamitoff continued preparations for payload operation, today removing the Mach-Zehnder covers of the SCOF (Solution Crystallization Observation Facility) and reconfigured/reconnected

the CB (Clean Bench) subrack facility from its launch configuration.

Volkov, Kononenko & Chamitoff spent three hours in the TMA-12 Descent Module (SA) to conduct the Soyuz descent drill, a standard training exercise for every crew returning on a Soyuz. The exercise, which strictly forbids any command activation (except for switching the InPU display), was supported by a tagup and discussions with ground instructor at TsUP/Moscow via S-band. *[The session includes a review of the pertinent ODFs (operational data files), specifically the books on Soyuz Ascent & Descent Procedures, Emergency Descents, and Off-Nominal Situations, crew responsibilities when executing the flight program, visual crew recognition of SUS (Entry Control System) failures, spacesuit procedures, etc., with special emphasis on operations with the Neptune-ME cockpit console. The training uses a Descent Simulator application on the RSK1 laptop. During the actual descent, Volkov, as Soyuz CDR, will occupy the middle couch, with SFP (Spaceflight Participant) Garriott in the right seat and Kononenko in the Descent Module's left Kazbek couch.]*

As part of regular preventive maintenance of RS ventilation systems, Oleg applied vacuum cleaner and soft brush to cleaning the detachable VT7 fan screens 1, 2 & 3 of the three SOTR (Thermal Control System) gas-liquid heat exchangers (GZhT4) In the FGB (Funktsionalnyi-Grusovoi Blok).

The FE-1 also conducted the periodic (about twice a month) replenishing of the Elektron oxygen generator's water supply for electrolysis, filling the KOV EDV container with water collected in a CWC (Contingency Water Container) from the Lab CCAA (Common Cabin Air Assembly) dehumidifier. *[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]*

Kononenko performed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Afterwards, Oleg performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The three crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise

device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Oleg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~5:20pm EDT, just before sleep time, the FE-1 will again set up the Russian MBI-12 SONOKARD (Sonocard) payload and start his seventh experiment session, using a sports shirt from the SONOKARD kit with a special device in the pocket for testing a new method for acquiring physiological data without using direct contact on the skin. Measurements are recorded on a data card for return to Earth.

[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]

OGS Update: The U.S. Oxygen Generation System is being activated periodically until the next planned processing of water by the system. The overall goal of this activity is to maintain pressure in the feedwater line below the maximum allowable pressure between activations. This will be accomplished by periodically powering the rack to monitor the rack temperature and feedwater pressure and then reopening the valve as needed to relieve pressure.

E17/E18 Handover Conference Update: Yesterday's "handover" conference was between the current ISS crew and the upcoming CDR (and ISS veteran) Mike Fink.

CEO (Crew Earth Observations) photo targets uplinked for today were **Yellow River Delta** *(this complex and dynamic delta is formed by one of central China's major rivers. Extensive land use changes and flood-control measures along its course have had significant impact on both the shape and location of the main river channel. The crew had a nadir pass over this feature in late afternoon. Although tropical storm Fung-wong is expected to be breaking up over interior SE China, partly cloudy to fair weather conditions were expected in the delta region. As ISS approached from the SW, Greg was to try for a mapping strip along the main channel of the river), **Mt. Kilimanjaro, Kenya*** *(this famous peak, at 19,340 feet, is Africa's highest mountain and is located in northeastern Tanzania near the border with Kenya. Researchers are monitoring the tiny ice fields near the summit that have noticeably diminished during the twentieth century. On this early afternoon pass Gregory was to look for this volcanic peak just right of track. There may have been low clouds in the surrounding plains as ISS approached the area from the*

SW), and **Amazonian Fans, Brazil** (*this has proven to be a very challenging target to acquire by ISS crews. Clouds usually obscure this area to the south of the Amazon for most of the year. Also the inland delta features CEO workers are attempting to detect and document here are very subtle due to vegetation cover and low topographic relief. The early afternoon ISS pass today should have had unusually few clouds, and researchers are seeking a nadir to just left of track mapping strip with the low-lens settings as the station moves from SW to NE across the region. It was hoped that these images can be used to help detect and pinpoint areas for more detailed images in the future. JSC geologists are investigating inland deltas worldwide as analogs for similar features on Mars*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

07/29/08 -- **NASA 50 Years** (Pres. Eisenhower signs)
08/13/08 -- ATV Reboost
08/30/08 -- Progress M-64/29P undocking, from FGB nadir
09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/observation)
09/10/08 -- Progress M-65/30P launch
09/12/08 -- Progress M-65/30P docking (SM aft port)
10/01/08 -- **NASA 50 Years** (official)
10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
03/25/09 -- Soyuz TMA-14/18S launch
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 07/28/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 15 of Increment 17.*

****** Happy 50th Birthday, NASA!******

CDR Volkov began his workday again by attending to the current experiment session with the Russian/German TEKh-20 Plasma Crystal-3+ (Plazmennyi-Kristall/PK-3+) payload, activating the turbopump in the Service Module (SM)'s Transfer Compartment (PkhO) for keeping the vacuum chamber (ZB) in the SM Work Compartment (RO) evacuated. The turbopump will be deactivated again tonight at ~5:25pm EDT before sleeptime. *[Main objective of PK-3 is to study dust plasma wave propagation and dispersion ratio at a specified power of HF discharge, pressure, and a varied number of particles.]*

The CDR also performed the periodic service of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The process will be terminated around sleeptime, at ~4:25pm EDT. Bed #2 regeneration follows tomorrow. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently to remove any traces of leaked Freon-218 from the cabin atmosphere (last time: 7/22&23).]*

FE-1 Kononenko performed more FGB outfitting with new stowage enclosures delivered by the ATV, built in Russia to provide new efficient stowage spaces behind FGB panels and improve airflow/circulation. *[Today's installations involved the spaces behind two panels (404, 405) in FGB zone 5, 8 & 9.]*

Conducting more preparations for initiating payload operations in the JAXA Kibo

JPM (JEM Pressurized Module), FE-2 Chamitoff verified the nominal performance of the ISPR (International Standard Payload Rack) power switch, using the SLT (Systems Laptop). Later, Greg collected the necessary parts for the reconnection of the CB (Clean Bench) subrack facility.

Also in the Kibo JPM, Gregory activated the PLT (Payload Laptop) for payload operation (after temporarily disconnecting the SSC-14/Station Support Computer 14 power cable to allow UOP/Utility Outlet Panel access), then turned off the PLT, relocated it for payload ops and powered it up again.

Afterwards, continuing FSL (Fluid Science Laboratory) commissioning in the COL (Columbus Orbital Laboratory), Chamitoff reconfigured the FSL by removing the OPT TGT (Optical Target) and inserting the GEOFLOW EC (Experiment Container), followed by unlocking and releasing the FSL FCE (Facility Core Element), setting up the FSL, and deactivating the PLT. *[The installation involved the demating of ECP Video By-Pass Connector from the EC's Panel Video P301. After some initial tests, the GEOFLOW science program is planned to start tomorrow.]*

Sergey Volkov worked on the Service Module (SM) toilet systems (ASU), performing the monthly 30-min. maintenance/servicing of the facility, changing out replaceable ASU parts with new components, i.e., the urine receptacle (MP) and a filter insert (F-V). The old parts were discarded as trash.

After the FE-2 broke out the auditory test equipment, the three crewmembers took the periodic O-OHA (on-orbit hearing assessment) test, a 30-min. NASA environmental health systems examination to assess the efficacy of acoustic countermeasures, using a special MEC (Medical Equipment Computer) laptop application. It was Greg's second O-OHA session, the third for Sergey & Oleg. *[The O-OHA audiography test involves minimum audibility measurements for each ear over a wide range of frequencies (0.25-10 kHz) and sound pressure levels, with the crewmembers using individual-specific Prophonics earphones, Bose ANC headsets and the SLM (sound level meter). To conduct the testing, the experimenter is supported by special EarQ software on the MEC, featuring an up/down-arrow-operated slider for each test frequency that the crewmember moves to the lowest sound pressure level at which the tone can still be heard. The baseline test is required not later than about Flight Day 14 for each new Expedition and is then generally performed once per month. Note: There have been temporary hearing deficits documented on some U.S. and Russian crewmembers, all of which recovered to pre-mission levels.]*

Working from the Russian RSE1 laptop, CDR Volkov loaded (ghosted) the RSK-1 laptop with upgrade software (Vers. 1.4) from a DVD via an HDD (Hard Disk Drive)

“image”.

In the Lab, Chamitoff performed maintenance on the CGBA (Commercial Generic Bioprocessing Apparatus) after its use for SHERE session on last weekend's VolSci (Voluntary Science) program, removing the CGBA-5 mufflers to clean the air inlet screens and then accessing and rotating the Silicate Garden Hab. CGBA-5 will be activated from the ground later this week.

The CDR continued the current round of the monthly preventive maintenance of RS (Russian Segment) ventilation systems in the *Funktsionalnyi-Grusovoi Blok* (FGB), cleaning the detachable fan screens 1, 2, and 3 of the three SOTR gas-liquid heat exchangers (GZhT4) and the fixed grill of GZhT #4.

Kononenko meanwhile had ~20 min set aside for reviewing an OBT (Onboard Training) for OpsLAN (Operations Local Area Network) reload procedures.

The FE-1 completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Oleg also performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The FE-2 completed the periodic (monthly) inspection of the RED (Resistive Exercise Device) canister cords and accessories.

The three crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Sergey transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~1:05pm EDT, the Expedition 17 crew held their first “handover” conference with the E-18 crew, via S-band (audio).

As a discretionary job from the Russian “time permitting” task list, Oleg was perform

the regular monitoring, picture-taking and downloading for the BIO-5 Rasteniya-3 ("Plants-3") experiment which researches growth and development of plants (peas) under spaceflight conditions in the Lada-13 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}).

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

SKV-2 Update: The Russian SKV-2 air conditioner was successfully recharged with fresh Khladon (Freon-218) coolant yesterday and is currently operating nominally, collecting the first condensate. TsUP-Moscow estimates that about 100 grams of Khladon leaked out during the recharge process. The BMP Micropurification Unit will be activated every 5 days for increased scrubbing of the cabin atmosphere (along with the previously reported Khladon spill).

Elektron Update: The Elektron oxygen generator was shut down over the last weekend due to a procedural error which introduced non-certified water into the Elektron water container. The unit was purged with nitrogen during the shutdown sequence as usual. It is scheduled to be re-activated on 7/30. An O₂ repress from ATV storage will be conducted tomorrow to maintain proper ppO₂ levels.

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

07/29/08 -- **NASA 50 Years**

08/13/08 -- ATV Reboost

08/30/08 -- Progress M-64/29P undocking, from FGB nadir

09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/observation)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft port)

ISS On-Orbit Status 07/27/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – rest day for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff. Ahead: Week 15 of Increment 17.*

Sergey Volkov began his workday again by attending to the current experiment session with the Russian/German TEKh-20 Plasma Crystal-3+ (Plazmennyi-Kristall/PK-3+) payload, activating the turbopump in the Service Module (SM)'s Transfer Compartment (PkhO) for keeping the vacuum chamber (ZB) in the SM Work Compartment (RO) evacuated. The turbopump will be deactivated again tonight at ~5:25pm EDT before sleeptime. *[Main objective of PK-3 is to study dust plasma wave propagation and dispersion ratio at a specified power of HF discharge, pressure, and a varied number of particles.]*

In the SM, Gregory Chamitoff set up the video equipment and opened the TVIS (Treadmill with Vibration Isolation & Stabilization) skirt for filming his subsequent workout on the for biomechanical evaluation of his performance and assessment of the hardware status by ground engineers. *[At the beginning of the day, Greg set up the camcorder, and all crewmembers recorded their TVIS exercise sessions. After the exercise sessions are complete, Greg recorded the videos to the VTRs (video tape recorders). Once the recording to the VTRs was complete, the ground began the restricted video downlink to the ground around the Ku availability. Greg then stowed the camcorder.]*

The three crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1).

At ~10:30am, the FE-2 had his weekly PFC (Private Family Conference) via S-band/ audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground

video on an SSC laptop).

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS On-Orbit Status 07/26/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – mostly off duty for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff.*

Sergey Volkov began his workday by attending to the current experiment session with the Russian/German TEKh-20 Plasma Crystal-3+ (Plazmennyi-Kristall/PK-3+) payload, activating the turbopump in the Service Module (SM)'s Transfer Compartment (PkhO) for keeping the vacuum chamber (ZB) in the SM Work Compartment (RO) evacuated. The turbopump will be deactivated again tonight at ~5:25pm EDT before sleeptime. *[Main objective of PK-3 is to study dust plasma wave propagation and dispersion ratio at a specified power of HF discharge, pressure, and a varied number of particles.]*

The crew performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the SM dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

As part of the house cleaning, the crew also conducted regular maintenance inspection & cleaning on fan grilles in the FGB (TsV2), SM (VPkhO, VPrK, FS5, FS6 & FS9), DC1 (V3) screens and PF1/PF2 dust filters, as well as in the COL (Columbus Orbital Laboratory).

Gregory filled out the regular FFQ (Food Frequency Questionnaire), his sixth, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software.]*

Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]

At ~9:45am EDT, the crewmembers conducted their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

Conducting his VolSci voluntary weekend science program, the FE-2 set up for several hours of a SHERE (Shear History Extension Rheology Experiment) session with the CGBA (Commercial Generic Bioprocessing Apparatus) activating the MSG (Microgravity Science Glovebox) with its A31p laptop, powered on the SHERE payload in the CGBA, unstowing Fluid Module #30 and performed a dry run, followed by CGBA power down, data transfer and deactivation of SHERE and the MSG via the A31p.

Afterwards, Gregory took measurements for the regular atmospheric status check for ppCO₂ (Carbon Dioxide partial pressure) in the Lab, SM (at panel 449) and COL (Columbus Orbital Laboratory), using the hand-held CDMK (CO₂ Monitoring Kit, #1002). *[The CDMK was then deactivated and returned to its stowage location at LA B1S2.]*

Oleg completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The three crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Greg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

The two cosmonauts had their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop), Sergey at ~8:20am, Oleg at ~10:20am.

Weekly Science Update (*Expedition Seventeen -- Week 14*)

3-D SPACE: Third session for Greg Chamitoff is currently planned for 7/30.

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):

Measurements continue in the FGB module. Last memory card exchange was performed on 7/1. Next activities are planned on 7/22 for the rotation of the ALTEINO instrument and the exchange of the memory card. Subsequent data downlink is currently planned on 7/23.

ANITA (Analyzing Interferometer for Ambient Air): Continuing.

BCAT-3 (Binary Colloidal Alloy Test 3): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System):

Samples returned on 1J.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): The Silicate Garden Hab S/N2 ground unit was activated at approximately 5:15pm EDT on 7/11. The flight unit was activated at approximately 1:25pm on 7/14 via remote command. There are 2 cameras in the flight unit imaging 2 chambers each for a total of 4 chambers on Side 1. Fibers continue to grow from the crystals in strange formations in the flight unit.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): On 7/16, EuTEF encountered a MIL-Bus error (this happened similarly in the past). The platform has to be power-cycled and the entire EuTEF facility re-initiated. On 7/20, a similar DHPU (Data Handling Processing Unit) problem was encountered again. Although this problem does not prevent EuTEF to function, ground teams are working hard to characterize it and find a solution. A DHPU software patch is currently being developed to fix the link error issues encountered with DEBIE-2 and FIPEX instruments. -- DEBIE-2: Instrument could not be restarted immediately after the DHPU problem on 7/20, and was finally re-activated on 7/22) for a short diagnostic run. EBIE-2 was stopped on 7/23 to allow science acquisition with FIPEX. Generic status: link error still in work. However, a work-around allows for regular science data acquisition using an on-board Instrument Operations Procedure (IOP), but not yet in conjunction with any FIPEX IOP – a final software patch, which will enhance the present instrument capabilities, is under finalization on ground;-- DOSTEL: On-going science acquisition;-- EuTEMP: Currently inactive as planned;-- EVC: Inactive this week;-- EXPOSE: On-going science acquisition;-- FIPEX: Instrument re-activated after DHPU problem on 7/20. Science acquisition since 7/23;-- MEDET: Instrument is not active due to low temperature; -- PLEGPAY: Currently in READY mode, no science data acquisition on-going;-- TRIBOLAB: The instrument is currently in Stand-By Mode. The Ball-Bearing experiment would be restarted towards mid-Aug. Analysis is on-going on ground.

FSL (Fluid Science Laboratory): FSL is back and running. Further FSL commissioning activities remain to be done (see following item).

GEOFLOW: On 7/23, Greg swapped the FSL optical targets, and the Optical check-out 2 has been successfully performed from ground before the ATV reboost. At this point, everything looks ready to remove this optical target and to insert the GEOFLOW Experiment Container on 7/28. After some initial tests, the GEOFLOW science program is planned to start on 7/29.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Planned.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer, ESA): In progress.

NUTRITION w/REPOSITORY: In progress.

PADLES (Passive Dosimeter for Lifescience Experiment in Space): In progress.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SAMPLE: Complete.

SHERE (Shear History Extensional Rheology Experiment): The SHERE team thanks Greg for selecting SHERE for Voluntary Science checkout activities performed on GMT 202. The checkout tests were a great success and showed that the SHERE hardware is functioning properly. The SHERE team looks forward to working with Greg again tomorrow, GMT 208, to perform the SHERE Dry Run. The recent fit problem with the Fluid Module Stowage Tray is being worked and will not affect the Dry Run.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): The HRP team thanks Greg for completing his first week of Sleep logs and his Actiwatch download initialization session. HRP is currently targeting the week of 8/4 for Greg's next week of Sleep logging and the week of 8/11 for his next Actiwatch download. Additional Sleep logging on non-targeted weeks is above and beyond and greatly appreciated by the PI.

SOLAR (Solar Monitoring Observatory): After a successful troubleshooting activity

by Greg on 7/21 (GMT203) and subsequent downlink of the log file generated during the boot sequence of SOLAR, ground teams have been very busy analyzing this new input with some very good news: the SOLAR LAN interface has been confirmed to be fully nominal. Next troubleshooting step was to focus on the Columbus LAN Switch#2 (CLSW#2), and on 7/23 (GMT205), ground activities were performed. SOLAR power feeder #1 was re-activated immediately and was forced to communicate via the other Columbus LAN switch (CLSW#1). Immediately, SOLAR started to re-send telemetry to the ground. Full functionality of the platform has been recovered. The instruments have been progressively warming up, thanks to continuous power via feeder #1 after this harsh beta angle period. The next Sun observation window starts on 7/31.-- SOVIM: Instrument confirmed fully functional; awaiting the Sun; -- SOLSPEC: Instrument confirmed fully functional; awaiting the Sun;-- SOLACES: Instrument confirmed fully functional; awaiting the Sun.

SOLO: Planned.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): The four ECs (Experiment Containers) of Rotor B are yet to be retrieved by the crew from the blocked Rotor B. BIOLAB could not be activated from ground yet, pending resolution of the Smoke Detector issue. A troubleshooting plan has been developed to recover all the BIOLAB functionalities. The first step is to exchange an ESEM Power Board, in which this activity is planned later on today, i.e. 7/25. Hopefully, this will resolve the Smoke Detector issue and the ground will proceed with the next steps; starting with the BIOLAB activation from ground on 7/26. The remaining WAICO-#1 ECs will be disposed and replaced by 6 Reference ECs on Rotor B. The remaining WAICO-#1 ECs will be disposed and replaced by six Reference ECs on Rotor B.

CEO (Crew Earth Observations): Through 7/15 the ground has received a total of 3,391 frames of CEO images for review and cataloging. New imagery received this week with times corresponding to CEO target request times included: Lake Poopo, Bolivia (interesting new imagery of the target is now under review); Jarvis Island, equatorial Pacific (only a solitary, late-shot frame of this isolated island); and Moorea Coral Reef, Tahiti (good imagery acquired, a bit late-oblique, and a touch

soft). “As you are aware CEO target opportunities have been limited by low light and winter weather. It will take good fortune to spot even a large, bright iceberg under those conditions. We hope you may have better luck with the Polar Mesospheric Cloud opportunities. This lull is allowing us to work through our backlog. You shot excellent imagery of: Mount Rainer in with snow, the Red River Valley, the Tigris-Euphrates Delta, and much of the Afar Rift Zone target. Good work! We suggest technique-wise that you continue to practice with the long lens settings to improve consistency of focus, and continue to practice providing an overlap between successive images when mapping a feature or a regional target. The composition and quality of your images is high and we do appreciate you all your efforts.”

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

08/30/08 -- Progress M-64/29P undocking, from FGB nadir
09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/ observation)
09/10/08 -- Progress M-65/30P launch
09/12/08 -- Progress M-65/30P docking (SM aft port)
10/01/08 -- **NASA 50 Years**
10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
03/25/09 -- Soyuz TMA-14/18S launch
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)

04/08/10 -- STS-132/Discovery/ ULF4 – ICC-VLD, MRM1

05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Subject: ISS On-Orbit Status 07/25/08

Date: Friday, July 25, 2008 8:11:00 PM

Attachments:

ISS On-Orbit Status 07/25/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Sergey Volkov continued preparations for operating the Russian/German TEKh-20 Plasma Crystal-3 Plus (PK-3+) experiment payload, the first time for Expedition 17. *[After unstowing and setting up the hardware yesterday in the Service Module (SM), leak checking of the electronics box and evacuation of the vacuum work chamber (ZB) in the SM Work Compartment (RO) with the turbopump, Volkov today conducted more hardware testing and calibration, uploaded new software from a USB stick, checked out the software installation and verified the readiness of the experiment. After starting the turbo pump right after wake-up and conducting additional leak checking on the ZB during the "day", the CDR will deactivate the turbopump tonight at ~5:25pm EDT. The resulting log file was then downloaded to laptop for downlink via BSR-TM. The experiment is performed on plasma, i.e., fine particles charged and excited by HF (high frequency) radio power inside the evacuated work chamber. Main objective is to obtain a homogeneous plasma dust cloud at various pressures and particle quantities with or without superimposition of an LF (low frequency) harmonic electrical field. The experiment is conducted in automated mode. PK-3+ has more advanced hardware and software than the previously used Russian PKE-Nefedov payload.]*

FE-2 Gregory Chamitoff supported OGS (Oxygen Generator System) activities, deactivating the OGS WDS (Water Delivery System) and then turning off the OGS for reconfiguring it for the subsequent purging of the H₂ (hydrogen) sensor.

Using the Russian MO-21 "Ecosfera" air sampler & incubation equipment, FE-1 Oleg Kononenko monitored the station's sanitary-hygiene status by conducting another 40-min. microbial analysis (T+2 days) on the air samples collected on 7/23,

including from the ATV (Automated Transfer Vehicle), and incubated since then in the MO-21 equipment. *[MO-21 determines microbial contamination of the ISS atmosphere, specifically the total bacterial and fungal microflora counts and microflora composition according to morphologic criteria of microorganism colonies. The equipment, consisting of an air sampler set, a charger and power supply unit, provides samples to help determine microbial contamination of the ISS atmosphere, specifically the total bacterial and fungal microflora counts and microflora composition according to morphologic criteria of microorganism colonies.]*

Volkov spent a few minutes on the weekly inspection of the TVIS treadmill roller bearings, checking the treadmill's belt both left and right for any noticeable depressions due to seized or worn rollers. *[With the TVIS treadmill rollers approaching their end-of-life, the frequency of their inspection has recently been increased for safety.]*

Kononenko performed more FGB outfitting with new stowage enclosures delivered by the ATV, built in Russia to provide more efficient stowage spaces behind FGB panels and improve airflow/circulation. *[Today's installations involved the spaces behind two panels (114, 115) in FGB zone 36 and behind one panel (215) in zone 40B.]*

The crew performed the mandatory two-hour OBT (onboard training) emergency egress drill for the case of rapid cabin depressurization, with Russian & US specialists standing by at both control centers for crew questions or comments. *[Background: Purpose of the drill is to (a) familiarize the station residents with the location of hardware and the positions of valves used in emergency situations, (b) work through the Russian Segment (RS) hardware deactivation procedures, (c) review ATV emergency response material, (d) practice crew emergency joint activities, and (e) identify crew comments and suggestions that arise during training regarding crew procedures and equipment. In the RS, the crew translated along the emergency egress path to the DC1 Docking Compartment (where Soyuz TMA-12 is currently docked), checking hardware such as the Sokol suits, cable cutters, fire extinguisher (OKR), gas masks (IPK), emergency procedures books, valve settings, hatch rubber seal & restraint integrity, etc. In the US Segment (USOS) the inspection focused on fireports being unblocked in the Lab {21}, with other US modules to be checked by future crews), readiness of CSA-CP (Compound Specific Analyzer-Combustion Products), ISS leak kit, PBA (portable breathing assembly) and PFE (portable fire extinguisher), emergency procedures books, valve settings, integrity of hatch rubber seals, presence of hatch handrails, etc. The checks also included Node-2, COL (Columbus Orbital Laboratory), JLP (Japanese Experiment Module Experiment Logistics Module Pressurized Section) and Kibo JPM (JEM Pressurized Module). The exercise was topped off by a thorough debrief with the ground via S-band. During the session, the crew simulated executing the planned*

emergency procedures while moving about the station. For the case of an onboard fire and for emergency descent, there are other mandatory emergency drill OBTs.]

The CDR completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Sergey also performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Later, Volkov began a new round of periodic preventive maintenance of cabin ventilation systems in the RS (Russian Segment), today cleaning the “Group A” fan grilles in the SM.

Continuing his work on the OpsLAN (Operations Local Area Network) software reload, Greg Chamitoff –

- Stowed the equipment used for the reload,
- Activated the Netgear WAPs (Wireless Access Points) which provide Ethernet connectivity for the JSL (Joint Station LAN), then
- Performed the reload on the PDAs, setting up their RF (radio frequency) connection and
- Prepared the BCR (Bar Code Reader),
- Activated the SSC-14 (Station Support Computer 14),
- Set up its wireless connection and
- Disconnected its drag-thru Ethernet cable to the Node-2 patch panel & the ISL (Integrated Station OpsLAN) Router for stowage.

The FE-2 also took water samples from the SRV-K outlet for return on Mission ULF-2 and analysis on the ground.

The three crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-1, FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-2), and VELO bike with bungee cord load trainer (CDR). Later, Sergey transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~4:20am, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU/*Glavnaya operativnaya gruppa upravleniya* = “Main Operative Control Group”), including Shift Flight Director (SRP), at TsUP-Moscow via S-band/audio, phone-patched from Houston and Moscow.

At ~10:55am, Sergey & Oleg linked up with TsUP stowage specialists via S-band to conduct the weekly IMS tagup, discussing stowage issues, equipment locations and ATV & Progress cargo transfers.

At ~4:35pm, the ISS crew is scheduled for their regular weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. [*S/G-2 (Space-to-Ground 2) phone patch via SSC (Station Support Computer)*].

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

08/30/08 -- Progress M-64/29P undocking, from FGB nadir
09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/observation)
09/10/08 -- Progress M-65/30P launch
09/12/08 -- Progress M-65/30P docking (SM aft port)
10/01/08 -- **NASA 50 Years**
10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
03/25/09 -- Soyuz TMA-14/18S launch
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 07/24/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Volkov made preparations for a run of the Russian/German TEKh-20 Plasma Crystal-3 Plus (PK-3+) experiment payload, the first of Expedition 17, by unstowing the hardware, installing it in the SM for operation and photographing the setup. The images were downlinked to TsUP via BSR-TM for inspection, and the CDR performed the initial leak check of the PK-3 Electronics Box before its evacuation. More work to come tomorrow. *[The experiment is performed on plasma, i.e., fine particles charged and excited by HF (high frequency) radio power inside a vacuum work chamber. Main objective is to obtain a homogeneous plasma dust cloud at various pressures and particle quantities with or without superimposition of an LF (low frequency) harmonic electrical field. The experiment is conducted in automated mode. PK-3+ has more advanced hardware and software than the previously used Russian PKE-Nefedov payload.]*

FE-1 Kononenko took and dumped the periodic sensor readings of the Russian "Pille-MKS" (MKS = ISS) radiation dosimetry experiment which has ten sensors placed at various locations in the Russian segment (DC1, SM starboard & port cabin windows, ASU toilet facility, control panel, etc.). *[Nine of the ten dosimeters are read manually.]*

Volkov performed IFM (in-flight maintenance) on the Russian segment (RS)'s electrical power system (SZP), removing and replacing the #7 unit of the eight 800A batteries in the Service Module (SM).

The CDR also conducted the monthly FDS PEP (Fire Detection & Suppression/Portable Emergency Provisions) safety inspection/audit in the ISS modules. *[The IMS-supported inspection involves verification that PFEs (Portable Fire Extinguishers), PBAs (Portable Breathing Apparatus), QDMAs (Quick-Don Mask*

Assemblies) and EHTKs (Extension Hose/Tee Kits) are free of damage to ensure their functionality, and to track shelf life/life cycles on the hardware.]

In the SM, Kononenko initiated the new Russian BIO-5 Rasteniya-3 ("Plants-3") experiment, replacing the root module with a new one from stowage, filling the KDV water canister, loading new software and running a hardware test, then starting the experiment. *[Rasteniya-2, researches growth and development of plants (peas) under spaceflight conditions in the Lada-13 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). The payload hardware includes a module (MIS/ Module for the Investigation of Substrates), a MIS control unit (BU), a nitrogen purge unit (BPA) and other accessories. During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording.]*

FE-2 Chamitoff conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. *[Updated "cue cards" based on the crew's water calldowns are sent up every other week. The current card (17-0002R) lists 35 CWCs (Contingency Water Containers, ~1401.8 L total) for the four types of water identified on board: technical water (650.6 L, for Elektron, flushing, hygiene, incl. 509.4 L non-usable water because of Wautersia bacteria), potable water (706.7 L, incl. 260.6 L currently on hold), condensate water (41.5 L), waste/EMU dump and other (7.9 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]*

The FE-2 also continued the OpsLAN (Operations Local Area Network) reload. *[Today's work included reloading SSCs (Station Support Computers) 12-15, followed by swapping hard drives on SSC 1-11, running a laptop configuration tool on every SSC Client, and loading DVDs in SSCs 4 & 8. The ground then is to take over to wrap up the activities overnight, finishing with configuring each of the clients to work on the Ops LAN, configuring the IP Communicator on each SSC, and running the KFx file transfer application on two of the SSCs so OCA can uplink execute packages. The OpsLAN updates by the ground included the OpsLAN home pages, Expedition 17 Mission load, and Ops Notes. Also, Service Pack 01 was uplinked for the SSC File Server.]*

Continuing the current round of periodic preventive maintenance of RS (Russian Segment) ventilation systems, Sergey worked in the DC1 (Docking Compartment), replacing the PF1,2 filter cartridges and cleaning the V1 & V2 fan grilles and VD1 & VD2 air ducts.

Kononenko & Volkov had ~1.5 hrs set aside for recharging the Russian SKV-2 air

conditioner with Khladon (Freon-218) coolant from a KVO 6003 bottle delivered on Progress 29P. *[SKV-2 was deactivated last April after a small Khladon spill on 4/24 during maintenance activity.]*

The CDR completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Working from the Russian discretionary “time permitting” task list, Oleg performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

At ~2:50m, Chamitoff is scheduled to power up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, & power supply) and to conduct, at 2:55pm, a ham radio exchange with the European Space Camp 2008 at the Zanka Children & Youth Centre, near Lake Balaton, Zanka, Hungary. *[The radio contact is made from ESA's Space Camp in Hungary. 120 children of ESA staff members from various European countries, between 8 and 17, interested in science and sports are participating. This year they're learning about Earth Observation. Helped by Hungarian radio amateurs, they would like to know more about astronauts' lives. Questions were uplinked beforehand. “What kind of earth observation experiments do you do from the space station?”, “What is the most beautiful or interesting thing that you have seen looking down at Earth?”, “Does weightlessness make you feel sick or ill?”, “I read you are a diver. How does diving compare to weightlessness in space?”, “How do you feel sleeping in the ISS? In which part of the station do you sleep? Do you have a separate cabin for sleeping?”, “Do you see the stars through the windows? Do they look different than from Earth?”, “How often do you have to do a cleaning-up of the station? Do you use an ordinary vacuum-cleaner? Do you wash your dishes or use disposable dishes?”, “Do you play any kind of games? Is there any game onboard specialised to weightlessness?”]*

ATV Reboost Update: The ISS reboost with ATV1 “Jules Verne” OCS (main propulsion) thrusters was started at 12:37pm EDT for 20 min 37 s and completed nominally. Actual Delta-V was 4.15 m/s vs. 4.1 m/s planned, resulting in a mean altitude increase of 7.21 km (3.88 nmi). Purpose of the reboost maneuver was altitude maintenance.

CEO (Crew Earth Observations) photo targets uplinked for today were **Pilcomayo River dynamics, N Argentina** *(the Pilcomayo River rises in the Andes foothills,*

*and then flows over 2,000 km southeast across central South America. As the ISS approached the area from the SW in mid-afternoon, Greg was to look to the left of track for the river. Requested were detailed mapping views along the river course to document current channel configuration and adjacent vegetation and land use patterns), and **High Central Andean Glaciers** (these tiny, isolated ice fields and glaciers are located only in the highest elevations along the crest of the Andes Mountains within the Tropics and are the remnants of more extensive features during recent ice ages. Earlier in Increment 17 the crew acquired excellent imagery of a few of these features. On this fair-weather pass in mid-afternoon, CEO researchers hoped that Greg could acquire additional views of this and other small glacial features in this target area).*

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 9:03am EDT [= epoch]*):

Mean altitude -- 351.3 km

Apogee height -- 357.9 km

Perigee height -- 344.6 km

Period -- 91.56 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0009847

Solar Beta Angle -- 59.3 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.73

Mean altitude gain in the last 24 hours -- 7200 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55441

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

08/30/08 -- Progress M-64/29P undocking, from FGB nadir

09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/observation)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft port)

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)

11/10/08 -- STS-126/Endeavour/ULF2 launch -- MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
03/25/09 -- Soyuz TMA-14/18S launch
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 07/23/08

All ISS systems continue to function nominally, except those noted previously or below.

Before breakfast & first exercise, CDR Volkov, FE-1 Kononenko and FE-2 Chamitoff completed a full session with the Russian crew health monitoring program's medical assessment MO-9/Biochemical Urinalysis. Afterwards, the FE-1 closed out and stowed the Urolux hardware. *[MO-9 is conducted every 30 days (and also before and after EVAs) and is one of five nominal Russian medical tests adopted by NASA for U.S. crewmembers for IMG PHS (Integrated Medical Group/Periodic Health Status) evaluation as part of the "PHS/Without Blood Labs" exam. The analysis uses the sophisticated in-vitro diagnostic apparatus Urolux developed originally for the Mir program. Afterwards, the data are entered in the MEC (Medical Equipment Computer)'s special IFEP software (In-Flight Examination Program).]*

The CDR serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out"-to-vacuum cycle on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated tonight at ~4:25pm EDT. Filter bed #1 was regenerated yesterday. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently to remove any lingering Freon-218 from the cabin atmosphere (last time done: 7/16&17).]*

Continuing the current round of preventive maintenance on the Russian Segment (RS) ventilation system, Oleg Kononenko cleaned the ventilation screens on interior panels of the *Funktsionalnyi-Grusovoi Blok* (FGB).

Later, Sergey Volkov replaced the four dust collector filters (PF1-4) in the Service Module (SM).

Prior to attitude control authority handover to RS thrusters for maneuvering to ATV reboost attitude, Gregory closed the protective Lab window shutter, keeping it closed until two orbits after returning to U.S. Momentum Management. *[For the ATV reboost at 12:18pm EDT, attitude control was handed over to RS at 10:35am, to be returned to US Momentum Management at 1:20pm.]*

For the recently arrived FE-2, the CDR and Gregory performed the mandatory CHeCS (Crew Health Care Systems) emergency/contingency medical OBT (on-board training) drill, a one-hour U.S. exercise designed to refresh crewmembers' acuity in applying HMS (Health Maintenance System) equipment like ACLS (Advanced Cardio Life Support) in an emergency. *[The drill gives crewmembers the opportunity to work as a team in resolving a simulated medical emergency onboard ISS and to refresh their memory of on-orbit stowage and deployment locations, equipment use, and procedures. Setting up (but not actually operating/manipulating) onboard equipment such as the RSP (Respiratory Support Pack), ALSP (Advanced Life Support Pack), intubation kit, HMS defibrillator, all stowed in the Lab CHeCS rack, and the CMRS (Crew Medical Restraint System), Gregory and Sergey stepped through the ACLS algorithm manual to resolve a simulated medical emergency onboard ISS. Objectives of the exercise include practicing communication and coordination necessary to perform medical emergency procedures, locating appropriate emergency medical components, and determining each crewmember's individual method of delivering CPR (cardio-pulmonary resuscitation) in zero-G.]*

In the Kibo JPM (JEM Pressurized Module), Chamitoff activated and checked out the internal TV camera, then installed a payload laptop terminal at the JPM forward Deck4 position, connected to the FD4 UOP (Utility Outlet Panel).

On the JAXA SCOF (Solution Crystallization Observation Facility), Gregory completed post-launch reconfiguration on the experiment equipment (pushing an inside rod down), then photo-documented the set-up.

Kononenko serviced the Matryoshka-R (RBO-3-2) radiation payload which has taken over the ESA/RSC-Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS/ALC) with its Spectrometer (AST) and ALC equipment on DC1 panel 429. *[Oleg retrieved the ALC-952 PCMCIA (Portable Computer Memory Card International Adapter), checked up on the size of the new file on it for downlink to TsUP-Moscow via OCA, then re-inserted the #952 card into the AST PCMCIA slot.]*

The FE-1 used the standard ECOSFERA equipment, set up yesterday, to conduct microbial air sampling runs for the MedOps SZM-MO-21 experiment, with the POTOK Air Purification System temporarily powered down, taking samples from

cabin surfaces along with samples from crewmembers for sanitation and disease studies. Samples were also collected in the ATV, using spare medium-carrying Petri dishes. The sample tubes were then stowed in the Kriogem-03 refrigerator for return on TMA-12. *[The equipment, consisting of an air sampler set, a charger and power supply unit, provides samples to help determine microbial contamination of the ISS atmosphere, specifically the total bacterial and fungal microflora counts and microflora composition according to morphologic criteria of microorganism colonies.]*

Preparatory to taking dynamic/vibrational data during the ATV reboost, Volkov & Chamitoff replaced the IWIS RSU #1027 (Internal Wireless Instrumentation System/ Remote Sensor Unit 1027) with RSU #1026, then set up the IWIS operational configuration. Later, at ~2:00pm, IWIS was powered down again.

The FE-2 gathered the necessary equipment for the OpsLAN (Operations Local Area Network) software reload ahead. Afterwards, Gregory connected SSCs (Station Support Computers) 13 & 14 to the JSL (Joint Station LAN) for the OpsLAN reload. *[SSC-13 was connected to the Lab ISL (Integrated Station OpsLAN) Router, SSC-14 to the Node-2 ISL Router via a drag-thru Ethernet cable.]*

Using the "Chibis" garment from yesterday, Oleg Kononenko underwent the MBI-5 KARDIO-ODNT exercise, with Sergey assisting as CMO (Crew Medical Officer). MBI-5 is an extensive cardiovascular test of human pericardium (heart muscle) activity as well as of primary parameters of central and regional blood circulation at rest and under the effect of lower body negative pressure (LBNP, Russian: ODNT). MBI-5 was closed out at ~12:00pm, followed by a medical health conference for Sergey & Oleg with ground specialists via S-band. *[The LBNP applies a lower than ambient pressure to the body from the hips down to simulate 1g loads normally experienced on Earth. This acts as an orthostatic stressor and can be used to study deconditioning of the human cardiovascular system in space. The Chibis provides gravity-simulating stress to the body's cardiovascular/circulatory system for evaluation of Sergey's orthostatic tolerance (e.g., the Gauer-Henry reflex) after 14 weeks in zero-G. The MBI-5 protocol again consisted of first imbibing 150-200 milliliters of water or juice, followed by a sequence of progressive regimes of reduced ("negative") pressure, set at -25, -30, -35 and -40 mmHg for five minutes each, while shifting from foot to foot at 10-12 steps per minute. The body's circulatory system interprets the pressure differential between upper and lower body as a gravity-like force pulling the blood and body fluids "down". MBI-5 data output include blood pressure readings with the Tenzoplus Sphygmomanometer, today without telemetry data monitoring but reporting of heart rate and blood pressure to TsUP-Moscow.]*

In preparation of the next SHERE (Shear History Extension Rheology Experiment) session, which will use the CGBA (Commercial Generic Bioprocessing

Apparatus), the FE-2 installed a fluid module tray inside the CGBA.

The CDR took the periodic readings of potentially harmful atmospheric contaminants in the SM, using the CMS (Countermeasure System), a component of the GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, which uses preprogrammed microchips to measure H₂CO (Formaldehyde, methanal), CO (Carbon Monoxide), NH₃ (Ammonia) and C₈H₈ (Styrol, Phenylethen) (for today, instead Benzol), taking one measurement per microchip. [CMS is a subsystem of the Russian SKDS Pressure Control & Atmosphere Monitoring System.]

The FE-1 completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (CDR). Later, Kononenko transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~2:50pm EDT, the crew will convene for their standard bi-weekly teleconference with the JSC Astronaut Office (Steve Lindsey), via S-band S/G-2 audio & phone patch.

CEO (Crew Earth Observation) photo targets uplinked for today were **Kwanza Basin** *(this region of extreme northwestern Angola is undergoing rapid land use changes as resource development is increasing. CEO researchers requested context mapping views during this pass. It was mid-afternoon as ISS approached from the SW. Morning low clouds will have burned off by then, especially in the interior. Trying for a detailed mapping swath of the clear area),* and **Lake Poopo, Bolivia** *(Lake Poopo is located at the southern end of the Altiplano region of Bolivia. Greg has recently acquired good imagery of this target area with the 180mm lens settings. These photos indicate that the lake water levels are very low. On this pass, Greg was to look just left of track and try for detailed views of only the lake and its shorelines, especially the southern end).*

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (awaiting reboost results).

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

08/30/08 -- Progress M-64/29P undocking, from FGB nadir
09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/ observation)
09/10/08 -- Progress M-65/30P launch
09/12/08 -- Progress M-65/30P docking (SM aft port)
10/01/08 -- **NASA 50 Years**
10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
03/25/09 -- Soyuz TMA-14/18S launch
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 07/22/08

All ISS systems continue to function nominally, except those noted previously or below.

FE-1 Kononenko performed the periodic service of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The process will be terminated around sleeptime, at ~4:40pm EDT. Bed #2 regeneration follows tomorrow. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently to remove any lingering Freon-218 from the cabin atmosphere (last time: 6/23&24).]*

CDR Volkov set up the electric pump and transfer equipment with pressure adapter, then transferred the remaining water from the WDS1 (Water Delivery System 1) tank of the ATV (Automated Transfer Vehicle), filling two EDV containers, to be used for electrolysis in the Elektron oxygen generator.

The FE-1 performed the periodic AST spectrometer repositioning for the MATRYOSHKA-R (RBO-3-2) radiation instrumentation, rotating the AST by 90 deg around the Y-axis to face along the FGB. Afterwards, Oleg retrieved the #951 PCMCIA memory card from the AST, checked it for contents before stowing it, and then installed a new card, #952, from an ALTCRISS kit. Photographs were taken of the setup and downlinked to TsUP-Moscow. *[RBO-3-2 is using the ESA/RSC-Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS/ALC) with its Spectrometer (AST) and ALC equipment, located now again in the DC1 Docking Compartment).]*

Gregory Chamitoff had a full plate of activities, viz.:

- Replacing the battery of the prime CSA-CP (Compound Specific Analyzer-Combustion Products) with a new battery (#1248),

- Updating the SODF/Station Operation Data File C&W (Caution & Warning) books to reflect the currently ongoing software transition of the S1 & P1 MDMs (Multiplexer/Demultiplexer) computers to vers. R3 *[today's transition was for the S1-2 & P1-1 MDMs, to be followed by the S1-1 & P1-2 MDMs tomorrow]*,
- Continuing FSL (Fluid Science Laboratory) commissioning in the COL (Columbus Orbital Laboratory) by reconfiguring for the Optical Test 1, afterwards removing the two test targets, installing the OPT TGT (Optical Target) and activating the FSL for optical monitoring,
- Preparing for reloading the OpsLAN (Operations Local Area Network) plus reviewing the procedures for the OpsLAN reload,
- Conducting a teleconference with ground specialists at ~12:05pm EDT on the OpsLAN reload *[the primary OpsLAN reload activities, scheduled on 7/23, 7/24 & 7/25, consist of four major pieces: reloading the File Server, reload of SSCs (Station Support Computers) 12-15, preparation for reloading SSCs 1-11, and the ground administration of the reload of SSCs 1-11]*, and
- Setting up an A31p laptop at the RWS (Robotics Workstation) to use the IPV (International Procedures Viewer) DVD during the reload (in the event that he needs an electronic procedure, such as a caution procedure, during the reload),
- Dumping MEC (Medical Equipment Computer) data logs for inspection after last night's reload by the ground, and
- Performing the periodic (monthly) inspection of the RED (Resistive Exercise Device) canister cords and accessories.

Kononenko began a new round of periodic preventive maintenance of cabin ventilation systems in the RS (Russian Segment), today cleaning fan grilles in the Service Module (SM).

Volkov set up the "Chibis" garment, an extensive cardiovascular test of human pericardium (heart muscle) activity as well as of primary parameters of central and regional blood circulation at rest and under the effect of lower body negative pressure (LBNP, Russian: ODNT). Sergey then underwent the MBI-5 LBNP exercise, with Oleg assisting as CMO (Crew Medical Officer). MBI-5 was closed out at ~1:00pm, with ground specialist tagup via S-band. *[The LBNP applies a lower than ambient pressure to the body from the hips down to simulate 1g loads normally experienced on Earth. This acts as an orthostatic stressor and can be used to study deconditioning of the human cardiovascular system in space. The Chibis provides gravity-simulating stress to the body's cardiovascular/circulatory system for evaluation of Sergey's orthostatic tolerance (e.g., the Gauer-Henry reflex) after 14 weeks in zero-G. The MBI-5 protocol again consisted of first imbibing 150-200 milliliters of water or juice, followed by a sequence of progressive*

regimes of reduced (“negative”) pressure, set at -25, -30, -35 and -40 mmHg for five minutes each, while shifting from foot to foot at 10-12 steps per minute. The body’s circulatory system interprets the pressure differential between upper and lower body as a gravity-like force pulling the blood and body fluids “down”. MBI-5 data output include blood pressure readings with the Tenzoplus Sphygmomanometer, today without telemetry data monitoring but reporting of heart rate and blood pressure to TsUP-Moscow.]

In preparation for a microbial air sampling session scheduled tomorrow, later today (~2:05pm) the CDR will unstow and set up the MedOps SZM-MO-21 ECOSFERA equipment, initiating charging on the Ecosphere power pack (BP) and activating the KRIOGEM-03 refrigerator for the samples. *[The equipment, consisting of an air sampler set, a charger, power supply unit, and incubation tray for Petri dishes, determines microbial contamination of the ISS atmosphere, specifically the total bacterial and fungal microflora counts and microflora composition according to morphologic criteria of microorganism colonies.]*

The FE-1 conducted the periodic checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the passageways SM PrK (Service Module Transfer Compartment)–ATV, PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1.

The CDR completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Kononenko performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1). Later, Oleg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

ATV1 Reboost Preview: Tomorrow's ISS reboost by the ATV is scheduled for a TIG (Time of Ignition) of 12:18pm EDT for 20min 37s, to yield an expected delta-V of 4.1 m/s (13.5 ft/s). Expected mean altitude increase is 7.21 km (3.89 n.mi.).

The purpose of the reboost is for altitude maintenance and to set up phasing for upcoming visiting vehicles.

VolSci Program Preview: For the weekend of August 2-3, Greg Chamitoff was offered three choices: (1) SHERE (Shear History Extensional Rheology Experiment) science runs in the CGBA; (2) an "operations improvement" session with SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellites) with all three satellites; and (3) a LOCAD PTS (Lab-On-A-Chip Application Development – Portable Test System) surface sampling session using Glucan LAL cartridges, targeting yeast & molds on ISS surfaces.

CEO (Crew Earth Observation) photo targets uplinked for today were **Polar Mesospheric Clouds (PMC) over Northwestern North America** (*DYNAMIC EVENT: The low-light window of opportunity for this pass ran for about 10-12 minutes from the central Aleutian Islands to just off the coast of southern California. These were high oblique views left of track towards darker parts of the Earth's limb*), and **PMC over Northern Asia** (*DYNAMIC EVENT: The low-light window of opportunity for this pass ran for about 10-12 minutes from the central Ural Mountains of Russia to the eastern China. These were high oblique views left of track towards the darker parts of the Earth's limb.*)

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 3:53am EDT [= epoch]*):

Mean altitude -- 344.1 km

Apogee height -- 350.9 km

Perigee height -- 337.4 km

Period -- 91.42 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0010008

Solar Beta Angle -- 67.2 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.75

Mean altitude loss in the last 24 hours -- 40 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55406

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

07/23/08 -- ATV1 reboost (12:18pm EDT)

08/30/08 -- Progress M-64/29P undocking, from FGB nadir

09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/ observation)
09/10/08 -- Progress M-65/30P launch
09/12/08 -- Progress M-65/30P docking (SM aft port)
10/01/08 -- **NASA 50 Years**
10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
03/25/09 -- Soyuz TMA-14/18S launch
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at

ISS On-Orbit Status 07/21/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 14 of Increment 17.*

CDR Volkov, FE-1 Kononenko and FE-2 Chamitoff began their workday before breakfast with the periodic session of the Russian biomedical routine assessments PZeh-MO-7/Calf Volume Measurement & PZeh-MO-8/Body Mass Measurement (fifth for CDR & FE-1, third for FE-2), using the IM mass measurement device which Sergey Volkov broke down afterwards for stowage. *[Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference pints, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures. For determining body mass in zero-G, where things are weightless but not massless, the Russian IM "scales" measure the inertial forces that arise during the oscillatory motion of a mass driven by two helical metering springs with known spring constants. By measuring the time period of each oscillation of the unknown mass (the crewmember) and comparing it to the period of a known mass, the crewmember's mass is calculated by the computer and displayed.]*

The FE-2 conducted another one of the periodic offloadings of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling a CWC (Contingency Water Container, #1054) with the collected water slated for processing. No samples were required. *[Estimated offload time before reaching the tank's neutral point (leaving ~6 kg in the tank): ~30 min. Condensate collection continues to be performed by the CCAA while the Russian SKV-2 air conditioner is off, awaiting its overdue Khladon (Freon-218) refill. SKV-1 has been nonfunctional for a long time. Greg was approved to use CWC #1062 in the event that #1054 is still full. Only these two CWCs are used for Lab condensate offloads.]*

The CDR & FE-1 spent several hours in the DC1 Docking Compartment to reconfigure the "Pirs" airlock module after the recent EVA-20. The reconfiguring

included the re-installation of the MATRYOSHKA-R radiation experiment with its anthropomorphic (human torso) "Phantom" setup with 16 passive dosimeters and the LULIN-5 electronics box, which was activated. *[The complex Matryoshka payload suite is designed for sophisticated radiation studies. The payload collects radiation measurements every few minutes of each hour around the clock. Note: Matryoshka is the name for the traditional Russian set of nested dolls, also called Babushka dolls when they are little old ladies ("grandmas").]*

Subsequently, Volkov supported the ground's activation of the Elektron O₂ generator at 32 amps by monitoring the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there is no overheating. In support of the reactivation, the ground electrically disconnected the ATV (Automated Transfer Vehicle) from the ISS at 6:47am EDT which required turning off lights in "Jules Verne". The lights were turned back on at ~8:21am. *[During nominal Elektron operations a gas analyzer is utilized to detect hydrogen (H₂) in the O₂ line (which could cause overheating) but is not included in the control algorithm until 10 minutes after Elektron startup.]*

Chamitoff performed activation & checkout work in the JAXA Kibo JPM (JEM Pressurized Module), reconfiguring the CBEF (Cell Biology Experiment Facility) subrack equipment through several stages.

Afterwards, Gregory remated and reconfigured the ISPR-2 (International Standard Payload Rack 2) SAIBO rack, performing Upper and Lower Closeout installation. *[SAIBO ("living cell") is a Japanese multipurpose experiment/payload rack system on the ISS that transports, stores and supports subrack facilities such as the CB (Clean Bench) and CBEF (Cell Biology Experiment Facility) equipment by providing structural interfaces, power, data, cooling, water and other items needed to operate science experiments in microgravity.]*

Later, the FE-2 checked out the Japanese fire alarm indicators in the JLP (JEM Logistics Pressurized Segment), JEMRMS (JEM Robotic Manipulator System), ISPR-A2 and ISPR-A3 racks, then moved stowage from COL (Columbus Orbital Laboratory) and Node-2 into Kibo, documenting some work areas photographically.

Chamitoff also supported the ground in powering up the SAMS ICU (Space Acceleration Measurement System/Interface Control Unit).

Sergey & Oleg underwent their third periodic (generally monthly) health test with the cardiological experiment PZEh MO-1 ("Study of the Bioelectric Activity of the Heart at Rest") on the TVIS (Treadmill with Vibration Isolation System). *[During the 40-min. test, the crewmembers tagged up with ground specialists on an RGS (Russian*

ground site) pass (~12:15pm EDT) via VHF and downlinked data from the Gamma-1M ECG (electrocardiograph) for about 5-6 minutes.]

The FE-1 completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The CDR meanwhile performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Working on the failed MEC (Medical Equipment Computer), Gregory Chamitoff swapped the laptop’s 60 GB hard drive and reloaded software. These activities were originally scheduled for 7/25, but were pulled forward in order to expedite the recovery of the A31p laptop. MEC data will be re-uplinked tonight during crew sleep. *[The MEC failed on 7/19 while Greg was setting up for the BP/ECG (Blood Pressure/Electrocardiogram) Checkout activity. Even after multiple reboots the laptop could not be used. Since MEC is an integral part of the BP/ECG Checkout, no BP/ECG data could be collected. In addition, the MEC is necessary for recording and storing all crew medical and exercise data. The lack of a MEC also prevents the execution of the PFE w/OUM (Periodic Fitness Evaluation with Oxygen Uptake Measurement) activity next week since no BP/ECG or Heart Rate Monitor data can be collected. Thus, the PFE w/OUM session scheduled tomorrow was removed from the plan and will be rescheduled.]*

The FE-2 had ~35 min to troubleshoot the Columbus SOLAR (Solar Monitoring Observatory) experiment, trying to diagnose the connectivity between Columbus and the external SOLAR, using the ESA Multi-Purpose Laptop. *[SOLAR is currently powered via the feeder#2 (survival) only and all instruments are off. All of the past Sun observation period data acquisitions have been lost, from sun visibility windows that closed on 7/7. Ground engineers are awaiting the outcome of today’s troubleshooting to revive SOLAR, so that it is fully operational when the next Sun observation window starts on 7/30.]*

In the ER4 (EXPRESS Rack 4), Chamitoff replaced failed light bulbs, in ER3 failed power indicators. The broken/defective items were placed in a Ziplock bag for return to Earth.

The three crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (FE-1, FE-2), and VELO bike with bungee cord load trainer (FE-1).

MDM Software Upgrade: At ~10:10am, the ground began a two-hour activity of uploading a new version of ALSYS software to the Airlock MDM (Multiplexer/Demultiplexer) computers.

VolSci Kudos: Gregory was thanked for yesterday's Voluntary Science program with SHERE (Shear History Extensional Rheology Experiment) checkout tests which were "a great success and showed that the SHERE hardware is functioning properly. We look forward to working with you again next Saturday to perform the Dry Run."

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 8:07am EDT [= epoch]*):

Mean altitude -- 344.2 km

Apogee height -- 350.8 km

Perigee height -- 337.5 km

Period -- 91.42 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0009918

Solar Beta Angle -- 70.1 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.75

Mean altitude loss in the last 24 hours -- 22 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55393

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

07/23/08 -- ATV1 reboost (~12:06pm EDT)

08/30/08 -- Progress M-64/29P undocking, from FGB nadir

09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/observation)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft port)

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
03/25/09 -- Soyuz TMA-14/18S launch
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 07/20/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – rest day for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff. Ahead: Week 14 of Increment 17.*

Today 39 years ago (July 20, 1969), Apollo 11 fulfilled a dream of Earth people when Neil Armstrong and Buzz Aldrin landed their LM “Eagle” on the Moon at Tranquility Base, with Michael Collins orbiting overhead in the mothership Columbia.

Crew sleep cycle has returned to normal times: wake-up -- 2:00am EDT, sleeptime -- 5:30pm.

Continuing the extended leak checking of the spare BZh Liquid Unit (#056) for the Elektron O₂ generator, Kononenko charged the unit once again with pressurized N₂ from the BPA Nitrogen Purge Unit (#23) to 1 atm (1 kg/cm²). The last test pressurization to monitor for leakage was on 6/27. *[During Elektron operation, the inert gas locked up in the BZh has the purpose to prevent dangerous O₂/H₂ mixing. A leaking BZh cannot be used.]*

For his Voluntary Weekend Science (VolSci) program today, FE-2 Chamitoff has selected a session with the new SHERE (Shear History Extensional Rheology Experiment) payload, first activating the MSG (Microgravity Science Glovebox), powering on the experiment, aligning the disk, then performing the four checkout tests that will verify proper operation of the SHERE hardware (force transducer, laser micrometer test, camera, data transfer), followed by experiment shutdown and MSG deactivation. *[SHERE, which has never before been performed in micro-G, studies the effect of preshearing (rotation) on the stress and strain response of a polymer fluid (a complex fluid containing long chains of polymer molecules) being stretched in micro-G. The fundamental understanding & measurement of the*

extensional rheology of complex fluids is important for understanding containerless processing, an important operation for fabrication of parts (such as adhesives or fillers) using elastomeric materials on future exploration missions. This knowledge can be applied as well to controlling and improving Earth-based manufacturing processes.]

Sergey Volkov conducted the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1).

Working off his suggested "time permitting" task list, FE-1 Kononenko conducted another session of the Russian GFI-8 "Uragan" (hurricane) earth-imaging program, using the D2X digital camera with the F800 telephoto lens. *[Uplinked target areas were Patagonian glaciers and icebergs near South Georgia Island.]*

Also working from the discretionary task list, Oleg conducted another run of the Russian DZZ-2 "Diatomeya" ocean observations program, using the NIKON-F5 DCS still camera and the HDV (high-definition) video camcorder from SM window 8 for ~20 min to record high production water areas for obtaining data on color field composition in dynamic regions of the ocean and in near-estuary areas of large rivers, plus the current cloud cover above these waters, its rating, and special forms of cloud formation. *[Target zones today in the South Atlantic were the Parana river runoff area (Argentina), Bahia Grande (Argentina), the Falkland Islands, and the Namibia offshore area.]*

For the CDR, a discretionary task list job was another session for Russia's Environmental Safety Agency (EKON), making observations and taking KPT-3 aerial photography of environmental conditions of the Indian Ocean (Chagos Archipelago) and the New Zealand islands coastal area.

MEC Failure: Yesterday, the Medical Equipment Computer (MEC) failed while Gregory was setting up for the BP/ECG (Blood Pressure/Electrocardiogram) Checkout activity. Even after multiple reboots the laptop could not be used. Since MEC is an integral part of the BP/ECG Checkout, no BP/ECG data could be

collected. In addition, the MEC is necessary for recording and storing all crew medical and exercise data. The lack of a MEC also prevents the execution of the PFE w/OUM (Periodic Fitness Evaluation with Oxygen Uptake Measurement) activity next week since no BP/ECG or Heart Rate Monitor data can be collected. Thus, the PFE w/OUM session scheduled on 7/22 was removed from the plan and will be rescheduled. The MEC hard drive swap and software reloads previously scheduled for 7/25 have been moved forward to tomorrow in order to expedite the recovery of the MEC.

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 7:43am EDT [= epoch]*):

Mean altitude -- 344.2 km

Apogee height -- 350.8 km

Perigee height -- 337.5 km

Period -- 91.42 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0009861

Solar Beta Angle -- 71.9 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.75

Mean altitude loss in the last 24 hours -- 33 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55377

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

07/23/08 -- ATV1 reboost (~12:06pm EDT)

08/30/08 -- Progress M-64/29P undocking, from FGB nadir

09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/observation)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft port)

ISS On-Orbit Status 07/19/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – mostly off duty for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff.*

Upon wake-up, Sergey Volkov terminated his sixth MBI-12 SONOKARD experiment session for the long-term Russian sleep study, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

The crew performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

As part of the house cleaning, the crew also conducted regular maintenance inspection & cleaning on fan grilles in the FGB (TsV2), SM (VPkhO, VPrK, FS5, FS6 & FS9), DC1 (V3) screens and PF1/PF2 dust filters, as well as in the COL (Columbus Orbital Laboratory).

In addition, Volkov temporarily powered down the POTOK air filtration system for the periodic cleaning of its pre-filter, using the vacuum cleaner with narrow-slit nozzle attachment.

At ~10:20am EDT, the crewmembers conducted their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

Chamitoff retrieved and stowed the four passive FMK (Formaldehyde Monitoring Kit) sampling assemblies deployed by him on 7/17 in the Lab (at P3, below CEVIS) and SM (at the most forward handrail, on panel 307), to catch any atmospheric formaldehyde on a collector substrate for subsequent analysis on the ground.

[Two monitors each are usually attached side by side, preferably in an orientation with their faces perpendicular to the direction of air flow.]

The FE-2 did another sample rearrangement in the MELFI (Minus Eighty Degree Laboratory Freezer for the ISS), swapping blood and urine samples in their box modules between two Dewars of different temperature. *[Sample vials were swapped between Dewar 1/Tray A/Sect. 1.2 and Dewar 2/Tray A/Sects. 2 & 3.]*

Greg also conducted the periodic ACO (activation & checkout) of the BPM (Blood Pressure Monitor) and ECG (Electrocardiogram) Recorder. *[The BP/ECG ACO today, in preparation for next week's PFE w/ OUM activity, included steps to correct some issues encountered during the previous use of the BP/ECG,.]*

The two cosmonauts had their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop), Oleg at ~8:50am EDT, Sergey at ~11:50am.

The three crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Greg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

For Oleg Kononenko, today's Russian discretionary task list held one job – doing another session of the GFI-8 "Uragan" (hurricane) earth-imaging program, using the D2X digital camera with the F800 telephoto lens. *[Uplinked target areas were*

Patagonian glaciers and icebergs near South Georgia Island.]

For Sergey Volkov, a new discretionary task list job was another session for Russia's Environmental Safety Agency (EKON), making observations and taking KPT-3 aerial photography of environmental conditions using the Nikon D2X with the SIGMA 300-800mm telephoto lens.

Weekly Science Update (*Expedition Seventeen -- Week 13*)

3-D SPACE: Third session for Greg Chamitoff will be planned in the near future.

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):

Measurements continue in the FGB module. Last memory card exchange was performed on 7/1. Next activities are planned on 7/22 for the rotation of the ALTEINO instrument and the exchange of the memory card. Subsequent data downlink is currently planned on 7/23.

ANITA (Analyzing Interferometer for Ambient Air): Continuing.

BCAT-3 (Binary Colloidal Alloy Test 3): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System):
Samples returned on 1J.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): The Silicate Garden Hab S/N2 ground unit was activated at approximately 5:15pm EDT on 7/11. The flight unit was activated at approximately 1:25pm on 7/14 via remote command. There are 2 cameras in the flight unit imaging 2 chambers each for a total of 4 chambers on Side 1. Fibers continue to grow from the crystals in strange formations in the flight unit.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): On 7/16, EuTEF encountered a MIL-Bus error (this happened in a similar way in the past). The platform has to be powered cycled and all of the instruments have to be re-initiated. A DHPU (Data Handling Processing Unit) software patch is currently being developed to fix the link error issues encountered with DEBIE-2 and FIPEX instruments.-- DEBIE-2: several 24hrs run were successfully performed between 7/13 and 7/15. Generic status: link error still in work. However a work-around allows for regular science data acquisition using an on-board IOP (Instrument Operations Procedure), but not yet in conjunction with any FIPEX IOP – a final software patch, which will enhance the present instrument capabilities, is under finalization on ground;-- DOSTEL: On-going science acquisition;-- EuTEMP: Currently inactive as planned;-- EVC: foreseen EVC activation on 7/10 was not performed due to low temperatures;-- EXPOSE: On-going science acquisition;-- FIPEX: Weekly science script has been started nominally on 7/16. However after the EuTEF MIL-Bus error, this script was interrupted and has not been restarted yet; -- MEDET: Continuously acquiring science data, but its temperature is very low. This instrument was also impacted by the EuTEF MIL-Bus error and will be restarted on 7/17; -- PLEGPAY: Last runs were successfully performed on 7/9. Currently in READY mode, no science data acquisition on-going;-- TRIBOLAB: The Ball-Bearing experiment 1/2/3 has been running since 6/16. On 7/10 it has been paused for Station activities. TRIBOLAB will be commanded into Thermal Stabilization Mode on 7/11 and then continue the Ball-Bearing experiment again on 7/12. TRIBOLAB went to NNM (Non Nominal Mode) on 7/14. The instrument was put back into Thermal Stabilization Mode on 7/16, but LAN connectivity with SOLAR has been lost since 6/25.

FSL (Fluid Science Laboratory): FSL is back and running. Further FSL commissioning activities remain to be done (see following item).

GEOFLOW: Additional optical check-out tests will be performed from ground on 7/22. The crew will then swap the optical target on 7/23, stand by until further optical modes checks (planned from 7/23 to 7/25). The GEOFLOW Experiment Container insertion into FSL is currently planned on 7/28. After some initial tests, the GEOFLOW science program is planned to be started on 7/29.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Planned.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer, ESA): In progress.

NUTRITION w/REPOSITORY: In progress.

PADLES (Passive Dosimeter for Lifescience Experiment in Space): In progress.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SAMPLE: Complete.

SHERE (Shear History Extensional Rheology Experiment): In progress.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): In progress.

SOLAR (Solar Monitoring Observatory): SOLAR is currently powered via the feeder#2 (survival) only and all instruments are off. Troubleshooting plan has been worked out and a crew activity has been planned for 7/21 to diagnose the connectivity between Columbus and SOLAR, making use of the ESA Multi-Purpose Laptop. Unfortunately all of the past Sun observation period data acquisition has been lost. These sun visibility windows closed on 7/7. The engineering teams on

ground are awaiting the outcome of the troubleshooting activity on 7/21 to revive SOLAR, so that it is fully operational when the next Sun observation window starts on 7/30.-- SOVIM: Instrument switched off pending above issue; -- SOLSPEC: Instrument switched off pending above issue;-- SOLACES: Instrument switched off pending above issue.

SOLO: Planned.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): The four ECs (Experiment Containers) of Rotor B are yet to be retrieved by the crew from the blocked Rotor B. BIOLAB could not be activated from ground yet, pending resolution of the Smoke Detector issue. A troubleshooting plan has been developed to recover all the BIOLAB functionalities. The remaining WAICO-#1 ECs will be disposed and replaced by six Reference ECs on Rotor B.

CEO (Crew Earth Observations): Through 7/15 the ground has received a total of 3,391 frames of CEO images for review and cataloging. New imagery received this week with times corresponding to CEO target request times included: Lake Poopo, Bolivia (interesting new imagery of the target is now under review); Jarvis Island, equatorial Pacific (only a solitary, late-shot frame of this isolated island); and Moorea Coral Reef, Tahiti (good imagery acquired, a bit late-oblique, and a touch soft). "As you are aware CEO target opportunities have been limited by low light and winter weather. It will take good fortune to spot even a large, bright iceberg under those conditions. We hope you may have better luck with the Polar Mesospheric Cloud opportunities. This lull is allowing us to work through our backlog. You shot excellent imagery of: Mount Rainer in with snow, the Red River Valley, the Tigris-Euphrates Delta, and much of the Afar Rift Zone target. Good work! We suggest technique-wise that you continue to practice with the long lens settings to improve consistency of focus, and continue to practice providing an overlap between successive images when mapping a feature or a regional target. The composition and quality of your images is high and we do appreciate you all your efforts."

CEO photo targets uplinked for today were **Polar Mesospheric Clouds (PMC)**

over Far Eastern Asia (*DYNAMIC EVENT: Greg's low light window of opportunity for this pass ran for about 10-12 minutes from the eastern China to the central Aleutian Islands. These will be high oblique views left of track towards the Earth's limb*), and **PMC** over Northeastern Europe (*DYNAMIC EVENT: Chamitoff's low light window of opportunity for this pass ran for about 10-12 minutes from the Algerian Coast to the central Ural Mountains of Russia. These were high oblique views left of track towards the Earth's limb*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 5:36am EDT [= epoch]*):

Mean altitude -- 344.2 km

Apogee height -- 350.7 km

Perigee height -- 337.7 km

Period -- 91.42 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0009682

Solar Beta Angle -- 72.2 deg (magnitude peaking)

Orbits per 24-hr. day -- 15.75

Mean altitude loss in the last 24 hours -- 30 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55360

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

07/23/08 -- ATV1 reboost (~12:06pm EDT)

08/30/08 -- Progress M-64/29P undocking, from FGB nadir

09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/observation)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft port)

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)

11/10/08 -- STS-126/Endeavour/ULF2 launch -- MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking

02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
03/25/09 -- Soyuz TMA-14/18S launch
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 07/18/08

All ISS systems continue to function nominally, except those noted previously or below.

Crew Sleep Cycle: Wakeup today was at 4:30am; sleeptime tonight remains at 8:00pm EDT.

Upon wake-up, Oleg Kononenko terminated his sixth MBI-12 SONOKARD experiment session for the long-term Russian sleep study, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. Sergey Volkov's new MBI-12 session starts tonight (~7:15pm). *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

In the DC-1 Docking Compartment, CDR Volkov terminated the discharge process on the second set of 825-M3 Orlan batteries and initiated it on the third set. Later tonight (~7:40pm), he will also terminate discharging the third set.

Afterwards, Volkov & Kononenko worked on the Progress M-64/29P cargo ship, re-integrating it with the ISS by

- Conducting a leak check between 29P and the FGB module,
- Opening the Progress/FGB hatches,
- Installing the LKT local temperature sensor commutator (TA251MB) of the BITS2-12 onboard telemetry measurement system, along with its ROM unit (read-only memory, TA765B) *[LKT was subsequently switched on by the*

- ground to complete the basic configuration.]*
- Deactivating the Progress vehicle, and
 - Closing out 29P re-integration operations.

Later, the CDR initiated, then terminated, a repress of the ISS cabin atmosphere with compressed air from Progress 29P tankage by ~18-20 mmHg.

Gregory Chamitoff had 4h 50min reserved for removing & replacing the Flexpacks in both RED (Resistive Exercise Device) canisters, along with spacers and canister cords, with on-orbit spares. The installation included the regular calibration of both canisters. *[The Flexpacks (one each in the two RED canisters, not swappable) were approaching the end of their certified life of 289,000 cycles. The R&R involves replacement of the Canister Cords, Flexpack Assemblies, External Splines, and Spacers. Following the changeout, Greg performed the usual calibration, wearing special footwear (athletic shoes), to allow accurate execution of exercise protocol objectives. The calibration confirms a good Flexpack replacement, identifies the maximum allowed settings and allows for adjusting each crewmember's RED exercise protocols accordingly. The canisters are only certified to a maximum load of 160 lbs each. If at any point doing the calibration, a load of 160 lbs or greater is reached before getting to the last load index setting of 5.5, the calibration is not to proceed to the next higher setting and MCC-H must be notified. Upon receipt of the results of the calibration data, ground specialists will review the data and, assuming favorable engineering analysis, will get back to the crew quickly to give them a GO for their RED exercise session. Calibration of the load settings of the pulley cans is performed with an on-orbit calibration kit with a special calibration tool and steel handles.]*

Sergey conducted the periodic maintenance/checkout of the spare BZh Liquid Unit (#056) for the Elektron O₂ generator, *[Objective of the checkout of the BZh, which has been in stowage for 1.5 years, was to check water passage through the feed line inside of the BZh (from ZL1 connector to the buffer tank) and to check the response of the Electronics Unit's micro switches (signaling "Buffer Tank is Empty" & "Buffer Tank is Full").]*

FE-1 Kononenko performed routine IFM (Inflight Maintenance) on the second Russian SRVK condensate water processor by removing & replacing its BRPK-2 (Condensate Separation & Pumping Unit) separator.

Chamitoff completed the regular 30-day inspection of the new AED (Automated External Defibrillator) in the CHeCS (Crew Health Care Systems) rack. *[The AED is a portable electronic device that automatically diagnoses the potentially life threatening cardiac arrhythmias of ventricular fibrillation and ventricular tachycardia]*

in a patient. It then can treat them through defibrillation, i.e., the application of electrical therapy which stops the arrhythmia, allowing the heart to reestablish an effective rhythm. AEDs are generally either held by trained personnel who will attend events or are public access units which can be found in places including corporate and government offices, shopping centers, airports, restaurants, casinos, hotels, sports stadiums, schools and universities, community centers, fitness centers, health clubs and any other location where people may congregate.]

Oleg Kononenko took the periodic readings of potentially harmful atmospheric contaminants in the Service Module (SM), using the CMS (Countermeasure System), a component of the GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, which uses preprogrammed microchips to measure H₂CO (Formaldehyde, methanal), CO (Carbon Monoxide) and NH₃ (Ammonia), taking one measurement per microchip. *[CMS is a subsystem of the Russian SKDS Pressure Control & Atmosphere Monitoring System.]*

Afterwards, the FE-2 conducted the periodic atmospheric sampling in the center of the Lab, SM and FGB with the GSC (Grab Sample Container), while Oleg, in parallel, used the AK-1M adsorber to collect cabin air samples in the SM and FGB.

Greg also took measurements for the regular atmospheric status check for ppCO₂ (Carbon Dioxide partial pressure) in the Lab, SM (at panel 449) and COL (Columbus Orbital Laboratory), using the hand-held CDMK (CO₂ Monitoring Kit, #1002). *[The battery pack is to be replaced with the one from unit #1009 if necessary.],*

Later, Chamitoff performed some troubleshooting on ANITA (Analyzing Interferometer for Ambient Air), checking on correct mating of cables, then powered up the ANITA hardware.

Volkov completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The FE-2 conducted the regular bi-monthly reboot of the OCA Router and File Server SSC (Station Support Computer) laptops.

At ~7:50pm, getting ready for sleep time, the CDR will again set up the Russian MBI-12 SONOKARD (Sonocard) payload and start his sixth experiment session,

using a sports shirt from the SONOKARD kit with a special device in the pocket for testing a new method for acquiring physiological data without using direct contact on the skin. Measurements are recorded on a data card for return to Earth.

The three crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-1), TVIS treadmill (CDR, FE-1, FE-2), and RED resistive exercise device (FE-2). Later, Oleg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~5:50pm EDT, the ISS crew is scheduled for their regular weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. *[Private S/G-2 (Space-to-Ground 2) phone patch via SSC (Station Support Computer)].*

WRM Update: An updated WRM (Water Recovery Management) “cue card” was uplinked overnight for the crew’s reference in lieu of yesterday’s uplink. *[The new card (17-0002S) lists 35 CWCs (Contingency Water Containers, ~1356.0 L total) for the four types of water identified on board: technical water (578.9 L, for Elektron, flushing, hygiene, incl. 509.4 L non-usable water because of Wautersia bacteria), potable water (706.7 L, incl. 260.6 L currently on hold), condensate water (62.5 L), waste/EMU dump and other (7.9 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]*

BCC at MSFC: Last night, ground engineers conducted command & voice tests aimed at setting up BCC (Backup Control Center) capability at Marshall Space Flight Center/Huntsville.

VolSci Preview: For the weekend ahead, Gregory has selected another SHERE (Shear History Extensional Rheology Experiment) session in the MSG (Microgravity Science Glovebox) for the Voluntary Science program.

ATV1 Remaining O₂: After last Monday’s (7/14) ISS cabin atmosphere repress with oxygen from ATV1 “Jules Verne”, about 3.7 kg of O₂ remain in the supply ship’s tank.

CEO (Crew Earth Observations) photo targets uplinked for today were **Iceberg A43f** (DYNAMIC EVENT: *(This large iceberg broke away from the Antarctic Ice Shelf near the Antarctic Peninsula over 18 months ago. It is now in the area just north of South Georgia Island. Conditions were marginal for viewing as the ISS*

*pass was in the low light of winter during early afternoon. Clouds were expected to be broken to scattered. Approach was from the W. Looking just right of track for this high contrast feature in the darkness of the sea and using the long lens settings for detail), and **Polar Mesospheric Clouds (PMC)** over Northwestern Europe (DYNAMIC EVENT: The nighttime window of opportunity for this pass ran for about 10-12 minutes from just SW of the Azores in the eastern North Atlantic to eastern Poland. These were high oblique views left of track towards the Earth's limb.)*

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 8:31am EDT [= epoch]*):

Mean altitude -- 344.2 km

Apogee height -- 350.8 km

Perigee height -- 337.7 km

Period -- 91.42 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.000977

Solar Beta Angle -- 71.0 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.75

Mean altitude loss in the last 24 hours -- 31 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55346

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

07/23/08 -- ATV1 reboost (~12:06pm EDT, ~4.1 m/sec delta-V)

08/30/08 -- Progress M-64/29P undocking, from FGB nadir

09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/observation)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft port)

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)

11/10/08 -- STS-126/Endeavour/ULF2 launch -- MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
03/25/09 -- Soyuz TMA-14/18S launch
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 07/17/08

All ISS systems continue to function nominally, except those noted previously or below.

Crew Sleep Cycle: After last night's sleeptime at 8:00pm EDT, wakeup today was at a more regular 4:30am, to extend again to 8:00pm tonight.

The CDR began the day by servicing the Russian BMP (Harmful Impurities Removal System), first terminating the regeneration cycle on filter bed #1 initiated yesterday, then starting the "bake-out"-to-vacuum cycle on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated tonight at ~5:20 EDT. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently to remove any lingering Freon-218 from the cabin atmosphere (last time done: 6/19&20).]*

Sergey Volkov & Oleg Kononenko then completed final post-EVA cleanup activities, by –

- Removing the O₂ repressurization tanks (BK-3, primary & backup) as well as batteries from the Orlan & BSS radio telemetry units (BRTA),
- Starting the discharge/recharge cycle on the first 825M3 battery pack from Orlan-M #25 in the ZU-S battery charger in the DC1 Docking Compartment, later tonight (~7:50pm) terminating it and initiating the process on the second 825M3 pack,
- Setting up both Orlan-M suits for airing/drying and later stowing them, plus
- Tagging up with ground specialists (at ~6:30am) for a final post-EVA debriefing.

FE-2 Chamitoff meanwhile had 1.5 hrs set aside for collecting and stowing the US

tools used in the two Russian EVAs.

In the DC1, Sergey conducted an inspection of areas behind panel 301 (equipment, connectors, shell) to check for any traces of coolant of the STR Thermal Control System.

The FE-2 completed the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WRM (Water Recovery & Management) assessment of onboard water supplies. *[Updated "cue cards" based on the crew's water calldowns are sent up every other week. The current card (17-0002R) lists 35 CWCs (Contingency Water Containers, ~1401.8 L total) for the four types of water identified on board: technical water (650.6 L, for Elektron, flushing, hygiene, incl. 509.4 L non-usable water because of Wautersia bacteria), potable water (706.7 L, incl. 260.6 L currently on hold), condensate water (41.5 L), waste/EMU dump and other (7.9 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]*

The FE-1 conducted the periodic (about twice a month) replenishing of the Elektron oxygen generator's water supply for electrolysis, filling the KOV EDV container with water collected in a CWC (Contingency Water Container) from the Lab CCAA (Common Cabin Air Assembly) dehumidifier. *[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]*

Gregory performed the periodic deployment of four passive FMK (Formaldehyde Monitoring Kit) sampling assemblies in the Lab (at P3, below CEVIS) and SM (at the most forward handrail, on panel 307) for two days, to catch any atmospheric formaldehyde on a collector substrate for subsequent analysis on the ground.

[Two monitors each are usually attached side by side, preferably in an orientation with their faces perpendicular to the direction of air flow.]

Kononenko gathered the equipment necessary for tomorrow's planned periodic checkout of the spare BZh Liquid Unit (#056) for the Elektron O₂ generator,

[Objective of the checkout of the BZh, which has been in stowage for 1.5 years, is to check water passage through the feed line inside of the BZh (from ZL1 connector to the buffer tank) and to check the response of the Electronics Unit's micro switches (signaling "Buffer Tank is Empty" & "Buffer Tank is Full").]

The FE-1 completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM). *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities,*

replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]

Working from the Russian discretionary “time permitting” task list, Oleg also performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The three crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Greg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~7:50pm EDT, just before sleep time, Oleg will again set up the Russian MBI-12 SONOKARD (Sonocard) payload and start his sixth experiment session, using a sports shirt from the SONOKARD kit with a special device in the pocket for testing a new method for acquiring physiological data without using direct contact on the skin. Measurements are recorded on a data card for return to Earth.

[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember’s physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]

As most every day, starting at ~9:00am this morning and running until 3:00pm, the US CDRA (Carbon Dioxide Removal Assembly) was activated intermittently for two half-cycles to control ppCO₂ levels. In this configuration for the daily ops, connecting & disconnecting the ITCS cooling loop is not required. *[A forward plan is in work for cycling the CSV (CO₂ Selector Valve) to prevent its sticking.]*

At ~7:55am, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU/*Glavnaya operativnaya gruppа upravleniya* = “Main Operative Control Group”), including Shift Flight Director (SRP), at TsUP-Moscow via S-band/audio, phone-patched from Houston and Moscow.

At ~8:00am, the crew downlinked a message of appreciation and greetings to a festive event at ESA Headquarters in Paris about ATV and ESA's ISS efforts, taking place during today's top-level HOA (Heads of Space Agencies) meeting. The footage shot by the crew earlier of the unveiling of original manuscripts by French author Jules Verne was also replayed at the event. *[For the video, produced on 7/7, a crewmember was shown entering the ATV and conducting a "tour" of the large vehicle, then making presentations of four historic items, namely an original copy of the 19th century of Jules Verne's book "De la Terre à la Lune" (From the Earth to the Moon), a Jules Verne poster showing three small original manuscripts, and a set of two original manuscripts within their protective plastic covers.]*

CEO (Crew Earth Observations) photo targets uplinked for today were **Iceberg A43f** (DYNAMIC EVENT: *(This large iceberg broke away from the Antarctic Ice Shelf near the Antarctic Peninsula over 18 months ago. It is now in the area just north of South Georgia Island. Conditions were marginal for viewing as the ISS pass was in the low light of winter during early afternoon. Clouds were expected to be broken to scattered. Approach was from the W. Looking just right of track for this high contrast feature in the darkness of the sea and using the long lens settings for detail), and **Polar Mesospheric Clouds (PMC)** over Northwestern Europe* (DYNAMIC EVENT: *The nighttime window of opportunity for this pass ran for about 10-12 minutes from just N of the eastern North Atlantic to northern Ukraine. These were to be high oblique views left of track towards the Earth's limb.)*

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 8:13am EDT [= epoch]):*

Mean altitude -- 344.3 km

Apogee height -- 350.7 km

Perigee height -- 337.8 km

Period -- 91.42 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0009612

Solar Beta Angle -- 68.5 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.75

Mean altitude loss in the last 24 hours -- 35 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55330

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

07/23/08 -- ATV1 reboost (~12:06pm EDT)

08/30/08 -- Progress M-64/29P undocking, from FGB nadir

09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/

observation)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft port)

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)

11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

03/25/09 -- Soyuz TMA-14/18S launch

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation

05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**

10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A – MPLM(P)

04/08/10 -- STS-132/Discovery/ ULF4 – ICC-VLD, MRM1

05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 07/16/08

All ISS systems continue to function nominally, except those noted previously or below. *Rest day for ISS.*

Crew Sleep Cycle: After this morning's sleeptime at 12:20am EDT, wakeup today was delayed to 9:50am. Bedtime tonight moves to a more "normal" 8:00pm for the rest of this week.

To provide cooling for today's ground-commanded re-activation of the U.S. CDRA (Carbon Dioxide Removal Assembly), FE-2 Chamitoff after wakeup connected the regular ITCS LTL (Internal Thermal Control System/Low Temperature Loop) coolant jumper connection to the CDRA support rack LAB1D6. The ground then lowered the temperature setpoint in Node-2 to control for humidity across the USOS. *[CDRA was activated at 1:25pm-7:25pm EDT to control ppCO₂ (CO₂ partial pressure) level.]*

Gregory reconfigured the POC (Portable Onboard Computer) laptops in the USOS from "uncrewed" to nominal OpsLAN operations, including NetMeeting and KFX (Ku-band File Transfer) functions. *[Reconfiguration activities included relocating the SSC-5 (Station Support Computer 5) A31p laptop back to its nominal location in the Lab and reconnecting it to power, plus relocating four A31p battery packs from the Soyuz spacecraft to the Lab for temporary stowage.]*

Greg's restoration activities also included –

- Transferring the FGB PCS (Portable Computer System) A31p laptop with cabling to the Lab Cupola RWS (Robotic Workstation) and connecting it, while stowing the RS (Russian Segment) DC power cable and A31p 28V DC power supply,
- Relocating the SSC-5 (Station Support Computer 5) laptop from the Soyuz SA (Descent Module) to the Lab, reconnecting it to power & Ethernet (ISL user cable) and powering on the "Cobalt brick" power unit,
- Turning off the PWS (Portable Workstation) laptops in the COL (Columbus

- Orbital Laboratory),
- Activating the SLT (System Laptop) in the Kibo JEM (Japanese Experiment Module), Activation Activate SLT
- Opening remaining USOS hatches (JPM (JEM Pressurized Module) starboard & overhead, JLP (JEM Logistics Pressurized Segment) deck, COL, NODE-2 portside & starboard),
- Returning unused consumable and other items from Soyuz to the USOS.

CDR Sergey Volkov cleaned up after the EVA by returning the medical kits to their nominal stowage location and reconfiguring the REGUL-Packet communications link from Set 1 to Set 2.

In the Service Module (SM), Sergey completed the routine maintenance of the SOZh/ECLSS system, including ASU toilet facilities systems/replaceables.

[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]

The CDR performed the periodic service of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. Bed #2 regeneration follows tomorrow. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently to remove any lingering Freon-218 from the cabin atmosphere (last time: 6/23&24).]*

Cleanup activities by FE-1 Oleg Kononenko consisted of –

- Taking post-EVA radiation readings of the "Pille-MKS" dosimeters carried by the spacewalkers in their Orlan suits,
- Downlinking EVA-20 digital photography,
- Activating the ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS/ALC) Spectrometer (AST), and
- Setting up 825M3 Orlan batteries for complete discharge/recharge.

Kononenko also spent a few minutes on the weekly inspection of the TVIS treadmill roller bearings, checking the treadmill's belt both left and right for any noticeable depressions due to seized or worn rollers. *[With the TVIS treadmill rollers approaching their end-of-life, the frequency of their inspection has recently been increased for safety.]*

Afterwards, Oleg completed closeout ops on the BIORISK-MSN payload which he

had brought in from EVA-20.

The two spacewalkers had their regular post-EVA PMCs (Private Medical Conferences) via Ku- & S-band audio/video, Sergey at ~4:15pm EDT, Oleg at ~4:50pm.

Gregory filled out the regular FFQ (Food Frequency Questionnaire), his fifth, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

The three crewmembers conducted an abbreviated physical workout program on the CEVIS cycle ergometer (FE-2) and TVIS treadmill (CDR, FE-1). Before sleeptime tonight, Oleg is to transfer the exercise data file to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week)

Before sleeptime, FE-2 Chamitoff started out on his second session with the NASA SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment by initializing and donning an Actiwatch, using the HRF-1 (Human Research Facility 1) laptop. *[As other crewmembers before him, to monitor his sleep/wake patterns and light exposure, Gregory will be wearing the special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout this week, for the last time. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

S-band Forward Link Dropout: After crew ingress from EVA-20 and DC-1 repressurization, an unexpected loss of S-Band forward link (ground-to-ISS) impacted MCC-Houston's ability to command to ISS and to communicate with the crew (whose voices came through clearly). The S-Band loss was due to a misconfiguration in the ground network, but other means of informing the crew were available. After 45 minutes, communications were re-established OK.

CEO (Crew Earth Observations) photo targets uplinked for today were **Iceberg A43f** (**DYNAMIC EVENT:** *This large iceberg broke away from the Antarctic Ice Shelf near the Antarctic Peninsula over 18 months ago. It is now in the area just*

*north of South Georgia Island. Conditions were marginal for viewing as the ISS pass was in the low light of winter at mid-afternoon. Clouds were expected to be broken to scattered. ISS approach was from the W. Looking well right of track for this high contrast feature in the darkness of the sea and using the long lens settings for detail), and **Polar Mesospheric Clouds (PMC)** over Northwestern Europe (DYNAMIC EVENT: The ISS window of opportunity for this pass ran for about 10-12 minutes from just north of the Canary Islands to the eastern Ukraine. These were to be high oblique views left of track towards the Earth's limb).*

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 7:49am EDT [= epoch]*):

Mean altitude -- 344.3 km

Apogee height -- 350.7 km

Perigee height -- 337.9 km

Period -- 91.42 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0009467

Solar Beta Angle -- 65.3 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.75

Mean altitude loss in the last 24 hours -- 45 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55314

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

07/18/08 -- ATV1 reboost

08/30/08 -- Progress M-64/29P undocking, from FGB nadir

09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/observation)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft port)

ISS On-Orbit Status 07/15/08

All ISS systems continue to function nominally, except those noted previously or below.

The Orlan spacewalk EVA-20 by CDR Volkov and FE-1 Kononenko from the DC1 (Docking Compartment) airlock lasted 5 hrs 54 min. All objectives were successfully achieved. The spacewalkers –

- (1) Installed a new docking target on SM PkhO (Service Module Transfer Compartment) for zenith port docking of the new Russian MRM2 module (deferred from EVA-20A);*
- (2) Took post-installation photography of the new docking target;*
- (3) Inspected & photographed two mounting holes for an adapter of a Kurs antenna (4AO-VKA) on PkhO-RO (SM Working Compartment, small diameter section) for MLM;*
- (4) Transferred one “Yakor” foot restraint (of two) from the DC1 EVA ladder to the SM and installed it in an attachment socket at a PkhO handrail (two Yakors were installed on DC1 ladder during EVA-17A on 2/22/07);*
- (5) Installed the VSPLESK (“Burst”) science payload (for studying cosmic radiation bursts) on a handrail at SM RO (large diameter section);*
- (6) Removed the BIORISK-MSN (BIO-2) experiment container 1 (of three) from the DC1 for return to the station (BIORISK-MSN, with three containers, was installed during EVA-19 on 6/6/07), plus*
- (7) Straightened out a bent amateur radio antenna (an impromptu add-on task).*

The spacewalk began 6 min early, with EVA hatch open at 1:08pm EDT, and ended at 7:02pm. It was the 114th EVA in support of ISS assembly, outfitting & maintenance, with a total spacewalk time of 718 h 48 min, and the 86th EVA out of the ISS. Predicted radiation exposure for the EVA-20 crew was about 15 millirads.

To accommodate the spacewalk schedule, the crew's activity cycle was shifted for a

1h 20min earlier wakeup in the morning (4:10am EDT) and a 4h 50min delayed bedtime tonight (i.e., sleep tonight at 12:20am). Wakeup on Wednesday will be at 9:50am (extending to the more regular 8:00pm bedtime).

After morning inspection, all pre-EVA activities proceeded smoothly and on schedule, starting out with Volkov & Kononenko taking another MO-9 “Urolux” urine biochemistry test before breakfast. *[A second session with the Urolux equipment will be conducted by both crewmembers tonight (~7:40/7:55pm) immediately after post-EVA station repress.]*

FE-2 Chamitoff supported the preparations by installing fresh batteries in the cameras and transferring them over to the DC1, then configuring ISS systems for EVA.

Pre-EVA preparations by the crew included –

- Closing external covers on SM (Service Module) windows #8, #12, #13, #14,
- Deactivating the Kenwood-D700/Sputnik-SM amateur radio equipment to prevent RF interference with the Orlans’ wireless in-suit Tranzit-B radio telemetry system,
- Changing the settings of the DSP pressure alarm sensors in the RS (Russian Segment),
- Deactivating the DS-7A Smoke Detector #1 in the SM PkhO (Transfer Compartment),
- Setting up the PSS Caution & Warning System in the FGB,
- Deactivating the Vozdukh carbon dioxide (CO₂) removal system,
- Removing SM air ducts to enable RO-PkhO hatch closure,
- Deactivating VN1 & VN2 air heaters,
- Powering down ventilation fans in the SM (VK1, VK2, VK3, VK4, VKYu1, VKYu2),
- Turning off the SRVK-2M condensate water processor, and
- Powering off electrical food heaters in the SM galley.

In addition, CDR Volkov and FE-1 Kononenko had about an hour reserved to complete setting up DC1 (Docking Compartment) and PkhO systems for pre-EVA mode.

Next steps by Sergey & Oleg were to –

- Check out the Orlan-M spacesuits and their systems, as well as the suit interface control panels (BSS) in DC1 & PkhO,
- Retest the BK-3 primary & backup oxygen (O₂) tanks of the Orlans and DC1,
- Disassemble the DC1 air duct, but leaving the V3 fan in place, and
- Set up the STTS communications/telemetry links necessary for the

spacewalk from the DC1, including switching over the caution & warning system from the regular PSS console to the EVA support panel (POV).
[Most activities were paced by RGS (Russian ground site) comm window passes.]

After a midday “snack” at ~8:30-9:10am, the spacewalkers conducted final inspections of the suits, BSS interface units & biomedical parameter telemetry to RGS (~9:50am), including VHF/voice & biomedical electrode belt and *telemetry hookups via the BSS (later by the wireless in-suit Tranzit-B radio telemetry system) for vital signs and equipment monitoring.

FE-2 Chamitoff configured the ISS for uncrewed ops. With FE-1 Kononenko, he prepared the Soyuz for his stay during the spacewalk. Gregory’s preparations in the Descent Module (SA) included transfer of SOP (Food Supply Subsystem) food containers and a supply of eight Russian SVO (Water Supply System) water bags. *[These provisions would also have been needed in a contingency requiring the entire crew taking to the Soyuz for some time.]*

After entering the SA and closing the hatch between it and the BO (Orbital Module) at ~9:30am, Gregory performed a 30-min leak check on the hatch interface.

In the DC1 and PkhO, after the Orlan & BSS systems checkouts Volkov & Kononenko donned the spacesuits and ancillary gear at ~10:50am, assisting each other, then closed the hatchways between SM RO/PkhO (Working Compartment/ Transfer Compartment) and PkhO/SU (DC1 Transfer Vestibule) at ~12:40pm, keeping hatches open between FGB & PMA-1 (Pressurized Mating Adapter 1) and between SM & DC1.

At ~10:30am, ISS attitude control authority was handed over to RS MCS (Motion Control System) to keep attitude stable during the (reactive) DC1 airlock depressurization, and was returned to US momentum management by CMGs (Control Moment Gyroscopes) at ~1:50pm.

The spacewalkers sealed the Orlan backpacks (~11:20am), followed by Orlan & BSS controls checks. Final checkout of suits and their controls included checking for leak during successive stages of depressurization. *[Pressure inside the Orlans was reduced to 0.42 at (6.2 psi). After suit purge, the spacewalkers had a 30-minute oxygen prebreathe period, as pressures between DC-1 and the PkhO were equalized and then further reduced.]*

Gregory Chamitoff remained sealed off in the Soyuz SA during the spacewalk which began after a final leak check on the four BK-3 O₂ tanks. At end of prebreathe,

DC1 pressure was down to 15 mmHg (Torr), holding for 5 min for a final cabin leak check, followed by switching the Orlans to autonomous (battery) suit power and opening of EV hatch #1 at 1:08pm.

After return and ingress from the EVA, with DC1 airlock repressurization from SM cabin air, the crew opened hatches and reentered the SM for their second MO-9 “Urolux” biochemical urine test.

The FE-1 secured and stowed the returned BIORISK-MSN payload.

This was to be followed by the crew resetting communications, conducting ISS activation operations and restoring systems configurations in the DC1 and other RS modules to pre-EVA conditions, then installing the DC1 air ducts.

Chamitoff will return ISS systems to their initial states, including hatch opening (Node-1, Lab, A/L, Node-2) at ~9:20pm, installing air ducts, activating the Vozdukh CO₂ scrubber and the Sputnik-SM amateur radio, and turning around the DCS760 EVA camera.

Later in the night, Gregory will reconfigure the POC (Portable Onboard Computer) laptops in the USOS for nominal OpsLAN operations, including NetMeeting and KFX (Ku-band File Transfer) functions. *[Reconfiguration activities included relocating the SSC-5 (Station Support Computer 5) A31p laptop back to its nominal location in the Lab and reconnecting it to power, plus relocating four A31p battery packs from the Soyuz spacecraft to the Lab for temporary stowage.]*

Cleaning up after the spacewalk, CDR Volkov & FE-1 Kononenko will –

- Remove the Orlan BRTA radio/telemetry unit batteries,
- Take post-EVA radiation readings of the “Pille-MKS” dosimeters carried by the spacewalkers in their Orlan suits,
- Downlink EVA-20A digital photography,
- Activate the ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS/ALC) Spectrometer (AST), and
- Set up the 825M3 Orlan batteries for complete discharge/recharge, but
- Leave the backup BNP portable oxygen repressurization tank in DC1, since it will also be needed for EVA-20.

JPM GLAs Failures: JAXA’s Kibo JPM (JEM Pressurized Module) has 3 GLAs (General Luminaire Assemblies) failed. There are no spares on orbit. Work is underway to manifest new units. *[ULF-2 plan is to remove all LHAs (Lamp Housing Assemblies) from MPLM (Multipurpose Logistics Module) before undock.]*

CEO (Crew Earth Observations) photo targets uplinked for today were **Polar Mesospheric Clouds (PMC) over Far East Asia**, also known as Noctilucent Clouds (*the ISS nighttime pass opportunity tracked from the western North Pacific Ocean [just south of Japan] to the western Aleutian Islands [near the International Date Line] for about a ten-minute period. These were high oblique views left of track towards the Earth's limb*) and **Lake Poopo, Bolivia** (*Lake Poopo is a small lake near the southern end of a long, elevated basin in the Bolivian Andes known as the Altiplano. The Altiplano extends from the relatively moist region of Lake Titicaca south-southeastward to the large, bright playa of Salar de Uyuni. Poopo is subject to significant changes in size and color related to the El Nino-Southern Oscillation (ENSO) cycle. The ISS pass was in mid-morning and expected to be clear. Looking well right of track and trying for contextual views of the southern end of the Altiplano including Lake Poopo.*)

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 9:00am EDT [= epoch]*):

Mean altitude -- 344.3 km
Apogee height -- 350.8 km
Perigee height -- 337.9 km
Period -- 91.42 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0009557
Solar Beta Angle -- 61.2 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.75
Mean altitude loss in the last 24 hours -- 57 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 55299

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

07/18/08 -- ATV1 reboost
08/30/08 -- Progress M-64/29P undocking, from FGB nadir
09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/observation)
09/10/08 -- Progress M-65/30P launch
09/12/08 -- Progress M-65/30P docking (SM aft port)
10/01/08 -- **NASA 50 Years**
10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
03/25/09 -- Soyuz TMA-14/18S launch
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 07/14/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 13 of Increment 17.*

Crew Sleep Cycle: With wakeup this morning remaining at 5:30am EDT, sleeptime tonight is 7:30pm, i.e., 1.5 hrs earlier. This allows an earlier wakeup tomorrow morning, at 4:10am, to accommodate tomorrow's EVA-20 at ~1:14pm.

In preparation for tomorrow's Orlan EVA-20, Volkov & Kononenko conducted a 2h 40min review of specific spacewalk procedures and the timeline, supported by tagup with ground specialists via S-band. *[The spacewalk by Volkov (EV1) and Kononenko (EV2) from DC1, estimated at 5h 30 min duration, will begin at 1:14pm EDT (EV hatch opening, timed by RGS/Russian Ground Site acquisition) and last until an estimated ~6:45pm (hatch closing). After egress, the crew will experience four orbital nights, egressing on the first. Part of the EVA will be supported by the DC1-based GStM-1 "Strela-1" crane, operated via hand crank. EVA-20 objectives are:*

- (1) Installation of a new docking target on SM PkhO (Service Module Transfer Compartment) for zenith port docking of the MLM (deferred from EVA-20A);*
- (2) Post-installation photography of the new docking target;*
- (3) Inspection of mounting holes for an adapter of a Kurs antenna (4AO-VKA) on PkhO-RO (SM Working Compartment, small diameter section) for MLM;*
- (4) Transferring one "Yakor" foot restraint (of two) from the DC1 EVA ladder to the SM and installing it in an attachment socket at a PkhO handrail (two Yakors were installed on DC1 ladder during EVA-17A on 2/22/07);*
- (5) Installing the VSPLESK ("Burst") science payload on a handrail at SM RO (large diameter section); and*
- (6) Removing the BIORISK-MSN (BIO-2) experiment container 1 (of three) from the DC1 for return to the station (BIORISK-MSN, with three containers,*

was installed during EVA-19 on 6/6/07).

With FE-2 Chamitoff in the Soyuz Descent Module (SA), closing of hatches between PkhO & SM RO (Work Compartment) and between PkhO & DC1 will be at ~12:00pm, followed by suit donning, preliminary & final leak checks of suits, BSS and hatches, staged depressurization of DC1 with crew prebreathing, Orlan transition to autonomous battery power and EVA hatch opening at ~1:14pm for egress.]

In the Soyuz SA, Sergey Volkov made preparations for Gregory's stay by readying its ASU toilet facilities and preparing and placing procedural/informational radiograms.

In the DC1, the CDR configured CCPKs (Crew Contamination Protection Kits, Russian: PNST), intended to protect the spacewalkers from FORP (Fuel/Oxidizer Reaction Products, e.g., N-nitrosodimethylamine, NDMA), i.e., incompletely-burnt fuel residue on the SM hull from yaw/pitch thruster plumes. *[Protective gear kits for use during and after the EVA in case the Orlans are inadvertently contaminated, are extensively equipped with wet wipes, dry towels, goggles, IPK gas masks and half masks, latex gloves, high performance filters, trash containers, etc. The crew review today included detailed instructions what to do if any spacesuit contamination is detected after the EVA. Towels used for wiping gloves etc. will be thrown overboard in retrograde direction (i.e., against flight direction).]*

Chamitoff "turned around" the Kodak DCS 760 EVA camera by initiating charging two batteries for it and later configuring the camera for operation.

Meanwhile, Oleg retrieved three Russian "Pille-MKS" radiation dosimeters, recorded their dosages and equipped each Orlan (in pocket on left calf) with a radiation sensor (A0309 & A0310). *[A third sensor, A0307, will be placed in the SM for background readings, and a fourth, A0308, is on standby. Also, Oleg transferred the ID-3 personal dosimeters, normally worn on the flight suit, to the chest pocket of the Orlan's lining (near the DIDB), later to be returned to the flight suits. After the EVA, readings from all dosimeters will be recorded and downlinked.]*

In the Soyuz SA, Volkov prepared the SOA Atmosphere Purification Unit for Greg by replacing the used P5 cartridge with a fresh cartridge (P4).

Kononenko also broke out and set up the equipment for tomorrow's planned "Urolux" biochemical urine test (PZE MO-9), readying the kit with fresh test strips in the ASU toilet facility. *[MO-9 is conducted regularly every 30 days (and also before and after EVAs) and is one of five nominal Russian medical tests adopted by NASA for US crewmembers for IMG (Integrated Medical Group) PHS evaluation as part of the "PHS/Without Blood Labs" exam. The analysis uses the sophisticated in-vitro*

diagnostic apparatus Urolux developed originally for the Mir program. The data are then entered in the Medical Equipment Computer (MEC)'s special IFEP software (In-Flight Examination Program).]

In preparation for the uncrewed period, the FE-1 later deactivated the AST Spectrometer of the Matryoshka-R (RBO-3-2) radiation payload. *[RBO-3-2 is using the ESA/RSC-Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS/ALC) with its Spectrometer (AST) and ALC equipment, temporarily located in the FGB on panel 429 (normally in DC1).]*

Greg Chamitoff had ~70 min set aside for unpacking & stowing cargo items delivered on STS-124/1J in their final ISS locations.

The FE-2 also set up two SONY PD100 camcorders in the Lab and Node-1 to provide situational awareness during the uncrewed period tomorrow (viewing only, not recording). *[To get the longest view, the cameras are "zoomed out" with a Wide Conversion lens attached. The camcorders were positioned to provide most the encompassing view of the modules, each one using one of the module power outlets.]*

The USB cameras on the Lab SSC (Station Support Computer) laptops were positioned such that areas not covered by the Lab PD100 video cam can be viewed from the ground.

To provide an SSC laptop for his stay in the Soyuz SA, Chamitoff powered off SSC-5 and its "cobalt brick" power supply for temporary transfer to the Soyuz spacecraft and also collected freshly charged batteries from four Lab SSC Clients for use in the Soyuz during the Russian EVA, replacing them in the laptops temporarily with stowed batteries.

Gregory also conducted another one of the periodic offloadings of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling a CWC (Contingency Water Container, #1054) with the collected water slated for processing. No samples were required. *[Estimated offload time before reaching the tank's neutral point (leaving ~6 kg in the tank): ~30 min. Condensate collection continues to be performed by the CCAA while the Russian SKV-2 air conditioner is off, awaiting its overdue Khladon (Freon-218) refill. SKV-1 has been nonfunctional for a long time.]*

Also in preparation for the spacewalk, the FE-2 closed the protective Lab science window shutter (to be verified closed prior to attitude control handover to RS thrusters tomorrow at ~10:30am).

With the U.S. CDRA (Carbon Dioxide Removal Assembly) deactivated by the ground this morning (~9:00am-3:00pm) and its cooling no longer required, Chamitoff demated and took down the ITCS LTL (Internal Thermal Control System/ Low Temperature Loop) jumper at the CDRA-supporting LAB1D6 rack.

The two spacewalkers will have their regular pre-EVA PMCs (Private Medical Conferences) via S- & Ku-band audio/video, Sergey at ~2:25pm EDT, Oleg at ~2:40pm.

At ~11:40am, Gregory too had his regular PMC.

The FE-2 conducted today's routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

The crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1). Afterwards, Oleg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~1:00pm, Chamitoff will power up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply) and at 1:05pm conducted a ham radio exchange with the Department of Astronomy & Space Sciences (DASS) at the Kuwait Science Club.

At ~2:05pm, Sergey & Oleg are scheduled to support a PAO TV event by downlinking a message of greetings and well-wishing to the participants of the 2nd International Workshop-Conference Cosmotrans 2008 on Satellite Technologies for Rail Road Transportation, to take place in Moscow on 7/24. *[It is expected that almost 200 delegates representing Russian Railway limited partnership, Ministries of Transportation & Defense; Academy of Science, leading science, research, design and development institutions, production, and foreign companies will participate in the conference. Expected for the conference opening ceremony are S. B. Ivanov, Chairman of RF Government; A. N. Perminov, the Head of Roskosmos; A. V. Borodko, Head of Russian Cartography; V. I. Yakunin, President of Russian Rail Roads, and other VIPs. ISS crew: "...Greetings from Expedition 17 of the International Space Station! We are happy that the achievements in cosmonautics find practical application in the cutting edge development of such*

strategic industries as Russian rail road systems. Every time, when we watch our country's expanses from orbit, we can appreciate the importance of the rail road network in maintaining the integrity of Russia's economy by connecting the most remote areas, and the impact of its efficient operation on the country's economic development. We hope that space technologies-based GLONASS satellite navigation system, satellite communication, and Earth remote probing systems will have a profound impact on improving rail road transportation safety, improve passenger and cargo traffic control, and environmental protection measures.."]

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 8:37am EDT [= epoch]):*

Mean altitude -- 344.4 km

Apogee height -- 350.9 km

Perigee height -- 337.9 km

Period -- 91.42 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0009689

Solar Beta Angle -- 56.9 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.75

Mean altitude loss in the last 24 hours -- 53 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55283

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

07/15/08 -- Russian EVA-20 (1:14pm)

07/18/08 -- ATV1 reboost

08/30/08 -- Progress M-64/29P undocking, from FGB nadir

09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/observation)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft port)

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)

11/10/08 -- STS-126/Endeavour/ULF2 launch -- MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

03/25/09 -- Soyuz TMA-14/18S launch

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation

05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**

10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A – MPLM(P)

04/08/10 -- STS-132/Discovery/ ULF4 – ICC-VLD, MRM1

05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 07/13/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – light duty for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff. Ahead: Week 13 of Increment 17.*

Crew Sleep Cycle: Currently remaining at 5:30am – 9:00pm EDT.

After wakeup and before breakfast, FE-2 Chamitoff downloaded the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data from his Actiwatch to the HRF-1 (Human Research Facility 1) laptop. *[To monitor the crewmember's sleep/wake patterns and light exposure, crewmembers wear a special Actiwatch device which measures the light levels encountered by them as well as their patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

Also upon wakeup, the FE-2 started the next part (3rd of 5) of the periodic acoustic measurement protocol by recording post-sleep data of the crew-worn acoustic dosimeters, later deploying the dosimeters statically (Part 4), one in the Node-2 and two the Kibo JPM (JEM Pressurized Module). Tonight (~5:55pm), Chamitoff will record the data taken by the three static dosimeters during the day (Part 5). *[Acoustic data must be taken twice per Increment, each time for the duration of the 16-hour crew workday.]*

CDR Volkov & FE-1 Kononenko spent most of their workday with equipment preparations in the DC1 "Pirs" Docking Compartment for the second Orlan EVA (#20) on 7/15.

After configuring the DC1 communications link to support their presence in "Pirs", Volkov & Kononenko today –

- Terminated the recharge process on the 825M3 Orlan battery in the ZU-S recharge unit,
- Prepared spacesuit replaceable elements, both individual and supplemental,

- Conducted pressure checks on the SM BK-3 oxygen (O₂) tanks and the BNP portable repress O₂ tank in the SM PkhO Service Module Transfer Compartment),
- Ran leak checks & valve functionality tests on the Orlans and their BSS interface/gas-liquid separation unit in the DC1 & PkhO from the EVA support panels (POV);
- Performed leak checking on the backup bladder of suit #27, and
- Installed US add-on gear on the Orlan #25,
- Prepared the BRTK electronic control system (with Central & Terminal Computer Systems check), and
- Checked out the Orlan & BSS systems, including the BRTA-1M comm/telemetry units.

In the Lab, the FE-2 serviced the US OGS (Oxygen Generation System), removing the PWR (Payload Water Reservoir) from in front of the WDS (Water Delivery System) and replacing it with a filled PWR. *[Like the Russian Elektron, OGS produces O₂ from water by electrolysis, dumping the also generated H₂ (hydrogen) through venting.]*

Gregory also completed the periodic inspection of the SPS ELPS (Secondary Power System/Emergency Lighting & Power Supply) subsystems in Node-2, A/L (US Airlock), Lab, and Node-1. *[This activity, now hard scheduled, was suggested yesterday on the US discretionary “job jar” task list.]*

For today’s workouts by all crewmembers on the RED (Resistive Exercise Device), Chamitoff set up the video camcorder for filming and recording the sessions via ground commanding. Afterwards, the video equipment was put back in stowage, and the video was to be downlinked from the VTR (Video Tape Recorder) by ground commanding. *[The RED video, showing the apparatus on the “ceiling” hatch of the Node, is periodically required to support biomechanical evaluation of the exercising crewmember and assessment of the on-orbit setup of equipment during data collection.]*

Greg conducted today’s routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Working off the Russian discretionary “time permitting” task list, Oleg took care of the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Chamitoff completed the regular monthly & quarterly maintenance of the TVIS (Treadmill with Vibration Isolation & Stabilization), inspecting the condition of harnesses, belt slats, corner bracket ropes, IRBAs (Isolation Restorative Bungee Assemblies) and gyroscope wire ropes for any damage or defects, lubricating as required plus recording time & date values.

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1).

At ~5:35pm EDT, Volkov & Kononenko will support a Russian PAO TV event by downlinking a message of greetings and well-wishing for replay at the grand opening of a new administration building of the Korolev Traffic Police on 7/15 in the City of Korolev, in the presence of Russian Interior Ministry officials; B. V. Gromov, the Governor of the Moscow region; N. V. Golovkin, the Head of Traffic Police in the Moscow Region; and A. F. Morozenko, the Mayor of Korolev.

At ~6:45pm, the FE-2 is scheduled for his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop).

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

07/15/08 -- Russian EVA-20 (1:14pm)

07/18/08 -- ATV1 reboost

08/30/08 -- Progress M-64/29P undocking, from FGB nadir

09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/observation)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft port)

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)

11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
03/25/09 -- Soyuz TMA-14/18S launch
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at

ISS On-Orbit Status 07/12/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday.*

Crew Sleep Cycle: Currently remaining at 5:30am – 9:00pm EDT.

After wakeup and before breakfast, FE-2 Chamitoff downloaded the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data from his Actiwatch to the HRF-1 (Human Research Facility 1) laptop. *[To monitor the crewmember's sleep/wake patterns and light exposure, crewmembers wear a special Actiwatch device which measures the light levels encountered by them as well as their patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

Before breakfast, Gregory began Part 1 (of 5) of the periodic acoustic measurement protocol by deploying crew-worn acoustic dosimeters, to be carried for 24 hours (with a microphone on the shirt collar). (Last time done: 4/1 – the session with Malenchenko on 4/13 failed). *[Tonight, after about 15 hours of measurements, dosimeter data will be downloaded and the hardware power-cycled for another data take starting tonight after 8.5-hr. sleep. At that point, the crew will deploy the dosimeters statically in the station for the duration of the day, record measurements tomorrow noon and stow the instruments. Acoustic data must be taken twice per Increment, each time for the duration of the 16-hour crew workday.]*

CDR Volkov and FE-1 Kononenko completed final post-EVA cleanup activities, starting the discharge/recharge cycle on the 825M3 battery from Orlan-M #25 in the ZU-S battery charger in the DC1 Docking Compartment, refilling the Orlan feedwater reservoirs (for cooling), setting up both Orlan-M suits for airing/drying, and tagging up with ground specialists on S/G-1-audio to discuss the spacewalk at ~7:45am EDT.

After running his first NOA-2/Nitric Oxide Analyzer (MBI-21) session on 7/10, measuring post-EVA NO (Nitric Oxide) in his exhaled air, Kononenko today closed out the experiment, filling in the electronic log book on the RSE1 laptop, downlinking images to TsUP via OCA, copying photos to the RSK1 laptop hard drive for return, and restowed the hardware.

FE-2 Chamitoff performed the periodic inspection & cleaning of the FDS (Fire Detection & Suppression) system's bacteria filters and SDs (smoke detectors) in the US Airlock (one SD), Node-1 (2 SDs), Lab (2 SDs), and Node-2 (2 SDs).

Gregory also completed the periodic (monthly) inspection of the RED (Resistive Exercise Device) canister cords and accessories.

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Gregory transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Oleg conducted today's routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Sergey completed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The two cosmonauts had their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop), Sergey at ~9:15am, Oleg at ~11:00am.

Suggested on the US "job jar" task list for Gregory Chamitoff's discretionary performance is the periodic inspection of the ELPS (Emergency Lighting & Power Supply) subsystems in Node-2, A/L (US Airlock), Lab, and Node-1, to become hard-scheduled tomorrow.

WRM Update: An updated WRM (Water Recovery Management) "cue card" was uplinked overnight for the crew's reference in lieu of yesterday's uplink. *[The new card (17-0002R) lists 35 CWCs (Contingency Water Containers, ~1401.8 L total) for*

the four types of water identified on board: technical water (650.6 L, for Elektron, flushing, hygiene, incl. 509.4 L non-usable water because of Wautersia bacteria), potable water (706.7 L, incl. 260.6 L currently on hold), condensate water (41.5 L), waste/EMU dump and other (7.9 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]

Weekly Science Update (*Expedition Seventeen -- Week 12*)

3-D SPACE : Planned (3 sessions in Inc-17, 1 in Inc-18)

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):
Measurements continue in FGB module. Last memory card exchange was performed on 7/1.

ANITA (Analyzing Interferometer for Ambient Air): Continuing.

BCAT-3 (Binary Colloidal Alloy Test 3): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System):
Samples returned on 1J.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): The Silicate Garden Hab ground unit was activated successfully yesterday at the Univ. of Colorado. CGBA-5 will be powered up and the Silicate Garden Hab flight unit will be activated on Monday, 7/14.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): The experiment platform continues to operate nominally. A DHPU (Data Handling Processing Unit) software patch is currently being developed to fix the link error issues encountered with DEBIE-2 and FIPEX instruments. - DEBIE-2: Link error still in work. However a work-around allows for regular science data acquisition using an on-board IOP (Instrument Operations Procedure), but not yet in conjunction with any FIPEX IOP – a final software patch, which will enhance the present instrument capabilities, is under finalization on ground; - DOSTEL: On-going science acquisition; - EuTEMP: Currently inactive as planned; - EVC: Several successful ground commanded runs. Some nice pictures of Earth at sunset and sunset could be obtained. In full Sun illumination, the EVC sensor seems to saturate and consequently the picture quality is not optimum; - EXPOSE: On-going science acquisition; - FIPEX: Science script was running nominally until 6/28, when a sudden sensor switch off was encountered. It is a known problem, under assessment. Currently up and running; - MEDET: Some commandings were performed to adjust the frequency of acquisition of the microcalorimeter. Continuously acquiring science data; - PLEGPAY: currently in READY mode, no science data acquisition on-going; - TRIBOLAB: The Ball-Bearing experiment 1/2/3 which is running since 6/16 has been paused during the EUTEF power-down on 6/21 and has been resumed since. On 6/25, the experiment went suddenly to Non-Nominal Mode, after some higher than expected currents have been measured with the motor. On 6/30, the instrument was put in Thermal Stabilization Mode, and the Ball-Bearing experiment 1/2/3 was restarted on 7/1. This experiment run is expected to last until Week #14.

FSL (Fluid Science Laboratory): FSL is back and running. Further FSL commissioning activities remain to be done (see following item).

GEOFLOW: Commissioning activities for FSL have been continued successfully with the FSL RIC and FSL VMU S/W upgrades on 07/3. On 07/4, the Optical Check-out 1 was also successfully completed. In the near future, the crew will swap the optical target, stand-by until further optical modes checks, and then GEOFLOW Experiment Container will be inserted to start GEOFLOW science runs in the near future.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Planned.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer, ESA): Measurements for NOA-2 by the two Russian cosmonauts were successfully completed before (7/9) and after (7/11) the Russian EVA-20A.

NUTRITION w/REPOSITORY: "Greg, thank you for your continued support of the Nutrition experiment objectives during the FD30 session. We appreciate all of the barcode information relayed via crew notes."

PADLES (Passive Dosimeter for Lifescience Experiment in Space): In progress.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SAMPLE: Complete.

SHERE (Shear History Extensional Rheology Experiment): In progress.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): In progress.

SOLAR (Solar Monitoring Observatory): In progress.

SOLO: Planned.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): The four ECs (Experiment Containers) of Rotor B are yet to be retrieved by the crew from the blocked Rotor B. BIOLAB could not be activated from ground yet, pending resolution of the Smoke Detector issue. A troubleshooting plan has been developed to recover all the BIOLAB functionalities. The remaining WAICO-#1 ECs will be disposed and replaced by six Reference ECs on Rotor B.

CEO (Crew Earth Observations): Through 7/9 the ground has received a total of 2,862 CEO images for review and cataloging. CEO now has a backlog to review of imagery with camera times corresponding to the target request times that include: Central-Arizona Phoenix; Barringer Impact Crater; the Karakoram; Mt. Rainier, Vesuvius, and Etna; the Ganges River Delta; Red River Basin; Santa Barbara Coast; and S. Mozambique. "You have been providing an excellent response to our requests and we will be providing feedback on your success with these and other targets in the coming days. This week's highlights include your timely imagery of the Big Sur Fire in California and your excellent views of Hurricane Bertha in the Atlantic. The former have been published on NASA/GSFC's Earth Observatory website while the latter have been captioned for use by PAO."

CEO photo targets uplinked for today were **Jarvis Island, equatorial Pacific** (*this unusual, trapezoid-shaped island is located just south of the equator about halfway between Hawaii and the Cook Islands. It is low-lying, uninhabited, has very little vegetation and is just about 2 miles long and 1 mile wide. CEO is supporting international efforts to document and monitor the Earth's coral reef systems. On this mid-morning pass, Greg was to look left of track for this target. Then use the long lens settings for detailed views of the fringing coral reefs, especially those on the eastern side*), and **Moorea Coral Reef, Tahiti** (*Moorea is a beautiful, mountainous, and heart-shaped island in French Polynesia. It is part of the Society Islands and located 17 km NW of Tahiti. The island has a striking set of fringing coral reefs. Looking for this island to the right of track as ISS approached the larger island of Tahiti from the NW in mid-morning light, using the long lens settings to carefully map the coral reef structures.*)

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 4:59am EDT [= epoch]):*

Mean altitude -- 344.5 km

Apogee height -- 350.8 km

Perigee height -- 338.2 km

Period -- 91.43 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0009317

Solar Beta Angle -- 47.8 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.75

Mean altitude loss in the last 24 hours -- 20 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55249

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

07/15/08 -- Russian EVA-20 (1:14pm)

07/18/08 -- ATV1 reboost

08/30/08 -- Progress M-64/29P undocking, from FGB nadir

09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/observation)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft port)

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)

11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

03/25/09 -- Soyuz TMA-14/18S launch

05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD

07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation

05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**

10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2

12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola

02/11/10 -- STS-131/Atlantis/19A – MPLM(P)

04/08/10 -- STS-132/Discovery/ ULF4 – ICC-VLD, MRM1

05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at

ISS On-Orbit Status 07/11/08

All ISS systems continue to function nominally, except those noted previously or below.

Crew Sleep Cycle: After the late post-EVA sleeptime this morning night (2:10am EDT), crew wakeup today was delayed to 11:40am; sleep time: 9:00pm EDT.

After wakeup and before breakfast, FE-2 Chamitoff downloaded the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data from his Actiwatch to the HRF-1 (Human Research Facility 1) laptop. *[To monitor the crewmember's sleep/wake patterns and light exposure, crewmembers wear a special Actiwatch device which measures the light levels encountered by them as well as their patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

Later, Gregory reconfigured the POC (Portable Onboard Computer) laptops in the USOS for nominal OpsLAN operations, including NetMeeting and KFX (Ku-band File Transfer) functions. *[Reconfiguration activities included relocating the SSC-13 (Station Support Computer 13) back to its nominal location in the Lab and reconnecting it to power, plus relocating four A31p battery packs from the Soyuz spacecraft to the Lab for temporary stowage.]*

Cleaning up after the spacewalk, CDR Volkov & FE-1 Kononenko will –

- Remove the BK-3 portable oxygen repressurization tanks (primary & backup) from the DC1 BSS (Orlan Interface Unit),
- Remove the Orlan BRTA radio/telemetry unit batteries,
- Take post-EVA radiation readings of the “Pille-MKS” dosimeters carried by the spacewalkers in their Orlan suits,
- Downlink EVA-20A digital photography,
- Activate the ALT-CRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS/ALC) Spectrometer (AST), and

- Set up the first 825M3 Orlan battery for complete discharge/recharge.

Both spacewalkers are timed for their standard post-EVA PMCs (Private Medical Conferences) via S-band/audio, Oleg at 4:35pm, Sergey at 4:50pm.

Greg Chamitoff will tag up with EVA debriefers at MCC-Houston at ~5:15pm via S/G audio.

Oleg Kononenko is scheduled for taking the periodic readings of potentially harmful atmospheric contaminants in the Service Module (SM), using the CMS (Countermeasure System), a component of the GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, which uses preprogrammed microchips to measure H₂CO (Formaldehyde, methanal), CO (Carbon Monoxide) and NH₃ (Ammonia), taking one measurement per microchip. *[CMS is a subsystem of the Russian SKDS Pressure Control & Atmosphere Monitoring System.]*

The FE-2 has the weekly 10-min. CWC (Contingency Water Container) audit on his schedule, as part of on-going WRM (Water Recovery & Management) assessment of onboard water supplies. *[Updated "cue cards" based on the crew's water calldowns are sent up every other week. The current card (17-0002Q) lists 35 CWCs (Contingency Water Containers, ~1365.2 L total) for the four types of water identified on board: technical water (650.6 L, for Elektron, flushing, hygiene, incl. 509.4 L non-usable water because of Wautersia bacteria), potable water (706.7 L, incl. 260.6 L currently on hold), condensate water (4.9 L), waste/EMU dump and other (7.9 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]*

The CDR is scheduled to conduct the periodic (about twice a month) replenishing of the Elektron oxygen generator's water supply for electrolysis, filling the KOV EDV container with water collected in a CWC (Contingency Water Container) from the Lab CCAA (Common Cabin Air Assembly) dehumidifier. *[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown. With both Russian SKV air conditioners still not functioning, condensate is being produced (from air humidity) solely by the CCAA.]*

Kononenko later performs the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Gregory will work on the US OGS (Oxygen Generation System), to set it up for activation. *[Activities include installation of a WW (Waste Water) check valve at the OGS UIP (LAB1P1), accessing the OGS rack front and mating the O₂ outlet jumper QD (Quick Disconnect) at the N₂ Purge ORU (Orbit Replaceable Unit, LAB1PD1 panel), then performing an N₂ (nitrogen) purge of the H₂ (hydrogen) sensor, letting the OGA (Oxygen Generation Assembly) powered for ~20 min. Afterwards, the H₂ sensor QDs are reconnected, the rack door closed, and the WDS (Water Delivery System) re-attached and activated.]*

Other activities scheduled for FE-2 Chamitoff today are to –

- Reconfigure the flexible “elephant” air duct in the US Airlock (A/L), with the A/L CCAA (Common Cabin Air Assembly) air conditioner deactivated, to its nominal post-US EVA configuration at the IMV (Intermodular Ventilation) air return port,
- Turn off the ANITA (Analyzing Interferometer for Ambient Air) hardware, terminating its sampling mode, exiting ANITA software and powering down its laptop in support of subsequent ER4 (EXPRESS Rack 4) repair,
- Perform maintenance on ER4 (EXPRESS Rack 4) by replacing failed power indicators in Lockers 7 & 8, placing the defective light bulbs in a Ziploc bag and CTB for return,
- Take measurements for the regular atmospheric status check for ppCO₂ (Carbon Dioxide partial pressure) in the Lab, SM (at panel 449) and COL (Columbus Orbital Laboratory), using the hand-held CDMK (CO₂ Monitoring Kit, #1002). *[The battery pack is to be replaced with the one from unit #1009 if necessary.], and*
- Fill out the regular FFQ (Food Frequency Questionnaire), his fourth, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

A new task item on Greg's discretionary “job jar” list is the periodic inspection & cleaning of the FDS (Fire Detection & Suppression) system's bacteria filters and SDs (smoke detectors) in the Lab, Node-1, and Node-2.

The crew today performs a reduced physical exercise program on the CEVIS cycle ergometer (FE-2), TVIS treadmill (FE-1) and VELO bike with bungee cord load trainer (CDR).

CEO (Crew Earth Observations) photo targets uplinked for today were **Polar Mesospheric Clouds (PMC)**, also known as Noctilucent Clouds. *(These are transient, upper atmospheric phenomena which are only observed in the summer season at higher latitudes (greater than 35 degrees). Furthermore, they are only visible under special lighting conditions when the observer is in darkness and the sun is 10 to 35 degrees below the horizon. Because of their transient nature and the fact that their presence is almost impossible to predict, researchers consider PMC's to be a DYNAMIC EVENT of opportunity. They are phenomena that we are documenting from the ISS in support of the International Polar Year (IPY). These are very subtle features and sometimes can only be confirmed with image enhancement.)*

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 10:32am EDT [= epoch]):*

Mean altitude -- 344.5 km

Apogee height -- 350.7 km

Perigee height -- 338.4 km

Period -- 91.43 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0009145

Solar Beta Angle -- 43.1 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.75

Mean altitude loss in the last 24 hours -- negligible due to EVA-20A

Revolutions since FGB/Zarya launch (Nov. 98) -- 55237

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

07/15/08 -- Russian EVA-20 (1:14pm)

07/18/08 -- ATV1 reboost

08/30/08 -- Progress M-64/29P undocking, from FGB nadir

09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/observation)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft port)

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
03/25/09 -- Soyuz TMA-14/18S launch
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 07/10/08

All ISS systems continue to function nominally, except those noted previously or below.

The Orlan spacewalk EVA-20A by CDR Volkov and FE-1 Kononenko from the DC1 (Docking Compartment) airlock lasted 6 hrs 18 min. For both it was the first EVA. The main objective of the spacewalk, the first time for both of them, was successfully achieved: The spacewalkers –

- inspected the Soyuz TMA-12 spacecraft at its first separation plane (Plane I),
- removed a section of thermal insulation,
- cut a wire tie connecting pyrobolts, and at 6:44pm EDT
- removed one pyrobolt (of two) from one (#5) of the five locks which tie der Instrumentation & Propulsion Module to the Descent Module (SA) *[the removal functionally opened the latch lock, which apparently had failed twice before on Soyuz reentries 11S and 10S],* and
- secured the pyrobolt inside a blast proof container for returning it onboard and then to Earth aboard Soyuz 16S in October.

The second planned task of installing a docking target for the new Russian MRM (Multipurpose Research Module) on the SM PkhO (Service Module Transfer Compartment) for docking at the SM zenith port was moved to EVA-20 next Tuesday (7/15).

The spacewalk began 30 minutes late, with EVA hatch open at 2:48pm EDT, ending at 9:06pm. It was the 113th EVA in support of ISS assembly, outfitting & maintenance, with a total spacewalk time of 712 h 54 min, and the 85th EVA out of the ISS.

To accommodate the spacewalk schedule, the crew's activity cycle was shifted for a 10 min earlier wakeup in the morning (5:20am EDT) and a 5h 20min delayed

bedtime tonight (i.e., sleep tomorrow morning at 2:10am). Wakeup tomorrow will be at 11:40am (extending to the more regular 9:00pm bedtime).

Before breakfast, FE-2 Chamitoff started his day again with the week-long SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment, using the payload software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop. *[To monitor the crewmember's sleep/wake patterns and light exposure, Greg wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list. This is Week 1 of 3 for the FE-2.]*

After morning inspection, all pre-EVA activities proceeded smoothly and on schedule, starting out with Volkov & Kononenko taking another MO-9 "Urolux" urine biochemistry test before breakfast. *[A second session with the Urolux equipment will be conducted by both crewmembers tonight (~9:15pm) immediately after post-EVA station repress.]*

FE-2 Chamitoff supported the preparations by installing fresh batteries in the cameras and transfer them over to the DC1, then configuring ISS systems for EVA.

Pre-EVA preparations by the crew included –

- Closing external covers on SM (Service Module) windows #8, #12, #13, #14,
- Deactivating the Kenwood-D700/Sputnik-SM amateur radio equipment to prevent RF interference with the Orlans' wireless in-suit Tranzit-B radio telemetry system,
- Changing the settings of the DSP pressure alarm sensors in the RS (Russian Segment),
- Deactivating the DS-7A Smoke Detector #1 in the SM PkhO (Transfer Compartment),
- Setting up the PSS Caution & Warning System in the FGB,
- Deactivating the Vozdukh carbon dioxide (CO₂) removal system,
- Removing SM air ducts to enable RO-PkhO hatch closure,
- Deactivating VN1 & VN2 air heaters,
- Powering down ventilation fans in the SM (VK1, VK2, VK3, VK4, VKYu1, VKYu2),
- Turning off the SRVK-2M condensate water processor, and
- Powering off electrical food heaters in the SM galley.

CDR Volkov and FE-1 Kononenko had about an hour reserved to complete setting up DC1 and PkhO systems for pre-EVA mode.

To monitor their work area at the Soyuz TMA-12 during the spacewalk, the CDR set up the SONY HDV high-resolution camcorder (HRV-Z1J, from SFP Charles Simonyi) at SM window #6 and arranged a portable fan from FGB stowage to provide cooling to the camcorder body during operation.

Next steps by Sergey & Oleg were to –

- Check out the Orlan-M spacesuits and their systems as well as the suit interface control panels (BSS) in DC1 & PkhO,
- Retest the BK-3 primary & backup oxygen (O₂) tanks of the Orlans and DC1,
- Disassemble the DC1 air duct, but leaving the V3 fan in place, and
- Set up the STTS communications/telemetry links necessary for the spacewalk from the DC1. *[Most activities were paced by RGS (Russian ground site) comm window passes.]*

After a midday “snack” (9:40-10:20am), the spacewalkers conducted final inspection of the suits, BSS interface units & biomedical parameter telemetry to RGS (~11:00am), including VHF/voice & biomedical electrode belt and telemetry hookups via the BSS (later by the wireless in-suit Tranzit-B radio telemetry system) for vital signs and equipment monitoring.

FE-2 Chamitoff configured the ISS for uncrewed ops and, with FE-1 Kononenko, prepared the Soyuz for his stay during the spacewalk. Gregory’s preparations in the Descent Module (SA) included transfer of SOP (Food Supply Subsystem) food containers and a supply of eight Russian SVO (Water Supply System) water bags. *[These provisions would also have been needed in a contingency requiring the entire crew taking to the Soyuz for some time.]*

After entering the SA and closing the hatch between it and the BO (Orbital Module) at ~10:45am, Gregory performed a 30-min leak check on the hatch interface, then settled down for the six-hour lockout.

In the DC1 & PkhO, after the Orlan & BSS systems checkouts Volkov & Kononenko donned spacesuits and ancillary gear at ~12:10pm, assisting each other, then closed the hatchways between SM RO/PkhO (Working Compartment/Transfer Compartment) and PkhO/SU (DC1 Transfer Vestibule) at ~12:40pm, keeping hatches open between FGB & PMA-1 (Pressurized Mating Adapter 1) and between SM & DC1.

At ~11:50am, ISS attitude control authority was handed over to RS MCS (Motion Control System) to keep attitude stable during the (reactive) DC1 airlock depressurization, and was returned to US momentum management by CMGs

(Control Moment Gyroscopes) at ~2:50pm.

The spacewalkers sealed the Orlan backpacks (~12:30pm), followed by Orlan & BSS controls checks. Final checkout of suits and their controls included checking for leak during successive stages of depressurization. *[Pressure inside the Orlans was reduced to 0.42 at (6.2 psi). After suit purge, the spacewalkers had a 30-minute oxygen prebreathe period, as pressures between DC-1 and the PkhO were equalized and then further reduced.]*

Gregory Chamitoff remained sealed off in the Soyuz SA during the spacewalk which began after a final leak check on the four BK-3 O₂ tanks. At end of prebreathe, DC1 pressure was down to 15 mmHg (Torr), holding for 5 min for a final cabin leak check, followed by switching the Orlans to autonomous (battery) suit power (~2:15pm) and opening of EV hatch #1 at 2:48pm.

After return and ingress from the EVA, with DC1 airlock repressurization from SM cabin air, the crew opened hatches and reentered the SM for their second MO-9 “Urolux” biochemical urine test.

Later, the CDR & FE-1 will have their scheduled post-EVA data take with the NOA/ Nitric Oxide Analyzer (MBI-21) experiment (Sergey’s fourth, Oleg’s third), filling in the electronic log book on the RSE1 laptop for downlink and restoring the hardware. Each subject takes two NO (Nitric Oxide) measurements in exhaled air. *[Purpose of the ESA experiment ESANO1, consisting of the “Platon” analyzer and its power supply, is to monitor expired NO in the subject’s exhaled air to detect signs of airway inflammation and indications of venous gas emboli (bubbles) that may be caused by inhalation of pollutants in the closed environment of the ISS cabin and increased risk of decompression sickness.]*

This will be followed by the crew resetting communications, conducting ISS activation operations and restoring systems configurations in the DC1 and other RS modules to pre-EVA conditions, then installing the DC1 air ducts.

Cleaning up after the spacewalk, CDR Volkov & FE-1 Kononenko will –

- Remove the Orlan BRTA radio/telemetry unit batteries,
- Take post-EVA radiation readings of the “Pille-MKS” dosimeters carried by the spacewalkers in their Orlan suits,
- Downlink EVA-20A digital photography,
- Activate the ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS/ALC) Spectrometer (AST), and
- Set up the 825M3 Orlan batteries for complete discharge/recharge, but

- Leave the backup BNP portable oxygen repressurization tank in DC1, since it will also be needed for EVA-20.

Chamitoff will return ISS systems to their initial states, including hatch opening (Node-1, Lab) at ~11:05pm, air ducts, Vozdukh CO₂ scrubber and Sputnik-SM amateur radio.

Later in the night, Gregory will reconfigure the POC (Portable Onboard Computer) laptops in the USOS for nominal OpsLAN operations, including NetMeeting and KFX (Ku-band File Transfer) functions. *[Reconfiguration activities included relocating the SSC-5 (Station Support Computer 5) A31p laptop back to its nominal location in the Lab and reconnecting it to power, plus relocating four A31p battery packs from the Soyuz spacecraft to the Lab for temporary stowage.]*

To provide cooling for tomorrow's ground-commanded activation of the U.S. CDRA (Carbon Dioxide Removal Assembly), shortly before sleeptime the FE-2 will connect the regular ITCS LTL (Internal Thermal Control System/Low Temperature Loop) coolant jumper connection to the CDRA support rack LAB1D6. The ground will then lower the temperature setpoint in Node-2 to control for humidity across the USOS. *[CDRA will be activated tomorrow at 9:00am-3:00pm EDT to reduce cabin CO₂ levels.]*

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 8:40am EDT [= epoch]):*

Mean altitude -- 344.5 km
 Apogee height -- 350.7 km
 Perigee height -- 338.4 km
 Period -- 91.43 min.
 Inclination (to Equator) -- 51.64 deg
 Eccentricity -- 0.000908
 Solar Beta Angle -- 38.3 deg (magnitude increasing)
 Orbits per 24-hr. day -- 15.75
 Mean altitude loss in the last 24 hours -- 35 m
 Revolutions since FGB/Zarya launch (Nov. 98) -- 55220

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

07/15/08 -- Russian EVA-20 (1:14pm)

07/18/08 -- ATV1 reboost
 08/30/08 -- Progress M-64/29P undocking, from FGB nadir
 09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/observation)
 09/10/08 -- Progress M-65/30P launch
 09/12/08 -- Progress M-65/30P docking (SM aft port)
 10/01/08 -- **NASA 50 Years**
 10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
 10/12/08 -- Soyuz TMA-13/17S launch
 10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port)
 10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)
 11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
 11/12/08 -- STS-126/Endeavour/ULF2 docking
 11/20/08 -- **ISS 10 Years**
 11/26/08 -- Progress M-66/31P launch
 11/28/08 -- Progress M-66/31P docking
 02/10/09 -- Progress M-67/32P launch
 02/12/09 -- Progress M-67/32P docking
 02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
 03/25/09 -- Soyuz TMA-14/18S launch
 05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
 05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
 10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
 12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
 02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
 04/08/10 -- STS-132/Discovery/ ULF4 – ICC-VLD, MRM1
 05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 07/09/08

All ISS systems continue to function nominally, except those noted previously or below.

Crew Sleep Cycle: With wakeup this morning remaining at 5:30am EDT, sleeptime is beginning to move left, tonight at 8:50pm, i.e., 10 min earlier. Wakeup tomorrow will also be 10 min earlier, at 5:20am.

FE-2 Chamitoff started his day again with the week-long SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment, using the payload software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop. *[To monitor the crewmember's sleep/wake patterns and light exposure, Greg wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list. This is Week 1 of 3 for the FE-2.]*

In preparation for tomorrow's Orlan EVA-20A, CDR Volkov & FE-1 Kononenko began their day by tagging up with ground specialists via S-band to review an updated EVA timeline. *[The Orlan spacewalk by Sergey/EV1 & Oleg/EV2, now estimated at 6hrs 10min, will begin with DC1 (Docking Compartment) **hatch opening at 2:18pm EDT** (ingress & hatch close at ~8:22pm). The spacewalkers will experience three orbital "nights", during which they will rest, and a fourth during their ingress. EVA-20A objectives are: (1) Inspection & mechanical unlatching of one of five locks on Plane I of the Soyuz TMA-12 spacecraft, followed by removal of one of the two pyrobolts (8Kh55) from inside the lock body, (2) installation of the docking target unit for the new Russian research module on the SM PkhO (Service Module/Transfer Compartment), Plane 4, for the zenith (upward facing) docking port. During the EVA, the protective thruster covers & wipes/towels will be jettisoned from the Soyuz in carefully prescribed zones to prevent later recontact.]*

After the timeline review, CDR Volkov was to –

- Make preparations for Gregory Chamitoff's stay in the Soyuz Descent Module (SA) by placing instructional/reference material (radiograms) in the SA and readying its ASU toilet facility,
- Support an automatic closure test of the hatch cover between the DC1 Docking Compartment and its transfer vestibule (SU) to the Soyuz, with the DC1 & Soyuz air ducts (VD2 & VD) temporarily moved out of the way [*the hatch closure was ground commanded during an RGS (Russian Ground Site) comm window*],
- Configure CCPKs (Crew Contamination Protection Kits, Russian: PNST) in the DC1, for protecting the spacewalkers from FORP (Fuel/Oxidizer Reaction Products, e.g., N-nitrosodimethylamine, NDMA), i.e., incompletely-burnt fuel residue on the SM hull from yaw/pitch thruster plumes [*protective gear kits for use during and after the EVA in case the Orlans are inadvertently contaminated, are extensively equipped with wet wipes, dry towels, goggles, IPK gas masks and half masks, latex gloves, high performance filters, trash containers, etc. The crew review today included detailed instructions what to do if any spacesuit contamination is detected after the EVA. Towels used for wiping gloves etc. will be thrown overboard in retrograde direction (i.e., against flight direction)*], and
- Conduct a functional test of the KSD Pressure Relief Valve (PRV) in the+ Soyuz BO (Orbital Module) from the DC1 EVA panel (POV).

FE-1 Kononenko's preparatory activities meanwhile include –

- Conducting a pressure check on the BNP portable repress O₂ tank in the DC-1, to be used for repressurization of the "Pirs" airlock after the spacewalk,
- Retrieving three "Pille-MKS" radiation dosimeters, recording their dosages and equipping each Orlan (in pocket on left calf) with a sensor unit (A0309 & A0310) [*a third sensor (A0307) is worn by the FE-2 in his flight attire, and a fourth, A0308, remains on duty for SM background readings on the Pille Reader tray*],
- Preparing & setting up a kit with test strips for the MO-9 "Biochemical Urinalysis" experiment in the SM's ASU facility for the usual pre-EVA session of the two spacewalkers tomorrow,
- Deactivating the Elektron oxygen (O₂) generator after purging its BZh Liquid Unit with nitrogen (N₂) at 0.65 kg/cm² via its KE3 & VN3 valves, and
- Turning off the AST Spectrometer of the Matryoshka-R (RBO-3-2) radiation payload plus checking the ALC-950 memory card for file quantity and space [*RBO-3-2 is using the ESA/RSC-Energia experiment ALTCRISS (Alteino*

Long Term monitoring of Cosmic Rays on the ISS/ALC) with its Spectrometer (AST) and ALC equipment, temporarily located in the FGB on panel 429 (normally in DC1)].

FE-2 Chamitoff prepared for the EVA-20A by setting up two SONY PD100 camcorders in the Lab and Node-1 to provide situational awareness during the uncrewed period tomorrow (viewing only, not recording). *[There's no tape in the camcorders, to prevent them from going into "Standby" mode. To get the longest view, the cameras are "zoomed out" with a Wide Conversion lens attached. The camcorders were positioned to provide most the encompassing view of the modules, each one using one of the module power outlets.]*

In addition, the USB cameras on the Lab SSC (Station Support Computer) A31p laptops were positioned by the FE-2 such that areas not covered by the Lab PD100 video cam can be viewed from the ground.

Also, to provide a laptop for his stay in the Soyuz, Gregory powered off the SSC-5 A31p and its "cobalt brick" power supply for temporary transfer to the Descent Module (SA) and collected freshly charged batteries from four Lab SSC Clients for use in the Soyuz during the Russian EVA, replacing them in the laptops temporarily with stowed batteries.

Other preparatory activities by Greg Chamitoff for EVA-20A, the decrewed period and a potential Soyuz relocation to the FGB nadir port (after Progress 29P undocking) today include –

- Ready the Kodak DCS760 EVA camera by initiating charging two batteries for it and later configuring the camera for operation,
- Closing the protective Lab science window shutter *[to be verified as Closed tomorrow prior to attitude control handover to RS (Russian Segment) thrusters at 11:50am],*
- Demating & taking down the ITCS LTL (Internal Thermal Control System/ Low Temperature Loop) jumper at the LAB1D6 rack after deactivation of the U.S. CDRA (Carbon Dioxide Removal Assembly) by the ground today (~12:20pm-5:20pm) and cooling no longer required,
- Transfer of US items, such as ODF (Operations Data Files) & CCPKs, to the RS,
- Deactivating PWS (Portable Workstation) laptops in the COL (Columbus Orbital Laboratory), and
- Closing USOS hatches at ~2:55pm *[for Kibo JPM (JEM Pressurized Module), Kibo JLP JEM Logistics Pressurized Segment), COL, Node-2, and US A/L (Airlock).]*

After CDR Volkov sets up the NOA/Nitric Oxide Analyzer (MBI-21) experiment later

today, he and Kononenko are to conduct another data take session (his third, Oleg's second), later filling in the electronic log book on the RSE1 laptop for downlink and restowing the hardware. Each subject takes two NO (Nitric Oxide) measurements in exhaled air. There will also be post-EVA data takes. *[Purpose of the ESA experiment ESANO1, consisting of the "Platon" analyzer and its power supply, is to monitor expired NO in the subject's exhaled air to detect signs of airway inflammation and indications of venous gas emboli (bubbles) that may be caused by inhalation of pollutants in the closed environment of the ISS cabin and increased risk of decompression sickness.]*

Oleg is also scheduled to perform routine IFM (Inflight Maintenance) on the Russian SRVK condensate water processor by removing & replacing its BRPK-1 (Condensate Separation & Pumping Unit) separator. *[The latter had been temporarily moved over on 5/30 from the line-2 BRPK to replace the earlier failed BRPK-1 separator.]*

The FE-2 spent a few minutes on the weekly inspection of the TVIS treadmill roller bearings, checking the treadmill's belt both left and right for any noticeable depressions due to seized or worn rollers. *[With the TVIS treadmill rollers approaching their end-of-life, the frequency of their inspection has recently been increased for safety.]*

The FE-1 will conduct the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1). Later tonight, Oleg will transfer the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Volkov & Kononenko are scheduled for their regular pre-EVA PMCs (Private Medical Conferences) via S- & Ku-band audio/video, Sergey at ~2:15pm EDT, Oleg at ~2:30pm.

At ~11:05am EDT, Kononenko powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply) and at 11:10am conducted a ham radio exchange with students at the City

of Ottawa Central Experimental Farm, Ottawa/Ontario Canada. *[The Canada Agriculture Museum in Ottawa is a unique combination farm and museum. The Museum offers animated bilingual interpretation which shows the making and tasting of foods such as ice cream, bread and butter. Other demonstrations present farming activities, including year-round animal care and spring sheep shearing.*

Visitors to the animal barns will see a collection of common farm animals, as well as several rare breeds. The Museum's Tractors exhibition and the exhibition on rural electrification of one hundred years ago bring the science of the past to life. Questions to the crew were uplinked beforehand. "What kind of animals have been brought to space?"; "Is it possible to grow food in space?"; "What planet would be the best for farming?"; "What would be the easiest plant to grow in space?"; "What is the difference between growing plants on earth and in space?"; "What is GPS technology, and how does it affect agriculture?"; "What are the difficulties of agriculture in space?"; "What is your favorite farm animal and why?"]

Uncrewed Station Ops Update: For the Orlan spacewalks on 7/10 & 7/15 Moscow has proposed not to configure RS hatches for station decredwing. This will keep hatches open between FGB & PMA-1, and SM & DC1, and hatch closed inside the SM between RO/Working Compartment & PkhO/Transfer Compartment). In case of a DC1 leak during airlock repress, the Soyuz TMA-12, with all three crewmembers, would relocate from the DC1 to the FGB nadir port, a brief 25-min trip. In this contingency, the Progress 29P, currently docked at the FGB port, would be separated on 7/11 at ~1:18pm EDT in sunlight. Soyuz 16S would undock from the DC1 on the same day at ~6:31pm, translate a few meters along the RS and redock at the FGB nadir dock at ~6:56pm. [Note: A second docking attempt at the SM aft end, the current ATV location, is not considered due to insufficient Soyuz consumables.]

CEO (Crew Earth Observations) photo targets uplinked for today were **S.**

Mozambique (the southern portion of this African nation is undergoing rapid land use change as mineral exploration is driving the construction of new infrastructure. This fair-weather pass in late morning offered the opportunity to acquire good baseline, contextual views of the southwestern part of the CEO target area. There are very few strong visual cues for this area, so as ISS approached the target area from the NW and left the mountain regions of South Africa, Greg was to try for near nadir views in the plains until the coast, then to map the coastal area), **Hurricane Bertha** (Bertha became a major hurricane yesterday with winds briefly approaching 115kts. The early morning pass of ISS found a somewhat weakened storm well to the right of track holding at just 95kts and moving northwestward. Trying for more detailed views today of the cloud structure and using the long lens settings only if the eye becomes visible during transit), **Andrews Forest, Oregon** (the Andrews Forest is a Long Term Ecological Research [LTER] site located in the Cascade Mountains of western Oregon. On this early morning pass, in fair weather,

*Chamitoff was to look left of track and try for contextual mapping views of the western flank of the Cascade Range), **Barringer Impact Crater** (also known as "Meteor Crater," this site is a landmark feature in northern Arizona about 60 miles east of Flagstaff. After crossing the Grand Canyon, the FE-2 was to begin looking for the small crater just right of track. It will be midmorning and monsoon clouds will be closing in from the SE. It lies just south of Interstate Highway 20 in a barren plains area. Using the long lens settings for detail), and **Lake Poopo, Bolivia** (Lake Poopo is a small lake near the southern end of a long, elevated basin in the Bolivian Andes known as the Altiplano. The Altiplano extends from the relatively moist region of Lake Titicaca S-SEward to the large, bright playa of Salar de Uyuni. Poopo is subject to significant changes in size and color related to the El Niño-Southern Oscillation (ENSO) cycle. The station pass was in late morning and expected to be clear. Looking well right of track and trying for contextual views of the southern end of the Altiplano including Lake Poopo.)*

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 8:32am EDT [= epoch]):*

Mean altitude -- 344.6 km

Apogee height -- 350.7 km

Perigee height -- 338.4 km

Period -- 91.43 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0009145

Solar Beta Angle -- 33.6 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.75

Mean altitude loss in the last 24 hours -- 53 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55204

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

07/10/08 -- Russian EVA-20A (2:18pm)

07/15/08 -- Russian EVA-20 (1:14pm)

07/18/08 -- ATV1 reboost

08/30/08 -- Progress M-64/29P undocking, from FGB nadir

09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/observation)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft port)

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
03/25/09 -- Soyuz TMA-14/18S launch
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

ISS On-Orbit Status 07/08/08

All ISS systems continue to function nominally, except those noted previously or below.

Crew Sleep Cycle: Wake/sleep cycle remains right-shifted by 3.5 hrs (5:30am - 9:00pm EDT).

Onboard activities today are mostly focused on the suited exercise/dry-run preparatory to Thursday's (7/10) Orlan spacewalk (EVA-20A).

FE-2 Chamitoff started his day with the week-long SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment, using the payload software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop. *[To monitor the crewmember's sleep/wake patterns and light exposure, Greg wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list. This is Week 1 of 3 for the FE-2.]*

After yesterday's completion of all Orlan-M suit preparations, dry-run activities began today at ~9:45am EDT with CDR Volkov tearing down and removing the air ducts between the Service Module Transfer Compartment (SM PkhO) and DC1 Docking Compartment/airlock (skipping ventilation fan V3) to make room for the subsequent suited exercise.

At the same time, FE-1 Kononenko worked on configuring the communications systems in the DC1 and Soyuz TMA-12 spacecraft for the exercise. *[The suited run requires wireless Tranzit-B suit radio telemetry on both semisets and temporary deactivation of the Russian VHF channel 1 (Very High Frequency, Russian: UKV1, for ultra-shortwave) to avoid interference from extraneous radio stations to the*

Orlans while over Russian ground stations (RGS). All EVA preps are monitored by the ground via audio. Tranzit-B TM is to be turned off later today at ~3:30pm EDT.]

After another functionality and leak checking of the Orlan-Ms, their equipment and their interface units (BSS) in the DC1 & PkhO, the crew began donning EVA gear at ~11:20am, including putting on personal gear bags, biomed harness, thermal underwear, LCG (liquid cooling garment), low-noise headset, gloves, etc.

After another checkout of comm hookups & biomedical parameter telemetry via the BSS Orlan interface system for vital signs and equipment monitoring, suiting up then culminated in ingress in the Orlans (~12:30pm) through their “backdoors” and sealing off of the backpacks.

Next in line are functionality checkouts of the suits and their BSS controls (e.g., temperature control handling, water cooling system ops, preliminary Orlan & BSS leak checks, preliminary dimensional suit fit checks at reduced suit pressure of 0.4at/5.9 psi, and about an hour of testing/training of suited mobility and translation inside the DC1, beginning at ~1:00pm. *[These exercises include translation to all DC1 work stations with mated fluid umbilical, verification of Orlan fit, checkout of onboard cooling system operation, assessment of how the interior DC1 config impacts operations with various gear and accessories such as the POV (EVA support panel) and BSS, moving the BRT (Body Restraint Tether) with a CLB (Crew Lock Bag) and securing the BRT on a handrail, retrieving the Kodak 760 camera from the KPU tool carrier and stowing it temporarily on the OTA swing arm, plus some typical EVA-20A tasks such as working with the Soyuz truss/node mockup to remove one of the two pyrobolts in the lock, etc.]*

FE-2 Chamitoff is to participate in part of the exercise by checking out his comm links.

Egress from the Orlans is timelined for around 2:00pm, to be followed by a one hour lunch break.

Afterwards, Volkov & Kononenko will restore communications settings in DC1 & Soyuz to nominal ops and perform post-training cleanup activities, including air duct assembly. Later tonight, after the Orlans are confirmed to be dry, they will be re-equipped with fresh consumables/replaceable elements for the spacewalk on Thursday.

During the suited exercise in the closed-off DC1, Gregory Chamitoff conducted the periodic inspection of all US segment (USOS), ESA & JAXA hatch seals (Node-1 Forward, Aft & Starboard, Airlock, Lab Aft & Forward, Node-2 Aft, Starboard & Port, Columbus, Kibo JPM Starboard & Zenith, Kibo JLP Nadir) in support of ACS

(Atmospheric Control System) maintenance, using a special vacuum cleaner and other tools (last time done: 4/16).

Making preparations for possible uncrewed operation, Chamitoff first worked in JAXA's Kibo modules JPM & JLP by checking out lighting fixtures and verifying that all GLA (General Luminaire Assembly) switches are set to ON/full bright and that the SRCA (System on/off Remote Control Assembly) is also turned on.

In the JPM, to support ground commanding from Japan's Tsukuba Flight Control Center, the FE-2 will also get science payloads ready for operation by connecting their video cables to the IPU (Image Processing Unit) and bus cables to the ISPR UIP (International Standard Payload Rack Utility Interface Panel).

Afterwards, Greg will connect the ISPR-3 (International Standard Payload Rack 3) RYUTAI via umbilical and verify that power is turned on for all active JEM racks (control switch JPM A2 on ISPR-A2, JPM1A6 on JEMRMS). *[RYUTAI ("fluid") is a Japanese multipurpose experiment/payload rack system to support the FPEF (Fluid Physics Experiment Facility), SCOF (Solution Crystallization Observation Facility), PCRF (Protein Crystallization Research Facility) and the IPU (Image Processing Unit) by providing structural interfaces, power, data, cooling, water and other items needed to operate science experiments in micro-G.]*

In preparation for possible remote-controlled operation, the FE-2 also deactivates the JPM SLT (System Laptop).

Moving over to ESA's Columbus module, Gregory will be checking out the vacuum part of the ECLSS (Environment Control & Life Support System), making sure that filter plugs are properly installed on the VAMRV (Vacuum Manual Repressurization Valve) on the forward side of the Columbus Starboard Deck Cone panel, and on the VEMRV (Venting Manual Repressurization Valve) on the aft side of the Starboard Deck Cone panel).

Chamitoff's work schedule also includes the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling a CWC (Contingency Water Container, #1054) with the collected water slated for processing. No samples are required. *[Estimated offload time before reaching the tank's neutral point (leaving ~6 kg in the tank): ~30 min. Condensate collection continues to be performed by the CCAA while the Russian SKV-2 air conditioner is off, awaiting its overdue Khladon (Freon-218) refill. SKV-1 has been nonfunctional for a long time.]*

Oleg Kononenko is scheduled to handle the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage

locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The FE-2 is to perform the standard calibration on the new CSA-O₂ (Compound Specific Analyzer-Oxygen) units #1043 & #1059 delivered on 1J.

The routine maintenance of the SOZh system (ECLSS) in the SM, including ASU toilet facilities systems/replaceables, was added to Gregory's discretionary "job jar" task list for today.

A second discretionary item on his task list is to gather and temporarily stow US equipment that should be transferred tomorrow to the RS (Russian Segment) for the EVA-20A & EVA-20 spacewalks.

At ~2:05pm, Chamitoff is scheduled for another regular PMC (Private Medical Conference) via S- & Ku-band audio/video.

With Sergey & Oleg getting plenty of physical exercise today in form of the strenuous suited dry-run, the FE-2 worked out alone on the regular 2.5-hr. physical exercise protocol (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill and RED resistive exercise device. Afterwards, Greg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Uncrewed Station Ops Update: For the Orlan spacewalks on 7/10 & 7/15 Moscow has proposed not to configure RS hatches for station decrewing. This will keep hatches open between FGB & PMA-1, and SM & DC1, and hatch closed inside the SM between RO/Working Compartment & PkhO/Transfer Compartment). In case of a DC1 leak during airlock repress, the Soyuz TMA-12, with all three crewmembers, would relocate from the DC1 to the FGB nadir port, a brief 25-min trip (6:56pm-6:31pm EDT on 7/11). While ensuring crew safety and station integrity, this minimizes necessary crewtime which is already in severe shortage due to the EVA-20A date. The necessary waiver of the applicable Flight Rule (15-158) for the three hatches was discussed in detail on 7/7 by the IMMT (ISS Mission Management Team) and approved. There is no impact on status of KVD pressure equalization valves (PEV). *[Note: A second docking attempt at the SM aft end, the current ATV location, is not considered due to insufficient Soyuz consumables.]*

CEO (Crew Earth Observations) photo targets uplinked for today were **Hurricane Bertha** (*DYNAMIC EVENT: This tropical storm was just upgraded to the Atlantic*

season's first hurricane. It is tracking W-NWward through open waters and by the time of this ISS pass, at mid-morning, should be a strong Category 2 storm with 90kt winds. As the station approached from the NW, Chamitoff was to look left of track for a small, symmetric storm with a distinct eye and try for oblique views of the entire storm system showing its general cloud structure), **Red River Basin, TX** (the Red River is a major tributary of the Mississippi River that also forms the border between the states of Texas and Oklahoma. The basin area north of the Dallas-Fort Worth area is primarily an agricultural region that is changing under increasing urban development. As ISS approached this area from the NW near mid-morning, Greg was to look for the W-to-E meandering flow of the river and map the area west of the man-made Lake Texoma), and **Jarvis Island, Equatorial Pacific** (this unusual, trapezoid-shaped island is located just south of the equator about halfway between Hawaii and the Cook Islands. It is low-lying, uninhabited, has very little vegetation and is just about 2 miles long and 1 mile wide. CEO is assisting international efforts to document and monitor the Earth's coral reef systems. On this late morning pass, looking just left of track for this target, then using the long lens settings for detailed views of the fringing coral reefs, especially those on the eastern side).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (as of this morning, 7:51am EDT [= epoch]):

Mean altitude -- 344.6 km

Apogee height -- 350.8 km

Perigee height -- 338.5 km

Period -- 91.43 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0009099

Solar Beta Angle -- 28.8 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.75

Mean altitude loss in the last 24 hours -- 58 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55188

Significant Events Ahead (all dates Eastern Time, some changes possible.):

07/10/08 -- Russian EVA-20A (2:21pm)

07/15/08 -- Russian EVA-20 (1:14pm)

07/23/08 -- ATV1 reboost (tent.)

09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/observation)

09/09/08 -- Progress M-64/29P undocking, from FGB nadir (may move to 8/30)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft port)
10/01/08 -- **NASA 50 Years**
10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
03/25/09 -- Soyuz TMA-14/18S launch
05/15/09 -- STS-127/Endeavour/2J/A launch - JEM EF, ELM-ES, ICC-VLD
07/30/09 -- STS-128/Atlantis/17A – MPLM(P), last crew rotation
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
10/15/09 -- STS-129/Discovery/ULF3 - ELC1, ELC2
12/10/09 -- STS-130/Endeavour/20A – Node-3 + Cupola
02/11/10 -- STS-131/Atlantis/19A – MPLM(P)
04/08/10 -- STS-132/Discovery/ ULF4 – ICC-VLD, MRM1
05/31/10 -- STS-133/Endeavour/ULF5 – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 07/07/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 12 of Increment 17.*

Crew Sleep Cycle: Wake/sleep cycle remains right-shifted by 3.5 hrs (5:30am - 9:00pm EDT).

Gregory Chamitoff started his day with his first week-long session with the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment, using the payload software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop. *[To monitor the crewmember's sleep/wake patterns and light exposure, Greg wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list. This is Week 1 of 3 for the FE-2.]*

Gregory also ended his FD30 session with the NASA/JSC experiment NUTRITION w/Repository, his second, by collecting a final urine sample upon wakeup for storage in the MELFI (Minus-Eighty Laboratory Freezer for ISS). The sampling kit was then stowed away. Greg's next activity with this experiment will be the FD60 session. *[The current NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

Before breakfast, the CDR, FE-1 and FE-2 completed another periodic session of

the Russian biomedical routine assessment PZEH-MO-7/Calf Volume Measurement (fifth for CDR & FE-1, third for FE-2). *[Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference points, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures.]*

After breakfast, Volkov & Kononenko had an hour reserved for reviewing specific procedures for EVA-20A, the first of two planned Orlan spacewalks, and tagged up with ground specialists via S-band. *[Among the procedures reviewed were timeline details, Strela crane operations (to maneuver EV2/Oleg to the Soyuz worksite), EV1/Sergey joining him at the worksite, crew interactions during the EVA, placement of safety tethers, etc. Specialists are still assessing if there is a potential issue with the configuration in which Soyuz and the extended Strela could be left in case of an EVA termination due to a systems failure.]*

Later, with the STTS communication/telemetry links configured for working in the DC1 Docking Compartment, the two spacewalkers spent several more hours on -

- continuing Orlan preparations, e.g., gathering equipment & tools,
- taking documentary photography of the VSPLESK payload, to be installed outside during the second spacewalk (EVA-20),
- checking the installation of selected US add-on hardware on EV2's Orlan-M #26 (TV camera, power harness, etc.) for video coverage of the work at the Soyuz spacecraft,
- performing the gas/water separation in the Orlan & DC1 BSS interface unit cooling loops, and
- restoring STTS comm/TM links to nominal configuration.

Sergey also recharged the battery of the SONY HVR-Z1J digital high-definition camcorder (provided last year by VC12 Charles Simonyi) and configured the ZVK LIV Experimental Video Complex in the Service Module (SM) for covering EVA-20A. *[Volkov's setup involves the KL-211 MPEG-2 Encoder which uses the RSS1 A31p laptop (for monitoring the digital video) and a U.S. SSC (Station Support Computer) laptop (for converting analog TV from Russian PAL mode to U.S. NTSC) and making the video hardware connections, checked with a network ping test. Transmission tests with the ground followed (10:00am – 2:00pm EDT), including launching the NViewer (NASA Viewer) application on the Central Post SSC (Station Support Computer) laptop and the VLC Media Player on the RSS1 laptop, linking KL-211 to various video cameras onboard, and checking the digital video transmission over JSL/Ethernet plus OCA/Ku-Band to MCC-Houston and from there to Moscow via the ESA Gateway for COL-CC/Oberpfaffenhofen transmission to at TsUP-Moscow, plus transfer of the USOS analog video of the RS ISS video downlink via Streambox 2 to NISN (i.e., the Moscow Ostankino communication hub).]*

FE-2 Chamitoff worked several hours in the Kibo JPM (JEM Pressurized Module), first preparing the TCA LTL (Thermal Control Assembly/Low Temperature Loop) gas trap for the subsequent operations, by reconfiguring valves manually and activating the gas trap heater. After the operations, the heater will be deactivated and the valves reset to their nominal (bypassed) configuration.

As next steps, Gregory was to collect fluid samples in the JPM, specifically, to remove an LTL flexhose, install an ITCS (Internal Thermal Control System) fluid sampling adapter, connect umbilicals at the SAIBO and RYUTAI racks, and collect both ammonia and OPA (Ortho-Phthalaldehyde) fluid samples at the JPM1F2 sampling port. *[SAIBO (“living cell”) is a Japanese multipurpose experiment/payload rack system on the ISS that transports, stores and supports subrack facilities such as the CB (Clean Bench) and CBEF (Cell Biology Experiment Facility) equipment by providing structural interfaces, power, data, cooling, water and other items needed to operate science experiments in microgravity. RYUTAI (“fluid”) is a Japanese multipurpose experiment/payload rack system to support the FPEF (Fluid Physics Experiment Facility), SCOF (Solution Crystallization Observation Facility), PCRf (Protein Crystallization Research Facility) and the IPU (Image Processing Unit) by providing structural interfaces, power, data, cooling, water and other items needed to operate science experiments in micro-G.]*

The FE-2 conducted the periodic (monthly) CSA-CP (Compound Specific Analyzer-Combustion Products) maintenance/checkout, today on all four units. *[The CSA-CP is a passive cabin atmosphere monitor that provides quick response capability during a combustion event (fire). Its collected data are stored on a logger. Garrett checked batteries, then zero-calibrated all instruments (to eliminate drift in the combustion sensors). Following zero calibration, the backup units were stowed in the Node, along with the sampling pump, while the prime unit was deployed at the SM Central Post.]*

Later tonight, Gregory is timelined for ~10 min. for the periodic inspection of the ELPS (Emergency Light Power Supply) in the Columbus module.

Sergey Volkov will conduct the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Oleg Kononenko is scheduled to handle the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew worked out in their regular 2.5-hr. physical exercise protocol (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1).

Later tonight, Chamitoff transfers the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~9:15am, Sergey & Oleg downlinked a PAO TV message of greetings via S- & Ku-band to an International Youth Science School Conference on "Space Exploration: Theory and Practice", held currently (July 5-15) in Moscow at the Bauman MGTU (Moscow State Technological University). *[Today's crew downlink to TsUP Mission Control Center was viewed by International Youth Science School attendees including students from the Swiss Federal Institute of Technology, Lausanne (Switzerland), the Massachusetts Institute of Technology, the Northwestern University (Evanston, USA), the University of Sheffield (Sheffield, UK), Sardar Vallabhbhai National Institute of Technology (Gujarat, India), Aalborg University (Copenhagen, Denmark), and Russian students and professors.]*

At ~5:20pm, Volkov & Kononenko will be performing a video shoot in the ATV1 (Automated Transfer Vehicle 1) "Jules Verne" to be replayed on 7/17 in Paris at a festive event about ATV and ESA's ISS efforts during the top-level HOA (Heads of Space Agencies) meeting. An ISS downlink with a crew address will be scheduled during the event at ~8:00am EDT at ESA Headquarters. *[Shooting suggestions for today have one crewmember shown entering the ATV and conducting a "tour" of the large vehicle, then making presentations of four historic items, namely an original copy of the 19th century of Jules Verne's book "De la Terre à la Lune" (From the Earth to the Moon), a Jules Verne poster showing three small original manuscripts, and a set of two original manuscripts within their protective plastic covers.]*

CMG Testing: At 9:40am-12:40pm EDT today, a CMG steering test was performed by ground commanding. CMGs 1,2 and 3 were tested at five different speeds for each CMG to see if they stay in the steering law. This was an attempt to recreate a problem seen on the last CMG wheel speed test where CMG-3 toggled out of the steering law briefly.

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS On-Orbit Status 07/06/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday -- off-duty for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff. Ahead: Week 12 of Increment 17.*

Crew Sleep Cycle: Wake/sleep cycle remains right-shifted by 3.5 hrs (5:30am - 9:00pm EDT).

Gregory Chamitoff started out on the second part of his Flight Day 30 session with the NASA/JSC experiment NUTRITION w/Repository. This is an all-day session, the second for Greg, of collecting urine samples several times for 24 hrs through first void tomorrow morning. *[The NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by supercold MELFI dewars), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

Oleg Kononenko completed the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The FE-1 also checked up on the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem, gathering weekly data on Total

Operating Time & "On" durations for reporting to TsUP-Moscow.

At ~8:35am EDT, the crewmembers conducted their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

At ~9:30am, Gregory had his weekly PFC (Private Family Conference) via S-band/ audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop).

The crew worked out in their regular 2.5-hr. physical exercise protocol (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1).

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

ISS On-Orbit Status 07/05/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – off duty for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff.*

Crew Sleep Cycle: Wake/sleep cycle remains right-shifted (5:30am - 9:00pm EDT).

Greg Chamitoff had his second session with the NASA/JSC experiment NUTRITION w/Repository, the FD30 session for blood collection only, for which he had to forego exercising and food intake for eight hours. Later today, the FE-2 will also set up the equipment for the 24-hour urine collections which start with the first void early tomorrow morning and continue through Monday morning. *[After performing self-phlebotomy, i.e., drawing blood samples (from an arm vein), the samples were first allowed to coagulate in the Repository for 20-30 minutes, then spun in the HRF RC (Human Research Facility/Refrigerated Centrifuge) and finally placed in MELFI (Minus-Eighty Laboratory Freezer for ISS). No thruster activity was allowed during the blood drawing. The RC was later powered off after a temperature reset to limit wear on the compressor, and cleaned.]*

The crew performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

As part of the house cleaning, the crew also conducted regular maintenance inspection & cleaning on fan grilles in the FGB (TsV2), SM (VPkhO, VPrK, FS5, FS6 & FS9), DC1 (V3) screens and PF1/PF2 dust filters, as well as in the COL (Columbus Orbital Laboratory).

In addition, Volkov temporarily powered down the POTOK air filtration system for the periodic cleaning of its pre-filter, using the vacuum cleaner with narrow-slit nozzle attachment.

Earlier, Sergey serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out"-to-vacuum cycle on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated tonight at ~5:15pm EDT. Filter bed #1 regeneration was performed yesterday.

[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently to remove any lingering Freon-218 from the cabin atmosphere (last time done: 6/19&20).]

Later today, FE-1 Kononenko is scheduled for regular maintenance work on the powered-down Russian SRVK-2M water condensate processor, first replacing its BKO multifiltration column unit with a new BKO spare, then also removing & replacing its life-expired FGS gas-liquid mixture filter with a new one. Both old units are to be discarded

Gregory completed today's routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

For the CDR, it was time again for the recharging of the Motorola Iridium-9505A satellite phone brought up on Soyuz 16S, a monthly routine job and his third time. *[After retrieving it from its location in the TMA-12/16S descent module (BO), Sergey was to initiate the recharging of its lithium-ion battery, monitoring the process every 10-15 minutes as it takes place. Upon completion at ~4:50pm, the phone will be returned inside its SSSP Iridium kit and stowed back in the BO's operational data files (ODF) container. The satphone accompanies returning ISS crews on Soyuz reentry & landing for contingency communications with SAR (Search-and-Rescue) personnel after touchdown (e.g., after an "undershoot" ballistic reentry, as happened during the recent 15S return). The Russian-developed procedure for the monthly recharging has been approved jointly by safety officials. During the procedure, the phone is left in its fire-protective fluoroplastic bag with open flap. The Iridium 9505A satphone uses the Iridium constellation of low-Earth orbit satellites to relay the landed Soyuz capsule's GPS (Global Positioning System) coordinates to helicopter-borne recovery crews. The older Iridium-9505 phones were first put onboard Soyuz in August 2003. The newer 9505A phone, currently in use, delivers 30 hours of standby time and three hours of talk, up from 20 and two hours, respectively, on the older units.]*

The three crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1). Later tonight, Gregory will transfer the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

The Russian crewmembers had their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop), Sergey at ~9:45am EDT, Oleg at ~11:30am.

At ~7:50am, as part of his FD30 NUTRITION w/Repository session today, Gregory held a teleconference with ground specialists at JSC, including the Principal Investigator, Dr. Scott Smith.

At ~8:05am, the three crewmembers tagged up for 90 min with EVA representatives of star City's Cosmonaut Corps to go over the two upcoming Russian spacewalks in careful detail, via S-band during several comm windows.

Weekly Science Update (*Expedition Seventeen -- Week 11*)

3-D SPACE : Second session has been successfully performed by Greg Chamitoff on 6/30, "much faster than the first session".

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): Measurements continue in FGB module. Last memory card exchange was performed on 7/1.

ANITA (Analyzing Interferometer for Ambient Air): Continuing.

BCAT-3 (Binary Colloidal Alloy Test 3): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System): Samples returned on 1J.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): The experiment platform continues to operate nominally. A DHPU (Data Handling Processing Unit) software patch is currently being developed to fix the link error issues encountered with DEBIE-2 and FIPEX instruments. - DEBIE-2: Link error still in work. However a work-around allows for regular science data acquisition using an on-board IOP (Instrument Operations Procedure), but not yet in conjunction with any FIPEX IOP – a final software patch, which will enhance the present instrument capabilities, is under finalization on ground; - DOSTEL: On-going science acquisition; - EuTEMP: Currently inactive as planned; - EVC: Several successful ground commanded runs. Some nice pictures of Earth at sunset and sunset could be obtained. In full Sun illumination, the EVC sensor seems to saturate and consequently the picture quality is not optimum; - EXPOSE: On-going science acquisition; - FIPEX: Science script was running nominally until 6/28, when a sudden sensor switch off was encountered. It is a known problem, under assessment. Currently up and running; - MEDET: Some commandings were performed to adjust the frequency of acquisition of the microcalorimeter. Continuously acquiring science data; - PLEGPAY: currently in READY mode, no science data acquisition on-going; - TRIBOLAB: The Ball-Bearing experiment 1/2/3 which is running since 6/16 has been paused during the EUTEF power-down on 6/21 and has been resumed since. On 6/25, the experiment went suddenly to Non-Nominal Mode, after some higher than expected currents have been measured with the motor. On 6/30, the instrument was put in Thermal Stabilization Mode, and the Ball-Bearing experiment 1/2/3 was restarted on 7/1. This experiment run is expected to last until Week #14.

FSL (Fluid Science Laboratory): FSL is back and running. Further FSL commissioning activities remain to be done.

GEOFLOW: A long and complex mechanical procedure which aimed at replacing the lamp of the CEM (Central Experiment Module)-Upper Drawer has been successfully completed by Greg on 7/1. The next day, ground teams in Europe activated the FSL Rack and successfully completed a significant number of the check-out steps. That means that FSL is back and running. The start of GEOFLOW is pending further FSL remaining commissioning activities (FSL RIC and FSL VMU software upgrades, check of FSL optical modes). In the near future, the crew will swap the optical target, stand-by until further optical modes checks, and then will be able to insert the GEOFLOW Experiment Container. "...we are a significant step closer to GEOFLOW start. Thanks a lot for the great job on-orbit!"

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Planned.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer, ESA): Measurements are currently planned before and after the Russian EVA-20 on 7/10 for the two Russian cosmonauts.

NUTRITION w/REPOSITORY: In progress.

PADLES (Passive Dosimeter for Lifescience Experiment in Space): In progress.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems):

Ongoing.

SAMPLE: Complete.

SHERE (Shear History Extensional Rheology Experiment): SHERE was successfully installed into the MSG (Microgravity Science Glovebox) on 6/29.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): In progress.

SOLAR (Solar Monitoring Observatory): LAN (Local Areas Network) connectivity with SOLAR has been lost since 6/25. SOLAR is currently powered via the feeder #2 (survival) only and all instruments are off. Troubleshooting plan has been worked out this week and the next steps would require crew support to diagnose the connectivity between Columbus and SOLAR, making use of the ESA Multi-Purpose Laptop. Unfortunately most of the on-going Sun observation period data acquisition has been lost, which ends on 7/7. - SOVIM: Instrument switched off pending above issue; - SOLSPEC: Instrument switched off pending above issue; - SOLACES: Instrument switched off pending above issue.

SOLO: Planned.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): The four ECs (Experiment Containers) of Rotor B are yet to be retrieved by the crew from the blocked Rotor B. BIOLAB could not be activated from ground yet, pending resolution of the Smoke Detector issue. A troubleshooting plan has been developed to recover all the BIOLAB functionalities. The remaining WAICO-#1 ECs will be disposed and replaced by six Reference ECs on Rotor B.

CEO (Crew Earth Observations): Continuing.

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

07/10/08 -- Russian EVA-20A (2:18pm)
07/15/08 -- Russian EVA-20 (1:14pm)
07/23/08 -- ATV1 reboost (tent.)
09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/observation)
09/09/08 -- Progress M-64/29P undocking, from FGB nadir (may move to 8/30)
09/10/08 -- Progress M-65/30P launch
09/12/08 -- Progress M-65/30P docking (SM aft port)
10/01/08 -- **NASA 50 Years**
10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
1QTR CY09 -- STS-119/Discovery/15A launch – S6 truss segment
03/25/09 -- Soyuz TMA-14/18S launch
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osp/iss_reports/index.htm

ISS On-Orbit Status 07/04/08

All ISS systems continue to function nominally, except those noted previously or below. *Independence Day* holiday for the US of A, but a full workday for the crew.

Crew Sleep Cycle: Wake/sleep cycle remains right-shifted (5:30am - 9:00pm EDT).

Continuing preparations for the two upcoming Orlan EVAs, CDR Volkov & FE-2 Chamitoff held another 3-hr. training session in Soyuz TMA-12 to familiarize the American FE-2 with spacecraft ops during his isolation in the Descent Module (SA) during the EVAs. FE-1 Kononenko joined in the drill for some time. *[With Sergey supervising, Gregory's hands-on training focused on equipment familiarization, working with Soyuz communications facilities, monitoring & interfacing with the Soyuz Neptun-ME console displays & controls, reviewing his tasks during his stay in the SA, assisting the CDR & FE-1 with leak checking, pressure equalization between Orbital Module (BO) and SA, BO/SA hatch opening, Orlan suit doffing if required, etc.]*

After deferral of yesterday's MELFI (Minus Eighty Degree Laboratory Freezer for the ISS) activity, Chamitoff today worked on the sample rearrangements in the Brayton-cycle freezer, swapping the latest blood and urine samples in their box modules between two dewars of different temperature, started on 7/2. *[Sample vials, separated in bags, were swapped between Dewars 2 & 3 and Dewars 1 & 2.*

Rationale: The uncrewed station configuration during the upcoming Russian spacewalks will require MELFI being powered off for an extended period. Gregory's current configuration changes between dewars are intended to provide best possible protection of the science samples contained in them. Toward this aim, Greg is packing as much thermal mass ("coldness") into Dewar 2 to maximize the cold volume hold time.]

The CDR performed the periodic service of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on

absorbent bed #1 of the regenerable dual-channel filtration system. The process will be terminated around sleeptime, at ~8:45pm EDT. Bed #2 regeneration follows tomorrow. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently to remove any lingering Freon-218 from the cabin atmosphere (last time: 6/23&24).]*

With the ATV WDS (Automated Transfer Vehicle/Water Delivery System) tanks emptied of their water contents, Oleg Kononenko set up the hose & electric pump assembly and initiated (later closed out) transfer of urine from four EDV-U containers in the Service Module (SM) to ATV WDS tank #2. *[The setup was then torn down and the hose capped and stowed in its KBO-M bag for future ATV urine transfers, with the IMS (Inventory Management System) updated accordingly.]*

After the recent upload by the Tsukuba JFCT (Japanese Flight Control Team) of a new database file to the Kibo JEMRMS (Japanese Experiment Module/Robotic Maneuvering System) console, Gregory Chamitoff today briefly activated, then deactivated the RTL (RMS Laptop) to enable/initialize the database.

The FE-2 also completed the T+2 in-flight microbiology analysis of "Week 11" potable water samples collected by him in MCDs (Microbial Capture Devices) and set up for incubation on 7/2. *[The water samples were taken from the SM SRV-K (Service Module/Condensate Water Processor) Hot and Warm water taps. Two 750 mL samples from the three ports (SRV-K Hot + Warm, plus SVO-ZV) will return on Flight STS-126/ULF2 for postflight chemical analysis.]*

Chamitoff then took measurements for the regular atmospheric status check for ppCO₂ (Carbon Dioxide partial pressure) in the Lab, SM (at panel 449) and COL (Columbus Orbital Laboratory), using the hand-held CDMK (CO₂ Monitoring Kit, #1002). *[The battery pack is to be replaced with the one from unit #1009 if necessary.]*

Greg also conducted the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling a CWC (Contingency Water Container, #1054) with the collected water slated for processing. No samples were required. *[Estimated offload time before reaching the tank's neutral point (leaving ~6 kg in the tank): ~30 min. Condensate collection continues to be performed by the CCAA while the Russian SKV-2 air conditioner is off, awaiting its overdue Khladon (Freon-218) refill. SKV-1 has been nonfunctional for a long time.]*

Sergey Volkov performed the regular bi-monthly reboot of the OCA Router and File Server SSC (Station Support Computer) laptops.

Later, Greg will do the periodic battery check and reboot of the COL PWS (Columbus Orbital Laboratory/Portable Workstation) laptop, a monthly activity.

Today's mated Soyuz 16S thruster firing test was scheduled at 1:38pm-1:55pm EDT. After attitude handover to the Russian MCS (motion control system) at 1:30pm, the ISS goes briefly into free drift for the standard pre-undock hot fire test of the Soyuz KDU Combined Propulsion System. Attitude authority was to return to USOS momentum management at 3:14pm. *[For the test, the Lab window shutters were closed for protection by Greg at 8:40am, the ISS audio remained configured for the crew's entry into the Soyuz, the solar arrays were feathered to mitigate structural loads and contamination issues, and certain electrical loads were powered down due to the decreased power availability. All systems were to be returned to nominal configurations after the test.]*

To prepare for the eventuality that the Progress TM-64/29P cargo ship needs to be undocked from the FGB nadir port to allow repositioning the Soyuz 16S spacecraft in case of a contingency after the upcoming Orlan EVAs, FE-1 Kononenko dismantled and removed electronic equipment from the ship, to be recycled, specifically the US-21 matching unit, the cargo ship's LKT local temperature sensor commutator (TA251MB) of the BITS2-12 and its PZU-1M ROM (read-only memory) unit. These devices will be re-installed if the crew ingress after EVA-20A & EVA-20 is nominal. *[When a Progress is undocked and jettisoned, the valuable electronics are retained, to be recycled on a future vehicle.]*

Continuing preparations for Progress 29P undocking, Kononenko & Volkov then installed the StM Docking Mechanism between Progress and the FGB. *[StM is the "classic" probe-and-cone type, consisting of an active docking assembly (ASA) with a probe (SSh), which fits into the cone (SK) on the passive docking assembly (PSA) for initial soft dock and subsequent retraction to hard dock. The ASA is mounted on the Progress' cargo module (GrO), while the PSA sits on the docking ports of the SM, FGB and DC1.]*

Later in the day, after activating the 29P, Oleg will disassemble the air duct in the hatchway to the FGB, remove the threaded quick-disconnect (QD) screw clamps of the FGB docking & internal transfer system (SSVP), which has rigidized the mating surfaces, closes hatches between 29P & the FGB and performs the standard one-hour leak check of the vestibule to verify hermeticity.

Before sleeptime tonight, Chamitoff is to set up NASA's NUTRITION/Repository experiment hardware for his second session scheduled tomorrow. For the phlebotomy (blood sample draw), Greg has to start fasting 8 hrs before, i.e., tonight, with only water consumption allowed. *[The NUTRITION project is the most*

comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by supercold MELFI dewars), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]

Sergey Volkov completed today's routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

The three crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1). Later, Gregory was to transfer the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~7:55am EDT, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU/*Glavnaya operativnaya gruppа upravleniya* = "Main Operative Control Group"), including Shift Flight Director (SRP), at TsUP-Moscow via S-band/audio, phone-patched from Houston and Moscow.

At ~12:23pm, Chamitoff powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply) and at 12:28pm conducted a ham radio exchange with the Round Rock Scout Pack #304 and Blackland Prairie Elementary School, Round Rock, TX. *[Cub Scout Pack 304 consists of about 50 boys, most of whom are students at Blackland Prairie Elementary School in Round Rock, Texas. The pack and the school are participating in this contact as a joint educational project. The project reinforces what the Cubs have been learning in their Science class, and enables them to earn some of the requirements for their "Scientist" activity badge in Scouting. The Cub's radio station has been set up at the school. Questions to Greg were uplinked beforehand. "Were you afraid to travel into space?"; "How do you sleep onboard the Space Station with no gravity?"; "Would you go to the moon if you had the opportunity?"; "Are you weightless all the time in the Space Station?"; "How much training is required to be an astronaut?"; "How does it feel to be so far away from Earth?"; "Do you think there is intelligent alien life, and if so, why?"; "What school subjects helped you most in becoming an astronaut?"; "What do you do in your*

spare time in space?"; "What suggestions do you have for kids as they prepare for the future?"; "What impact will the shuttle missions have on future space missions?"; "How do you get privacy on the Space Station?"]

WRM Update: A corrected Water Recovery Management "cue card" was uplinked overnight for the crew's reference in lieu of yesterday's uplink. [The new card (17-0002Q) lists 35 CWCs (Contingency Water Containers, ~1365.2 L total) for the four types of water identified on board: technical water (650.6 L, for Elektron, flushing, hygiene, incl. 509.4 L non-usable water because of Wautersia bacteria), potable water (706.7 L, incl. 260.6 L currently on hold), condensate water (4.9 L), waste/ EMU dump and other (7.9 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]

*CEO (Crew Earth Observations) photo targets uplinked for today were **Congo River headwaters** (Dynamic event. Cloudiness over equatorial Africa is so pervasive that the Congo basin is seldom photographed. Clearer skies are forecast: Greg was to look right for oblique views of the southern basin and its major rivers. Lake Tanganyika at nadir), and **Big Sur fires**, California (Dynamic event. Overnight on Tuesday July 1, fires near Big Sur unexpectedly strengthened, and residents are now evacuating. Extensive yellow-brown smoke plumes should be visible left of track. Forecast is for partly cloudy weather. "Statewide, more than 19,000 firefighters and other workers have been fighting fires since June 20, when a line of storms and lightning sparked hundreds of blazes across the northern and central parts of the state.")*

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (as of this morning, 9:14am EDT [= epoch]):

Mean altitude -- 344.8 km

Apogee height -- 350.6 km

Perigee height -- 339.0 km

Period -- 91.43 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0008601

Solar Beta Angle -- 10.3 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.75

Mean altitude loss in the last 24 hours -- 22 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55126

Significant Events Ahead (all dates Eastern Time, some changes possible.):

07/10/08 -- Russian EVA-20A (2:18pm)
07/15/08 -- Russian EVA-20 (1:14pm)
07/23/08 -- ATV1 reboost (tent.)
09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/ observation)
09/09/08 -- Progress M-64/29P undocking, from FGB nadir (may move to 8/30)
09/10/08 -- Progress M-65/30P launch
09/12/08 -- Progress M-65/30P docking (SM aft port)
10/01/08 -- **NASA 50 Years**
10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
1QTR CY09 -- STS-119/Discovery/15A launch – S6 truss segment
03/25/09 -- Soyuz TMA-14/18S launch
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at

ISS On-Orbit Status 07/03/08

All ISS systems continue to function nominally, except those noted previously or below.

Crew Sleep Cycle: Wake/sleep cycle remains right-shifted (5:30am - 9:00pm EDT).

Continuing preparations for the two upcoming Orlan EVAs, CDR Volkov & FE-2 Chamitoff began their day with a 3-hr. training session in Soyuz TMA-12 to familiarize Gregory with spacecraft ops during his isolation in the Descent Module (SA) during the EVAs. *[With Sergey supervising, Gregory's hands-on training focused on equipment familiarization, working with Soyuz communications facilities, monitoring & interfacing with the Soyuz Neptun-ME console displays & controls, reviewing his tasks during his stay in the SA, assisting the CDR & FE-1 with leak checking, pressure equalization between Orbital Module (BO) and SA, BO/SA hatch opening, Orlan suit doffing if required, etc.]*

Afterwards, Chamitoff & FE-1 Kononenko worked in the US Airlock (A/L) on EMU (Extravehicular Mobility Unit) #3004 to disconnect and remove its power harness for its subsequent use on an Orlan-M suit for EVA-20A. *[The electrical harness, which normally powers the glove heaters and the EMU TV, is going to be used, along with a US REBA (Rechargeable EVA Battery Assembly), on Orlan #26 to provide real-time EVA video coverage via the US EMU TV and helmet lights. The harness will be installed on Orlan #26 next week during the EVA Dry-Run. EMU #3004 is not planned for use during Increment 17, 18, or ULF2 and will be brought home on 15A.]*

Afterwards, Kononenko continued previously started work on Orlan #26, equipping it up with the electrical cable to provide power from the REBA to the US wireless TV ERCA (EMU RF Camera Assembly) in the BRTA-1M telemetry systems unit installed earlier (6/27).

Later, the crew conducted a 1.5-hr review of the airlock procedures for DC1 Docking Compartment egress/ingress, supported with ground specialist tagup via S-band. FE-2 Chamitoff also tagged up with EVA specialists at MCC-H to discuss his support activities.

As part of their standard fitness evaluation, Kononenko & Volkov undertook another session with the Russian MO-5 MedOps protocol of Cardiovascular Evaluation during Graded Exercises on the VELO cycle ergometer, assisting each other as CMO (Crew Medical Officer). (Last time done: 5/21). *[The 50-min assessment, supported by ground specialist tagup via VHF and telemetry monitoring, uses the Gamma-1 ECG equipment with biomed harness, skin electrodes and a blood pressure and rheoplethysmograph cuff wired to the cycle ergometer's instrumentation panels. For the graded exercise, the subject works the pedals after a prescribed program at load settings of 125, 150, and 175 watts for three minutes each. Data output involves a kinetocardiogram, rheoplethysmogram, rheoencephalogram and a temporal pulsogram.]*

Chamitoff did another sample rearrangement in the MELFI (Minus Eighty Degree Laboratory Freezer for the ISS), swapping the latest blood and urine samples in their box modules between two dewars of different temperature, started yesterday. *[Today, sample vials (separated in 6 bags) were swapped between Dewar 2 and Dewar 3. Rationale: The uncrewed station configuration during the upcoming Russian spacewalks will require MELFI being powered off for an extended period. Gregory's current configuration changes between dewars are intended to provide best possible protection of the science samples contained in them. Toward this aim, Greg is packing as much thermal mass ("coldness") into Dewar 2 to maximize the cold volume hold time.]*

In the FGB, after having set up the Matryoshka-R (RBO-3-2) radiation payload on 7/1 with a new memory card (#950), the FE-1 today checked the contents of the new card for temperature, quantity and total file size, prepared all data for downlink and reinstalled the ALC-950 PCMCIA (Portable Computer Memory Card International Adapter) card in the Spectrometer. *[RBO-3-2 is using the ESA/RSC-Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS/ALC) with its Spectrometer (AST) and ALC equipment, temporarily located in the FGB on panel 429 (normally in DC1).]*

With the TVIS treadmill roller bearings approaching their end-of-life, the FE-2 spent a few minutes on the weekly inspection of the rollers, checking the treadmill's belt both left and right for any noticeable depressions due to seized or worn rollers.

The FE-1 completed the periodic (about twice a month) replenishing of the Elektron oxygen generator's water supply for electrolysis, filling the KOV EDV container with

water transferred on 6/30 from the ATV WDS (Water Delivery System) tank 1 to an empty EDV. *[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]*

Oleg also conducted today's routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Later, working from the Russian discretionary "time permitting" task list, Kononenko completed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The three crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (FE-2), and VELO bike with bungee cord load trainer (CDR/MO-5, FE-1/MO-5). Before sleeptime tonight, Oleg is to transfer the exercise data file to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~1:35pm EDT, the CDR and both FEs participated in a seven-minute live televised PAO interview event with KGPE-TV (Mike Scott) in Fresno, CA.

At ~3:25pm, the ISS crew is scheduled for their regular weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. *[Private S/G-2 (Space-to-Ground 2) phone patch via SSC (Station Support Computer)].*

A new task added to Gregory Chamitoff's voluntary "job jar" is the transfer of hardware (ESA payload spares) from ATV to COL (Columbus Orbital Laboratory) and to unpack/rearrange/stow the CTBs (Cargo Transfer Bags) in the Columbus MSSP (Mobile System Stowage) & FSSP (Fixed System Stowage) Provisions or in other CTBs.

WRM Update: An updated Water Recovery Management "cue card" was uplinked overnight for the crew's reference. *[The new card (17-0002P) lists 35 CWCs (Contingency Water Containers, ~1365.2 L total) for the four types of water identified on board: technical water (650.6 L, for Elektron, flushing, hygiene, incl. 509.4 L non-usable water because of Wautersia bacteria), potable water (706.7 L, incl. 260.6 L currently on hold), condensate water (4.9 L), waste/EMU dump and other (7.9 L).*

Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]

FSL Troubleshooting Update: On 7/1, during his troubleshooting of the Fluid Science Laboratory in ESA's Columbus module, Chamitoff replaced the halogen lamp that appeared to be malfunctioning in the FSL CEM (Central Experiment Module). Yesterday, FSL rack checkouts by ground teams at COL-CC/Oberpfaffenhofen showed that Greg's work was successful and the FSL is fully functional. Further FSL commissioning is required prior to starting Geoflow payload operation, but Geoflow can be installed.

Russian TVM Issue: As reported by Moscow, Lane 3 of the Russian Terminal Computer (TVM) system is showing off-nominal performance. Under investigation.

EVA-20A Timeline Preview: Orlan EVA-20a by Volkov/EV1 & Kononenko/EV2 is scheduled to begin at on 7/10 ~2:18pm EDT (DC1 EV hatch open), to last an estimated 6 hrs. During the spacewalk, EV2 will be riding on the DC1-based Strela 1 crane, operated via hand crank by EV1, who will then join EV2. Main objective is the inspection of the Soyuz TMA-12 spacecraft at its first separation plane (Plane I) followed by removal of one pyrobolt for return to Earth. Before removing the separation bolt, EV2 will install temporary protective covers on the spacecraft's DPO attitude control thrusters, open up the MLI (Multi-Layer Insulation), demate the pyrobolt's electrical connector and cut the wiretie between the pyrobolts. MLI will then be reattached and the covers removed again. If enough time remains after the Soyuz activity, the spacewalkers will also install a docking target (for the new MLM/Multipurpose Laboratory Module) in the SM PkhO (Transfer Compartment) area for zenith port docking. *[Background: Before their separation, Descent Module (SA) & Instrumentation Compartment (AO) are connected by five locks, each "zamok" containing two pyrobolts with individual electrical connection, of which only one needs to fire to release the lock. The locks are equally spaced around the 360-degree circumference of the separation plane, i.e., 72 deg apart. After the five locks have released, five pushers, also equally spaced, separate the two modules by pre-loaded spring force. Each lock and pusher is located at the apex (node) of two triangularly arranged aluminum pipes, i.e., altogether 20 inclined pipes, which make up the open truss structure between the modules.]*

EVA-20 Timeline Preview (preliminary): Orlan EVA-20 by Volkov & Kononenko is scheduled to begin on 7/15 at ~1:14m EDT (DC1 EV hatch open), to last an estimated 5 hrs 30 min. Part of the EVA will be supported by the DC1-based Strela 1 crane, operated via hand crank. Main objectives of EVA-20 are –

- Closeout ops on Soyuz TMA-12 Plane I inspection/pyrobolt removal (if not completed during EVA-20A);
- Installation of a new docking target on SM PkhO (Transfer Compartment)

for zenith port docking of the MLM (if not completed during EVA-20A);

- Post-installation photography of the new docking target;
- Inspection of mounting holes for an adapter of a Kurs antenna (4AO-VKA) on PkhO-RO (SM Working Compartment, small diameter section) for MLM;
- Transferring one “Yakor” foot restraint (of two) from the DC1 EVA ladder to the SM and installing it in an attachment socket at a PkhO handrail (two Yakors were installed on DC1 ladder during EVA-17A on 2/22/07);
- Installing the VSPLESK (“Burst”) science payload on a handrail at SM RO (large diameter section); and
- Removing the BIORISK-MSN (BIO-2) experiment container 1 (of three) from the DC1 for return to the station (BIORISK-MSN, with three containers, was installed during EVA-19 on 6/6/07).

Uncrewed Station Ops Planning: One of the contingencies associated with the Orlan EVA-20A next week (and EVA-20 on 7/15) could require uncrewed station operation for some time. As per IMMT (ISS Mission Management Team) decision this morning, SM-to-ATV hatches are to remain open during this period (to be reassessed for EVA-20). ATV batteries are non-rechargeable, thus, time for ATV to be on independent power is very limited. Most of the USOS preparations for the uncrewed period will be done by Gregory Chamitoff next Wednesday (7/9), such as transferring selected hardware to the RS (Russian Segment), setting up a PCS (Portable Computer System) laptop in the FGB as backup to the PCS in the RS, powering down ham/amateur radio equipment, reconfiguring some LAN software (NetMeeting, KFX), powering down the COL PWS (Columbus Orbital Laboratory Portable Workstation) laptop, and closing selected hatches. On 7/10, the IATCS (Internal Thermal Control System) will be configured as usual for uncrewed ops, some racks will be jumpered to the LTL (Low Temperature Loop) in case they need cooling, and some remaining hatches will be closed, before Gregory moves to the Soyuz Descent Module (SA) and closes the hatch between it and the Orbital Module (BO).

CEO (Crew Earth Observations) photo targets uplinked for today were **Mt.**

Kilimanjaro, Kenya (*this famous peak, at 19,340 feet, is Africa’s highest mountain and is located in northeastern Tanzania near the border with Kenya. CEO specialists are monitoring the tiny ice fields near the summit that have noticeably diminished during the twentieth century. On this pass, just after midday local time, there may have been low clouds in the surrounding plains as ISS approached the area from the NW. Looking well right of track for the high volcanic crater with patches of ice and snow and using the long lens settings for detail*), **S.**

Mozambique (*the southern portion of this African nation is undergoing rapid land use change as mineral exploration is driving the construction of new infrastructure. This ISS fair-weather pass in mid-afternoon offered the opportunity to acquire good*

baseline, contextual views of the southwestern part the target area. There are very few strong visual cues for this area, so as ISS approached the target area from the NW and left the mountain regions of South Africa, Greg was to try for near nadir views in the plains until reaching the coast, then map the coastal area), and
Georgia Coastal Ecosystems *(the coastal wetlands and barrier islands of Georgia are designated a Long Term Ecological Research [LTER] site. ISS had a fine nadir pass over this target in fair weather conditions, just before noon local time. As the station approached from the NW, the FE-2 was to use the long lens setting to map, in detail, the coastal features northward from the urban areas of Jacksonville, Florida).*

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 9:01am EDT [= epoch]):*

Mean altitude -- 344.8 km

Apogee height -- 350.5 km

Perigee height -- 339.1 km

Period -- 91.43 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0008498

Solar Beta Angle -- 5.9 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.75

Mean altitude loss in the last 24 hours -- 48 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55110

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

07/10/08 -- Russian EVA-20A (2:18pm)

07/15/08 -- Russian EVA-20 (1:14pm)

07/23/08 -- ATV1 reboost (tent.)

09/05/08 -- ATV1 undocking, from SM aft port (loiter until ~9/25 for nighttime reentry/observation)

09/09/08 -- Progress M-64/29P undocking, from FGB nadir (may move to 8/30)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (SM aft port)

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (FGB nadir port)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)

11/10/08 -- STS-126/Endeavour/ULF2 launch -- MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
1QTR CY09 -- STS-119/Discovery/15A launch – S6 truss segment
03/25/09 -- Soyuz TMA-14/18S launch
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 07/02/08

All ISS systems continue to function nominally, except those noted previously or below.

Crew Sleep Cycle: Wake/sleep cycle remains right-shifted (5:30am - 9:00pm EDT).

Continuing preparations for the two upcoming Russian Orlan EVAs, CDR Volkov & FE-1 Kononenko today focused on the second spacewalk, EVA-20, starting out with a three-hour review of familiarization material, watching a training video, and studying the preliminary EVA timeline (details, see below).

Later, Volkov gathered equipment and tools for EVA-20, going by an uplinked search list and supported by ground specialist tagup. *[Besides two well-stocked tool kits, EVA-20 equipment includes the new VSPLESK ("Burst) science payload, a container for the BIORISK-MSN payload and a mounting platform.]*

After configuring STTS communication/telemetry links for their stay in the DC1 Docking Compartment, Volkov & Kononenko then –

- Readied hardware and tools for the first spacewalk, EVA-20A,
- Reviewed staging procedures & photography requirements for the docking target installation, "Yakor" foot restraint transfer, and inspection of mounting holes for the Kurs antenna,
- Performed a pressure check on the supplementary BNP portable air repress bottle in the SM PkhO (Service Module Transfer Compartment),
- Updated the airlock depress/repress cue cards in the DC1 "Pirs", and
- Restored nominal STTS comm settings in the DC1.

FE-2 Chamitoff continued checking out JEM (Japanese Experiment Module) "Kibo" payload systems, today working on the JCGSE (JEM Common Gas Support Equipment), with the Ar (Argon) gas supply from the Ar GBUs (Gas Bottle Units)

opened to take pressure readings for leak checking. *[Checkout activities included accessing and setting the JEM HRMS (High Rate Data Multiplexer & Switcher), after configuring cable connections to the HRMS patch panel. After the checkout, the Ar gas supply was stopped and the HRMS access door closed again.]*

Chamitoff also conducted “Week 11” sampling of potable water for chemical and microbial analysis from the SVO-ZV tap and two SRV-K taps, the latter after preliminary heating of the water (three heating cycles) and flushing. *[Gregory collected three 225 mL samples (for inflight microbial analysis) and two 750 mL samples (for postflight chemical analysis) from each of three ports (SRV-K hot, SRV-K warm, SVO-ZV) for return on STS-126/ULF2.]*

Later, the FE-2 performed the in-flight microbial analysis using the WMK (Water Microbiology Kit) and its MCDs (Microbial Capture Devices) with Coliform Detection Bags. The small amounts of flush and leftover water in the 50 mL waste water & micro sample in-flight analysis bags were reclaimed for use. *[Coliform bacteria are the commonly-used bacterial indicator of sanitary quality of foods and water. They are defined as rod-shaped “gram-negative” non-spore forming organisms that ferment lactose with the production of acid and gas when incubated at 35-37 degC.]*

Gregory also conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WRM (Water Recovery & Management) assessment of onboard water supplies. *[Updated “cue cards” based on the crew’s water calldowns are sent up every other week. The current card (17-0002O) lists 36 CWCs (~1365.2 L total) for the four types of water identified on board: technical water (650.6 L, for Elektron, flushing, hygiene, incl. 509.4 L non-usable water because of Wautersia bacteria), potable water (706.7 L, incl. 260.6 L currently on hold), condensate water (0 L), waste/EMU dump and other (7.9 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]*

Oleg Kononenko took the periodic readings of potentially harmful atmospheric contaminants in the SM, using the CMS (Countermeasure System), a component of the GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, which uses preprogrammed microchips to measure H₂CO (Formaldehyde, methanal), CO (Carbon Monoxide) and NH₃ (Ammonia), taking one measurement per microchip. Today’s measurements also looked for O₃ (Ozone), C₆H₆ (Benzene) and NO₂ (Nitrogen Dioxide), using special chips. *[CMS is a subsystem of the Russian SKDS Pressure Control & Atmosphere Monitoring System.]*

Later tonight, Sergey Volkov is scheduled to perform monthly maintenance on the

deactivated Russian IK0501 GA (Gas Analyzer) of the SOGS Pressure Control & Atmospheric Monitoring System by replacing its CO₂ filter assembly (BF) with a new unit from FGB stowage (done last: 5/22), then reactivating the unit.

Kononenko has another 30 min. set aside to continue relocating and loading common trash into the ATV1 (Automated Transfer Vehicle) "Jules Verne", based on an uplinked checklist for discarded cargo.

The FE-1 conducted today's routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

The CDR completed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Greg rearranged samples in the MELFI (Minus Eighty Degree Laboratory Freezer for the ISS), relocating the latest blood and urine samples from their current box module in a dewar to another box module in a different dewar. *[Sample vials (separated in bags) were transferred from Dewar 3 to Dewar 2 and from Dewar 1 to Dewar 2.]*

The three crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1). Later tonight, Kononenko transfers the exercise data file to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Progress M-64/29P Line Purging: Two Progress 29P prop line purges are scheduled tonight at ~6:50pm and ~8:30pm. ISS attitude control authority will be handed over from US CMG momentum management to Russian MCS (Motion Control System) thrusters at 6:35pm for the subsequent maneuvers to the line purge attitude (yaw/pitch/roll: 0.0/340.0/0.0). Return to LVLH TEA (Local Vertical/Local Horizontal Torque Equilibrium Attitude) follows at ~9:00pm and control handover back to US momentum management at ~10:40pm. For the propellant venting, the protective Lab science window shutters will be closed by Gregory at ~6:00pm and not opened until about 1:40am.

EVA-20 Timeline Preview (preliminary): The Orlan EVA-20 by Volkov (EV1) & Kononenko (EV2) on 7/15 is scheduled to begin at ~1:14m EDT (DC1 EV hatch open), to last an estimated 5 hrs 30 min, i.e., concluding at approximately 6:44pm. Part of the EVA will be supported by the DC1-based Strela 1 crane, operated via hand crank. Main objectives of the Russian spacewalk are –

- Closeout ops on Soyuz TMA-12 Plane I inspection/pyrobolt removal (if not completed during EVA-20A);
- Installation of a new docking target on SM PkhO (Transfer Compartment), Plane IV, for MLM (if not completed during EVA-20A);
- Post-installation photography of the new docking target;
- Inspection of mounting holes for an adapter of a Kurs antenna (4AO-VKA) on PkhO-RO (SM Working Compartment, small diameter section);
- Transferring one “Yakor” foot restraint (of two) from the DC1 EVA ladder to the SM and installing it in an attachment socket at a PkhO handrail (two Yakors were installed on DC1 ladder during EVA-17A on 2/22/07);
- Installing the VSPLESK (“Burst”) science payload on the SM RO (large diameter section); and
- Removing the BIORISK-MSN (BIO-2) experiment container 1 from the DC1 for return to the station (BIORISK-MSN #1 was installed with two other BIO-2 containers during EVA-19 on 6/6/07).

Uncrewed Station Ops Preview: One of the contingencies associated with the Orlan EVA-20A next week (and EVA-20 on 7/15) could require uncrewed station operation for some time. Most of the US Segment preparations for this eventuality will be done by Gregory Chamitoff next Wednesday (7/9), such as transferring selected hardware to the RS (Russian Segment), setting up a PCS (Portable Computer System) laptop in the FGB as backup to the PCS in the RS, powering down ham/amateur radio equipment, reconfiguring some LAN software (NetMeeting, KFX), powering down the COL PWS (Columbus Orbital Laboratory Portable Workstation) laptop, and closing selected hatches. On 7/10, the IATCS (Internal Thermal Control System) will be configured as usual for uncrewed ops, some racks will be jumpered to the LTL (Low Temperature Loop) in case they need cooling, and some remaining hatches will be closed, before Gregory moves to the Soyuz Descent Module (SA) and closes the hatch between it and the Orbital Module (BO).

CEO (Crew Earth Observations) photo targets uplinked for today were **Mt. Etna** (*this famous European Volcano is located in the eastern part of the island of Sicily. As ISS approached the island from the NW. Greg was to begin looking for the volcano to the E and try for detailed views of the eastern slopes of the volcano between the summit and the coast*), **Red River Basin, TX** (*the Red River is a major tributary of the Mississippi River that also forms the border between the states of*

*Texas and Oklahoma. The basin area north of the Dallas-Fort Worth area is primarily an agricultural region that is changing under increasing urban development. As the station approached this area from the NW near midday, Greg was to look for the W-to-E meandering flow of the river and map the area west of the man-made Lake Texoma), and **Santa Barbara Coast, California** (the coastal area near Santa Barbara, California has been designated as a Long Term Ecological Research [LTER] site. On this pass as ISS approached the coast from the NW, looking just left of track and trying for a detailed mapping strip of the coastal range known as the Santa Inez Mountains from Point Conception to just north of the city of Santa Barbara).*

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 8:39am EDT [= epoch]):*

Mean altitude -- 344.8 km

Apogee height -- 350.6 km

Perigee height -- 339.1 km

Period -- 91.43 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0008523

Solar Beta Angle -- 1.6 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.75

Mean altitude loss in the last 24 hours -- 58 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55094

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

07/10/08 -- Russian EVA-20A (2:18pm)

07/15/08 -- Russian EVA-20 (1:14pm)

07/18/08 -- ATV1 reboost (tent.)

09/05/08 -- ATV1 undocking, from SM aft port (may move to 9/25)

09/09/08 -- Progress M-64/29P undocking, from FGB nadir (may move to 8/30)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)

11/03/08 -- Soyuz TMA-13/17S relocation

11/10/08 -- STS-126/Endeavour/ULF2 launch -- MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
1QTR CY09 -- STS-119/Discovery/15A launch – S6 truss segment
03/25/09 -- Soyuz TMA-14/18S launch
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 07/01/08

All ISS systems continue to function nominally, except those noted previously or below. >>>Today 46 years ago (7/1/62), Cape Canaveral, FL was established as NASA's Launch Operations Center, under its first director, Dr. Kurt Debus.<<<

Crew Sleep Cycle: Wake/sleep cycle remains right-shifted (5:30am - 9:00pm EDT).

As part of the crew's regular morning inspection tour, FE-1 Kononenko began his workday with the routine checkup of DC1 (Docking Compartment) circuit breakers and fuses. *[The monthly checkup in the "Pirs" module looks at AZS circuit breakers on the BVP Amp Switch Panel (they should all be On) and the LEDs (light-emitting diodes) of 14 fuses in fuse panels BPP-30 & BPP-36.]*

After resetting STTS communication/telemetry links for their stay in the DC1, Volkov & Kononenko continued preparations for the Orlan EVA-20A on 7/10. Today's focus, supported by ground specialist tagup, dealt with –

1. Configuring an onboard mockup of one of the 10 triangular truss segments between the Soyuz Descent Module (SA) and Instrumentation Compartment (AO) which are holding the twin pyrobolt-equipped locks and pushers for the module separation, and
2. Working with various devices and tools on the mockup to try out and rehearse the removal of a pyrobolt during the EVA-20A. *[Background: Main objective of the spacewalk is the inspection of the Soyuz TMA-12 spacecraft at its first separation plane (Plane I) and the removal of one pyrobolt for return to Earth. Before their separation during entry, SA & AO are connected by five locks, each "zamok" containing two pyrobolts (explosive bolts) with individual electrical connection, of which only one needs to fire to release the lock. The locks are equally spaced around the 360-degree circumference of the separation plane, i.e., 72 deg apart. After the five locks have released, five spring-loaded pushers, also equally spaced, separate the two modules by spring force. Each lock and pusher is located at the apex of two triangularly arranged aluminum*

pipes, i.e., altogether 20 inclined pipes, which make up the open truss structure between the modules. Since not all locks separated nominally during the reentry of Soyuz TMA-11 on 4/19/08, investigations are focusing on the separation mechanisms.]

Afterwards Sergey & Oleg restored the nominal STTS comm settings in the DC1.

FE-2 Chamitoff meanwhile performed the planned FSL (Fluid Science Laboratory) troubleshooting in the Columbus module, going through the procedural steps reviewed yesterday. With the FSL rack powered off and ground support via S- & Ku-Band voice communication & video downlink established, troubleshooting activities called for –

- Removing front gap protections on the FSL rack,
- Opening the FSL drawers,
- Accessing the CEM (Central Experiment Module) E-Box3 and removing its halogen lamp,
- Verifying if the lamp is broken, and, if so,
- Replacing it with a spare unit delivered on 1J, after inspecting the spare for damages or debris, followed by
- Photodocumenting the E-Box3 lamp after installation, and
- Closing the FSL drawers and reattaching the gap protectors.

The FE-1 performed the periodic memory card replacement and functional checkout of the Matryoshka-R (RBO-3-2) radiation payload which is using the ESA/RSC-Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS/ALC) with its Spectrometer (AST) and ALC equipment on FGB panel 429. *[Oleg replaced the ALC-949 PCMCIA (Portable Computer Memory Card International Adapter) card with a new one (#950) for testing the AST to continue Matryoshka operation. He then used the RSK1 laptop for briefly checking the new 950 card after 5-7 min of AST activity for quantity & total size of its stored file, before re-installing it in the AST. Card 949 was stowed for return to earth.]*

Later today, Greg Chamitoff is scheduled to conduct the periodic nitrogen (N₂) pressure check on the MELFI (Minus Eighty Degree Laboratory Freezer for the ISS). *[Nitrogen is the working fluid used by MELFI's cooling system, based on the Reverse Brayton Thermodynamic Cycle. The cooling engine, a Brayton Machine (BM), works with a compression wheel and expansion wheel on the same shaft supported by a gas bearings system. The BM can rotate at speeds up to 96,000 rpm depending on the cooling requirements. After the N₂ is cooled in the BM, it is distributed to each of four independently-controlled, thermally-insulated volumes (Dewars). The N₂ loop is a closed system, i.e., the gas never comes in contact with the samples in the dewars.]*

Sergey Volkov has the task to conduct the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Oleg Kononenko will perform the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The three crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1). Later tonight, Kononenko transfers the exercise data file to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

The three crewmembers were scheduled for their regular periodic PMCs (Private Medical Conferences) via S- & Ku-band audio/video, Gregory at ~11:25am, Oleg at ~4:15pm, Sergey at ~5:25pm.

At ~1:00pm EDT, Gregory Chamitoff was interviewed in a 10-min. PAO TV event with KPIX-TV, San Francisco, CA.

CEO (Crew Earth Observations) photo targets uplinked for today were **Mississippi floods** (*Dynamic event. Floods are cresting in the St Louis-Cape Girardeau stretch of the Mississippi River. St Louis harbor is closed to barge traffic. Looking left for the Mississippi River and St Louis. Weather was expected to be “mostly sunny”*), and **Pilcomayo River dynamics, Northern Argentina** (*this ISS pass almost paralleled the course of the failing Pilcomayo River. This river has special geological interest because it is blocking its own course with sediment, and spilling out onto the surrounding flatlands, at the point near where the track crosses the course. Also, this river has built the largest megafan [inland delta] on Earth. Wider views slightly right then left of nadir with the 180 lens will capture the engineering canals put in place by Argentina and Paraguay to maintain flow of the river [which defines the international boundary]*).

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 8:14am EDT [= epoch]):*

Mean altitude -- 344.9 km

Apogee height -- 350.7 km

Perigee height -- 339.1 km

Period -- 91.43 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0008611

Solar Beta Angle -- -2.5 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.75

Mean altitude loss in the last 24 hours -- 58 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55078

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

07/02/08 -- Progress 29P line purging

07/10/08 -- Russian EVA-20A (7/10, 2:18pm)

07/18/08 -- ATV1 reboost (tent.)

09/05/08 -- ATV1 undocking, from SM aft port (may move to 9/25)

09/09/08 -- Progress M-64/29P undocking, from FGB nadir (may move to 8/30)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)

11/03/08 -- Soyuz TMA-13/17S relocation

11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

1QTR CY09 -- STS-119/Discovery/15A launch – S6 truss segment

03/25/09 -- Soyuz TMA-14/18S launch

2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD

3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation

05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**

3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2

4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola

1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)

1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)

2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

Attachments:

ISS On-Orbit Status 06/30/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 11 of Increment 17.*

Crew Sleep Cycle: Wake/sleep cycle remains right-shifted (5:30am - 9:00pm EDT).

After readying the equipment for the US PHS (Periodic Health Status) w/Blood Labs exam, FE-2 Chamitoff underwent the clinical evaluation as subject, using the PCBA (Portable Clinical Blood Analyzer), assisted by CDR Volkov as CMO (Crew Medical Officer) for the blood draw. The second part of PHS, Subjective Clinical Evaluation, was performed afterwards. All data were then logged on the MEC (Medical Equipment Computer) and the hardware stowed. *[The PHS exam, with PCBA analysis and clinical evaluation, is guided by special software (IFEP, In-Flight Examination Program) on the MEC laptop. While PCBA analyzes total blood composition, the blood's hematocrit is particularly measured by the Russian MO-10 protocol.]*

The CDR serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out"-to-vacuum cycle on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated tonight at ~8:45pm EDT. Filter bed #1 regeneration was performed yesterday. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently to remove any lingering Freon-218 from the cabin atmosphere (last time done: 6/19&20).]*

Working on the IK0501 GA (gas analyzer), Volkov removed & replaced its O₂ transducer of with a spare unit, located by Kononenko on 6/27, and installed a cap on it. *[Located in the Service Module (SM) behind panel 449, the IK0501 is an automated system for measuring CO₂, O₂, and H₂O in the air as well as the flow*

rate of the gas being analyzed].

In preparation for a possible EVA-related contingency involving Soyuz TMA-12/16S relocation on 7/11, FE-1 Kononenko dismantled and removed electronic equipment from the spacecraft's Orbital Module (BO), to be re-installed after a nominal spacewalk. *[Removed were the LKT local temperature sensor commutator (TA251MB) of the BITS2-12 onboard telemetry measurement system and its PZU-1M ROM (read-only memory) unit. When a Soyuz departs or a Progress is jettisoned, these valuable electronics are retained, to be recycled on a future vehicle.]*

Volkov & Kononenko had two hours set aside for an in-depth review of the EVA-20a timeline, watching an uplinked video and tagging up with ground specialists view S-band. *[The off-nominal scenario of the crew training involves the case where the DC1 Docking Compartment fails to repressurize after ingress of the two spacewalkers on 7/11. This would necessitate their ingress in the Soyuz and the relocation of the spacecraft, docked to the DC1 nadir port with FE-2 Chamitoff already safely locked out in the 16S Descent Module, to the FGB nadir port after prior separation of the Progress cargo ship. In addition, for the relocation the three crewmembers and the spacecraft will have to be prepared for a return to Earth in the event of a no-docking contingency, and the station will have to be configured for uncrewed operation. The off-nominal scenario currently assumes the following timeline on 7/11 (EDT):*

- 12:20pm: Attitude control handover from USOS CMGs to RS thrusters;*
- 12:30pm: Maneuver to Progress 29P undocking attitude;*
- 1:14pm: 29P undocking from FGB nadir port;*
- 4:13pm: Free drift for Soyuz 16S hooks opening;*
- 5:40pm: Maneuver to 16S undock attitude;*
- 6:27pm: 16S undocking for relocation to FGB nadir port;*
- 6:56pm: 16S docking at FGB nadir port; 8:10pm: Attitude control authority handover from RS to USOS.]*

After the review, the CDR & FE-1 had another 90 min for preparing EVA-20a equipment and gathering the necessary tools.

Also in preparation for the Orlan spacewalk, Sergey & Oleg are scheduled later today for the mandatory Russian pre-EVA MedOps procedure MO-6 (hand-cycle ergometry) in the SM, assisting each other in turn and supported by tagup with ground specialists who are to clear them for spacewalking. *[Because cosmonauts in early Russian programs have shown noticeable decrease in arm muscle tone, TsUP/IBMP (MCC-Moscow/Institute of Biomedical Problems) physical fitness experts have groundruled the handgrip/arm tolerance test analysis (hand*

ergometry) as a standard pre-Orlan EVA requirement. For MO-6, the subject dons the ECG (electrocardiogram) biomed harness, attaches three skin electrodes and plugs the harness into the PKO medical exam panel on the cycle ergometer. The other crewmember assists. The 30-min exercise itself starts after 10 seconds of complete rest, by manually rotating the cycle's pedals, set at 150 W, backwards until "complete exhaustion".]

Getting ready for tomorrow's planned troubleshooting of Columbus science equipment, Gregory Chamitoff reviewed CBT (Computer-Based Training) material on the procedures required to safely access and investigate the FSL (Fluid Science Laboratory) in COL (Columbus Orbital Laboratory). *[With the FSL rack powered off, troubleshooting steps include FSL drawer opening, inspecting the CEM (Central Experiment Module), checking out the nonfunctional CEM halogen lamp in the E-Box3, taking photographs of the E-Box3, replacing the lamp with a 1J-delivered spare unit (if found broken) and re-closing the drawers.]*

Chamitoff later set up the payload equipment for his second session with the 3D-Space (Mental Representation of Spatial Cues During Space Flight) experiment and then performed the protocol, with all three exercises (distance, illusion, handwriting). After all data were stored on PCMCIA memory card, the ESA multipurpose laptop was shut down and the hardware disconnected & stowed away. *[3D-SPACE, a collaboration of ESA and the French space agency CNES (Centre National de la Recherche Scientifique), is designed to identify accurate visual perception & localization of objects in the space environment as prerequisites for spatial orientation & reliable performance of motor tasks in microgravity.*

Humans have mental representations of their surroundings based on sensory information & experience. It is hypothesized that depth & distance perception of objects could be altered in space due to the absence of gravitational reference and ambiguous perspective cues. 3D-SPACE investigates (a) depth perception & the role of perspective cues using geometric illusions, (b) distance perception using both standard psychophysics tests & natural three-dimensional scenes presented on a virtual reality head-mounted display, and (c) the effects of cognitive vs. perceptual-motor changes using handwriting & drawing tests.]

After the recent (6/16) water transfer from the WDS (Water Delivery System) of ATV1 "Jules Verne" to an EDV container in the SM for the Elektron electrolysis system, FE-1 Kononenko today again used the electric pump with water transfer hoses & pressure adapter for pumping over more water from WDS tank #1 to an empty EDV.

Gregory conducted the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling a CWC (Contingency Water Container, #1054) with the collected water slated for processing. No samples were

required. *[Estimated offload time before reaching the tank's neutral point (leaving ~6 kg in the tank): ~30 min. Condensate collection continues to be performed by the CCAA while the Russian SKV-2 air conditioner is off, awaiting its overdue Khladon (Freon-218) refill. SKV-1 has been nonfunctional for a long time.]*

Continuing his systems checkout activities in the Kibo JEM (Japanese Experiment Module), today on the CGSE (Common Gas Support Equipment), the FE-2 made connections between its valve unit and four CO₂ & Argon GBUs (gas bottle units), then opened the CO₂ gas supply to check out the system.

Later today, Greg will also take down the VAJ (Vacuum Access Jumper) connections set up by him on 6/19 from the Kibo WG (Waste Gas) and VV (Vacuum Vent) for initial VV exhaust gas activation.

Sergey Volkov has the task to conduct the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Oleg Kononenko will perform the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The three crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1). Later tonight, Oleg transfers the exercise data file to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

The FE-2 again had the option of spending about an hour for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residence, if she/he chooses to take it.

BCC Checkout: Last night, the ground initiated the two-hour standard checkout of BCC (Backup Control Center) Swing and Activation procedures that would be necessary in the event of a flight control transfer from Houston to the HSG (Houston Support Group) at TsUP/Moscow. The checkout, which did not involve the crew, included PPCP (PrePlanned Command Package) and real-time command uplinks

from MCC-H via RS ground station (DO4; ~1:40am). *[Purpose of the BCC C/O is to demonstrate BCC functionality and provide proficiency training for HSR (Houston Support Room) personnel. Objectives are: successful swing to BCC, command verification via PPCP transmission and real-time command uplink, and ACT (American Contingency Telemetry) verification.]*

CDRA Update: Starting at ~9:00am this morning, the US Carbon Dioxide Removal Assembly was activated again for two half-cycles to control ppCO₂ levels. In this configuration for the daily ops, connecting & disconnecting the ITCS cooling loop is not required. A forward plan for cycling the CSV (CO₂ Selector Valve) to prevent its sticking is in work.

Voluntary Science (VolSci) Update: Words of thanks and appreciation were uplinked to Gregory Chamitoff from POIC (Payload Operations & Integration Center, Huntsville) ground specialists for his outstanding job yesterday in setting up the new SHERE (Shear History Extensional Rheology Experiment) experiment in the MSG (Microgravity Science Glovebox), including video configuration and software upload, plus overcoming some minor data comm problems.

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (as of this morning, 7:50am EDT [= epoch]):

Mean altitude -- 345.0 km

Apogee height -- 350.7 km

Perigee height -- 339.3 km

Period -- 91.44 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0008497

Solar Beta Angle -- -6.5 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.75

Mean altitude loss in the last 24 hours -- 68 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55062

Significant Events Ahead (all dates Eastern Time, some changes possible.):

07/02/08 -- Progress 29P line purging

07/10/08 -- Russian EVA-20a (7/10, 2:18pm)

07/18/08 -- ATV1 reboost (tent.)

09/05/08 -- ATV1 undocking, from SM aft port (may move to 9/25)

09/09/08 -- Progress M-64/29P undocking, from FGB nadir (may move to 8/30)
09/10/08 -- Progress M-65/30P launch
09/12/08 -- Progress M-65/30P docking
10/01/08 -- **NASA 50 Years**
10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)
11/03/08 -- Soyuz TMA-13/17S relocation
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
1QTR CY09 -- STS-119/Discovery/15A launch – S6 truss segment
03/25/09 -- Soyuz TMA-14/18S launch
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 06/29/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday -- off-duty for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff. Ahead: Week 11 of Increment 17.*

Crew Sleep Cycle: Wake/sleep cycle currently remains shifted to the right (5:30am - 9:00pm EDT).

The FE-1 performed the periodic service of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed 1 of the regenerable dual-channel filtration system. The regen process will be terminated before sleeptime, at ~8:30pm EDT. Bed 2 regeneration follows tomorrow. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently to remove any lingering Freon-218 from the cabin atmosphere (last time: 6/19&20).]*

The CDR conducted the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Volkov also gathered weekly data on Total Operating Time & "On" durations of the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem for reporting to TsUP.

For his Voluntary Weekend Science (VolSci) program today, FE-2 Chamitoff has

selected a session with the new SHERE (Shear History Extensional Rheology Experiment) payload, first reviewing familiarization material, then going through the individual procedural steps of activating the MSG (Microgravity Science Glovebox), gathering SHERE hardware for assembly in the MSG WV (Work Volume), setting up the camcorder equipment to take video of the assembly, powering up & starting the experiment and loading the updated software in the MSF laptop. Afterwards, the experiment will be terminated and everything powered down. *[SHERE, which has never before been performed in micro-G, studies the effect of preshearing (rotation) on the stress and strain response of a polymer fluid (a complex fluid containing long chains of polymer molecules) being stretched in micro-G. The fundamental understanding & measurement of the extensional rheology of complex fluids is important for understanding containerless processing, an important operation for fabrication of parts (such as adhesives or fillers) using elastomeric materials on future exploration missions. This knowledge can be applied as well to controlling and improving Earth-based manufacturing processes.]*

Later today, the FE-2 will also break out and set up the equipment for tomorrow's scheduled U.S. PHS (Periodic Health Status) w/Blood Labs exam, a clinical evaluation of Chamitoff as subject, with Sergey Volkov assisting as CMO (Crew Medical Officer) for the blood sampling part. *[The task today included an electronic function test and control analysis of the blood lab equipment, viz., the PCBA (Portable Clinical Blood Analyzer), which was then temporarily stowed.]*

At ~3:10pm, Gregory is scheduled for weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop).

Working off his suggested "time permitting" task list, the CDR performed another session of the Russian GFI-8 "Uragan" (hurricane) earth-imaging program using the HVR-Z1J SONY digital cameral. *[Uploaded target zones today were the Alps, glaciers above the arch-shaped dams on the south (left) slope of Rhone river falling into Lake of Geneva from the west, Allaline Glacier (7.37E; 46.00S), Balkan coast line, close-up views of Greece and her islands, fires (Athens), general video views of major faults of Earth's crust – rifts in Africa stretched along rock-basin lakes, and the Indian Ocean coastline.]*

Also from the Russian discretionary task list, Volkov conducts another run, his seventh, of the Russian DZZ-2 "Diatomeya" ocean observations program, using the NIKON-F5 DCS still camera and the HDV (high-definition) video camcorder from SM window 8 for ~20 min to record color contrast blooms and cloud patterns in flight path. *[The spring & summer seasons in the Northern Hemisphere are distinguished by very strong bio-productive developments in the waters of North Atlantic. At this time the largest currents, upwelling areas, and near-estuary areas*

of the ocean should display large-scale spots and bands of green and greenish-brown fields of plankton. Target zones today in the North Atlantic were waters off Newfoundland Island, the coastal area of Morocco plus US and Venezuelan coastal areas.]

For Oleg Kononenko, the voluntary task list suggested another ECON KPT-3 session for today, making observations and taking aerial photography of environmental conditions for Russia's Environmental Safety Agency (ECON) using the Nikon D2X digital camera with SIGMA 300-800mm telephoto lens.

For Greg, a new job on the voluntary "job jar" task list for today called for a CBT (Computer-Based Training) session of upcoming troubleshooting activities on the failed COL FSL (Columbus Orbital Laboratory/Fluid Science Laboratory). *[The CBT, hard-scheduled tomorrow, focuses on operations overview, safety aspects, CEM Upper (Central Experiment Module), softshield CEM, and the halogen lamp unit.]*

The three crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1).

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 8:47am EDT [= epoch]):*

Mean altitude -- 345.0 km

Apogee height -- 350.7 km

Perigee height -- 339.4 km

Period -- 91.44 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0008373

Solar Beta Angle -- -10.2 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.75

Mean altitude loss in the last 24 hours -- 84 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55047

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

07/02/08 -- Progress 29P line purging

07/10/08 -- Russian EVA-20a (7/10, 2:18pm)

09/05/08 -- ATV1 undocking, from SM aft port (may move to 9/25)
 09/09/08 -- Progress M-64/29P undocking, from FGB nadir (may move to 8/30)
 09/10/08 -- Progress M-65/30P launch
 09/12/08 -- Progress M-65/30P docking
 10/01/08 -- **NASA 50 Years**
 10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
 10/12/08 -- Soyuz TMA-13/17S launch
 10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
 10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)
 11/03/08 -- Soyuz TMA-13/17S relocation
 11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
 11/12/08 -- STS-126/Endeavour/ULF2 docking
 11/20/08 -- **ISS 10 Years**
 11/26/08 -- Progress M-66/31P launch
 11/28/08 -- Progress M-66/31P docking
 02/10/09 -- Progress M-67/32P launch
 02/12/09 -- Progress M-67/32P docking
 1QTR CY09 -- STS-119/Discovery/15A launch – S6 truss segment
 03/25/09 -- Soyuz TMA-14/18S launch
 2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
 05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
 3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
 4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
 1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
 1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
 2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 06/28/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – off duty for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff.*

Crew Sleep Cycle Adjustments: Crew wake/sleep cycle today shifted 3.5 hrs to the right for the next days: wakeup – 5:30am, sleep – 9:00pm EDT.

Upon wake-up, Sergey Volkov terminated his 5th MBI-12 SONOKARD experiment session for the long-term Russian sleep study, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

The crew performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

As part of the house cleaning, the crew also conducted regular maintenance inspection & cleaning on fan grilles in the FGB (TsV2), SM (VPkhO & VPrK), DC1 (V1, V2, V3) screens and PF1/PF2 dust filters, as well as in the COL (Columbus

Orbital Laboratory).

Gregory Chamitoff filled out the regular FFQ (Food Frequency Questionnaire), his third, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

At ~10:10am EDT, the crewmembers held their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

The three crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1).

Afterwards, Chamitoff transferred the crew's exercise data file to the MEC for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

The Russian crewmembers had their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop), Sergey at ~11:00am, Oleg at ~11:45am.

Working off his suggested "time permitting" task list, CDR Volkov performed another session of the Russian GFI-8 "Uragan" (hurricane) earth-imaging program using the HVR-Z1J SONY digital cameral. *[Uploaded target today was Darwin Island (-92.0E; 1.7S), one of the islands in the Galapagos Archipelago.]*

For FE-1 Kononenko, the Russian voluntary task list suggested another ECON KPT-3 session for today, making observations and taking aerial photography of environmental conditions for Russia's Environmental Safety Agency (ECON) using the Nikon D2X digital camera with SIGMA 300-800mm telephoto lens.

CDRA Activity: The US Carbon Dioxide Removal Assembly was activated by ground commanding at ~9:00am for two half-cycles, until ppCO₂ had dropped below ~4.5 mmHg, then turned off again. Crew support consisted in deactivation of the ARS (Atmosphere Revitalization Systems) rack.

Airlock (A/L) CCAA Activity: Also by ground commanding, the THC CCAA (Temperature & Humidity Control/Common Cabin Air Assembly) air conditioner in the "Quest" A/L was deactivated after running for at least 6 hrs. *[Per Flight Rule, when A/L CCAA is activated following a seven-day inactive period, it must be operated a minimum of 6 hrs continuously without water carryover before being shut down. The CCAA may thereafter remain inactive for 7 days with the LTL (Low Temperature Loop) set point below the USOS (U.S. Segment) dew point.]*

Weekly Science Update (*Expedition Seventeen -- Week 10*)

3-D SPACE : After a successful session on 6/13, the second session for the FE-2 is currently planned for 6/30.

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):
Measurements continue in FGB module.

ANITA (Analyzing Interferometer for Ambient Air): Continuing.

BCAT-3 (Binary Colloidal Alloy Test 3): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System):
Samples returned on 1J.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): The CGBA Ops team is hoping to run Side 1 of Silicate Garden Hab (S/N 2) in the next couple of weeks to collect data for the upcoming school year. No crew action needed.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): The experiment platform continues to operate nominally. The instruments and its power feeder #1 have been de-activated on 6/21 because of planned power outage in ERASMUS USOC. Afterwards the EuTEF instruments have been re-activated nominally. A DHPU (Data Handling Processing Unit) software patch is currently being developed to fix the link error issues encountered with DEBIE-2 and FIPEX instruments. -- DEBIE-2: Link error still in work. However a work-around allows for regular science data acquisition using an on-board IOP (Instrument Operations Procedure); -- DOSTEL: On-going science acquisition; -- EuTEMP: Currently inactive as planned; -- EVC: still under investigation. On 0/23, a link with the HRM could successfully be established; -- EXPOSE: On-going science acquisition; -- FIPEX: It was noticed that a script run during Week 10 had to be repeated as the data file was corrupted. The file has been deleted and a new script has been started on 6/25, containing fast measure program with 3 sensors; -- MEDET: Some commanding was performed on 6/23 to increase the frequency of acquisition of the microcalorimeter. Commands to bring back to the initial value were sent on 6/24. Continuously acquiring science data; -- PLEGPAY: currently in READY mode, no science data acquisition on-going; -- TRIBOLAB: The Ball-Bearing experiment 1/2/3 which is running since 6/16 has been paused during the EUTEF power-down on 6/21 and has been resumed since. The experiment run is expected to last until ~7/18-20.

FSL (Fluid Science Laboratory): Further troubleshooting activities on FSL are planned for 7/1.

GEOFLOW: The start of GEOFLOW is pending further FSL troubleshooting and remaining commissioning activities (check of FSL optical modes).

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System):

Node-1 surfaces were expected to contain little/no fungal material, but Greg's 2nd swab contained 18 ng/ml of the fungal cell wall molecule 'Glucan' (within the 1-100 ng/ml detection range of the instrument). This level is not a concern for crew health on the ISS and probably represents dead residual fungal material killed during cleaning. However, such a reading might be a scientific concern if obtained during a human exploration mission to Mars, where biological material on internal surfaces could be transferred to the outside, e.g. during EVA. This transfer could interfere with experiments designed to search for biological molecules indigenous to the Martian surface. Chamitoff's ISS results are helping scientists define requirements for spacecraft "cleanliness", which need to be in place for these exploration missions.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION w/REPOSITORY: In progress.

PADLES (Passive Dosimeter for Lifescience Experiment in Space): In progress.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems):
Ongoing.

SAMPLE: Inc16 samples have been downloaded with 15S and handed over to science team.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): "Greg, thanks for completing your Actiwatch initialization. If you find your other Actiwatch, please let us know so we can coordinate the downloads of both Actiwatchs into

the timeline for your next session.”

SOLAR (*Solar Monitoring Observatory*): Sun observation window was expected to open on 6/24, however the sun was not sufficiently visible to start measurements. On 6/25, the SOLAR platform has been reconfigured to PM (Pointing Mode). After a while, however, the HK data were lost. Some test on 6/25 and power cycles on 6/25 & 26 have not resolved the problem. The issue appears to be related either to the LAN or to an internal process of SOLAR not sending HK packets. The instruments are currently switched off. Currently under further investigation.

SOLO: Planned.

SPHERES (*Synchronized Position Hold, Engage, Reorient, Experimental Satellite*): In progress.

Swab (*Characterization of Microorganisms & Allergens in Spacecraft*): Complete.

TRAC (*Test of Reaction & Adaptation Capabilities*): Planned.

ULTRASOUND: Planned.

WAICO #1 (*Waving and Coiling of Arabidopsis Roots at Different g-levels*): In progress.

CEO (*Crew Earth Observations*): Continuing.

CEO (Crew Earth Observations) photo targets uplinked for Greg Chamitoff for today were **Mount Rainier** (*detailed images of Mt. Rainier, right of track, were requested. This active volcano lies immediately behind Seattle*), **Yellowstone National Park, Wyoming** (*detailed images were requested for information about roads and trails. Mapping series of overlapping images left of track was requested. Yellowstone Lake was in the center of the view and the NP*), and **South Amazonian Fans, Brazil** (*this site is almost never called out due to cloudiness [forecast was mostly clear for today]. The Aripuana River and its neighbor in central Amazonia have created vast fan-shaped features [“inland deltas,” – polygon]. Research is centering on old channels which appear as a series of sinuous white lines: aiming the lens left and right of track to acquire a mapping swath of images. Visual cues were a highway and the Madeira River on one side and the Trans-Amazon Highway on the other. JSC geologists are investigating inland deltas worldwide as analogs for similar features on Mars*).

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the

Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 8:37am EDT [= epoch]):*

Mean altitude -- 345.1 km

Apogee height -- 350.8 km

Perigee height -- 339.5 km

Period -- 91.44 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0008414

Solar Beta Angle -- -13.7 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.75

Mean altitude loss in the last 24 hours -- 100 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55031

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

07/10/08 -- Russian EVA-20a (7/10, 2:18pm)

09/05/08 -- ATV1 undocking, from SM aft port (may move to 9/25)

09/09/08 -- Progress M-64/29P undocking, from FGB nadir (may move to 8/30)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)

11/03/08 -- Soyuz TMA-13/17S relocation

11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

1QTR CY09 -- STS-119/Discovery/15A launch – S6 truss segment

03/25/09 -- Soyuz TMA-14/18S launch

2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD

3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation

05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**

3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2

4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola

1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)

1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)

2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 06/27/08

All ISS systems continue to function nominally, except those noted previously or below. *Half-day rest for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff.*

Crew Sleep Cycle Adjustments: Crew wake/sleep cycle today is back on normal (2:00am-5:30pm) but will shift forward again starting tomorrow morning, by 3.5 hrs, throughout next week for the Orlan EVA on 7/10: wakeup – 5:30am, sleep – 9:00pm EDT.

Oleg Kononenko started his workday by taking the periodic readings of potentially harmful atmospheric contaminants in the SM (Service Module), using the CMS (Countermeasure System), a component of the GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, which uses preprogrammed microchips to measure H₂CO (Formaldehyde, methanal), CO (Carbon Monoxide) and NH₃ (Ammonia), taking one measurement per microchip. Today's measurements also looked for O₃ (Ozone), C₆H₆ (Benzene) and NO₂ (Nitrogen Dioxide), using special chips. *[CMS is a subsystem of the Russian SKDS Pressure Control & Atmosphere Monitoring System.]*

Later, the FE-1 used the SOGS GANK-4M system for taking and recording atmospheric readings. *[GANK tests for Methane (CH₄), NH₃, CO, H₂CO, Nitrogen Oxides (NO, NO₂), Hydrogen Chloride (HCl), Hydrogen Fluoride (HF), and Hydrogen Cyanide (HCN).]*

Kononenko also conducted a search for a spare O₂ transducer for the IK0501 GA (gas analyzer), and a cap to install on it. *[IK0501 is an automated system for measuring CO₂, O₂, and H₂O in the air as well as the flow rate of the gas being analyzed].*

Before sleep time tonight, the CDR will take measurements for the regular atmospheric status check for ppCO₂ (Carbon Dioxide partial pressure) in the Lab, SM (at panel 449) and COL (Columbus Orbital Laboratory), using the hand-held CDMK (CO₂ Monitoring Kit, #1002). *[The battery pack is to be replaced with the one from unit #1009 if necessary.]*

For Gregory Chamitoff, it was Day 2 of the two-day IFM (Inflight Maintenance) for refilling the two coolant loops of the ITCS (Internal Thermal Control System). *[After first backing out of the safety steps put in place last night, the FE-2 then used the FSS (Fluid System Servicer) with its FCPA (Fluid Control Pump Assembly) to charge the LTL & MTL PPA (Low Temperature Loop & Moderate Temperature Loop Pump Package Assembly) accumulators as well as the spare ITCS CSA (Coolant Sampling Adapter). Afterwards, the FSS plus jumpers were drained and purged to vacuum, then stowed away. The coolant refill of the accumulators became necessary due to the recent installation of the Lab AmiA (Antimicrobial Applicator) by Karen Nyberg during 1J and the leak at the LTL supply QD (Quick Disconnect). The PPAs are located in the LAB1P6 & LAB1S6 racks. The refill of the spare CSA anticipates its use in the Kibo JPM: since both JEM ITCS CSAs were deleted from the 1J manifest, the plan is to eventually install the spare onboard CSA in the JPM to take samples until the JEM Adapters are delivered on a later mission.]*

Chamitoff also conducted the monthly FDS PEP (Fire Detection & Suppression/ Portable Emergency Provisions) safety inspection/audit in the ISS modules. *[Today's inspection also covered the QDMA (Quick-Don Mask Assembly) harnesses, including those that had not been unpacked yet. In addition, photo documentation of all PBA (Portable Breathing Apparatus) and PFE (Portable Fire Extinguishers) gauges was required. The IMS (Inventory Management System)-supported inspection involves verification that PFEs, PBAs, QDMAs and EHTKs (Extension Hose/Tee Kits) are free of damage to ensure their functionality, and to track shelf life/life cycles on the hardware.]*

Volkov & Chamitoff completed another monthly session (Sergey's third, Gregory's first) of the CHeCS (Crew Health Care Systems) emergency medical operations OBT (On-Board Training) drill, a 30-min. exercise to refresh their CMO (Crew Medical Officer)'s acuity in a number of critical health areas. Sergey's proficiency drill today focused on nosebleed treatment, Greg's on eye treatment. *[The HMS (Health Maintenance Systems) hardware, including ACLS (Advanced Cardiac Life Support) equipment, may be used in contingency situations where crew life is at risk. To maintain proficiency, crewmembers spend one hour per month reviewing HMS and ACLS equipment and procedures via the HMS and ACLS CBT (computer-based training). The training drill, each crewmember for him/herself, refreshes their memory of the on-orbit stowage and deployment locations, equipment etc. and*

procedures.]

CDR Volkov had another 30 min reserved for relocating and stowing common trash into the ATV1 (Automated Transfer Vehicle) "Jules Verne".

Continuing the extended leak checking of the spare BZh Liquid Unit (#056) for the Elektron O₂ generator, Kononenko charged the unit once again with pressurized N₂ from the BPA Nitrogen Purge Unit (#23) to 1 atm (1 kg/cm²). The last test pressurization to monitor for leakage was on 5/22. *[During Elektron operation, the inert gas locked up in the BZh has the purpose to prevent dangerous O₂/H₂ mixing. A leaking BZh cannot be used.]*

Continuing Orlan preparations for the spacewalk on 7/10, Oleg installed the battery for powering the US wireless TV camera (ERCA/EMU RF Camera Assembly) in the BRTA-1M telemetry systems unit of Orlan-M suit #26, with cable routing, then covered BRTA-1M & cables with MLI (Multi-Layered Insulation), fastened down with Kapton tape.

On the US REBA (Rechargeable EVA Battery Assembly), also used on the Orlan, the FE-1 worked with Kapton tape, scissors and tape measure to jerry-rig an extension for the pull tab of the REBA which allows activation of the battery once it is installed in the Orlan.

Volkov performed the daily IMS maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Kononenko completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

The crew worked out according to their regular 2.5-hr. physical exercise protocol (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exerciser (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1). Afterwards, Oleg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

This morning at ~4:15am EDT the CDR & FE-1 linked up with TsUP-Moscow stowage specialists via S-band to conduct the weekly IMS tagup, discussing

stowage issues, equipment locations, Progress cargo transfers and ATV trash stowage.

At ~4:25am, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU/*Glavnaya operativnaya gruppa upravleniya* = “Main Operative Control Group”), including Shift Flight Director (SRP), at TsUP-Moscow via S-band/audio, phone-patched from Houston and Moscow.

At ~9:00am, Sergey & Oleg downlinked a PAO TV message of greetings and congratulations to an International Conference on Mental Recovery, to be held on July 2-4 in Moscow, organized by Academician N. N. Burdenko of the Scientific & Research Institute of Neurosurgery at M. V. Lomonosov Moscow State University, and the World Federation of Neurosurgical Societies. *[“...Space and the human brain are the two vast, hardly fully researched universes, requiring more studies to discover the essence of all their processes. To reach their goals, space researchers and brain scientists-neurosurgeons, are taking advantage of cutting-edge technology and procedures. Some are looking into the depths of the Universe, trying to resolve the mysteries of planets and interstellar matter. The others are trying to learn about higher mental functions and dynamics on the cellular and molecular levels. We, the cosmonauts, are always aware of the doctors’ attention to our health, well-being, and mental state. It is a well-known fact that medical doctors participated in numerous flights aboard space vehicles and orbital stations. We always assist our colleagues in conducting medical space experiments, in human bio-medical research in space flight... We wish you new scientific discoveries and tangible achievements, every success in your noble activities, good health, well-being, happiness and prosperity to you and your loved ones.”]*

At ~4:00pm, the ISS crew is scheduled for their regular weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. *[S/G-2 (Space-to-Ground 2) phone patch via SSC (Station Support Computer)].*

At ~5:20pm, getting ready for sleep time, Sergey will again set up the Russian MBI-12 SONOKARD (Sonocard) payload and start his 5th experiment session, using a sports shirt from the SONOKARD kit with a special device in the pocket for testing a new method for acquiring physiological data without using direct contact on the skin. Measurements are recorded on a data card for return to Earth.

[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember’s physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]

WRM Update: An updated Water Recovery Management “cue card” was uplinked overnight for the crew’s reference. *[The new card (17-00020) lists 36 CWCs (~1365.2 L total) for the four types of water identified on board: technical water (650.6 L, for Elektron, flushing, hygiene, incl. 509.4 L non-usable water because of Wautersia bacteria), potable water (706.7 L, incl. 260.6 L currently on hold), condensate water (0 L), waste/EMU dump and other (7.9 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]*

ATV Hygiene Use: Due to some health concern about microbial/fungal growth in the FGB, an agreement has been reached with ESA to allow crewmembers to perform their hair and body washing in the ATV1 (away from sensitive equipment) as long as it is available. Other hygiene activities (shaving, hair cutting, fingernail clipping, etc.) will continue to be done near air filter intakes elsewhere on the station, not in the ATV.

EVA-20a Timeline Preview: The Orlan EVA-20a by Volkov/EV1 & Kononenko/EV2 on 7/10 is scheduled to begin at **~2:18pm EDT** (DC1 EV hatch open), to last an estimated 6 hrs. During the spacewalk, EV2 will be riding on the DC1-based Strela 1 crane, operated via hand crank by EV1. Main objective is the inspection of the Soyuz TMA-12 spacecraft at its first separation plane (Plane I) followed by removal of one pyrobolt for return to Earth. Before removing the separation bolt, Oleg will install temporary protective covers on the spacecraft’s DPO attitude control thrusters, open up the MLI (Multi-Layer Insulation), demate the pyrobolt’s electrical connector and cut the wiretie between the pyrobolts. MLI will then be reattached and the covers removed again. If enough time remains after the Soyuz activity, the spacewalkers will also install a docking target (for the new MEM module) on the SM PkhO (Transfer Compartment) exterior.

[Background: Before their separation, Descent Module (SA) & Instrumentation Compartment (AO) are connected by five locks, each “zamok” containing two pyrobolts (explosive bolts) with individual electrical connection, of which only one needs to fire to release the lock. The locks are equally spaced around the 360-degree circumference of the separation plane, i.e., 72 deg apart. After the five locks have released, five spring-loaded pushers, also equally spaced, separate the two modules by spring force. Each lock and pusher is located at the apex of two triangularly arranged aluminum pipes, i.e., altogether 20 inclined pipes, which make up the open truss structure between the modules.]

CEO (Crew Earth Observations) photo target uplinked for today was **St. Louis, Mississippi floods** (Dynamic event. Sun and cloud with isolated thunderstorms are forecast for the Mississippi valley in the vicinity of St Louis. Looking left for the Mississippi River floodplain where many counties are under flood warnings north of

St. Louis, and now increasingly south of St. Louis.)

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 8:12am EDT [= epoch]):*

Mean altitude -- 345.2 km

Apogee height -- 351.1 km

Perigee height -- 339.3 km

Period -- 91.44 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0008808

Solar Beta Angle -- -16.9 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.75

Mean altitude loss in the last 24 hours -- 60 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 55015

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

07/10/08 -- Russian EVA-20a (7/10, 2:18pm)

09/05/08 -- ATV1 undocking, from SM aft port (may move to 9/25)

09/09/08 -- Progress M-64/29P undocking, from FGB nadir (may move to 8/30)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)

11/03/08 -- Soyuz TMA-13/17S relocation

11/10/08 -- STS-126/Endeavour/ULF2 launch -- MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

1QTR CY09 -- STS-119/Discovery/15A launch -- S6 truss segment

03/25/09 -- Soyuz TMA-14/18S launch

2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD

3QTR CY09 -- STS-128/17A/Atlantis -- MPLM(P), last crew rotation

05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**

3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 06/26/08

All ISS systems continue to function nominally, except those noted previously or below.

*>>>> Today at ~9:55am EDT, the ISS (specifically its FGB module) completed **55,000 orbits** of the Earth, having covered a distance of 2.32 billion kilometers (1.45 billion st.miles) in 3506 days. The 19,300 kg (42,600 lbs) Zarya ("Dawn") was launched on a Russian/Khrunichev Proton from Baikonur over 9.5 years ago (11/20/98) as the first element of the multi-national space station. <<<<*

Current sleep cycle: Crew wakeup last night: 11:00pm EDT; sleeptime today: 3:30pm. Wakeup tomorrow: back at 2:00am, for a half-duty day.

Crew activities focused on a thorough Orlan systems checkout and suited exercise in preparation for the EVA-20a on 7/10. The successful Orlan-suited dry run demonstrated that in the case of a contingency situation during the spacewalk, the crew would be able to ingress the Soyuz module while still in their Orlan suits. The activities were recorded on VTR (Video Tape Recorder) by camcorder equipment set up by FE-2 Chamitoff. *[Plans for live TV downlink during the run had to be scrapped because a necessary drag-through cable could not be located in time.]*

After breakfast and DPC (daily planning conference), CDR Volkov & FE-1 Kononenko proceeded with the suited dry run, beginning with disassembly and removal of the SOTR ventilation air ducts between the SM PkhO (Service Module Transfer Compartment) & DC1 (Docking Compartment) and between the DC1 SU (vestibule) and Soyuz BO (Orbital Module), to gain room for the suited translation exercises.

With the STTS communications links configured for S/G (Space-to-Ground) for their stay in the DC1 & BO and fresh batteries installed in the BRTA telemetry comm

units of both Orlan-Ms (#26 & #27), the two spacewalkers checked out the suits, their equipment and BSS interface units via USI data output device. *[All EVA preps were monitored by TsUP/Moscow via S-Band and VHF.]*

Donning of EVA gear began at ~2:30am, starting with checkout of the comm hookups & biomedical parameter telemetry via BSS support panel and equipment monitoring, then culminating in complete ingress in the Orlans at ~3:00am and closure of backpacks.

DC1 hatch closing (isolation) and start of partial depress for subsequent leak checks was timed at ~4:00am but conducted ahead of schedule, followed by a functionality checkout of the suits and their BSS controls, preliminary fit checks at 0.4 atm (5.9 psi) suit pressure, and about an hour of testing/training of suited mobility & translation. *[The suited mobility & translation exercises included moving to VL1 (EVA hatch #1), translating to the EVA support panel (POV), BSS and SU-BO hatch (closed but not latched), checking out rotation capability with and without lights on, moving payload bundles, operating with OTAs (Orlan tether assemblies), plus operating the PGPU pneumohydraulic control panel and switching to autonomous suit power.]*

Sergey & Oleg then moved through the DC1 SU hatch into the Soyuz BO Module and closed the hatch to the DC1 (no comm while suited), then started depressurizing the Orlans and finally doffed the suits, re-establishing comm through Soyuz systems.

Orlan egress was ahead of schedule, followed by a 2h 20m period of post-training cleanup activities. *[These include changing clothes, drying out LCG (liquid cooling garment), biomed harness belt, thermal undergarment, socks, comfort gloves, hygienic trunks and comm caps, removing LiOH canister and moisture collector, etc., restoration of STTS communications settings to nominal operation, re-installation of the air duct between SM PkhO and DC1, and replacing the BRTA telemetry unit batteries for both suits (always for immediate readiness).]*

FE-2 Chamitoff monitored the training activities from the SM. *[During the actual EVA, Gregory will be located in the Soyuz Descent Module (SA), with the BO/SA hatch closed.]*

Later, Chamitoff had ~2 hrs reserved for performing Part 1 of the planned IFM (Inflight Maintenance) task on the ITCS (Internal Thermal Control System), first clearing the work area in the Lab by moving obstructing stowage to temporary locations and relocating (but not disconnecting) File Server, MEC (Medical Equipment Computer), Printer, and SSC (Station Support Computer) Client laptops as needed, then setting up the FSS (Fluid System Servicer) and priming (filling) the

FSS, consisting of the FCPA (Fluid Control Pump Assembly) with jumpers, and the ITCS CSA (Coolant Sampling Adapter). *[Since FSS ops are scheduled over two days, today's procedures also included steps for overnight safing of the FSS. Day 2 activities tomorrow will focus on the actual refilling of the LTL & MTL PPA (Low Temperature Loop & Moderate Temperature Loop Pump Package Assembly) accumulators as well as the spare ITCS CSA, draining the FSS & FSS jumpers drained plus purging them to vacuum FSS jumpers, and finally stowing everything. The coolant refill of the accumulators became necessary due to the recent installation of the Lab AmiA (Antimicrobial Applicator) by Karen Nyberg during 1J and the leak at the LTL supply QD (Quick Disconnect). The PPAs are located in the LAB1P6 & LAB1S6 racks. The refill of the spare CSA anticipates its use in the Kibo JPM: since both JEM ITCS CSAs were deleted from the 1J manifest, the plan is to eventually install the spare onboard CSA in the JPM to take samples until the JEM Adapters are delivered on a later mission.]*

Gregory also conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WRM (Water Recovery & Management (WRM)) assessment of onboard water supplies. *[Updated "cue cards" based on the crew's water calldowns are sent up every other week. The current card (17-0002N) lists 36 CWCs (~1484.9 L total) for the four types of water identified on board: technical water (694.6 L, for Elektron, flushing, hygiene, incl. 553.4 L non-usable water because of Wautersia bacteria), potable water (706.7 L, incl. 260.6 L currently on hold), condensate water (75.7 L), waste/EMU dump and other (7.9 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]*

In the US Airlock, Oleg Kononenko initiated recharge on the REBAs (Rechargeable EVA Battery Assemblies) and helmet light batteries in the BSA (Battery Stowage Assembly), for use on the Orlans during the EVA-20a. Recharge was terminated after about 5.5 hrs.

The FE-2 worked out according to his regular 2.5-hr. physical exercise protocol (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill and RED resistive exerciser. Afterwards, Greg transferred the exercise data file to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~11:50am EDT, Gregory participated in an interactive TV PAO/Educational event with Burleson Independent School District, Burleson, TX, responding to questions asked by the students of Burleson High School. *[The primarily rural Burleson, TX district highlighted the downlink around an existing summer science & technology camp for students called "All Systems Go." Greg's downlink, which allowed*

students in grade levels 5-8 an opportunity to ask questions about the ISS and living and working in a microgravity environment, provided a stage to spotlight math & science to the surrounding community, and the district looked to establish new partnerships within their community as a result.]

Chamitoff completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Working off the Russian discretionary “time permitting” task list, Kononenko was to perform the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Still remaining on the voluntary task list item for Kononenko & Volkov was an audit of expired Expedition 16 food rations, with repacking & preparation of food packages for disposal on the ATV1. *[To clear storage space for cargo items delivered on Progress M-64/29P.]*

The FE-2 again had the option of spending about an hour for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residence, if she/he chooses to take it.

PPS P6 Battery Capacity Test: The capacity testing on the P6 truss batteries 2B3 (channel 2B) and 4B3 (channel 4B) by ground commanding, started on 6/24, was successfully completed yesterday morning. The batteries were re-connected and are supporting nominally. Data analysis is currently in work with the results on the battery capacity expected tomorrow.

EVA-20a Timeline Preview (preliminary): The Orlan EVA-20a by Volkov/EV1 & Kononenko/EV2 on 7/10 is scheduled to begin at ~2:18pm EDT (DC1 EV hatch open), to last an estimated 5 hrs 43 min, i.e., concluding at approximately 8:00pm. The EVA is supported by the DC1-based Strela 1 crane, operated via hand crank by EV1. Main objective is the inspection of the Soyuz TMA-12 spacecraft at its first separation plane (Plane I) followed by removal of one Soyuz pyrobolt for retrieval to the DC1 and return to Earth. Before the removal of the separation bolt, protective covers will be temporarily installed on the spacecraft’s attitude control thrusters (later removed), the pyrobolt’s electrical connector will be demated, and the wiretie between the pyrobolts will be cut. If enough time remains after the Soyuz activity, the spacewalkers will also install a docking target (for the new MEM module) on the SM PkhO (Transfer Compartment) exterior.

[Background: Before their separation, Descent Module (SA) & Instrumentation Compartment (AO) are connected by five locks, each “zamok” containing two pyrobolts (explosive bolts) with individual electrical connection, of which only one needs to fire to release the lock. The locks are equally spaced around the 360-degree circumference of the separation plane, i.e., 72 deg apart. After the five locks have released, there are five spring-loaded pushers, also equally spaced, for separating the two modules by spring force. Each lock and pusher is located at the apex of two triangularly arranged aluminum pipes, i.e., altogether 20 inclined pipes, which make up the open truss structure between the modules.]

CEO (Crew Earth Observations) photo targets uplinked for today were **Mt. Etna, Sicily** (*nadir pass over Etna smoking. Crew was to shoot detail of black lava flows near summit*), and **Afar Rift Zone, Ethiopia** (*looking left towards the Red Sea Coast to document modern lava flows from several volcanoes. The alignment of fault lines also interests geologists. Lavas and fault lines relate to active opening of the Red sea and the Gulf of Aden*).

CEO photography can be studied at this “Gateway” website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 7:34am EDT [= epoch]*):

Mean altitude -- 345.3 km

Apogee height -- 350.8 km

Perigee height -- 339.7 km

Period -- 91.44 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0008292

Solar Beta Angle -- -19.8 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.75

Mean altitude loss in the last 24 hours -- 60 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 559002

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

07/10/08 -- Russian EVA-20a (7/10-11)

09/05/08 -- ATV1 Undocking

09/09/08 -- Progress M-64/29P undocking (from FGB nadir)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)
11/03/08 -- Soyuz TMA-13/17S relocation
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
1QTR CY09 -- STS-119/Discovery/15A launch – S6 truss segment
03/25/09 -- Soyuz TMA-14/18S launch
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 06/25/08

All ISS systems continue to function nominally, except those noted previously or below.

Crew sleep cycle shift: After wake-up at the regular 2:00am EDT this morning, the crew will begin their sleeptime at 2:30pm, i.e., three hours earlier than usual, followed by a late-night wakeup at 11:00pm, to adjust the planned Orlan-suited dry-run & Soyuz ingress training for live VHF telemetry/comm visibility over RGS (Russian Groundsites). Tomorrow's sleep period begins at 3:30pm and extends to the regular 2:00am on 6/27 (Friday). The crew will then have half the day off to recover from the sleep shift.

Upon wake-up, FE-1 Kononenko terminated his fifth MBI-12 SONOKARD experiment session, started last night, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

After resetting STTS communication/telemetry links for their stay in the DC1 Docking Compartment, Volkov & Kononenko continued preparations for the subsequent suited Soyuz emergency ingress and the training for the Orlan EVA-20a:

- Kononenko, with FE-2 Chamitoff assisting, installed the US EMU (Extravehicular Mobility Unit) lights and TV camera on the helmet of Orlan-M #26, based on uplinked detailed procedures, while

- Volkov set up the DC1 and the Soyuz Orbital Module (BO) for the simulation run, creating room for moving about in the Orlans by removing air ducts (VD1, VD2) in DC1 and the BVN fan/heater assembly with air duct in the BO.

Afterwards, the CDR & FE-1 had three hours blocked out for rehearsing emergency escape from the DC1 into the Soyuz spacecraft while clad in the bulky spacesuits. *[Should the DC1 exhibit a pressure anomaly during the Orlan EVA activities, the BO of the Soyuz would be used (off-nominally) as an airlock. This would require: equalizing the pressure between DC1 and BO, ingressing the BO, closing the BO-DC1 (SU) hatch, doffing the Orlan-Ms, equalizing the pressure between the BO and the SA, and ingressing the SA (which already contains the FE-2). Either restoring DC1 hermeticity or Soyuz relocation to the FGB nadir port or return to Earth could then be performed safely.]*

After conclusion of the exercise, Sergey restored the nominal STTS comm settings and reconfigured the DC1 & Soyuz SOTR (Thermal Control System) with its air ducts etc. back to nominal.

Meanwhile, Gregory Chamitoff had an hour set aside for unpacking cargo delivered on STS-124/1J and stowing it at its final locations.

For covering tomorrow's Orlan donning & checkout for real-time photo/video downlink via US Ku-band assets, Greg worked on setting up the SONY PD100 camcorder with the necessary connections, including long drag-thru cables from the DC1.

The FE-2 also prepared the third Icepac insertion into the MELFI (Minus Eighty Degree Laboratory Freezer for the ISS) in the Lab for upcoming sample stowage by retrieving one -32deg Icepac belt from stowage and inserting it in Section 1 of Tray B in Dewar 3. *[Second insertion: 6/19.]*

Chamitoff then completed a run with the MedOps experiment WinSCAT (Windows Spaceflight Cognitive Assessment Tool), his first onboard session, by logging in on the MEC (Medical Equipment Computer) and performing the psychological evaluation exercise on the laptop-based WinSCAT experiment. *[WinSCAT is a monthly time-constrained questionnaire test of cognitive abilities, routinely performed by astronauts aboard the ISS every 30 days before or after the PHS (periodic health status) test or on special CDR's, crewmembers or flight surgeons request.]*

The FE-1 conducted the periodic checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the passageways SM PrK (Service Module

Transfer Compartment)–ATV, PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1.

Working off the Russian discretionary “time permitting” task list, Oleg completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables

Kononenko also performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

At ~9:45am EDT, Greg Chamitoff, with Volkov & Kononenko floating beside him, downlinked two televised PAO messages of greetings, to be taped on the ground for use at NASA Visitors Centers around the US and for promotional clips for NASA TV and the NASA website.

At ~11:40am, the FE-2 powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply) and at 11:45am conducted a ham radio exchange with students at Robinson Elementary School, Robinson, TX. *[Robinson Elementary is a second and third grade public school in Robinson, a suburb of Waco, TX. The campus has approximately 250 students and 32 teachers and staff. Students are from, mostly, low to middle income families with a rural background. The school has been recognized by the state of Texas for their performance in the state-based TAKS test. Questions to Greg were uplinked beforehand: “What countries are represented by the space station right now?”; “Do you float or walk in the space station?”; “Have you walked in space?”; “How do you go to the bathroom?”; “What do you do for fun in the space station?”; “Can you email or surf the web on the space station?”; “Do you watch your TV shows or any TV shows on the space station?”; “Does the space station orbit at the same speed as the earth?”; “How do you take a shower or a bath?”]*

The crew worked out according to their regular 2.5-hr. physical exercise protocol (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS (CDR, FE-2), RED (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1). Afterwards, Gregory transferred the exercise data file to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Periodic Noise Level Survey Abort: Due to a software/display issue with the new SLM (Sound Level Meter), yesterday's scheduled acoustic station survey by

Chamitoff was aborted for lack of troubleshooting time. Currently being assessed and to be re-scheduled at a later time.

Columbus Troubleshooting: Ground teams are investigating what appears to be insufficient humidity collection (condensing) by the COL CWSA (Columbus Orbital Laboratory/Condensate Water Separator Assembly), possibly caused by a bad delta-pressure sensor, system blockage upstream of the sensor, or simply by the alteration of the station configuration by the addition of the Kibo JEM (Japanese Experiment Module). COL has also lost one of eight lighting fixtures, and a replacement with a spare LHA (Lamp Housing Assembly) is being considered.

VolSci Program: After receiving kudos from the PI for his excellent LOCAD Voluntary Science session last weekend, Greg Chamitoff was offered three choices each for the two weekends ahead (6/28-6/29, 7/5-6): (1) a SHERE (Shear History Extensional Rheology Experiment) session, to locate and assemble the SHERE hardware in the MSG WV (Microgravity Science Glovebox Work Volume) and assess the condition of the hardware (SHERE will study the effect of rotational preshear on a polymer fluid being stretched axially in a microgravity environment; this knowledge can be applied to designing and processing materials for future exploration missions); (2) an “operations improvement” session with SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellites) with all three satellites (single-satellite experiments to test new thrusting algorithms and demonstrate safe trajectories for the inspection of space structures; two-satellite experiments to introduce new controllers and on-line path planning tools for purpose of docking to a complex tumbling satellite; three-satellite runs for formation flight experiments to test initialization of a formation and obstacle avoidance; (3) an EPO (Education Payload Operations) Demo on Space Careers, creating an educational video discussing different careers found at NASA, to be used to produce an educational product to enhance existing education resources for students in grades 9-12. For 7/5-6: (1) SHERE (see above); (2) SPHERES (see above); (3) a LOCAD PTS (Lab-On-A-Chip Application Development – Portable Test System) surface sampling session using Glucan LAL cartridges, targeting yeast & molds on ISS surfaces.

EVA-20a Timeline Preview (preliminary): The Orlan EVA-20a by Volkov/EV1 & Kononenko/EV2 on 7/10 is scheduled to begin at ~2:18pm EDT (DC1 EV hatch open), to last an estimated 5 hrs 43 min, thus concluding at approximately 8:00pm. The EVA is supported by the DC1-based Strela 1 crane, operated via hand crank by EV1. Main objective is the inspection of the Soyuz TMA-12 spacecraft at its first separation plane (Plane I) followed by removal of one Soyuz pyrobolt for retrieval to the DC1. Before the removal of the separation bolt, protective covers will be temporarily installed on the spacecraft’s attitude control thrusters (later removed), the pyrobolt’s electrical connector will be demated, and the wiretie between the

pyrobolts will be cut. If enough time remains after the Soyuz activity, the spacewalkers will also install a new docking target (for the new MEM module) on the SM PkhO (Transfer Compartment) exterior.

CEO (Crew Earth Observations) photo target uplinked for today was Ganges River Delta (*the Ganges Delta is the world's largest delta. It empties into the Bay of Bengal and is one of the most fertile regions in the world. The Ganges Delta is one of CEO's long term monitoring sites. Context views of the delta were requested. There's particular interest in the land use boundaries. As with most deltas, there will probably have been clouds covering parts of the delta.*)

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 7:34am EDT [= epoch]*):

Mean altitude -- 345.3 km

Apogee height -- 350.9 km

Perigee height -- 339.8 km

Period -- 91.44 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0008287

Solar Beta Angle -- -22.4 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.75

Mean altitude loss in the last 24 hours -- 50 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54983

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

06/26/08 -- Orlan-suited dry-run & Soyuz ingress training

07/10/08 -- Russian EVA-20a (7/10-11)

09/05/08 -- ATV1 Undocking

09/09/08 -- Progress M-64/29P undocking (from FGB nadir)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)

11/03/08 -- Soyuz TMA-13/17S relocation

11/10/08 -- STS-126/Endeavour/ULF2 launch -- MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking

02/10/09 -- Progress M-67/32P launch

02/12/09 -- Progress M-67/32P docking

1QTR CY09 -- STS-119/Discovery/15A launch – S6 truss segment

03/25/09 -- Soyuz TMA-14/18S launch

2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD

3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation

05/27/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**

3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2

4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola

1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)

1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)

2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at

http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 06/24/08

All ISS systems continue to function nominally, except those noted previously or below.

Before breakfast and exercise, all crewmembers completed a 10-min session with the periodic Russian MedOps test "Hematokrit" (MO-10), which measures the red cell count of the blood, with CDR Volkov acting as CMO (Crew Medical Officer, Russian: Examiner). It was the second session for Volkov & Kononenko, the first for Chamitoff. *[The blood samples were drawn from a finger with a perforator lancet, then centrifuged in two microcapillary tubes in the M-1100 kit's minicentrifuge, and its hematocrit value was read off the tubes with a magnifying glass. It is a well-known phenomenon of space flight that red blood cell count (normal range: 30-45%) tends to go down over time. After the exam, the data were saved in the IFEP software (In-Flight Examination Program) on the MEC (Medical Equipment Computer), and Kononenko stowed the equipment.]*

FE-2 Chamitoff started out on the NASA SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment by initializing and donning an Actiwatch, using the HRF-1 (Human Research Facility 1) laptop. *[As other crewmembers before him, to monitor his sleep/wake patterns and light exposure, Gregory will be wearing the special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout this week, for the last time. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

The CDR serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out"-to-vacuum cycle on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated tonight at ~5:15pm EDT. Filter bed #1 regeneration was performed yesterday. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is*

currently performed four times more frequently to remove any lingering Freon-218 from the cabin atmosphere (last time done: 6/19&20).]

Before starting today's suited Soyuz ingress training, Sergey, Oleg and Greg conducted the standard 30-min. fit check of the Kazbek couches, the contoured shock absorbing seats in the Descent Module (SA) of the Soyuz TMA-12/16S spacecraft docked at the DC1 Docking Compartment. *[For the fit check, crew members removed their cabin suits and donned Sokol KV-2 suit and comm caps, got into in their seats and assessed the degree of comfort & uniform body support provided by the seat liner. Using a ruler, they then measured the gap between the top of the head and the top edge of the structure facing the head crown. The results were reported to TsUP. Kazbek-UM couches are designed to withstand g-loads during launch and orbital insertion as well as during reentry and brake-rocket-assisted landing. Each seat has two positions: cocked (armed) and noncocked. In cocked position, they are raised to allow the shock absorbers to function during touchdown. The fit check assures that the crewmembers, whose bodies gain in length during longer-term stay in zero-G, will still be adequately protected by the seat liners for their touchdown in Kazakhstan, either emergency or regular return.]*

After resetting DC1 communication/telemetry links for their presence, Oleg continued clearing and configuring the "Pirs" module for the spacewalk training, including deactivating the spherical Phantom device and the Lulin-5 electronics box of the "Matryoshka-R" (RBO-3-3) radiation payload suite plus ancillary hardware and moving all of it to the FGB for temporary stowage.

Continuing preparations for the Orlan EVA-20a on 7/10-11, Volkov first tested the proper function of the pressure equalization valve (PEV; Russian: KVD) in the DC1 (SU)-to-Soyuz transfer hatch. Volkov & Kononenko then had ~2 hrs set aside for rehearsing and training a possible emergency situation which calls for their translation from the DC1 to the Soyuz Orbital Module (BO) in flight suits, with a pressurized Orlan-M spacesuit and in two spacesuits. *[Should the DC1 exhibit a pressure anomaly during the Orlan EVA activities, the BO of the Soyuz would be used (off-nominally) as an airlock. This would require equalizing the pressure between DC1 and BO, ingressing the BO, closing the BO-DC1 (SU) hatch, doffing the Orlan-Ms, equalizing the pressure between the BO and the SA, and ingressing the SA (which already contains the FE-2). Either restoring DC1 hermeticity or Soyuz relocation to the FGB nadir port or return to Earth could then be performed safely.]*

Afterwards, Kononenko restored the nominal communications setup in DC1 and Service Module (SM).

Later, the CDR & FE-1 installed US add-on hardware on their Orlan suits and took

photographs for ground inspection. *[US add-ons include helmet lights, WVS (Wireless Video System) helmet cam & associated tools, DIDBs (Disposable In-suit Drink Bags), Fresnel lenses, Orlan tether adapters, adjustable fuse tether, DCS760 camera, needle-nose pliers, etc. from previous ECOKs (EMU Crew Options Kits).]*

In the DC1 "Pirs", Kononenko then removed the threaded QD (quick disconnect) screw clamps (BZV) of the SSVP docking & internal transfer system to enable contingency Soyuz undocking, should it become necessary.

Sergey Volkov also worked on the SM toilet systems (ASU), performing the monthly 30-min. maintenance/servicing of the facility, changing out replaceable ASU parts with new components, i.e., the urine receptacle (MP) and a filter insert (F-V). The old parts were discarded as trash.

Greg completed the periodic relocation of the IVCPDS/TEPC (Intravehicular Charged Particle Directional Spectrometer/Tissue Equivalent Proportional Counter), the primary radiation measurement tool in the ISS, from Lab at position LAB1S4 to SM panel 449, plugging its power cable in the CHeCS (Crew Health Care Systems) power/data outlet 6 on panel 450. *[Before its move to LAB1S4 on 5/21, TEPC was installed first on the Columbus L1A3 panel by Peggy Whitson, after Dan Tani had relocated it to the SM (panel 410) on 1/23/08 from its previous location in Node-2 (since 12/24/07).]*

The FE-2 also performed the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling a CWC (Contingency Water Container, #1062) with the collected water slated for processing. No samples were required. *[Transferred quantity is determined by allowing tank and CWC equalize with each other. Tank quantity stabilizes at a value higher than the neutral point. Waiting time ~30 min.]*

In the COL (Columbus Orbital Laboratory), Chamitoff did a quick inspection & cleaning job on the RGSH (Return Grid Sensor Housing) of the COL's ventilation system.

Gregory checked out the U.S. SLM (Sound Level Meter) instrument and then used it to conduct the periodic noise level measurements program in the station interior for a 2-hr acoustic survey, including transfer of the recorded data to the MEC (Medical Equipment Computer). *[A total of 45 acoustic measurements were obtained at four locations in the ATV-1, six locations in Node-2, 11 locations in the SM, eight locations in the COL, nine locations in the Kibo JPM, and four locations in the Kibo JLP. The survey also includes three crew preference locations taken at their perceived loudest locations in the station. The SLM gives instantaneous noise levels and their frequency spectra, which are transferred to the MEC laptop via an*

RS232 cable and later downlinked with regular CHeCS (Crew Health Care Systems) data dump or via OCA.]

Later, Chamitoff performed the monthly maintenance of the CEVIS (Cycle Ergometer with Vibration Isolation & Stabilization), focusing on isolator damage and documenting it with the videocam for ground evaluation.

The FE-2 also completed the periodic (monthly) inspection of the RED (Resistive Exercise Device) canister cords and accessories.

Oleg performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Later, Kononenko conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

The crew worked out according to their regular 2.5-hr. physical exercise protocol (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS (FE-1, FE-2), TVIS treadmill (CDR, FE-1), RED (FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR). Afterwards, Sergey transferred the exercise data file to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Gregory had about an hour for himself for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residence, if she/he chooses to take it.

At ~9:45am EDT, the two Russian crewmembers downlinked a PAO TV message of greetings and congratulations for the 30th Anniversary of the spaceflight of the first Polish cosmonaut, Miroslav Hermaszewski (Russian: Gerashevsky), who flew with Col. Pyotr Klimuk on June 27, 1978 on Soyuz-30 into orbit, spending 7 days 22 minutes 59 seconds in space. *[Hermaszewski’s flight was part of the East Bloc’s “Interkosmos” space program. After his flight, Hermaszewski continued to serve in the Polish armed forces. A Hero of the Soviet Union, he has been awarded the Soviet Order of Lenin, the Polish Order of the Grunwald Cross (1st degree), and other Polish decorations and medals. He was also conferred the Nicolaus Copernicus medal of the Polish Academy of Sciences. Today, Hermaszewski is retired and engaged, as a volunteer, in promoting space exploration. Hermaszewski sent a special message up to the ISS crew: “Hi there my friends!*

Cordial greetings from Miroslaw. I am happy that you are up there – realizing your dreams! Enriching wonderful tradition of World space technology! I regret that I cannot be now up there with the crew. I wish you a soft landing and see you on the ground! If I could have one request – would you mind making one photo of Poland? Cordial greetings from all of us here! Miroslaw Hermaszewski.”]

The three crewmembers had their regular periodic PMCs (Private Medical Conferences) via S- & Ku-band audio/video, Sergey at ~11:05am, Oleg at ~11:55am, Garrett at ~1:40pm.

At ~4:11pm, the crew will convene for their standard bi-weekly teleconference with the JSC Astronaut Office (Steve Lindsey), via S-band S/G-2 audio & phone patch.

At ~5:20pm, just before sleep time, Oleg will again set up the Russian MBI-12 SONOKARD (Sonocard) payload and start his fifth experiment session, using a sports shirt from the SONOKARD kit with a special device in the pocket for testing a new method for acquiring physiological data without using direct contact on the skin. Measurements are recorded on a data card for return to Earth.

[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember’s physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]

Still remaining on the voluntary task list item for Kononenko & Volkov today was an audit of expired Expedition 16 food rations, with repacking & preparation of food packages for disposal on the ATV1. *[To clear storage space for cargo items delivered on Progress M-64/29P.]*

Sleep Cycle Shift Preview: For adjusting the Orlan-suited dry-run & Soyuz ingress training next Thursday (6/26) to allow live VHF telemetry/comm visibility over RGS (Russian Groundsites), the crew will have an earlier (by 3 hrs) sleeptime tomorrow at 2:30pm EDT, followed by same-day wake-up at 11:00pm. On 6/26, sleep period begins at 3:30pm and extends to the regular 2:00am on 6/27 (Friday). The crew will then have half the day off to recover from the sleep shift.

BCC Dry Run: Early this morning, starting at 2:15am EDT and running for seven hours, MCC-Houston and its Moscow support group (HSG) conducted another BCC (Backup Control Center) dry run in test mode, with no involvement of the ISS crew or vehicle, with TsUP playing back ACT (American Contingency Telemetry) from the last BCC Checkout as test. *[Purpose of this periodic exercise is to*

demonstrate BCC functionality under Russian assets while providing proficiency training for HSG personnel at the HSR (Houston Support Room) and TsUP-Moscow specialists. The ISS EMCC (Emergency Mission Control Center), located in Russia, comprises TsUP/Moscow as the Lead Control Center, coupled with HSR at TsUP. The BCC facility provides a command and control capability from TsUP if the EMCC must be activated. This is the case in situations that render MCC-Houston unable to provide telemetry, voice, and command capability for extended periods. EMCC is also used when the threat of severe weather results in evacuation of the MCC-H building for extended periods. In such an emergency, both Russian servers (CMD/command & TM/telemetry) are transitioned from MCC-H connectivity to BCC configuration, after which only the BCC can connect to the CMD and TM ports. An actual contingency requiring switchover to the BCC occurred on 10/2/2002 when Hurricane Lili forced MCC-H to shut down at 4:00am EDT, and also last year during the Hurricane Katrina emergency.]

PPS P6 Capacity Test: At ~10:00am, a capacity test was started by ground commanding on the truss P6 battery sets 2B3 (channel 2B) and 4B3 (channel 4B), simultaneously. The PPS (Primary Power System) test involves discharging the batteries to their lower limits and then recharging them, in order to measure the effectiveness of recent (May '08) battery recondition activities. No systems powerdowns are required.

*CEO (Crew Earth Observations) photo targets uplinked for today were **Tigris-Euphrates Delta** (this area has undergone dramatic changes in the last few decades. The marshlands of the historic Tigris-Euphrates delta in southern Iraq have almost completely disappeared owing to excessive damming and drainage, according to a report from the UN Environmental Program. Overlapping, detailed, nadir views of the delta region were requested), **Mt. Etna** (Mt. Etna is a very active volcano located on the east coast of Sicily. It is the largest active volcano in Europe and some eruptions have been caught by past ISS crews. Nadir or near-nadir views were requested with overlapping frames. Documenting past lava flows [darker areas] and smaller cones and vents surrounding the volcano), and **Afar Rift Zone, Ethiopia** (the Afar region is one of our long term monitoring sites. We are particularly interested in documenting the faults, volcanoes, and past lava flows in this region. Overlapping frames were requested).*

*CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).*

ISS Orbit (as of this morning, 8:37am EDT [= epoch]):

Mean altitude -- 345.4 km

Apogee height -- 351.0 km

Perigee height -- 339.8 km
Period -- 91.44 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0008338
Solar Beta Angle -- -24.5 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.75
Mean altitude loss in the last 24 hours -- 62 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 54968

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

06/26/08 -- Orlan-suited dry-run & Soyuz ingress training
07/10/08 -- Russian EVA-20a (7/10-11)
09/05/08 -- ATV1 Undocking
09/09/08 -- Progress M-64/29P undocking (from FGB nadir)
09/10/08 -- Progress M-65/30P launch
09/12/08 -- Progress M-65/30P docking
10/01/08 -- **NASA 50 Years**
10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)
11/03/08 -- Soyuz TMA-13/17S relocation
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
02/10/09 -- Progress M-67/32P launch
02/12/09 -- Progress M-67/32P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/23/09 -- STS-119/Discovery/15A undocking
03/25/09 -- Soyuz TMA-14/18S launch
05/21/09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
07/30/09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 19S docking, May '09)**
4QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 06/23/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 10 of Increment 17.*

CDR Volkov, FE-1 Kononenko and FE-2 Chamitoff began their workday before breakfast with the periodic session of the Russian biomedical routine assessments PZeh-MO-7/Calf Volume Measurement & PZeh-MO-8/Body Mass Measurement (fourth for CDR & FE-1, second for FE-2), using the IM mass measurement device which Sergey Volkov broke down afterwards for stowage. *[Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference pints, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures. For determining body mass in zero-G, where things are weightless but not massless, the Russian IM "scales" measure the inertial forces that arise during the oscillatory motion of a mass driven by two helical metering springs with known spring constants. By measuring the time period of each oscillation of the unknown mass (the crewmember) and comparing it to the period of a known mass, the crewmember's mass is calculated by the computer and displayed.]*

The FE-1 performed the periodic service of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The regen process will be terminated before sleeptime, at ~5:30pm EDT. Bed #2 regeneration follows tomorrow. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle, normally done every 20 days, is currently performed four times more frequently to remove any lingering Freon-218 from the cabin atmosphere (last time: 6/19&20).]*

Pressing on with preparations for the Orlan EVA-20a on 7/10-11, Volkov & Kononenko, plus Chamitoff for some part, spent more time in the DC1 Docking

Compartment where they –

- Reviewed procedures for the Orlan-suited translation from the DC1 to the Soyuz BO/Orbital Module (when the FE-2 will be behind the closed SA/ Descent Module hatch), supported by ground specialist tagup,
- Searched for & gathered EVA tools & equipment, and
- Configured the BO & DC1 for the spacewalk *[mostly by transferring a large number of stowage items from the Soyuz & FGB to temporary locations in the DC1, SM (Service Module), COL (Columbus Orbital Laboratory), and also to Progress 29P and/or ATV1 for disposal, while keeping track of the moves in the IMS (Inventory Management System).]*

Gregory Chamitoff continued his JEM (Japanese Experiment Module) outfitting activities, today

- Connecting and activating the Kibo SLT (Station Laptop Terminal) on the JMP (JEM Pressurized Module) laptop table, after removing the SSC-14 (Station Support Computer 14) from it (but keeping it connected to its UOP/ Utility Outlet Panel),
- Reconfiguring the JMP laptop (local Bus 2) and IAA (Intravehicular Antenna Assembly) by connecting their jumper cables to the JLP (JEM Logistics Pressurized Section), and later
- Moving the SLT to a different location (and UOP) in the Kibo laboratory.

Volkov & Kononenko worked on the RS (Russian Segment) radiation payload suite “Matryoshka-R” (RBO-3-3)/SDTO (Station Development Test Objective) 50448.

[While Oleg opened the detector kit for checking out all Bubble Dosimeters for bubbles and photographing them for subsequent downlink of images, Sergey conducted the periodic time synchronization between the RSS1 laptop and BSPN payload server, after testing functionality by checking data comm between the two computers and synching RSS1 to station time with the RSC-E PingMaster application. The CDR then loaded new payload data in form of a parameter table into the RBO-3-3 hardware via the ShellForKE payload file transfer program.]

In preparation for an upcoming major IFM (Inflight Maintenance) task on the ITCS (Internal Thermal Control System), FE-2 Chamitoff had half an hour set aside to review and study background & procedures for the FSS (Fluid System Servicer) activities, scheduled later this week, on 7/26 & 7/27. *[The IFM will refill the LTL PPA (Low Temperature Loop Pump Package Assembly) accumulator, necessary due to the recent installation of the Lab AmiA (Antimicrobial Applicator) by Karen Nyberg during 1J and the leak at the LTL supply QD (Quick Disconnect). With the FSS set up on Day 1, Greg will also refill the MTL (Moderate Temperature Loop) PPA accumulator and the spare ITCS CSA (Coolant Sampling Adapter). Because both of the JEM ITCS CSAs were deleted from the 1J manifest, the plan is to eventually install the spare onboard CSA in the JPM to take samples until the JEM*

Adapters are delivered on a later mission. On Day 1 (7/26), Chamitoff will set up the FSS including filling its jumpers and the spare CSA. On Day 2 (7/27), the LTL & MTL PPA accumulators will be refilled, the FSS & FSS jumpers drained and purged to vacuum FSS jumpers, and everything stowed.]

Gregory had another hour reserved for working in the "Quest" Airlock, gathering and preparing the US hardware selected for use with the Russian spacesuits during the Orlan EVA-20a. *[Equipment to be installed on the Orlans includes helmet lights, WVS (Wireless Video System) helmet cam & associated tools, DIDBs (Disposable In-suit Drink Bags), Fresnel lenses, Orlan tether adapters, adjustable fuse tether, DCS760 camera, needle-nose pliers, etc. from previous ECOKs (EMU Crew Options Kits).]*

The FE-2 also completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Working off the Russian discretionary "time permitting" task list, the CDR performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Sergey Volkov unstowed and installed the equipment for the periodic Russian PZE-MO-10 "Hematokrit" testing which is scheduled for him and Oleg tomorrow. *[MO-10 measures the hematocrit (red blood cell mass) value of the blood (it is a well-known phenomenon of space flight that red blood cell mass {normal range: 30-45%} tends to go down over time).]*

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1).

Afterwards, Sergey transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Still remaining on the voluntary task list item for Kononenko & Volkov today was an audit of expired Expedition 16 food rations, with repacking & preparation of food packages for disposal on the ATV1. *[To clear storage space for cargo items delivered on Progress M-64/29P.]*

Sleep Cycle Shift Preview: For adjusting the Orlan-suited dry-run & Soyuz ingress training next Thursday (6/26) to allow live VHF telemetry/comm visibility over RGS (Russian Groundsites), the crew will have an earlier (by 3 hrs) sleeptime on Wednesday (6/25) at 2:30pm EDT, followed by same-day wake-up at 11:00pm.

On 6/26, sleep period begins at 3:30pm and extends to the regular 2:00am on 6/27 (Friday). The crew will then have half the day off to recover from the sleep shift.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 8:10am EDT [= epoch]*):

Mean altitude -- 345.5 km

Apogee height -- 351.0 km

Perigee height -- 339.9 km

Period -- 91.45 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0008318

Solar Beta Angle -- -26.2 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.75

Mean altitude loss in the last 24 hours -- 36 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54952

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

06/26/08 -- Orlan-suited dry-run & Soyuz ingress training

07/10/08 -- Russian EVA-20a (7/10-11)

09/05/08 -- ATV1 Undocking

09/09/08 -- Progress M-64/29P undocking (from FGB nadir)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)

11/03/08 -- Soyuz TMA-13/17S relocation

11/10/08 -- STS-126/Endeavour/ULF2 launch -- MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/23/09 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 06/22/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday -- off-duty for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff. Ahead: Week 10 of Increment 17.*

Sergey Volkov conducted the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The CDR also gathered weekly data on Total Operating Time & "On" durations of the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem for reporting to TsUP.

For some power switching by the PRO (Payload Rack Officer) at POIC (Payload Operations & Integration Center) on the ER4 (EXPRESS Rack 4) via ground commanding, FE-2 Chamitoff stopped sampling mode on the ANITA (Analyzing Interferometer for Ambient Air) payload, exited the software and powered down the laptop. Later, the procedures were reversed and ANITA powered up again with re-launched software. *[ANITA will be returned on STS-126/ULF-2.]*

Gregory also deinstalled the UOP DCP (Utility Outlet Panel/Display & Control Panel) bypass power cable to the VTR (Video Tape Recorder) at the Lab RWS (Robotics Work Station), now no longer required for a while.

At ~4:45am EDT, Kononenko powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply) and at 4:50am conducted a ham radio exchange with representatives of the

Kursk State Technical University who are participating in the Slavic Commonwealth Forum at the Dagomys (a giant resort complex/hotel near the Black Sea town of Sochi). *[Oleg was asked to take a few photos showing how he operated the ham radio and the equipment itself with cables going to the RSK-2 laptop, for downlink to TsUP-Moscow.]*

The three crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1).

At ~1:15pm, Greg Chamitoff had his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop).

Working off his suggested "time permitting" task list, CDR Volkov continued the session of the Russian GFI-8 "Uragan" (hurricane) earth-imaging program begun yesterday, using the NIKON D2X still camera and the Japanese HDV (High Definition) video camera provided by SFP Charles Simonyi. *[Uploaded targets were wooded areas in the Orenburg steppe, the Yasnyi Cosmodrome in nadir, the Irtysh river valley, video of the northern part of Taiwan, the confluence of the Desna and Seym rivers, Ugra National Park, the steppe 100 km south of Voronezh, one of the Chernozem river valleys, Yuri Gagarin's landing site, the Aral Sea, glaciers on the northern slopes of Kirghiz range to the west from lake Issyk-Kul, Tibet and Himalaya, remediation of the Soviet Army weaponry range to the south of Berlin, vestiges of flooding in Stavropol, floods in Volga-Aktyubinsk alluvial plain (photos downlinked in real time via BSRTM channel), and oil deposits in Kazakhstan.]*

Also working from the discretionary task list, the CDR conducted another run, his sixth, of the Russian DZZ-2 "Diatomeya" ocean observations program, using the NIKON-F5 DCS still camera and the HDV (high-definition) video camcorder from SM window 8 for ~20 min to record high production water areas for obtaining data on color field composition in dynamic regions of the ocean and in near-estuary areas of large rivers, plus the current cloud cover above these waters, its rating, and special forms of cloud formation. *[Target zones today in the North Atlantic were waters off Newfoundland Island, the Bay of Biscay and West Saharan offshore areas.]*

For the FE-1, a discretionary task list job was another session for Russia's Environmental Safety Agency (EKON), making observations and taking KPT-3 aerial photography of environmental conditions of the Baikonur Cosmodrome using the Nikon D2X with the SIGMA 300-800mm telephoto lens.

Still remaining on the voluntary task list item for Kononenko & Volkov today was an audit of expired Expedition 16 food rations, with repacking & preparation of food packages for disposal on the ATV. *[To clear storage space for cargo items delivered on Progress M-64/29P.]*

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 7:46am EDT [= epoch]):*

Mean altitude -- 345.5 km

Apogee height -- 351.2 km

Perigee height -- 339.8 km

Period -- 91.45 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0008476

Solar Beta Angle -- -27.3 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.75

Mean altitude loss in the last 24 hours -- 46 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54936

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

07/10/08 -- Russian EVA-20 (7/10-11)

09/05/08 -- ATV1 Undocking

09/09/08 -- Progress M-64/29P undocking (from FGB nadir)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)

11/03/08 -- Soyuz TMA-13/17S relocation

11/10/08 -- STS-126/Endeavour/ULF2 launch -- MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking

02/12/09 -- STS-119/Discovery/15A launch -- S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/23/09 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 06/21/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – lightened-duty day for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff. Today is Kononenko's 44th birthday. **Happy Birthday, Oleg Dmitriyevich!***

Volkov & Kononenko completed a review of flight procedures plus the standard 3-hr. training drill for a Soyuz TMA-12/16S relocation from the DC1 Docking Module to the FGB nadir port, supported by ground specialists via tagup on S-band/VHF-audio. *[Should "Pirs" fail to repressurize after ingress of the two spacewalkers on 7/11, a relocation of the Soyuz, docked to the DC1 nadir port with FE-2 Chamitoff already safely locked out in the 16S Descent Module, would become necessary. In addition, for the relocation the three crewmembers and the spacecraft will have to be prepared for a return to Earth in the event of a no-docking contingency, and the station has to be configured for uncrewed operation (for which intense planning is underway at NASA, ESA, and TsUP-Moscow). Today's 3-hr. OBT (on-board training) included Soyuz procedures and data analysis for ascent/descent, orbital flight and relocation as contained in RODF (Russian Operations Data File) books, tag-up with instructor, OBT simulator work on the RSK1 laptop, etc. It is assumed that Soyuz activation would be performed on 7/11 over RGS (Russian Groundsite) on DO13 (Daily Orbit 13), closure of hatch on DO15, undocking from DC1 on DO2 (~5:28pm EDT on 7/11), flyaround (~5:34pm) and redocking at FGB nadir at ~5:56pm (DO2).]*

Afterwards, the crew performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature*

risers. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]

The CDR conducted the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Volkov also gathered weekly data on Total Operating Time & "On" durations of the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem for reporting to TsUP.

Greg Chamitoff filled out the regular FFQ (Food Frequency Questionnaire), his second, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

At ~10:00am EDT, the crewmembers held their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

After setting up the Lulin-ISS radiation complex kit yesterday with its ICU (Interface Control Unit, Russian: BUI) for recharging the batteries of the four PILLE radiation dosimeters, Oleg today checked on the battery charges and reported to the ground, then disassembled and stowed the equipment.

Chamitoff performed the regular bi-monthly reboot of the OCA Router and File Server SSC (Station Support Computer) laptops.

For his Voluntary Weekend Science (VolSci) program today, Gregory conducted his first session with the LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System) payload, first conducting an OBT review and PI teleconference, then sampling/swabbing five surface sites for yeast & molds, using

Glucan LAL cartridges and a Negative Control sample of clean water. *[LOCAD uses small, thumb-sized “microfluidic” cartridges that are read by the experiment reader. The cartridges contain dried extract of horseshoe crab blood cells (LAL/ Limulus ameobocyte lysate) and colorless dye. LAL tests are used for the detection and quantification of bacterial endotoxins: in the presence of the bacteria, the dried extract reacts strongly to turn the dye a green color. Therefore, the more green dye, the more microorganisms there are in the original sample. Glucans are complex carbohydrate (sugar, D-glucose) macromolecules. The handheld device tests this new analysis technology by sampling for the presence of gram negative bacteria in the sample in about 15 minutes, showing the results on a display screen.]*

Background: *Lab-on-a-Chip technology has an ever-expanding range of applications in the biotech industry. Chips are available (or in development) which can also detect yeast, mold, and gram positive bacteria, identify environmental contaminants, and perform quick health diagnostics in medical clinics. The technology has been used to swab the MERs (Mars Exploration Rovers) for planetary protection. With expanded testing on ISS, began by Sunita Williams in March/April last year, this compact technology has broad potential applications in space exploration--from monitoring environmental conditions to monitoring crew health. The current study should prepare for long-duration exploration by demonstrating a system that enables the crew to perform biochemical analysis in space without having to return samples to Earth.]*

The three crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1).

Afterwards, Gregory transferred the crew’s exercise data file to the MEC for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

The Russian crewmembers had their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop), Oleg at ~6:30am (receiving birthday congrats from his wife and two children), Sergey at ~8:05am.

Working off his suggested “time permitting” task list, CDR Volkov performed another session of the Russian GFI-8 "Uragan" (hurricane) earth-imaging program using the NIKON D2X still camera and the Japanese HDV (High Definition) video camera provided by SFP Charles Simonyi. *[Uploaded targets were general views of the Pyrenees, the Alps-Sudetes-Tatras-Carpathians mountain chain , the Desna &*

Seym river confluence, steppes to the south of Voronezh, the valley of one of the Central Chernozem area rivers running from the north to the south to the Volga-Don delta, the Yasnyi launch site in nadir, remediation efforts of the former Soviet Army firing range in Germany, Ugra National Park, the hydrological situation on the Volga-Aktyubinsk alluvial plain, the coastal strip of the Aral Sea, tips of Pamir glaciers to the west, Fedchenko glacier, Karakorum glaciers, scenic photography of the Himalayas, detailed photography of the Himalayas tallest mountain peaks, the valley of one of the rivers in Moldova in nadir, the Kerch Strait, vestiges of flooding in the Stavropol Territory, the Mzymta river estuary near Adler, glaciers on the northern slope of the Caucasus Range in an area from the Elbrus to Kazbek, woodlands near northern shore of Sevan lake, glaciers near arc-shaped water reservoir dams on the south shore of Rhone river falling into the Lake of Geneva from the east, and general coastline views of the Balkans and Greece with her islands.]

For Kononenko, the Russian voluntary task list suggested another ECON KPT-3 session for today, making observations and taking aerial photography of environmental conditions for Russia's Environmental Safety Agency (ECON) using the Nikon D2X digital camera with SIGMA 300-800mm telephoto lens. *[Today's target zones: Lake Balkash and the Aral Sea.]*

Still remaining on the voluntary task list item for Kononenko & Volkov today was an audit of expired Expedition 16 food rations, with repacking & preparation of food packages for disposal on the ATV. *[To clear storage space for cargo items delivered on Progress M-64/29P.]*

HRM Troubleshooting: Troubleshooting attempts by the crew on a Heart Rate Monitor have not been successful as yet. Planning for more is underway.

COL Labeling Discrepancies: A total of eight fire ports in the COL (Columbus Orbital Laboratory) have been found to be labeled differently from the printed COL Emergency Procedures. This may put the crew at risk. Work is underway at COL-CC to determine best choice of correcting the discrepancies (either relabeling or reprinting the procedures).

SKV Restoration Outlook: For the restoration of the two Russian SKV air conditioners, both currently nonfunctional, plans are to attempt a recharge of SKV-2 with Khladon (Freon-218) in early July, timeline permitting. The retry could cause an additional leak but the crew will cap it as quickly as possible (if required, would also use Khladon from SKV-1). Check valves of both SKVs are post-EOL (end-of-life). New heat exchangers are being built in Russia for both SKVs, to be ready by the end of the year. US CCAA (Common Cabin Air Assembly) air conditioners are

currently active in the Lab (P6), in Node-2 and in the Airlock.

Weekly Science Update (*Expedition Seventeen -- Week 9*)

PADLES (Passive Dosimeter for Lifescience Experiment in Space): In progress.

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):
Measurements continue in FGB module.

ANITA (Analyzing Interferometer for Ambient Air): Continuing.

BCAT-3 (Binary Colloidal Alloy Test 3): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System):
In progress.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): In progress.

FSL (Fluid Science Laboratory): In progress.

GEOFLOW: In progress.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION w/REPOSITORY: "Greg, thank you for your efforts in completing the FD15 session. We appreciate the attention to detail in maintaining blood timeline constraints."

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SAMPLE: Inc16 samples have been downloaded with 15S and handed over to science team.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): "Greg, next week you will have your first Sleep Actiwatch download/initialization session. Due to a recent hardware issue in the previous crew rotation, we have spaced out your Actiwatch download task and Actiwatch initialization task to allow time for a downlink and verification of the data in between. This will allow the Sleep Experiment Support Scientist to verify the data before you initialize the Actiwatch, which is an operation that starts to overwrite the previous period's data."

SOLAR (Solar Monitoring Observatory): In progress.

SOLO: Planned.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite):
In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

3-D SPACE : In progress.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): In progress.

CEO (Crew Earth Observations): Through 6/16 the ground has received a total of 2,124 of ISS/CEO images for review and cataloging. No imagery was received since the last crew change and the resumption of CEO Target Lists on 6/17. “We look forward to working with you and helping you acquire good imagery of our science targets. Any feedback on our products and how we are doing in our support would be most welcome!”

CEO (Crew Earth Observations) photo targets uplinked for today were Madrean Sky Islands, New Mexico (this target is located in the northern reaches of Mexico’s Sierra Madre Occidental which boast some of the richest biodiversity anywhere in North America. The “Sky Islands” are a veritable archipelago of cool, moist, higher-altitude pine-oak forested mountain ranges that dot the hot deserts of southern Arizona New Mexico northwestern Mexico. These climatological islands, situated in remote and rugged areas, are being heavily modified by logging.

General images were requested for this relatively new site), East Haruj Megafans, Libya (ancient, now defunct rivers [sourced in the Tibesti Mountains to the south of the site when the Sahara Desert was much wetter] have laid down vast spreads of sediment as a series of large fans hundreds of km long and wide. As rivers shifted position they produced networks of criss-crossing stream channels covering the entire surface of megafans. Earth’s megafans may be the best analog for widespread “intercrater plains” on Mars. This analog is being applied for the first time in ongoing research), and Mississippi River flooding (Dynamic event. **ISS passed directly over sectors of the Mississippi River where levee breaks have occurred.** Cloud cover may break sufficiently to allow views of the river. Looking

left and then right of track for about 1.5 mins).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 8:52am EDT [= epoch]*):

Mean altitude -- 345.5 km

Apogee height -- 351.3 km

Perigee height -- 339.9 km

Period -- 91.45 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0008326

Solar Beta Angle -- -28.0 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.75

Mean altitude loss in the last 24 hours -- 71 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54921

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

07/10/08 -- Russian EVA-20 (7/10-11)

09/05/08 -- ATV1 Undocking

09/09/08 -- Progress M-64/29P undocking (from FGB nadir)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)

11/03/08 -- Soyuz TMA-13/17S relocation

11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking

02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment

02/14/09 -- STS-119/Discovery/15A docking

02/23/09 -- STS-119/Discovery/15A undocking

2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD

3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation

05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**

3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2

4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 06/20/08

All ISS systems continue to function nominally, except those noted previously or below.

Crew wake-up was half an hour earlier (1:30am EDT) for the Orlan training exercise, enabling suit telemetry over RGS (Russian Groundsites). Sleep time tonight will be back at regular time (5:30pm).

In the DC1 "Pirs", the CDR & FE-1 continued preparations for the EVA-20 on 7/10-11, with the DC1 comm links configured for their presence. Activities by Volkov & Kononenko today focused on

- Functional testing of the Russian BETA-08 ECG (electrocardiogram) lead cable belts, worn under the Orlan-M suits, using the Gamma-1M medical complex from the PKO medical exam panel,
- Transmission tests, after setting up the Orlan "Tranzit" communications links via the suits' BRTA radio telemetry units, with the ground via RGS VHF, for spacesuit voice, telemetry & biomedical parameters; followed by
- Restoring nominal communications setup in the DC1, and
- Configuring the backup Orlan #25 for stowage mode, leaving Orlans #26 (FE-1) & #27 (CDR) ready for use on the upcoming spacewalk.

In the U.S. "Quest" Airlock, FE-2 Chamitoff continued post-1J EVA activities, terminating the 13-hr discharge process on the last 16-volt EMU (Extravehicular Mobility Unit) battery in the BCM-3 (Battery Charger Module 3) from yesterday. *[BCM-4 is currently nonfunctional. The discharge process, originally handled manually by a crewmember, is an automated procedure controlled from an A31p SSC (Station Support Computer) laptop with a special DOS application.]*

The CDR serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out"-to-vacuum cycle on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated tonight at ~5:15pm

EDT. Filter bed #1 was regenerated yesterday. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle is regularly done every 20 days.]*

After breaking out the auditory test equipment, Gregory Chamitoff took the periodic O-OHA (on-orbit hearing assessment) test, a 30-min. NASA environmental health systems examination to assess the efficacy of acoustic countermeasures, using a special MEC (Medical Equipment Computer) laptop application. It was his first O-OHA session. *[The O-OHA audiography test involves minimum audibility measurements for each ear over a wide range of frequencies (0.25-10 kHz) and sound pressure levels, with the crewmembers using individual-specific Prophonics earphones, Bose ANC headsets and the SLM (sound level meter). To conduct the testing, the experimenter is supported by special EarQ software on the MEC, featuring an up/down-arrow-operated slider for each test frequency that the crewmember moves to the lowest sound pressure level at which the tone can still be heard. The baseline test is required not later than about Flight Day 14 for each new Expedition and is then generally performed once per month. Note: There have been temporary hearing deficits documented on some U.S. and Russian crewmembers, all of which recovered to pre-mission levels.]*

Later, after setting up the video equipment, Chamitoff underwent his first PFE (Periodic Fitness Evaluation) session on the CEVIS cycle ergometer, with Volkov assisting in filming Greg and obtaining his blood pressure measurements during the CEVIS workout. Subsequently, the FE-2 completed data entry and stowed the PFE and video hardware. *[The U.S. PFE w/o Blood Lab is a monthly 1.5-hr. procedure which checks up on blood pressure and electrocardiogram (ECG) during programmed exercise on the CEVIS (Cycle Ergometer with Vibration Isolation) in the Lab. Readings are taken with the BP/ECG (blood pressure/electrocardiograph) and the HRM (heart rate monitor) watch with its radio transmitter. BP/ECG provides automated noninvasive systolic and diastolic blood pressure measurements while also monitoring and displaying accurate heart rates on a continual basis at rest and during exercise.]*

Continuing Kibo laboratory outfitting, the FE-2 worked in the JPM (JEM Pressurized Module), removing the launch lock on the JPM internal port TV camera.

For setting up the Kibo SLT (Station Laptop Terminal), Chamitoff powered off the SSC-14 (Station Support Computer 14), relocated it in the JPM and plugged it into a new UOP (Utility Outlet Panel).

In the SM (Service Module), Kononenko downloaded protocol/log files of the BRI Smart Switch Router to the RSS1 laptop for subsequent dumping to the ground via OCA, for specialists to review issues, then rebooted the RRS1. *[BRI is part of the*

RS OpsLAN network with connections to the three SSC clients, the Ethernet tie-in with the US network, and a network printer in the RS (Russian segment).]

The FE-1 also performed functional verification of the ongoing radiation data monitoring for flux & dose rate data with the Matryoshka-R radiation payload via its Lulin-5 electronics box, supported by specialist tagup via S-band. *[Accumulated readings were recorded on a log sheet for subsequent downlink to TsUP/Moscow over the BSR-TM payload data channel.]*

Later, Kononenko unstowed the Lulin-ISS radiation complex kit, set up its ICU (Interface Control Unit, Russian: BUI) and connected it to a power outlet (PPS-26) with four PILLE radiation dosimeters, to allow their battery to recharge for the next 24 hrs. *[Done before on 4/24.]*

Performing routine maintenance on the primary CSA-CP (Compound Specific Analyzer-Combustion Products) instrument, Gregory replaced its battery (#1080) with a fresh one (#1329), then re-deployed the unit.

Kononenko conducted the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the passageways PrK (SM Transfer Compartment)–ATV, PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1.

Oleg also set up the pumping equipment and initiated (later closed out) the periodic transfer of urine from 9 EDV-U containers in the SM to the Rodnik BV2 tank of Progress M-64/29P, then flushed the system with ~5 L of disinfectant solution. *[Transfer hoses were discarded as usual.]*

As part of regular preventive maintenance of RS ventilation systems, Sergey meanwhile applied vacuum cleaner and soft brush to cleaning the detachable VT7 fan screens 1, 2 & 3 of the three SOTR (Thermal Control System) gas-liquid heat exchangers (GZhT4) In the FGB (Funktsionalnyi-Grusovoi Blok).

The FE-2 unstowed, activated and checked out a new AED (Automated External Defibrillator) in the CHeCS (Crew Health Care Systems) rack for future use on the ISS, disposing of the old defibrillator. *[The AED is a portable electronic device that automatically diagnoses the potentially life threatening cardiac arrhythmias of ventricular fibrillation and ventricular tachycardia in a patient. It then can treat them through defibrillation, i.e., the application of electrical therapy which stops the arrhythmia, allowing the heart to reestablish an effective rhythm. AEDs are generally either held by trained personnel who will attend events or are public access units which can be found in places including corporate and government*

offices, shopping centers, airports, restaurants, casinos, hotels, sports stadiums, schools and universities, community centers, fitness centers, health clubs and any other location where people may congregate.]

Afterwards, Gregory deployed a new CCPK (Crew Contamination Protection Kit, #1002) and new Eyewash Kit in the SM (near the SVO-ZV water tap/port).

Chamitoff also deployed new medical SODF (Station Operations Data File) books and updated checklists (cue cards), easily accessible in a Lab rack drawer used for medical items (LAB1D4_D1).

The FE-2 took measurements for the regular atmospheric status check for ppCO₂ (Carbon Dioxide partial pressure) in the Lab, SM (at panel 449) and COL (Columbus Orbital Laboratory), using the hand-held CDMK (CO₂ Monitoring Kit) #1002). *[The battery pack was to be replaced with the one from unit #1009 if necessary.]*

With the U.S. CDRA (Carbon Dioxide Removal Assembly) deactivated by the ground this morning (~5:00am-9:45am) and its cooling no longer required, Chamitoff demated and took down the ITCS LTL (Internal Thermal Control System/ Low Temperature Loop) jumper at the CDRA-supporting LAB1D6 rack.

After the hold put by the ground on the use of O₂ bottles (due to some corrosion observed on O₂ pressure gauges on ground units), Gregory took documentary close-up photography of the OUM-PFE (Oxygen Uptake Measurement - Periodic Fitness Evaluation) payload's DS (Gas Delivery System) for ground analysis.

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2/PFE), TVIS treadmill (CDR, FE-1), RED resistive exercise device (C DR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1).

Afterwards, Sergey transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Chamitoff conducted the periodic (every two weeks) inspection of the RED canister bolts, to be re-tightened if required. *[Deferred from 6/17.]*

The CDR completed the routine maintenance of the SOZh system (Environment

Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Volkov also performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Still remaining on the voluntary task list item for Kononenko & Volkov today was an audit of expired Expedition 16 food rations, with repacking & preparation of food packages for disposal on the ATV. *[To clear storage space for cargo items delivered on Progress M-64/29P.]*

At ~5:10am EDT, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU/*Glavnaya operativnaya gruppa upravleniya* = “Main Operative Control Group”), including Shift Flight Director (SRP), at TsUP-Moscow via S-band/audio, phone-patched from Houston and Moscow.

At ~6:05am, Sergey & Oleg linked up with TsUP stowage specialists via S-band to conduct the weekly IMS tagup, discussing stowage issues, equipment locations and Progress cargo transfers. *[Issues discussed today concerned Progress 29P unloading status, number of remaining ASU toilet replaceable rings, whereabouts of a specific cable, etc.]*

At ~3:10pm, the ISS crew is scheduled for their regular weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. *[S/G-2 (Space-to-Ground 2) phone patch via SSC (Station Support Computer)].*

MT Translation: The planned move of the MT (Mobile Transporter) from WS-6 (Worksite 6) to WS-4 is now scheduled for today at ~3:00pm-4:30pm. Russian RCS (Reaction Control System) thrusters will be disabled for this purpose at 3:00pm - 5:30pm.

WRM Update: An updated Water Recovery Management “cue card” was uplinked for the crew’s reference. *[The new card (17-0002M) lists 36 CWCs (~1448.4 L total) for the four types of water identified on board: technical water (694.6 L, for Elektron, flushing, hygiene, incl. 553.4 L non-usable water because of Wautersia bacteria), potable water (706.7 L, incl. 260.6 L currently on hold), condensate water (39.2 L), waste/EMU dump and other (7.9 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]*

CEO (Crew Earth Observations) photo targets uplinked for today were **Mt.**

Vesuvius (*Vesuvius is of course famous for its 79 AD eruption destroying the towns of Pompeii and Herculaneum. The volcano is still considered active and could erupt in the near future. The volcano's proximity to Naples is of great concern. Trying for nadir views of the volcano*), **Mt. Etna** (*Mount Etna, towering above Catania, Sicily's second largest city, has one of the world's longest documented records of historical volcanism, dating back to 1500 BC. Historical lava flows of basaltic composition cover much of the surface of this massive volcano, whose edifice is the highest and most voluminous in Italy. Context views of the volcano were requested*), **Central-Arizona Phoenix** (*the Central-Arizona Phoenix site is part of the Long Term Ecological Research [LTER] suite of sites. The main objective for these sites is to document the land cover/land use change on a seasonal basis. Looking for land cover or land use boundaries and document with overlapping frames*), and **Teide Volcano** (*the large triangular island of Tenerife is composed of a complex of overlapping volcanoes that have remained active into historical time. The United Nations Committee for Disaster Mitigation have designated Teide as a Decade Volcano. It is considered to be the 13th most dangerous volcano in the world due to its proximity to several major towns and the nearby city of Puerto de la Cruz. Contest views of the volcano were requested*).

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 8:48am EDT [= epoch]*):

Mean altitude -- 345.6 km

Apogee height -- 351.3 km

Perigee height -- 339.9 km

Period -- 91.45 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0008459

Solar Beta Angle -- -28.1 deg (magnitude peaking)

Orbits per 24-hr. day -- 15.75

Mean altitude loss in the last 24 hours -- 233 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54905

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

07/10/08 -- Russian EVA-20 (7/10-11)

09/05/08 -- ATV1 Undocking

09/09/08 -- Progress M-64/29P undocking (from FGB nadir)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)
11/03/08 -- Soyuz TMA-13/17S relocation
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
02/14/09 -- STS-119/Discovery/15A docking
02/23/09 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 06/19/08

All ISS systems continue to function nominally, except those noted previously or below.

Small sleep cycle shift: The crew goes to sleep half an hour earlier tonight for a 30-min earlier wakeup tomorrow morning in support of the Orlan training exercise, enabling suit telemetry over RGS (Russian Groundsites).

Volkov & Kononenko completed the two-hour Part 2 of their second onboard "Profilaktika" (MBI-8, "Countermeasures") series of preventive health maintenance fitness testing on the treadmill, assisting each other in turn. *[Today's fitness test was performed on the TVIS in unmotorized (idle) mode, with free choice of speeds within the range permitted. The test investigates the action mechanism and efficiency of various countermeasures (currently VELO and TVIS) aimed at preventing locomotor system disorders in weightlessness. The test differs from the normal TVIS session by the use of the TEEM-100 gas analyzer (via a mask equipped with a pneumotachometer sensor), measurement of blood lactate level and subjective evaluation of physical exertion levels during the test. The lactate blood samples were taken twice at the end of the session, using the ACCUSPORT analyzer and REFLOTRON-4 accessories. Results were entered on a log sheet. TEEM and ECG (electrocardiograph) data were transferred to the RSE-Med laptop, also on a tape cassette (Cardiocassette-2000), and prepared for later downlink via Regul-Packet comm.]*

Sergey & Oleg also underwent their second periodic (generally monthly) health test with the cardiological experiment PZEh MO-1 ("Study of the Bioelectric Activity of the Heart at Rest") on the TVIS (Treadmill with Vibration Isolation System). *[During the 40-min. test, the crewmembers tagged up with ground specialists on an RGS (Russian ground site) pass on DO3 (~5:13am EDT) via VHF and downlinked data from the Gamma-1M ECG (electrocardiograph) for about 5-6 minutes.]*

The CDR performed the periodic service of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The regen process will be terminated before sleeptime, at ~4:20pm EDT. Regeneration of bed #2 follows tomorrow. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle is normally done every 20 days, currently more frequently (last time: 6/13-14).]*

The crew conducted the regular fire drill/OBT (on-board training), a mandatory periodic one-hour exercise (including ground debrief conference). Primary goal of this Russian-led interactive exercise is to provide the station residents with the most realistic emergency training possible. The drill is always conducted with the support of both MCCs in close coordination. It should be performed every 2.5 months, but not later than 1 month prior to end of Increment. *[OBT objectives are to (a) practice fire response procedures (FRPs) and all incorporated actions for the case of a software-detected fire to locate, extinguish, and verify extinguishing attempts; (b) browse through RS laptop and the Signal-VM fire detection system displays as well as the automated software (algorithms) response to the fire event; (c) practice crew communication necessary to perform emergency FRPs; (d) ensure familiarization with support equipment (CSA-CP compound specific analyzer-combustion products, PBAs portable breathing assemblies, PFE/OSP-4 portable fire extinguishers, and IPK-1M gas masks to be used for fire suppression. These exercises do not actually use any fire equipment but simulate such actions to the maximum extent possible. The Emergency Procedures OBT concluded with a 15-min. debrief with Russian/U.S. ground specialists at ~4:00am EDT via S-band. The crew identified six Columbus locations where fireport labels did not match procedures; ESA is working to correct the discrepancies.]*

The CDR & FE-1 continued their preparations for the Orlan EVA (#20) on 7/10 and tomorrow's training exercise, performing further Orlan spacesuit activities in the DC1 "Pirs" Docking Compartment.

After configuring the DC1 communications link to support their presence, Volkov & Kononenko today –

- Completed individual fit sizing (central strap, lateral strap, hip strap, calf strap, arm cable and shoulder size, front & rear) on their suits *[#27 with red stripe for CDR, #26 with blue stripe for FE-1, #25 for recertification testing (life extension)]*,
- Ran leak checks & valve functionality tests on the Orlans and their BSS interface units in the DC1 & SM PkhO (Service Module Transfer Compartment) from the EVA support panels (POV);
- Performed leak checking on the backup bladder of suit #27, and
- Conducted pressure checks on the SM BK-3 oxygen (O₂) tanks and the

BNP portable repress O₂ tank in the DC-1 airlock module.

In the U.S. "Quest" Airlock, FE-2 Chamitoff continued post-EVA activities after 1J, closing down the regeneration of METOX (Metal Oxide) CO₂ absorption canisters #0020 & #0021 started yesterday, terminating the 13-hr discharge process on the 16-volt EMU (Extravehicular Mobility Unit) battery #2072 in the BCM-3 (Battery Charger Module 3) from yesterday and initiating the process on the second battery. *[BCM-4 is currently nonfunctional. The discharge process, originally handled manually by a crewmember, is an automated procedure controlled from an A31p SSC (Station Support Computer) laptop with a special DOS application.]*

In Japan's Kibo laboratory, Chamitoff readied the SCOF (Solution Crystallization Observation Facility) and PCRf (Protein Crystallization Research Facility) payloads for operation by connecting their video cables to the IPU (Image Processing Unit) and bus cables to the ISPR UIP (International Standard Payload Rack Utility Interface Panel). *[The SCOF cell exchange door was then opened for photography of the SCOF interior setup.]*

The FE-2 also set up VAJ (Vacuum Access Jumper) connections from the Kibo WG (Waste Gas) and VV (Vacuum Vent) for initial VV exhaust gas activation.

The FE-1 performed potable water transfer from the Progress M-64/29P Rodnik tank #2 to several EDV containers in the SM, then compressed the tank #2 bladder. *[After hooking up the plumbing connecting the 29P water tank with the SM and EDV containers, the water was transferred at first in self-flow (under its own tank pressure), then using an electric compressor pump. Rodnik tank #1 in 29P is already filled with urine.]*

Chamitoff retrieved and stowed the four passive FMK (Formaldehyde Monitoring Kit) sampling assemblies deployed by him on 6/17 in the Lab (at P3, below CEVIS) and SM (at the most forward handrail, on panel 307), to catch any atmospheric formaldehyde on a collector substrate for subsequent analysis on the ground.

[Two monitors each are usually attached side by side, preferably in an orientation with their faces perpendicular to the direction of air flow.]

After data download from the IWIS (Internal Wireless Instrumentation System, CDR Volkov restored the IWIS setup and stowed the equipment used for the download.

Greg Chamitoff conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WRM (Water Recovery & Management (WRM)) assessment of onboard water supplies. *[Updated "cue cards" based on the crew's water calldowns are sent up every other week. The current card (17-0002L) lists*

37 CWCs (~1457.2 L total) for the four types of water identified on board: technical water (694.6 L, for Elektron, flushing, hygiene, incl. 553.4 L non-usable water because of Wautersia bacteria), potable water (706.7 L, incl. 260.6 L currently on hold), condensate water (29.1 L), waste/EMU dump and other (7.9 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]

The FE-2 also prepared the second Icepac insertion into the MELFI (Minus Eighty Degree Laboratory Freezer for the ISS) in the Lab for upcoming sample stowage by retrieving two -32deg Icepac belts (#00070645J & #00062959J) from stowage and inserting them in Sections 3 & 4 of Tray A in Dewar 3. *[First insertion: 6/17.]*

Volkov completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Sergey also performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The CDR had 30 min reserved for transferring trash to the ATV (Automated Transfer Vehicle) and loading it aboard, guided by an uplinked cargo transfer list and stowage map (to ensure proper center-of-gravity positioning for post-undocking control).

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR/MBI-8, FE-1/MBI-8), and RED resistive exercise device (FE-2).

Afterwards, Gregory transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Still remaining on the voluntary task list item for Kononenko & Volkov today was an audit of expired Expedition 16 food rations, with repacking & preparation of food packages for disposal on the ATV. *[To clear storage space for cargo items delivered on Progress M-64/29P.]*

At ~12:45pm EDT, Flight Engineer Chamitoff participated in a live interactive PAO TV interview with KNTV-TV, San Jose, CA (Brent Cannon, Laura Garcia-Cannon)

from the Node-2. *[Greg has spent his early years in San Jose.]*

At ~1:05pm, CDR Volkov downlinked a crew message of congratulations to Cosmonaut Gennady Padalka, Commander of ISS Expedition 9 in 2004, who turns 50 on Saturday (6/21).

OUM-PFE Postponement: Today's scheduled preparations for Gregory's first session with the OUM-PFE (Oxygen Uptake Measurement - Periodic Fitness Evaluation) were postponed due to some corrosion observed in oxygen bottle pressure gauges on the ground, resulting in metallic debris. *[The bottles are part of the GDS (Gas Delivery System) in the HRF-2 (Human Research Facility 2) ground analog, and the O₂ is used to support OUM to evaluate crew health. The O₂ bottles will not be used until safety concerns due to possible FOD (Foreign Object Debris) in the O₂ lines can be addressed.]*

ATV Reboost Update: The ISS reboost with the ATV1 "Jules Verne" OCS (main propulsion) thrusters 1 & 3 was started at 2:41am EDT for 20 min 5 s and completed nominally. Actual Delta-V was 4.02 m/s vs. 4.02 m/s planned, resulting in a mean altitude increase of 7.04 km (3.80 nmi). Purpose of the reboost maneuver was altitude maintenance. ISS attitude control authority was handed over to RS MCS (Motion Control System) at 1:00am for the subsequent maneuver to reboost attitude at 1:05pm. After the burn, the station was turned back to TEA (Torque Equilibrium Attitude) and returned to US Momentum Management at ~3:40am. *[ATV "Jules Verne" has now successfully demonstrated all nominal functions intended for it (rendezvous & docking, cargo delivery, water transfer, propellant transfer, waste containment, and reboost) except for undocking and reentry.]*

MT Translation: A move of the Mobile Transporter from WS-6 (Worksite 6) to WS-4 is planned for tomorrow (9:58am-11:28am EDT).

Russian Orlan EVA: Planning is underway for the Russian EVA-20 from the DC1 on 7/10. If approved by the Partners, outboard activities by Volkov & Kononenko will include an inspection of the Soyuz TMA-12/16S docked at the DC1 nadir port and retrieval of a pyro bolt. The possibility of a second EVA about 4-5 days later is being kept in abeyance.

CEO (Crew Earth Observations) photo targets uplinked for today were **Yellow River Delta** *(although deltas typically have some cloud cover it looks like there should have been enough clear patches to take photos of this very dynamic delta. The Yellow River is the second-longest river in China. The Yellow River is called "the cradle of Chinese civilization" since its basin is the birthplace of the northern*

*Chinese civilizations and was the most prosperous region in early Chinese history. The time series imagery of this region available to CEO researchers shows a delta that is highly dynamic, changing its course recently because of human induced changes. Context views of the delta were requested), **Karakoram** (this is an extensively glaciated area with some of the world's longest mountain valley glaciers and elevations in the 20,000 to 29,000 ft range. This range spans the borders between Pakistan, China and India. Karakoram means "black gravel" in Turkic, as many of the glaciers are covered in rubble. K2, the second highest peak in the world is located within this mountain range. Documenting the extent of the glaciers. Context and overlapping views were requested), **Santa Barbara Coast, California** (the Santa Barbara Coastal Long Term Ecological Research [LTER] is located in the coastal zone of southern California near Santa Barbara. It is bounded by the steep east-west trending Santa Ynez Mountains and coastal plain to the north and the unique Northern Channel Islands archipelago to the south. Point Conception, where the coast of California returns to a north to south orientation, lies at the western boundary, and the Santa Clara River marks its eastern edge. The site lies on the active boundary of the Pacific Oceanic Plate and the North American Continental Plate. High levels of tectonic activity have created dramatic elevation gradients in both the terrestrial and the underwater landscapes of the site. Of interest are the effects of population and land use on this region. Overlapping images were requested), and **Yellowstone National Park, Wyoming** (Yellowstone NP is located mostly in the state of Wyoming, though some of it extends into Montana and Idaho. CEO researchers are currently monitoring the vegetation in the park on a seasonal basis. Regional views of the park were requested).*

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (as of this morning, 9:55am EDT [= epoch]):

Mean altitude -- 345.8 km

Apogee height -- 351.7 km

Perigee height -- 340.0 km

Period -- 91.45 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0008744

Solar Beta Angle -- -27.7 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.74

Mean altitude gain in the last 24 hours -- 7040 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54890

Significant Events Ahead (all dates Eastern Time, some changes possible.):

07/10/08 -- Russian EVA-20 (7/10-11)
 09/05/08 -- ATV1 Undocking
 09/09/08 -- Progress M-64/29P undocking (from FGB nadir)
 09/10/08 -- Progress M-65/30P launch
 09/12/08 -- Progress M-65/30P docking
 10/01/08 -- **NASA 50 Years**
 10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
 10/12/08 -- Soyuz TMA-13/17S launch
 10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
 10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)
 11/03/08 -- Soyuz TMA-13/17S relocation
 11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
 11/12/08 -- STS-126/Endeavour/ULF2 docking
 11/20/08 -- **ISS 10 Years**
 11/26/08 -- Progress M-66/31P launch
 11/28/08 -- Progress M-66/31P docking
 02/12/09 -- STS-119/Discovery/15A launch – S6 truss segment
 02/14/09 -- STS-119/Discovery/15A docking
 02/23/09 -- STS-119/Discovery/15A undocking
 2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
 05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
 3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
 4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
 1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
 1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
 2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 06/18/08

All ISS systems continue to function nominally, except those noted previously or below. >>>Today 25 years ago (June 18, 1983), Sally K. Ride became the first US woman to orbit the Earth. Launched on STS-7/Challenger, 32 years old at that time, she and her crew (CDR Bob Crippen) spent 6d 2h 23m in space.<<<

Before breakfast & first exercise, Volkov, Kononenko and Chamitoff completed a full session with the Russian crew health monitoring program's medical assessment MO-9/Biochemical Urinalysis. Afterwards, the FE-1 closed out and stowed the Urolux hardware. *[MO-9 is conducted every 30 days (and also before and after EVAs) and is one of five nominal Russian medical tests adopted by NASA for U.S. crewmembers for IMG PHS (Integrated Medical Group/Periodic Health Status) evaluation as part of the "PHS/Without Blood Labs" exam. The analysis uses the sophisticated in-vitro diagnostic apparatus Urolux developed originally for the Mir program. Afterwards, the data are entered in the MEC (Medical Equipment Computer)'s special IFEP software (In-Flight Examination Program).]*

Later in the day, Volkov & Kononenko also completed the first part of the onboard "Profilaktika" (MBI-8, "Countermeasures") preventive health maintenance fitness test on the VELO bicycle ergometer, assisting each other in turn. Part 2, on the TVIS treadmill, is scheduled tomorrow. *[Test procedure for MBI-8, which requires workouts on the VELO and TVIS, is identical to the Russian MO-5 assessment, but in addition to the nominal procedure it uses the TEEM-100M gas analyzer with breathing mask, a blood lactate test with the ACCUSPORT analyzer and REFLOTRON-4 accessories, and a subjective evaluation of physical exertion levels during the test (using the Borg Perceived Exertion Scale, viz., 10 steps from very light over hard and very hard to maximum). Results are entered on a log sheet. TEEM and ECG (electrocardiograph) data are transferred to the RSE-Med laptop, also on a tape cassette (Cardiocassette-2000), and prepared for later downlink via Regul-Packet comm. Results are also called down to specialists standing by at TsUP.]*

Major focus for the CDR & FE-1 today continued to be on Orlan spacesuit activities in the DC1 “Pirs” Docking Compartment, spreading over several days, i.e., preparing spacewalk hardware for the Orlan EVA (#20) on 7/10 and prior simulation exercises.

After configuring the DC1 communications link to support their presence, Sergey & Oleg –

- Equipped Orlan suits #27 & #26 with their respective new BRTA telemetry units,
- Performed leak checks & valve functionality tests on the Orlan BSS interface units in the DC1 & SM PkhO (Service Module Transfer Compartment) from their EVA support panels (POV);
- Degassed the cooling system (i.e., separated liquid/gas) of the Orlans & their BSS suit interface unit in DC1;
- Degassed the BSS interface unit in SM PkhO,
- Set up & prepared Orlan ORUs (orbit replaceable units) such as oxygen (O₂) tanks, batteries, lithium hydroxide (LiOH) cans, moisture collectors & feedwater filters (OTAs on the Orlans also typically include a right-hand swing arm, tool caddy, trash bags and tethers), and
- Reset the DC1 comm system to its regular configuration.

In the U.S. “Quest” Airlock, FE-2 Chamitoff continued post-EVA activities after 1J, terminating the regeneration of METOX (Metal Oxide) CO₂ absorption canisters #0015 & #0016 started yesterday and initiating the bake-out process on the third METOX batch, #0020 & #0021, with CDRA operating nominally.

The FE-2 also terminated the 13hr discharge process on the 16-volt EMU (Extravehicular Mobility Unit) batteries #2067 & #2071 in the BSA (Battery Stowage Assembly), and then started the discharge on EMU battery #2072, using BSA BCM-3 (Battery Charger Module 3) only. *[After the RPC-6 (Remote Power Controller 6) “fuse” tripped open yesterday, BCM-4, which it controls, is currently inoperable. There are 4 BCMs in the Airlock, and BCM-4 is not one of the two BCMs that were replaced during the 1J Mission. RPC-6 remains open while specialists continue to analyze the data to determine the cause for the trip. The discharge process, originally handled manually by a crewmember, is an automated procedure controlled from an A31p SSC (Station Support Computer) laptop with a special DOS application.]*

In the COL (Columbus Orbital Laboratory), Greg Chamitoff conducted an inspection of the CWSA (Condensate Water Separator Assembly)’s desiccant module (DM) in the D1 rack. *[Before inspecting and photodocumenting the DM and adjacent condensate flex line, the routing of the D1 Rack TCS (Thermal Control System)’s*

flex hoses had to be corrected and the visible portion of the condensate flex line inspected for observable damages or anomalous bending. Afterwards, the D1 rack panel was closed again.]

Moving then to the Kibo JPM laboratory, Greg modified the SCOF (Solution Crystallization Observation Facility) payload from its “safed” launch configuration to its operation config. *[SCOF is a JAXA (Japan Aerospace Exploration Agency) subrack facility for investigations of crystal growth phenomena in microgravity, housed in the “Ryutai” (fluid) experiment rack, along with the FPEF (Fluid Physics Experiment Facility), PCRF (Protein Crystallization Research Facility) and the IPU (Image Processing).]*

From the JLP (JEM Logistics Pressurized Section), Chamitoff retrieved the OI-H (On-Orbit Installed Handrail) and LDFRs (Long Duration Foot Restraints), to be install during a future EVA externally on the JPM and JEMRMS (Robotic Manipulator System) console.

The FE-2 also retrieved hard dummy panels from the JLP forward standoff for subsequent assembly and installation in the Kibo laboratory.

Oleg Kononenko took the periodic sensor readings of the Russian “Pille-MKS” (MKS = ISS) radiation dosimetry experiment which has ten sensors placed at various locations in the Russian segment (DC1, SM starboard & port cabin windows, ASU toilet facility, control panel, etc.). *[Nine of the ten dosimeters are read manually.]*

Continuing the current round of preventive maintenance on the Russian Segment (RS) ventilation system, Sergey Volkov replaced the two dust filters PS1 & PS2 in the *Funktsionalnyi-Grusovoi Blok* (FGB), registering the change in the IMS (Inventory Management System).

Gregory conducted the periodic atmospheric sampling in the center of the Lab, SM and JLP with the GSC (Grab Sample Container), while Oleg, in parallel, used the AK-1M adsorber to collect cabin air samples in the SM and FGB.

The FE-1 also completed the periodic (about twice a month) replenishing of the Elektron oxygen generator’s water supply for electrolysis, filling the KOV EDV container with water collected in CWC (Contingency Water Container) #1043 from the Lab CCAA (Common Cabin Air Assembly) dehumidifier. *[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown. With both Russian SKV air conditioners still not functioning, condensate is being produced (from air humidity) solely by the CCAA.]*

Kononenko completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Working off the Russian discretionary “time permitting” task list, Volkov performed the daily IMS maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Still remaining on the voluntary task list item for Kononenko & Volkov today was an audit of expired Expedition 16 food rations, with repacking & preparation of food packages for disposal on the ATV. *[To clear storage space for cargo items delivered on Progress M-64/29P.]*

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), RED resistive exercise device (FE-2) and VELO bike with bungee cord load trainer (CDR/MBI-8, FE-1/MBI-8).

Afterwards, Sergey transferred the exercise data file to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

In preparation for the ATV (Automated Transfer Vehicle) reboost tomorrow morning, Greg activated the RSUs (Remote Sensor Units) for the MAMS (Microgravity Accelerations Measuring System) and SAMS ICU (Space Acceleration Measurement System) as well as the EWIS (External Wireless Instrumentation System), for capturing structural dynamics data of the station during the event.

The new FE-2 again had about an hour for himself for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residence.

ATV1 Line Purge: After successfully transferring propellants from the ATV (Automated Transfer Vehicle) into ISS SM propellant tanks yesterday, ground personnel this morning (~2:35am EDT) conducted a propellant line purge, preceded by closure of the protective Lab science window shutters by Greg Chamitoff.

ATV1 Reboost: Tomorrow’s ISS reboost by the ATV main engines is scheduled for a TIG (Time of Ignition) of 2:41am EDT. Burn duration: 20 min 5,4 s, to yield a delta-V of 4.00 m/s (13.12 ft/s). The expected altitude gain (delta-H) is 6.92 km

(3.74 nm).

CEO (Crew Earth Observations) photo targets uplinked for today were **East Haruj Megafans** (*ancient rivers sourced in the Tibesti Mountains when the climate of the Sahara was wet [> 8000 years ago] have laid down vast spreads of sediment as a series of large fans ["megafans"] hundreds of km long and wide. A continuous pattern of criss-crossing stream channels, large and small, covers the entire surface of megafans. Flat "intercrater plains," measuring 104 km² and covered solely with what appear to be numerous river channels, cover large areas of Mars. Earth's megafans may be the best analog for these plains. Images of areas south of Tibesti are only available in low resolution: therefore crew imagery--continuous mapping saths taken with 400- and 800 mm lenses--are needed to provide the detail to reveal evidence of stream processes*), **Nasser, Toshka Lakes, Egypt** (*through ISS imagery of this site researchers have noted that the Toshka Lakes water levels appear to be declining. Context views of the lakes to the west of Lake Nasser are requested*), **Central-Arizona Phoenix** (*the Central-Arizona Phoenix site is part of the Long Term Ecological Research [LTER] suite of sites. The main objective for these sites is to document the land cover/land use change on a seasonal basis. Looking for land cover or land use boundaries and document with overlapping frames*), **Barringer Impact Crater** (*Barringer, or Meteor Crater, has been dated at approximately 50,000 to 60,000 years old. It was the study of this crater by Gene Shoemaker that set the standard for the identification and confirmation of impact craters around the world. Nadir view of the crater was requested*), **Niwot Ridge Tundra, Colorado** (*Niwot Ridge is another of the LTER sites and is located approximately 35 km west of Boulder, Colorado, with the entire study site lying above 3000 m elevation. Documenting land cover boundaries with overlapping imagery*), and **Cedar Creek Area, Minnesota** (*this was the final LTER site for this day. Cedar Creek Natural History Area [CCNHA], established in 1940, was designated a National Natural Landmark by the National Park Service in 1975. In 1977 it was included as an Experimental Ecology Reserve in a proposed national network, and in 1982 it was one of 11 sites in the United States selected by the National Science Foundation for funding of LTER. Documenting the wetland and upland boundaries*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 7:59am EDT [= epoch]*):

Mean altitude -- 338.8 km

Apogee height -- 342.6 km

Perigee height -- 335.0 km

Period -- 91.31 min.

Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0005703
Solar Beta Angle -- -26.8 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 132 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 54873

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

06/19/08 -- ATV1 Reboost (2:41am; delta-V ~ 4 m/s)
07/10/08 -- Russian EVA-20 (7/10-11)
09/05/08 -- ATV1 Undocking
09/09/08 -- Progress M-64/29P undocking (from FGB nadir)
09/10/08 -- Progress M-65/30P launch
09/12/08 -- Progress M-65/30P docking
10/01/08 -- **NASA 50 Years**
10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)
11/03/08 -- Soyuz TMA-13/17S relocation
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 06/17/08

All ISS systems continue to function nominally, except those noted previously or below.

Major focus for CDR Volkov & FE-1 Kononenko today was on Orlan spacesuit activities in the DC1 "Pirs" Docking Compartment, to extend for the next several days, i.e., preparing spacewalk hardware for the EVA-20 on 7/10 and prior simulation exercises.

After configuring the DC1 communications system for their presence, Sergey & Oleg –

- Readied and checked out replaceable components (OTA) and auxiliary gear for their particular Orlan "skafandr" suits [*i.e., portable primary & reserve O₂ tanks (BK-3), storage batteries (825M3), LiOH canisters (PL-9), moisture collectors, liquid cooling garments (KVO), comm headsets (ShL-10), gloves (GP-10K), thermal comfort undergarments (BK-10), socks, diapers, filters for feedwater lines (FOR), Orlan CO₂ measurement units (IK), degassing pump unit (BOS), etc.*],
- Configured & tested the EVA support panels (POV) in the DC1 and SM PkhO (Service Module Transfer Compartment) [*to be used for leak checks and valve tests on the Orlan suits, their BSS interface units & the hatch KVDs (pressure equalization valves)*],
- Activated & inspected their spacesuits plus a third Orlan for training/testing [*Orlan #27 (red stripe) for Volkov, #26 (blue stripe) for Kononenko, #25 for testing & training*],
- Terminated the charging on the 825M3 battery pack started yesterday,
- Activated the training Orlan #25 and equipped it with the BRTA-25 telemetry system,
- Installed the 825M3 battery pack in the #25 backpack, and
- Reset the DC1 comm system to its regular configuration.

In the U.S. "Quest" Airlock, FE-2 Chamitoff –

- Terminated the regeneration of METOX (Metal Oxide) CO₂ absorption canisters #0011 & #0007 started yesterday and initiated the bake-out process on the second batch, #0015 & #0016, with CDRA operating nominally,
- Started the ~13hr discharge on the 16-volt EMU (Extravehicular Mobility Unit) batteries #2067 & #2071 in the BSA (Battery Stowage Assembly),
- Set up EMUs #3018 & #3004 with their SCUs (Service & Cooling Umbilicals) and initiated the standard 1hr scrubbing process on the spacesuits' cooling water loops, filtering ionic and particulate matter (via a 3-micron filter), then
- Reconfigured the cooling loops and initiated the ~2hr biocide filtering *[loop scrubbing, incl. iodination of the LCVGs (Liquid Cooling & Ventilation Garments) for biocidal maintenance, is done to eliminate any biomass and particulate matter that may have accumulated in the loops]*, and
- Terminated the scrubbing, disassembled the EMU water processing kit and stowed the equipment.

Kononenko serviced the Matryoshka-R (RBO-3-2) radiation payload which has taken over the ESA/RSC-Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS/ALC) with its Spectrometer (AST) and ALC equipment on DC1 panel 429. *[Oleg replaced the ALC-948 PCMCIA (Portable Computer Memory Card International Adapter) card with a new one (#949) and used the RSK1 laptop for checking the 948 card for quantity and total size of its stored files, before stowing it for return to earth.]*

The FE-2 performed the periodic deployment of four passive FMK (formaldehyde monitoring kit) sampling assemblies in the Lab (at P3, below CEVIS) and SM (at the most forward handrail, on panel 307) for two days, to catch any atmospheric formaldehyde on a collector substrate for subsequent analysis on the ground.

[Two monitors each are usually attached side by side, preferably in an orientation with their faces perpendicular to the direction of air flow.]

The FE-1 conducted the monthly maintenance on the Russian IK0501 GA (gas analyzer) of the SOGS Pressure Control & Atmospheric Monitoring System, adjusting the sensor for O₂ readings. *[IK0501 is an automated system for measuring CO₂, O₂, and H₂O in the air as well as the flow rate of the gas being analyzed].*

Sergey & Greg had about half an hour reserved to work on the CMRS (Crew Medical Restraint System), stowed in the CHeCS (Crew Health Care Systems) rack, performing the periodic checkout and inspection of the system for upcoming

standard CMO (Crew Medical Officer) proficiency training. *[The crew inspected the CMRS for cracks in the board and/or metal fastener exposed on top of CMRS (found on the ground units), either of which could provide a high-voltage defibrillation ground path from the patient to ISS structure. The board-like CMRS allows strapping down a patient on the board with a harness for medical attention by the CMO who is also provided with restraints around the device. The device can be secured to the ISS structure within two minutes to provide a patient restraint surface for performing emergency medical procedures, such as during ACLS (Advanced Cardiac Life Support). It can also be used to transport a patient between the station and the Orbiter middeck. It isolates the crew and equipment electrically during defibrillations and pacing electrical discharges, accommodates the patient in the supine zero-G positions, provides cervical spine stabilization and, for a three-person crew, can also restrain two CMOs during their delivery of medical care.]*

Kononenko set up the equipment for his second session with the Russian experiment MBI-18 DYKHANIE (“respiration”, “breathing”), then conducted the session, controlled from the RSE-Med laptop, followed later by Volkov who also undertook the experiment for the second time. The crewmembers took photographs of each other working the hardware, then closed down the payload and stowed it. *[Dykhane-1 uses two body belts (PG-T/thoracic, PG-A/abdominal), a calibrator, resistor, mouthpiece, etc., to study fundamental physiological mechanisms of the external breathing function of crewmembers under long-duration orbital flight conditions. During the experiment, physiological measurements are taken and recorded with a pneumotachogram, a thoracic pneumogram, an abdominal pneumogram, and pressure data in the oral cavity. All experimentally derived plus salient environmental data along with personal data of the subject are recorded on PCMIA card for return to the ground at end of the Expedition. Objectives include determining the dynamics of the relationship between thoracic (pectoral) and abdominal breathing function reserves and their realization potential during spontaneous breathing, the coordinated spontaneous respiratory movements in terms of thoracic and abdominal components of volumetric, time & rate parameters of spontaneous respiratory cycle, identification of the features of humoral-reflex regulation of breathing by dynamics of ventilation sensitivity of thoracic and abdominal components to chemoreceptor stimuli, etc. Overall, the experiment is intended to provide a better understanding of the basic mechanisms of pulmonary respiration/gas exchange gravitational relations of cosmonauts.]*

Preparing for a repeat of the fine leak check on the Kibo JPM/JLP (JEM Pressurized Module/JEM Logistics Pressurized Section) vestibule deferred on 6/7, Chamitoff checked out the proper seating of JPM vacuum QD (Quick Disconnect) caps, then installed a cap on a connector of the JEMRMS BDS (JEM Robotic Manipulator System Backup Drive System) in the Kibo laboratory.

The FE-2 also prepared the MELFI (Minus Eighty Degree Laboratory Freezer for the ISS) in the Lab for upcoming sample stowage by retrieving two -32deg ICEPAC belts (#00070680J & #00070669) from stowage and inserting them in Sections 4 & 1 of Tray C in Dewar 1.

Afterwards, Gregory conducted the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling a CWC (Contingency Water Container, #1054) with the collected water slated for processing. No samples were required. *[Estimated offload time before reaching the tank's neutral point (leaving ~6 kg in the tank): ~27 min. Condensate collection continues to be performed by the CCAA while the Russian SKV-2 air conditioner is off, awaiting its overdue Khladon (Freon-218) refill. SKV-1 has been nonfunctional for a long time.]*

Chamitoff also conducted the periodic (every two weeks) inspection of the RED (Resistive Exercise Device) canister bolts, to be re-tightened if required.

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), and RED resistive exercise device (CDR, FE-1, FE-2).

Afterwards, Oleg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

In preparation for the ATV (Automated Transfer Vehicle) reboost on 6/19 (2:41am EDT), Greg activated the SAMS ICU (Space Acceleration Measurement System/Interface Control Unit), the control computer of the rack/drawer-based system for recording structural dynamics of the station.

At 1:25pm, Greg conducted the periodic VHF-1 emergency communications check over NASA's VHF (Very High Frequency) stations, today at the Wallops (1:44pm-1:46pm) and Dryden (1:33am – 1:40am) stations, talking with Houston/Capcom, MSFC/PAYCOM (Payload Operation & Integration Center Communicator) and Moscow/GLAVNI (TsUP Capcom) in the normal fashion via VHF radio from a handheld microphone and any of the USOS ATUs (Audio Terminal Units). *[Purpose of the test is to verify signal reception and link integrity, improve crew proficiency, and ensure minimum required link margin during emergency (no TDRS) and special events (such as a Soyuz relocation).]*

The three crewmembers had their standard periodic PMCs (Private Medical

Conferences) via S- & Ku-band audio/video, Oleg at ~9:55am, Sergey at ~11:35am, Greg at ~1:50pm EDT.

Kononenko completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Working off the Russian discretionary “time permitting” task list, Oleg also performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

A second voluntary task list item for Kononenko & Volkov today was an audit of expired Expedition 16 food rations, with repacking & preparation of food packages for disposal on the ATV. *[To clear storage space for cargo items delivered on Progress M-64/29P.]*

The new FE-2 again had about an hour for himself for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residence.

VOA Update: Shortly after yesterday’s ground-commanded activation of the EHS VOA (Environmental Health System/Volatile Organic Analyzer) in the Lab for a 4-hr sampling run, the unit performed an auto-shutdown with two pressure faults indicated. The engineering team is investigating

VolSci Program: For the Voluntary Science program on the weekend ahead (6/21-6/22), Greg Chamitoff was offered three choices for selection: (1) an “operations improvement” session with SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellites) with all three satellites (single-satellite experiments to test new thrusting algorithms and demonstrate safe trajectories for the inspection of space structures; two-satellite experiments to introduce new controllers and on-line path planning tools for purpose of docking to a complex tumbling satellite; three-satellite runs for formation flight experiments to test initialization of a formation and obstacle avoidance; (2) a LOCAD PTS (Lab-On-A-Chip Application Development – Portable Test System) session using Glucan LAL cartridges, targeting yeast & molds on ISS surfaces, preceded by an OBT review and PI teleconference, and (3) an EPO (Education Payload Operations) Demo on Space Careers, creating an educational video discussing different careers found at NASA, to be used to produce an educational product to enhance existing education resources for students in grades 9-12.

CEO (Crew Earth Observations) photo targets uplinked for today were **Mount Rainier** (*Mount Rainier, at 4392 m the highest peak in the Cascade Range, forms a dramatic backdrop to the Puget Sound region. The present-day summit cone was formed during a major mixed-magma explosive eruption about 2200 years ago and is capped by two overlapping craters. Rainier is located 54 miles southeast of Seattle, Washington. The most recent officially recorded volcanic eruptions occurred between 1820 and 1854. While there is no sign of an imminent eruption of Rainier, the volcano is not dormant and is expected to erupt again. This is especially significant because of the proximity of the volcano to the cities of Tacoma and south Seattle. About 5000 years ago the Osceola mudflow initiated by a Rainier eruption covered the site of present-day Tacoma*), and **Coast Mountains** (*these glaciers have been in a well-documented, heavy retreat for the past couple of decades even though they are located in a moist, marine environment, with heavy winter snowfalls and elevations ranging from 10,000 to 13,000 feet. Since we are approaching the summer solstice, the lighting is now best for photographing these ranges. Context view of the Coast Mountains is desired*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 7:41am EDT [= epoch]*):

Mean altitude -- 338.9 km

Apogee height -- 342.8 km

Perigee height -- 335.1 km

Period -- 91.31 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0005726

Solar Beta Angle -- -25.4 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 122 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54857

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

06/19/08 -- ATV1 Reboost (2:41am; delta-V ~ 4 m/s)

07/10/08 -- Russian EVA-20 (7/10-11)

09/05/08 -- ATV1 Undocking

09/09/08 -- Progress M-64/29P undocking (from FGB nadir)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)
11/03/08 -- Soyuz TMA-13/17S relocation
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 06/16/08

All ISS systems continue to function nominally, except those noted previously or below. >>>Today 45 years ago (June 16, 1963), Valentina Vladimirovna Tereshkova became the first woman to orbit the earth. Launched on Vostok 6, Mayor General Tereshkova (Codename Chaika, "Seagull"), 26 years old at that time, orbited the earth 48 times in 2d 22h 50m.<<< Underway: Week 9 of Increment 17.

FE-2 Chamitoff ended his FD15 session with the NASA/JSC experiment NUTRITION w/Repository, his first, by collecting a final urine sample upon wakeup for storage in the MELFI (Minus-Eighty Laboratory Freezer for ISS). The sampling kit was then stowed away. Greg's next NUTRITION activity will be the FD30 session. *[The current NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

In the Service Module (SM), FE-1 Kononenko readied the newly installed Russian BIO-5 Rasteniya-2 ("Plants-2") experiment, replacing the root module with a new one from stowage, filling the KDV water canister, loading new software and running a hardware test, then starting the experiment. *[Rasteniya-2, researches growth and development of plants (peas) under spaceflight conditions in the Lada-13 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording.]*

CDR Volkov prepared for today's half-day wearing test of the spring-loaded "Penguin-3" antigravity pressure/stress suit with its load measuring system (SIN), calibrating the SIN, donning the suit and its equipment, then going about his regular daily activities and downloading performance measurements several times. Test close-out was at ~9:00am EDT. *[After each download, Sergey selected higher symmetrical (shoulders) & asymmetrical (chest & back) loads (~20-30 kgf), plus 2.5-4 kgf on the stirrups, after calibrating the system with no load on the suit's internal tension straps. Performance/body motion data were then collected by the SIN electronics (via analog-to-digital converters) and downloaded to an A31p laptop three times, followed by downlink to the ground via BSR-TM.]*

Performing maintenance on the Russian SKV-2 air conditioner, the CDR set up the manual pump assembly (SRN) and flushed (wetted) the evaporator wicks of the BTA heat exchanger. Afterwards, the plumbing circuit was disassembled and removed again. *[Condensate collection continues to be performed by the U.S. CCAA (Common Cabin Air Assembly).]*

To provide cooling for ground-commanded activation of the U.S. CDRA (Carbon Dioxide Removal Assembly), Greg Chamitoff connected the regular ITCS LTL (Internal Thermal Control System/Low Temperature Loop) coolant jumper connection to the LAB1D6 rack. *[CDRA activation took place at 7:45am-8:45am EDT.]*

The ground also commanded activation of the EHS VOA (Environmental Health System/Volatile Organic Analyzer) for a 4-hr sampling run. *[Nitrogen (N₂) consumption: 4-6 mL/min, power consumption: 220W peak, 160W avg.]*

With the CDRA running, the FE-2 worked in the A/L (Airlock) to initiate regeneration/"bake-out" on the second set of METOX (Metal Oxide) CO₂ filtration canisters used during the recent EVA Campouts (#0011, #0007).

Performing more outfitting in the Japanese Kibo laboratory, Chamitoff exchanged the PPRVs (Positive Pressure Relief Valves) in the JLP (JEM Logistics Pressurized Section) deck hatch and JPM (JEM Pressurized Module) overhead hatch with the standard MPEVs (Manual Pressure Equalization Valves) and checked their functionality. *[Between the two hatches is the JPM/JLP transfer tunnel (vestibule).]*

Also in the Kibo JPM, Greg installed Monitor #1 in the WS (Workstation) Rack on the overhead side. *[The SLT (Station Laptop Terminal) assembled as MKAM (Minimum Keep Alive Monitor) was already functioning in Node-2 for JLP access.]*

Continuing the current round of regular preventive maintenance of RS (Russian

Segment) ventilation systems, Volkov cleaned the protective TsV1 fan screen in the FGB.

In the SM, after configuring an electric pump with water transfer hoses & pressure adapter, Kononenko transferred water from the WDS (Water Delivery System) tanks of the ATV1 "Jules Verne" to four EDV containers.

In the DC1 (Docking Module), Sergey Volkov set up and initiated charging on an Orlan 825M3 battery pack from FGB stowage, preparatory to tomorrow's scheduled Orlan spacesuit activations and checkout.

The three crewmembers performed a two-hour JEM (JPM+JLP) New Module "Delta" Emergency Procedure Drill, tailored for the new addition to the station. *[Purpose of the "Delta" OBT (Onboard Training) exercise, mandatory at no later than 7-10 days after arrival of the new module, was to familiarize the crew with JEM hardware and valves used in emergency situations and with the new Ammonia Detection Kit location, hardware and cue cards, and to review new, stand-alone JEM emergency procedures, including the "big picture" changes to the existing emergency procedures due to the new module addition. For example: the increased station volume increases the ISS reserve time in case of a leak (to ~1725 min, from ~1423 min); additional equipment safing would be required; the sequence of closing hatches for USOS (US Segment) leak checks will be impacted; more volume is now available for utilizing USOS atmosphere for RS (Russian Segment) leaks; while the automated response to a Rapid Depress situation for JEM is consistent with the automated response for the other USOS modules, although automatically commanded JEM hardware is added, etc. JEM has two ATUs (Audio Terminal Units) and two C&W (Caution & Warning) panels each on the JPM JEMRMS and WS racks. JLP does not have an ATU or C&W panel.]*

The CDR & FE-1 conducted the periodic (monthly) functional closure test of the Vozdukh CO₂ removal system's spare emergency vacuum valves (AVK), in the spare parts kit. *[The AVKs are critical because they close the Vozdukh's vacuum access lines in the event of a malfunction in the regular vacuum valves (BVK) or a depressurization in the Vozdukh valve panel (BOA). Access to vacuum is required to vent CO₂ during the regeneration of the absorbent cartridges (PP). During nominal operation, the AVK valves remain open.]*

Volkov repeated the data download from the IWIS RSU (Internal Wireless Instrumentation System Remote Sensor Unit, #1027) in the SM after the failed first attempt on FD11 during 1J. *[The download configuration was then disassembled and the hardware stowed.]*

In the SM, Oleg took the periodic readings of potentially harmful atmospheric contaminants with the CMS (Countermeasure System) component of the GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite which uses preprogrammed microchips to measure H₂CO (Formaldehyde, methanal), CO (Carbon Monoxide) and NH₃ (Ammonia), taking one measurement per microchip. *[CMS is a subsystem of the Russian SKDS Pressure Control & Atmosphere Monitoring System.]*

Sergey completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV at the SKV-2 air conditioner for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

The CDR also performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Chamitoff completed the regular monthly & quarterly maintenance of the TVIS (Treadmill with Vibration Isolation & Stabilization), inspecting the condition of harnesses, belt slats, corner bracket ropes, IRBAs (Isolation Restorative Bungee Assemblies) and gyroscope wire ropes for any damage or defects, lubricating as required plus recording time & date values.

The three crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1).

Afterwards, Greg transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

The new FE-2 again had about an hour for himself for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residence.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 5:28am EDT [= epoch]):*

Mean altitude -- 339.1 km

ISS On-Orbit Status 06/15/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday -- off-duty for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff. Ahead: Week 9 of Increment 17.*

First activity this morning for Gregory Chamitoff was to start on his Flight Day 15 session with the NASA/JSC experiment NUTRITION w/Repository. This is an all-day session, the first for Greg, of collecting urine samples several times for 24 hrs, to continue through first void tomorrow morning.

Oleg Kononenko conducted the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP-Moscow. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The FE-1 also gathered weekly data on Total Operating Time & "On" durations of the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem for reporting to TsUP.

For Sergey Volkov, today's Russian discretionary task list held one job – continuing the GFI-8 "Uragan" (hurricane) earth-imaging session begun two days ago, using the D2X digital camera with the F800 telephoto lens. *[Uplinked target areas were the forest cover on mountain slopes on the north shore of Lake Sevan, drilling platforms near the western shores & on the eastern shores of the Caspian Sea, the coastal strip of the Aral Sea (overlapping frames), the Katun river valley in nadir & to the right of track, the Eastern shores of Lake Teletsk, the forest condition in the Sayan mountains, the northern shore of Lake Baikal, wooded areas in Greece, the Danube river valley all the way to the estuary, scenic*

photography of the Crimea from different points on orbit, the Kerch Strait, the Don river valley, conditions of the Volga-Akhtubinsk flood plain during water reservoir releases, drill well fields along & to the south of Ural river, general views of the Pyrenees, of the Alps and the Carpathian mountains from various points on orbit, the Oka river and Don river valleys, and the valley of any other river between Don and Volga.]

Also working from the "if time permits" task list, the CDR conducted another run, his fifth, of the Russian DZZ-2 "Diatomeya" ocean observations program, using the NIKON-F5 DCS still camera and the HDV (high-definition) video camcorder from SM window 8 for ~20 min to record high production water areas for obtaining data on color field composition in dynamic regions of the ocean and in near-estuary areas of large rivers, plus the current cloud cover above these waters, its rating, and special forms of cloud formation. *[Target zones today were in the Atlantic Ocean (Cape Hatteras & English Channel).]*

For the FE-1, a discretionary task list job was another session for Russia's Environmental Safety Agency (EKON), making observations and taking KPT-3 aerial photography of environmental conditions of water contamination in the Kerch Strait using the Nikon D2X with the SIGMA 300-800mm telephoto lens.

At ~5:00pm EDT, Greg Chamitoff is scheduled for his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop).

The three crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1).

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 3:31am EDT [= epoch]):*

Mean altitude -- 339.1 km

Apogee height -- 342.9 km

Perigee height -- 335.4 km

Period -- 91.32 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0005574

Solar Beta Angle -- -21.1 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 75 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54822

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

06/19/08 -- ATV1 Reboost (delta-V ~ 4 m/s)

07/10/08 -- Russian EVA-20 (7/10-11)

09/05/08 -- ATV1 Undocking

ISS On-Orbit Status 06/14/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – off-duty day for CDR Volkov, FE-1 Kononenko & FE-2 Chamitoff.*

STS-124/Discovery returned to Earth this morning after 13d 18h 13min in space, touching down at KSC on the first landing opportunity at 11:15am EDT, after 217 orbits & 5.7 million miles. *[During the ISS 1J mission, executed with stellar perfection, its seven-member crew conducted three EVAs, delivered & installed the JEM (Japanese Experiment Module) Kibo with its RMS (Robotic Maneuvering System), brought up new Expedition 17 crewmember Gregory Chamitoff and returned his predecessor Garrett Reisman who spent 95d 8h 47m in space (with ~89d on board ISS). It was the 123rd flight of a Space Shuttle, the 26th Shuttle mission to visit the station, the 35th for Discovery and the 69th landing at KSC. Welcome back, Discovery! Next up: STS-125/Atlantis on 10/8, on Service Mission 4 (SM4) to the Hubble Space Telescope (HST).]*

The FE-1 serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out" cycle to vacuum on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated tonight at ~5:15pm EDT. Filter bed #1 was regenerated yesterday. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle is regularly done every 20 days.]*

Having reached Day 15 of his flight, Greg Chamitoff began his first session with the NASA/JSC experiment NUTRITION w/Repository, for which he had to forego exercising and food intake for eight hours. Today's protocol consisted of blood draws. Later tonight, the FE-2 will also set up the equipment for the 24-hour urine collections which start with the first void early tomorrow morning and continue through Monday morning. *[After performing self-phlebotomy, i.e., drawing blood samples (from an arm vein), the samples were first allowed to coagulate in the*

Repository for 20-30 minutes, then spun in the HRF RC (Human Research Facility/ Refrigerated Centrifuge) and finally placed in MELFI (Minus-Eighty Laboratory Freezer for ISS). No thruster activity was allowed during the blood drawing. The RC was later powered off after a temperature reset to limit wear on the compressor, and cleaned. Background: NUTRITION is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight; this includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes. The Clinical Nutritional Assessment profile currently required on all U.S. Astronauts collects blood and urine samples preflight and postflight. NUTRITION expands this protocol by also capturing inflight samples and an additional postflight sample. Furthermore, additional measurements are included for samples from all sessions, including additional markers of bone metabolism, vitamin status, and hormone and oxidative stressor tests. The results will be used to better understand the impact of countermeasures (exercise and pharmaceuticals) on nutritional status and nutrient requirements. The Clinical Nutritional Assessment profile (MR016L), first started on two Mir crewmembers and then on all ISS US crews, nominally consists of two pre-flight and one post-flight analysis of nutritional status, as well as an in-flight assessment of dietary intake using the FFQ (Food Frequency Questionnaire). The current NUTRITION project expands MR016L testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]

The crew performed the regular weekly three-hour task of thorough station cleaning. ["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]

Volkov & Kononenko also performed regular maintenance inspection & cleaning on fan grilles in the FGB (TsV & TsV2), SM (VPkhO & VPrK), DC1 (V3), and COL (Columbus Orbital Laboratory) for ESA.

Additionally, CDR Volkov conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. [Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]

Greg Chamitoff filled out the regular FFQ (Food Frequency Questionnaire), his first, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

At ~9:15am EDT, the crewmembers held their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP/Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

The three crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1).

Afterwards, Greg transferred the crew's exercise data file to the MEC for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

The Russian crewmembers had their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop), Oleg at ~7:00am, Sergey at ~8:40am.

For CDR Volkov, the Russian discretionary task list held one job for today – continuing the GFI-8 "Uragan" (hurricane) earth-imaging session begun yesterday, using the D2X with the F800 tele-lens. *[Uplinked target areas were the coastal line of Lesser Aral Sea, the northern section of the sea separated by a dam from the Greater Aral, Katunsky preserve inside of Katun river bend enveloping the mountains, South shores of Teletsk Lake, woodland area of Sayan mountains, Irkut river valley running in direction of Baikal, north shores of Lake Baikal near Angara, Trans-Baikal woodland area, woodlands near Russian population areas along Amur and Ussuri rivers, ocean shores, upper reaches of Mzymta river valley from Adler, Caucasus mountain range near Teberda-Donbai,*

flooded Volga-Akhtubinsk alluvial plain after water reservoir releases, oil spills on the north of Caspian Sea, the Yasnyi Cosmodrome left of track, Katun river valley, the western shore of Teletsk Lake in nadir woodland area of Sayan mountains, general view of Carpathian mountains, the valley of one of the rivers in Moldova, the Don river valley, wooded areas in Orenburg steppe, general view of the Ural mountains, the Irtysh river valley, general views of the Alps, general views of Byelorussia, Ugra National Park, Don river valley, general views of the Aral Sea, and the Kyrgyz mountain range to the west of Issyk-Kul.]

Also working from the "time permitting" task list, FE-1 Kononenko conducted another run, his sixth, of the Russian DZZ-2 "Diatomeya" ocean observations program, using the NIKON-F5 DCS and the HDV (high-definition) video camcorder from SM windows 8 for ~20 min to record high production water areas for obtaining data on color field composition in dynamic regions of the ocean and in near-estuary areas of large rivers, plus the current cloud cover above these waters, its rating, and special forms of cloud formation. *[Target zones today were in the Pacific Ocean (Tokelau Islands – Californian upwelling).]*

A second discretionary task list job for Oleg was a session for Russia's Environmental Safety Agency (EKON), making observations and taking KPT-3 aerial photography of environmental conditions of Astrakhan using the Nikon D2X digital camera with the SIGMA 300-800mm telephoto lens.

ITCS Temporary Leak Event: Yesterday a small leak occurred in a QD (quick disconnect) when the crew disconnected the ITCS LTL (Internal Thermal Control System/Low Temperature Loop) jumper to the AR (Air Revitalization) in support of the standard CDRA (Carbon Dioxide Removal Assembly) deactivation procedure. A second, larger leak occurred when the disconnect was repeated on ground advise. The AR Rack return side QD was subsequently disconnected with no leak occurring. The total accumulator quantity drop (all in the LTL) was about 18%, approximately 2 liters. The ITCS coolant is Toxicity-0, and the crew cleaned up completely after the leak, discarding the towels in a wet trash bag (if the coolant liquid is allowed to evaporate, the remaining dry biocide residue becomes Toxicity-1, possibly a mild irritant).

Weekly Science Update (*Expedition Seventeen -- Week 8*)

PADLES (Passive Dosimeter for Lifescience Experiment in Space): Twelve passive dosimeters were set up into JEM at different positions (6/12). *[Area PADLES measures radiation exposure levels onboard the ISS using passive & integrating dosimeters to detect radiation levels. These dosimeters are located near the biological experiment facilities and on the end of Kibo.]*

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):
Measurements continue in FGB module.

ANITA (Analyzing Interferometer for Ambient Air): Continuing.

BCAT-3 (Binary Colloidal Alloy Test 3): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System):
In progress.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): The experiment platform continues to operate nominally. Its power feeder #1 has been de-activated to support the JEM install activities (EVA-2). After the EVA-2, the EuTEF instruments have then been re-activated nominally. A DHPU (Data Handling Processing Unit) software patch is currently developed to fix the link error issues encountered with DEBIE-2 and FIPEX instruments.- DEBIE-2: Link error still under investigation. Some short-duration science measurements are on going since 6/11;- DOSTEL: On-going science acquisition.- EuTEMP: Currently inactive as planned.- EVC: Right after the EuTEF platform re-activation, EVC was successfully powered on and acquired very good images of Europe. Unfortunately, further new attempts were not successful early this week.- EXPOSE: On-going science acquisition.- FIPEX: A

new script has been started after the re-activation of the EuTEF platform. The instruments sensors went off on 6/6, and the measurement sequence had to be restarted, no significant science impact. Now acquiring science. - MEDET: Acquiring science since 6/5. - PLEGPAY: Several measurements have been performed with the Langmuir probe instrument during the STS-124 (1J) docking maneuver. The instrument is now powered on, but not in science acquisition mode. Unfortunately, no Langmuir probe measurements could be planned in conjunction with the Shuttle undocking.- TRIBOLAB: The instrument has been put in Thermal Stabilization Mode after EuTEF power feeder #1 re-activation. Pin on Disk Run #4 (POD#4) experiment was successfully started on 6/12.

FSL (Fluid Science Laboratory): FSL MIL Bus cable repair was successfully performed on 5/5. After FSL Rack Activation from ground on 5/8, the ground confirmed that the FSL cables repair activities were successful. Further troubleshooting activities with CEM-U(pper) Optical Module are required.

GEOFLOW: A new lamp set is delivered by STS-124 (1J). The start of GEOFLOW is pending further FSL troubleshooting and remaining commissioning activities (check of FSL optical modes).

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: “Greg, thanks for all your work and dedication in obtaining your early Integrated Immune samples. They will provide us with valuable, early in-flight data that will help us asses the risk of immune deregulation in spaceflight.”

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 “Pirs”.

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION w/REPOSITORY: Complete.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems):
Ongoing.

SAMPLE: Inc16 samples have been downloaded with 15S and handed over to science team.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): In progress.

SOLAR (Solar Monitoring Observatory): A new Sun observation period has started on 6/3. After the JEM activation, SOLAR power feeder #1 has been reactivated, and we are now acquiring science nominally. Some criss-cross maneuvers have been successfully performed on 6/8 & 6/12. These activities aim at correlating the sun sensor positions on the SOLAR Coarse Pointing Device (CPD) and the SOVIM / SOLSPEC instruments. The SOLACES instrument was also used during these activities. The present Sun observation window will close on 6/16. - SOVIM: Acquiring science. - SOLSPEC: Acquiring science.- SOLACES: Acquiring science.

SOLO: Planned.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite):
In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

3-D SPACE : PI (Principal Investigator)/crew conference was completed on 6/12. First session was performed (nominally, but with more crew time than planned) on 6/13. "Thank you for your efforts in getting the data for 3D-Space!"

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): The four ECs (Experiment Containers) of Rotor B are yet to be retrieved by the crew from the blocked Rotor B. BLB (BIOLAB) could not be activated from ground yet,

pending resolution of the Smoke Detector issue. After the 1J Flight, the remaining WAICO-#1 ECs will be disposed and replaced by six Reference ECs on Rotor B.

CEO (Crew Earth Observations): Ongoing.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 6:18am EDT [= epoch]*):

Mean altitude -- 339.2 km

Apogee height -- 343.0 km

Perigee height -- 335.4 km

Period -- 91.32 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0005682

Solar Beta Angle -- -18.4 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 35 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54809

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

06/19/08 -- ATV1 Reboost

07/10/08 -- Russian EVA-20 (7/10-11)

09/05/08 -- ATV1 undocking

09/09/08 -- Progress M-64/29P undocking (from FGB nadir)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)

11/03/08 -- Soyuz TMA-13/17S relocation

11/10/08 -- STS-126/Endeavour/ULF2 launch -- MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking

12/04/08 -- STS-119/Discovery/15A launch -- S6 truss segment

12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 06/13/08

All ISS systems continue to function nominally, except those noted previously or below.

Before breakfast, CDR Volkov, FE-1 Kononenko and FE-2 Chamitoff began their workday with the periodic session of the Russian biomedical routine assessment PZEh-MO-7/Calf Volume Measurement (third for CDR & FE-1, first for FE-2). *[Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference points, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures.]*

The FE-1 performed the periodic service of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The regen process will be terminated before sleeptime, at ~4:30pm EDT. Regeneration of bed #2 follows tomorrow. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle is normally done every 20 days.]*

For the benefit of the new US flight engineer, Gregory Chamitoff, CDR Volkov took Greg through the mandatory 60-min Emergency Event OBT (Onboard Training) drill for new crewmembers for situations such as rapid cabin depressurization or fire, involving all ISS modules including ATV (Automated Transfer Vehicle) "Jules Verne", COL (Columbus Orbital Laboratory) and the new Kibo laboratory.

[Russian, US and European experts stood by at TsUP/Moscow, MCC/Houston and COL-CC/Oberpfaffenhofen for consultation. The rule is that the Russian-led emergency exercise should be performed by every new station crewmember once within seven days after departure of the previous crew. Background: Purpose of the drill for new station residents is to (a) familiarize them with the location of hardware and the positions of valves used in emergency situations, (b) familiarize

them with the translation routes to the Soyuz vehicle, (c) work through the Russian Segment (RS) hardware deactivation procedures, (d) familiarize them with the particulars of the scenario and the results of the previous US Segment (USOS) fire drill, and (d) practice crew interactions in emergency situations. Referring to EMER book crew procedures, first Sergey and Greg translated along the emergency egress path to the DC1 Docking Compartment (where Soyuz TMA-12/16S is currently docked), checking hardware such as the Sokol suits, cable cutters, fire extinguisher (OKR), gas masks (IPK), emergency procedures books, valve settings, hatch rubber seal & restraint integrity, etc. In the USOS the inspection focused on fireports in the Lab, Node and Airlock, readiness of CSA-CP (Compound Specific Analyzer-Combustion Products), ISS leak kit, PBAs (portable breathing assemblies) and PFEs (portable fire extinguishers), emergency procedures books, valve settings, integrity of hatch rubber seals, presence of hatch handrails, etc. The exercise was topped off by a thorough debrief with the ground via S-band. During the session, the crew simulated executing the planned emergency procedures while moving about the station. For the case of an onboard fire and for emergency descent, there are other mandatory emergency drill OBTs.]

With the U.S. CDRA (Carbon Dioxide Removal Assembly) deactivated by the ground yesterday (~12:50pm-5:50pm) and its cooling no longer required, Chamitoff today demated and took down the ITCS LTL (Internal Thermal Control System/Low Temperature Loop) jumper at the CDRA-supporting LAB1D6 rack.

FE-1 Kononenko had another 2 hrs set aside for more Progress M-64/29P unloading & cargo transfers, based on an uplinked cargo transfer list showing 231 items, and logging movements in the IMS (Inventory Management System) database.

The CDR meanwhile conducted the periodic inventory audit of ~30 Russian medical kits and items located in the Service Module (SM) medical cabinet and Progress.

[Purpose: to verify their availability, condition and stowage locations, weed out a number of discarded kits, replace medications in the Emergency First Aid Kit (NP-2 #A 082) with fresh supplies, and relocate/reconfigure medical kit contents.]

Greg Chamitoff set up the new ESA/CNES experiment 3D-SPACE (Mental Representation of Spatial Cues During Space Flight) and then spent another half hour on his first experiment protocol, performing every exercise (Distance, Illusion, Writing) once to complete the activity. *[3D-SPACE is designed to identify accurate perception & localization of objects in the space environment as prerequisites for spatial orientation & reliable performance of motor tasks in microgravity. Humans have mental representations of their surroundings based on sensory information & experience. It is hypothesized that depth & distance perception of objects could be altered in space due to the absence of gravitational reference and ambiguous*

perspective cues. 3D-SPACE investigates (a) depth perception & the role of perspective cues using geometric illusions, (b) distance perception using both standard psychophysics tests & natural three-dimensional scenes presented on a virtual reality head-mounted display, and (c) the effects of cognitive vs. perceptual-motor changes using handwriting & drawing tests.]

Later, the FE-2 set up NASA's NUTRITION/Repository experiment hardware for his first blood draw scheduled tomorrow. For the phlebotomy (blood sample collection), Greg has to start fasting 8 hrs before, i.e., tonight, with only water consumption allowed. *[The NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by supercold MELFI dewars), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

Kononenko had ~90 min set aside for the periodic equipment servicing in the SM's ASU toilet facility, changing out replaceable parts with new components, e.g., a filter insert (F-V), the pretreat container (E-K), and the E-K's hose. All old parts were discarded as trash. *[E-K contains five liters of pre-treat solution, i.e., a mix of H_2SO_4 (sulfuric acid), CrO_3 (chromium oxide, for oxidation and purple color), and H_2O (water). The pre-treat liquid is mixed with water in a dispenser (DKiV) and used for toilet flushing.]*

Volkov began a new round of periodic preventive maintenance of cabin ventilation systems in the RS (Russian Segment), today cleaning the "Group A" fan grilles in the SM.

On the TVIS (Treadmill with Vibration Isolation & Stabilization), Chamitoff prepared and formatted a new PCMCIA (Portable Computer Memory Card International Adapter) for storing his personal physical exercise data for subsequent download to the MEC (Medical Equipment Computer).

Sergey & Oleg each spent ~1.5 hrs on the TVIS for the periodic Russian PZE-MO-3 test for physical fitness evaluation, their first time, using the TVIS in unmotorized (manual control) mode and wearing the Kardiokassette KK-2000 belt with three chest electrodes. *[The fitness test, controlled from the RSE-Med laptop, yields ECG (electrocardiogram) readings to the KK-2000 data storage device, later downlinked via the BSR-TM payload telemetry channel. Before the run, the KK-2000 was synchronized with the computer date/time readings. For the ECG, the*

crewmembers worked out on the treadmill, first walking 3 min. up to 3.5 km/h, then running at a medium pace of 6.5 km/h, followed by the maximum pace not exceeding 10 km/h, then walking again at gradually decreasing pace.]

The CDR performed the regular bi-monthly reboot of the OCA Router and File Server SSC (Station Support Computer) laptops.

Using the hand-held CDMK (Carbon Dioxide Monitoring Kit, #1002), Chamitoff collected air measurements for the regular atmospheric status check for ppCO₂ (Partial Pressure Carbon Dioxide) in the Lab, SM (at panel 449) and COL, and recording CO₂ readings and battery "ticks". *[Batteries were to be replaced if necessary. After all readings were taken, the CDM was deactivated and returned to its stowage place at LAB1S2.]*

In the SM, Oleg completed the routine maintenance of the SOZh/ECLSS (Environment Control & Life Support System) complex, including ASU toilet facilities systems/replaceables, today working off the discretionary "as time permits" task list.

Also suggested for Kononenko on today's task list was another EKON KPT-3 session, making observations and taking aerial photography of environmental conditions of Aqtobe (Aktyubinsk) and water contamination in the Kerch Strait for Russia's Environmental Safety Agency (EKON) using the Nikon D2X digital camera with SIGMA 300-800mm telephoto lens.

For CDR Volkov, the discretionary task list held two jobs for today: (1) a session with the Russian GFI-8 "Uragan" (hurricane) earth-imaging program, using the D2X to take telephotos *[shooting the forest cover on mountain slopes on the north shore of lake Sevan, drilling platforms near western shores of the Caspian Sea, drilling wells on the eastern shore of the Caspian, the coastal strip of the Aral Sea with overlapping frames, general views of the Pyrenees, the Alps and the Carpathian mountains, the Oka and Don river valleys, all other river valleys between Don and Volga, and fields of drilled wells along Ural river];* and (2) another run, his fourth, of the Russian DZZ-2 "Diatomeya" ocean observations program, using the NIKON-F5 DCS and the HDV (high-definition) video camcorder from SM windows 8 for ~20 min to record high production water areas in North Atlantic *[for obtaining data on color field composition in dynamic regions of the ocean and in near-estuary areas of large rivers, plus the current cloud cover above these waters, its rating, and special forms of cloud formation, for the Atlantic Ocean (coastal area of Brazil and the Strait of Gibraltar).]*

FE-2 Chamitoff had another hour for himself for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for

the first two weeks after starting station residency.

The crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR/MO-3, FE-1/MO-3), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1).

Afterwards, Oleg transferred the exercise data file to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~4:05am, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU; [*Glavnaya operativnaya gruppа upravleniya* = “Main Operative Control Group”]), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~4:50am EDT, the ISS crew (assembled in the Columbus laboratory on TV camera before flags of Germany, U.S., Russia and Japan) received a VIP call from Germany’s Bundespräsident (Federal President) Horst Köhler from COL-CC/Oberpfaffenhofen, accompanied by the Ambassador of the Holy See (Vatican) Dr. Jean-Claude Périsset, Bavaria’s State Minister for Science, Research & the Arts Dr. Thomas Goppel, and former ESA astronaut Reinhold Ewald.

At ~8:40am, Sergey & Oleg linked up with TsUP-Moscow stowage specialists via S-band to conduct the weekly IMS tagup, discussing stowage issues, equipment locations and Progress cargo transfers.

WRM Update: An updated Water Recovery Management “cue card” was uplinked for the crew’s reference. [*The new card (17-0002L) lists 37 CWCs (~1457.2 L total) for the four types of water identified on board: technical water (694.6 L, for Elektron, flushing, hygiene, incl. 553.4 L non-usable water because of Wautersia bacteria), potable water (706.7 L, incl. 260.6 L currently on hold), condensate water (29.1 L), waste/EMU dump and other (7.9 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.*]

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be studied at this “Gateway” website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 10:45am EDT [= epoch]):*

Mean altitude -- 339.2 km

Apogee height -- 343.1 km

Perigee height -- 335.4 km

Period -- 91.32 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0005711

Solar Beta Angle -- -15.4 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 195 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54796

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

06/14/08 -- STS-124/Discovery landing (KSC: 11:15am EDT – 1st opportunity; 2nd : 12:50pm).

07/10/08 -- Russian EVA-20 (7/10-11)

09/05/08 -- ATV1 undocking

09/09/08 -- Progress M-64/29P undocking (from FGB nadir)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)

11/03/08 -- Soyuz TMA-13/17S relocation

11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking

12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment

12/06/08 -- STS-119/Discovery/15A docking

12/15/08 -- STS-119/Discovery/15A undocking

2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD

3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation

05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**

3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2

4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola

1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)

1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)

2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 06/12/08

All ISS systems continue to function nominally, except those noted previously or below. *First day alone for CDR Volkov, FE-1 Kononenko and FE-2 Chamitoff. Off-duty day for the crew (except for necessary maintenance and voluntary tasks).*
***Russian Holiday:** Russia Day, established by Boris Yeltsin to celebrate national unity after the Russian parliament in 1990 formally declared its sovereignty.*

ISS crew sleep cycle returned to the nominal schedule of 2:00am – 5:30pm EDT

Upon wake-up, Sergey Volkov terminated his 4th MBI-12 SONOKARD experiment session for the long-term Russian sleep study, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

In the Kibo JPM (Japanese Pressurized Module) laboratory, FE-2 Chamitoff installed 12 area radiation dosimeters on the shell walls, then took documentary photographs of the setup for JAXA.

CDR Volkov dismantled the THC IMV (Temperature & Humidity Control/Intermodule Ventilation) air duct which was temporarily installed in Node-2 to support air circulation during the docked period.

Greg Chamitoff conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WRM (Water Recovery & Management (WRM))

assessment of onboard water supplies. *[Updated “cue cards” based on the crew’s water calldowns are sent up every other week. The current card (17-0002K) lists 37 CWCs (~1457.2 L total) for the four types of water identified on board: technical water (694.6 L, for Elektron, flushing, hygiene, incl. 553.4 L non-usable water because of Wautersia bacteria), potable water (706.7 L, incl. 260.6 L currently on hold), condensate water (48 L), waste/EMU dump and other (7.9 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]*

The FE-2 also updated his handheld PDA (Personal Digital Assistant) by plugging it into the A31p SSC5 (Station Support Computer 5) laptop to delete the PDA WorldMap Hi-Res image files and load it instead with new uplinked software for BCR (Bar Code Reader) operations with the IMS (Inventory Management System) database.

In the SM (Service Module), Oleg Kononenko completed the routine maintenance of the SOZh/ECLSS (Environment Control & Life Support System) complex, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

In the “Quest” Airlock, the FE-1 terminated the regeneration/“bake-out” on the METOX (Metal Oxide) CO₂ filtration canisters used during the recent EVA Campouts. This allowed the ground to conduct the deactivation of the onboard CDRA (Carbon Dioxide Removal Assembly) at 12:50pm-5:50pm.

The crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1).

Afterwards, Kononenko transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

The CDR & FE-1 had their weekly PFCs (Private Family Conferences) via S-band/ audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop), Sergey at ~6:15am, Oleg at ~7:50am.

At ~4:05am EDT, Volkov & Kononenko joined in downlinking a PAO TV message

of greetings to the participants of the 7th Russian Professional Skills Competition for the best Road Patrol (DPS) Officers in Moscow. [*“...Today we have the best Road Patrol Service inspectors from entire Russia gathered here near Moscow. Participation in such a competition is already a victory for each officer. You represent your region, therefore, the responsibility is enormous. For the past two years you were persistently getting yourselves ready for this trial. That makes you and us very much alike: only the best trained and capable of making the right decisions in difficult situations are sent to space, since our nations’ prestige is on stake here...”*]

At ~4:40am, Sergey & Oleg conducted a telephone conversation with Ekaterina Belograzova, editor of Rossiysky Kosmos Magazine. [*“How much has your life changed after the arrival of such a large and dynamic team? Please evaluate your colleagues’ work. And what did you do during that time?”; “Most likely, you performed a thorough inspection of the Japanese module. Tell us about it.”; “Garret Reisman handed over to Gregory Chamitoff. Does he, by any chance, have Russian roots? Do you know him? Tell us in few words about him.”*]

At ~11:50am, the crew tagged up with the Columbus Payload & Crew Operations Center (CADMOS) in Toulouse/France via S-band S/G audio channel to discuss upcoming COL (Columbus Orbital Laboratory) activities with ground personnel including Gilles Clement, the PI (Principal Investigator) of the new experiment 3D-SPACE. [*CADMOS (Centre d'Aide au Développement des activités en Micro-pesanteur et des Opérations Spatiales) is a facility of the French space agency CNES (Centre National d'Etudes Spatiales), charged with helping user teams to prepare and develop experiments requiring microgravity environment (ISS, automated spacecraft, Airbus-+0g, etc.). CADMOS, created in 1993 at CNES/ Toulouse to support all French manned flights performed on-board the MIR station or Shuttle missions, combines center functions of mission control, operation and exploitation.*]

At ~2:50pm, the crewmembers are scheduled for their regular weekly tagup with the Lead Flight Director at JSC/MCC-H, the first of the new 1J Stage.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be studied at this “Gateway” website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (as of this morning, 6:43am EDT [= epoch]):
Mean altitude -- 339.6 km

Apogee height -- 343.5 km
Perigee height -- 335.8 km
Period -- 91.33 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0005613
Solar Beta Angle -- -8.4 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 15 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 54761

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

STS-124 Timeline

- 6/13 – FD14 - Stowing; deorbit preps
- 6/14 – FD15 - Deorbit burn

ISS On-Orbit Status 06/11/08

All ISS systems continue to function nominally, except those noted previously or below. (FD12 for STS-124/1J).

ISS and STS-124/Discovery are flying in separate orbits again.

ISS crew wake-up shifted another 30 min. to the left (4:00am EDT), and CDR Sergey Volkov, FE-1 Oleg Kononenko and FE-2 Gregory (Taz) Chamitoff will go to bed two hours earlier tonight (~5:30pm) to move their circadian cycle back to the nominal schedule.

For the Russian Sleep study, FE-1 Oleg Kononenko terminated his fourth MBI-12 SONOKARD experiment session upon wake-up by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. CDR Sergey Volkov in turn will start his fourth overnight MBI-12 data take tonight. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

After final departure preparations on both sides of the hatches (closed yesterday on ISS side at 4:24pm EDT), Discovery undocked this morning exactly at 7:42am from PMA-2 (Pressurized Mating Adapter 2) after a total docked time of 8d 17h 39m. *[For undocking, the station was turned from -XVV through ~180 deg to +XVV ZLV (+x-axis in velocity vector, z-axis in local vertical, i.e., flying Shuttle in front again) at ~6:22am, put briefly on free drift for the undocking, and then moded to 1J Stage attitude of +XVV TEA (Torque Equilibrium Attitude).]*

After separation, Discovery completed a 360-deg station flyaround and obtained imagery of the ISS with the newly-delivered Kibo JPM (Japanese Pressurized Module), JEMRMS (JEM Robotic Manipulator System) and relocated JLP (JEM Logistics Pressurized Module). *[JPM added approximately 32,590 lb mass to the ISS.]*

KSC landing is nominally expected on 6/14 (Saturday) at ~11:02am EDT. *[If the landing occurs as planned, STS-124/1J mission duration will be 13d 18h. Garrett Reisman's total time in space will be 95d 8h 34m, with ~89d on board ISS.]*

Before and during the undocking, CDR Volkov stood by at the Cupola A31p laptop with a stopwatch to monitor the proper performance of automatic undocking software for the PMA-2 departure under Russian thruster attitude control. *[The procedure provides for the crewmember to take over the automatic operational attitude control sequence manually if the software does not resume control after the period of free drift a few minutes after physical separation. Free drift is employed to prevent a conflict between the control systems of the two vehicles (ISS & Shuttle) and to "limp" (unload) the docking mechanisms.]*

Later, the CDR powered down the Cupola RWS (Robotics Workstation) laptop.

FE-2 Greg Chamitoff used the Kodak DCS760 digital camera and PD-100 camcorder to document the undocking, backing away & separation of the Discovery.

After undocking, the FE-2 depressurized the PMA-2 to prevent humidity condensation and pressure fluctuations. Leak checking by Gregory followed after the standard one hour. Afterwards, the necessary testing equipment was torn down.

Volkov then completed the reconfiguration of the Russian telephone/telegraph subsystem (STTS) to its post-undocking settings, from its primary string back to nominal mode on the backup string. This also severed the VHS (UHF) channel to the receding Shuttle Orbiter and restored the RSA-2 S/G (Space-to-Ground) comm configuration on Panel 3. *[The "Voskhod-M" STTS enables telephone communications between the SM, FGB, DC1 Docking Compartment and U.S. segment (USOS), and also with users on the ground over VHF channels selected by an operator at an SM comm panel, via STTS antennas on the SM's outside. There are six comm panels in the SM with pushbuttons for accessing any of three audio channels, plus an intercom channel. Other modes of the STTS include telegraphy (teletype), EVA voice, emergency alarms, Packet/Email, and TORU docking support.]*

Greg Chamitoff, the new FE-2, deconfigured the BPSMU (Battery Powered Speaker

Microphone Unit) and its long drag-through cable, used during the docked phase, and stowed the equipment.

Terminating the video setup, Chamitoff removed the J-1 VCP cap of the VDS (Video Distribution System) in Node-2 from video port S3 (camcorder port).

The CDR & FE-1 had another ~3.5 hrs set aside for more Progress 29P unloading & cargo transfers, referring to an uplinked cargo transfer list showing 231 items and logging movements in the IMS (Inventory Management System) database. Transferred items included a new Orlan spacesuit telemetry unit (BRTA) which Oleg stowed in the FGB (panel 112).

The FE-2 performed the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling a CWC (Contingency Water Container, #1062) with the collected water slated for processing. No samples were required. *[Transferred quantity is determined by allowing tank and CWC equalize with each other. Tank quantity stabilizes at a value higher than the neutral point. Waiting time ~30 min.]*

Oleg completed the periodic (about twice a month) replenishing of the Elektron oxygen generator's water supply for electrolysis, filling the KOV EDV container with water collected in CWC (Contingency Water Container) #1043 from the Lab CCAA (Common Cabin Air Assembly) dehumidifier. *[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]*

In the SM (Service Module), Kononenko completed the routine maintenance of the SOZh/ECLSS system, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

CDR Volkov completed the daily IMS maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Kononenko conducted the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS (Russian Segment) hatchways, including the passageways PrK (SM Transfer Compartment)–ATV, PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1.

In the US A/L (Airlock), the new Flight Engineer began the bake-out/regeneration process on the METOX (Metal Oxide) canisters used in the A/L for CO₂ (carbon dioxide) removal during the EVA campouts. *[In the EMUs (Extravehicular Activity Units), nonregenerative LiOH (Lithium Hydroxide) filter cans were used for CO₂ control.]*

FE-1 Kononenko assisted with the METOX regen and then spent an additional 30 min in the A/L to deconfigure and clean up “Quest” after its support of the recent three 1J spacewalks.

After setting up and initializing the new Bubble dosimeters of the RS radiation payload suite “Matryoshka-R” (RBO-3-2) on 6/6, FE-1 Kononenko today collected the dosimeters for a checkout and recording of accumulated measurements (bubbles). *[A total of seven Bubble dosimeter detectors (A01-A08, A05 not used) were retrieved and “read” in the Bubble dosimeter reader in the SM. The results were reported to TsUP/Moscow via log sheet on the BSR-TM payload channel. The complex Matryoshka payload suite is designed for sophisticated radiation studies. Note: Matryoshka is the name for the traditional Russian set of nested dolls.]*

Sergey Volkov began the planned use of the ATV1 (Automated Transfer Vehicle 1) “Jules Verne” as a trash can by transferring accumulated waste and discarded equipment from the SM to the ATV. *[Masses & stowage locations of discarded items are tracked carefully for adequate vehicle CG (Center-of-Gravity) analysis prior to ATV departure.]*

In the Lab, FE-2 Chamitoff performed troubleshooting on the ANITA (Analyzing Interferometer for Ambient Air) experiment which had stopped downlinking all required spectra files. *[Log files indicate that this issue is due to lack of memory. Today’s troubleshooting will help the ground to determine if there is a memory issue with the A31p laptop. After this procedure was executed, ground commanding took over to continue troubleshooting.]*

The ISS crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1). For Taz, this started his regular daily exercise regimen.

Afterwards, Chamitoff transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM

storage medium (done six times a week).

At ~8:25am EDT, Volkov & Kononenko joined in downlinking two PAO TV messages of greetings & congratulations to TsUP/Moscow for later replay at two events: (1) the start of the 24-hr automobile race at Le Mans, France, on 6/14, and (2) the 10th anniversary of the Telecommunications Systems Operation Complex (TsENKIKOM) at Baikonur, Kazakhstan. *[(1) For the Le Mans event, which will be attended by Jean-Loup Chrétien, Mark Brown, Vladimir Titov and Michel Tognini: "...On the occasion of the centennial of the first flight by aviation pioneer Wilbur Wright, we are honored to take part in the start of Le Mans 2008 from the ISS..."; (2) "...The Complex contributed tremendous efforts and energy to implementing Russia's space programs involving Baikonur launches, and to improving the reliability and quality of the entire Roskosmos communications system. The formation of the Telecommunication Systems Operation Complex marked the beginning of a civil component on the Baikonur launch site..."].]*

Consumables Transfer Update: During the STS-124/1J docked period, a total of 783.5 lbs (355.3 L) of water was transferred to the ISS, in 7 CWCs (Contingency Water Containers, 662.0 lbs/300.1 L) and 6 PWRs (Payload Water Reservoirs, 121.5 lbs/55.2 L). Water samples were collected during each CWC fill. Nitrogen (N₂) transfer to ISS: 15 lbs (6.8 kg). Fresh LiOH canisters to ISS: 14; used LiOH cans to Shuttle: 14.

WDS Update: An updated Water Delivery System "cue card" was uplinked for the crew's reference. *[The new card (17-0002K) lists 37 CWCs (~1457.2 L total) for the four types of water identified on board: technical water (694.6 L, for Elektron, flushing, hygiene, incl. 553.4 L non-usable water because of Wautersia bacteria), potable water (706.7 L, incl. 260.6 L currently on hold), condensate water (48 L), waste/EMU dump and other (7.9 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]*

Planning for Russian EVA-20: Houston & Moscow teams are beginning work on the requirements & activities needed to support the next Russian spacewalk, to be conducted by Volkov & Kononenko in Orlan suits from the "Pirs" DC1 Docking Compartment on 7/10 (current tentative date). RSC-Energia indicated this morning that in addition to the originally planned payload tasks the spacewalkers will also conduct an inspection of the Soyuz 16S spacecraft (behind thermal covers) in support of the on-going investigation of the Soyuz TMA-11/15S entry anomaly.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 6:43am EDT [= epoch]*):

Mean altitude -- 339.6 km

Apogee height -- 343.5 km

Perigee height -- 335.8 km

Period -- 91.33 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0005613

Solar Beta Angle -- -8.4 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 15 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54761

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

STS-124 Timeline

- 6/12 – FD13 - Mostly off-duty
- 6/13 – FD14 - Stowing; deorbit preps
- 6/14 – FD15 - Deorbit burn

06/14/08 -- STS-124/Discovery landing (KSC: ~11:02am EDT, nominal)

ISS On-Orbit Status 06/10/08

All ISS systems continue to function nominally, except those noted previously or below. *Flight Day 11 (FD11) of STS-124/1J.*

JAXA/Japan to IMMT: "Arigato Gozaimasu! This flight was 100% successful for the Kibo elements. Thank you to everyone involved for the excellent support in preparation and execution of this mission!"

ISS crew work cycle (now including Greg Chamitoff) shifted another 30 min. to the left: wake-up 4:32am EDT; sleep 7:32pm (Shuttle crew 30 min later: 8:02pm, now including Garrett Reisman).

Crew activities aboard the ISS stack addressed five major areas: (1) Waste water dump from the Orbiter, (2) installation of JEM RMS Backup drive system, (3) PAO event, (4) Crew Sayonara, (5) hatches closing & ODS leak check.

For the biomed experiment INTEGRATED IMMUNE (Validating Procedures for Monitoring Crew member Immune Function), FE-2-17 Chamitoff drew his first venous blood sample, assisted by FE-2 Reisman, for return to Earth. *[IMMUNE protocol requires the collection to occur first thing post-sleep, before eating, drinking and brushing teeth, and all samples are stored at ambient temperature. Along with NUTRITION (Nutritional Status Assessment), INTEGRATED IMMUNE samples & analyzes participant's blood, urine, and saliva before, during and after flight for changes related to functions like bone metabolism, oxidative damage and immune function to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects.]*

Sergey Volkov & Oleg Kononenko set up the hardware for the Russian MBI-21 PNEVMOKARD experiment and conducted the session, their second, which forbids moving or talking during data recording. The experiment is controlled from the RSE-

Med A31p laptop, equipped with new software, and uses the TENZOPLUS sphygmomanometer to measure arterial blood pressure. *[PNEVMOKARD (Pneumocard) is an attempt to obtain new scientific information to refine the understanding about the mechanisms used by the cardiorespiratory system and the whole body organism to spaceflight conditions. By recording (on PCMCIA cards) the crewmember's electrocardiogram, impedance cardiogram, low-frequency phonocardiogram (seismocardiogram), pneumotachogram (using nose temperature sensors), and finger photoplethysmogram, the experiment supports integrated studies of (1) the cardiovascular system and its adaptation mechanisms in various phases of a long-duration mission, (2) the synchronization of heart activity and breathing factors, as well as the cardiorespiratory system control processes based on the variability rate of physiological parameters, and (3) the interconnection between the cardiorespiratory system during a long-duration mission and the tolerance of orthostatic & physical activities at the beginning of readaptation for predicting possible reactions of the crewmembers organism during the their return to ground.]*

The CDR conducted the periodic (monthly) functional closure test of the Vozdukh CO₂ removal system's spare emergency vacuum valves (AVK), in the spare parts kit. *[The AVKs are critical because they close the Vozdukh's vacuum access lines in the event of a malfunction in the regular vacuum valves (BVK) or a depressurization in the Vozdukh valve panel (BOA). Access to vacuum is required to vent CO₂ during the regeneration of the absorbent cartridges (PP). During nominal operation, the AVK valves remain open.]*

In the SM (Service Module), Volkov took the periodic readings of potentially harmful atmospheric contaminants with the CMS (Countermeasure System) component of the GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite which uses preprogrammed microchips to measure H₂CO (Formaldehyde, methanal), CO (Carbon Monoxide) and NH₃ (Ammonia), taking one measurement per microchip.

[CMS is a subsystem of the Russian SKDS Pressure Control & Atmosphere Monitoring System.]

Kononenko conducted the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the passageways PrK (SM Transfer Compartment)–ATV, PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1. *[This checkup is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons, and one of the two Russian SKV air conditioners off (SKV-1).]*

FE-2 Reisman deactivated the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload and removed its processed experiment contents for return to Earth. *[After uncabling & opening CGBA-5 to access its interior, Garrett took out the Silica Garden Habitat and used Petri Dish, packed the items for return in a Ziploc bag, inserted a new Silica Garden Hab in the incubator and closed & recabled the payload for future ops.]*

After yesterday's procedures review, Garrett & Greg completed packing frozen samples from MELFI (Minus-Eighty Laboratory Freezer for ISS) dewars in Icepac DCBs (Double Cold Bags) for return on 1J. *[Exposure of retrieved samples was to be minimized to prevent science warm-up/loss, and the DCB was stowed carefully in a Shuttle middeck locker.]*

MS1 Karen Nyberg & MS4 Aki Hoshide had four hours reserved each for working in the Kibo JPM (Japanese Pressurized Module) to set up and check out the BDS (Backup Drive System) for the JEM RMS (Robotic Manipulator System) at the RMS console. *[RMS nominal Configuration #1 was used for BDS stand-alone checkout (BDS Configuration #2 is used for MDP {Management Data Processor}, ACU {Arm Control Unit} or RIP {Remote Interface Panel} failure, and Config. #3 is used if the PDB {Power Distribution Box} fails). The RMS is a single-string system (i.e., no Channel A or B like the SSRMS), but BDS is available in the case of an anomaly, using power from an ISS UOP (Utility Outlet Panel) to provide a redundant means to control the MA (Main Arm) into a safe configuration. The BDS is external to the JEMRMS console (i.e., the crew interface) and is now mounted on the closeout panel at the right side of the JEMRMS Rack. Background: When not deployed, the JEMRMS is secured at the portside (outboard) end of the Kibo module with three HRMs (Hold & Release Mechanisms) which are opened or closed via a panel on the operator's console. The RMS MA is about 10 m long, with three booms connecting six joints (shoulder yaw, shoulder pitch, elbow pitch, wrist yaw, wrist pitch, wrist roll) and two cameras on the MA. An additional small, fine arm of 2 m length will be delivered on Mission 2J/A (STS-127). Primary function of the JEMRMS is to manipulate ORUs (Orbital Replaceable Units) and move them between the JEM Airlock, the EF (Exposed Facility) and the ELM-ES (Experiment Logistics Module-Exposed Section). EF & ELM-ES will be delivered on 2J/A.]*

In the US A/L (Airlock), CDR Mark Kelly terminated the recharge process on the EVA/EMU batteries.

Kelly & Kononenko ended the N₂ (nitrogen) transfer from the Shuttle to the ISS HPTs (High-Pressure Tanks) and tore down the transfer equipment.

Mark & Oleg also dismantled & removed the Node-2 oxygen supply line that was

used to pipe O₂ from the Shuttle to the ISS PBAs (Portable Breathing Apparatus) to support pre-EVA mask prebreathing for denitrogenation.

The FE-1 had another hour set aside on his schedule to look for a jumper cable which could not be located during the installation of VSPLESK ("Burst") science hardware on 5/27.

Volkov completed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Kononenko reloaded the two VTRs (Video Tape Recorders) of the VDS (Video Distribution Subsystem) with fresh tapes after taking the existing tapes from the machines, labeling them and stowing them for return to MCC-Houston.

At ~7:42am, PLT Ham & CDR Kelly initiated another periodic waste water dump from the Orbiter, the fifth since mission start. One additional water ventings is scheduled. *[After attitude control handover from ISS to Shuttle at 7:32am, the ISS/Shuttle stack was maneuvered from the current TEA (Torque Equilibrium Attitude) to the proper attitude (nozzles facing retrograde) for the venting from PWRs (Payload Water Reservoirs) & CWCs (Contingency Water Containers) and returned later to TEA. Attitude control was returned to ISS momentum management at ~10:25am.]*

Reisman, slated for return on the Discovery on 6/14, and Chamitoff, who replaces him as ISS FE-2, had 3-4 hours remaining for standard joint "handover" activities.

Kelly & Ham had a final five hours reserved to finish up on Shuttle/ISS cargo transfers, with a tagup with ground specialists and calldown of transfer status at ~11:45am. *[As of this morning, the crews were 98% complete on resupply transfers, 81% complete on return cargo, and 87% complete overall. The remaining transfers were completed today (with no margin left).]*

The ISS crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-1, FE-2, FE-2-17), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (CDR). Day 4 of CEVIS physical exercise for Greg Chamitoff.

Afterwards, Volkov transferred the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart

Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~2:10pm EDT, STS-124 Mission Specialist Garrett Reisman & ISS Flight Engineer Greg Chamitoff will be participating in three live interactive PAO TV interviews, with NBC News (Tom Costello), KGO Radio (Gil Gross), and FOX News Radio (Holly Hickman).

Volkov & Kononenko are scheduled for their regular periodic PMCs (Private Medical Conferences) via S- & Ku-band audio/video, Sergey at ~6:17pm, Oleg at ~6:32pm.

At ~7:22pm, just before sleep time, Oleg will again set up the Russian MBI-12 SONOKARD (Sonocard) payload and start his fourth experiment session, using a sports shirt from the SONOKARD kit with a special device in the pocket for testing a new method for acquiring physiological data without using direct contact on the skin. Measurements are recorded on a data card for return to Earth. Sergey will start his third MBI-12 session tomorrow evening. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

The traditional **Crew Farewell** ceremony is timed for ~3:57pm EDT, followed by air duct removal and hatch closure at ~4:10pm, handled on the ISS side by Volkov, Kononenko and Chamitoff. *[Afterwards (~4:30pm), Kelly & Ham switch attitude control authority of the mated stack from ISS CMG TA (Control Moment Gyroscope Thruster Assist) mode to Orbiter control and conduct the standard one-hour leak check on the ODS (Orbiter Docking System).]*

Discovery is scheduled to **undock** from ISS tomorrow morning at 7:42am, shortly after local midnight to ensure good lighting for the subsequent flyaround (starting at 8:16am, about 9 min after local sunrise), for a total docked time of 8d 17h 39m.

After a one-orbit flyaround for photo imaging at 400-600 ft, first separation burn of Discovery will be at 9:12am. Landing is set for Saturday, 6/14, nominally at KSC at 11:02am EDT. If so, total mission duration for STS-124/1J will have been 13d 18h. Garrett Reisman's total time in space will be 95d 8h 34m, with ~89d on board ISS.

Planning for Russian EVA-20: Houston & Moscow teams are beginning work on the requirements & activities needed to support the next Russian spacewalk, to be conducted by Volkov & Kononenko in Orlan suits from the "Pirs" DC1 Docking

Compartment on 7/10 (current tentative date). RSC-Energia indicated this morning that in addition to the originally planned payload tasks the spacewalkers will also conduct an inspection of the Soyuz 16S spacecraft (behind thermal covers) in support of the on-going investigation of the Soyuz TMA-11/15S entry anomaly.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 9:46pm EDT [= epoch]*):

Mean altitude -- 339.6 km

Apogee height -- 343.4 km

Perigee height -- 335.9 km

Period -- 91.33 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0005613

Solar Beta Angle -- -4.5 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 25 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54748

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

STS-124 Timeline

- 6/11 – FD12 - Undocking ~7:42am; Greg remains, Garrett leaves; OBSS survey/inspection
- 6/12 – FD13 - Mostly off-duty
- 6/13 – FD14 - Stowing; deorbit preps
- 6/14 – FD15 - Deorbit burn

06/14/08 -- STS-124/Discovery landing (KSC: ~11:02am EDT, nominal)

07/10/08 -- Russian EVA-20 (7/10-11)

09/05/08 -- ATV1 undocking

09/09/08 -- Progress M-64/29P undocking (from FGB nadir)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)

11/03/08 -- Soyuz TMA-13/17S relocation
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

Attachments:

ISS On-Orbit Status 06/09/08

All ISS systems continue to function nominally, except those noted previously or below. *Flight Day 10 (FD10) of STS-124/1J. Underway: Week 8 of Increment 17.*

ISS crew work cycle shifted another 30 min. to the left: wake-up 5:02am EDT; sleep 8:02pm (Shuttle crew 30 min later: 8:32pm).

Crew activities aboard the ISS addressed five major areas: (1) IWIS Dedicated Thruster Firing, (2) JEM RMS Final Deployment, (3) R&R of two A/L BCMs (Airlock Battery Charger Modules), (4) JLP/JPM vestibule final outfitting plus JLP ingress, (5) crew media conference & photo.

For the biomed experiment INTEGRATED IMMUNE (Validating Procedures for Monitoring Crew member Immune Function), FE-2 Reisman collected a "wet" saliva sample before breakfast while FE-2-17 Chamitoff collected his first dry saliva samples, five times during the day. *[IMMUNE protocol requires the collection to occur first thing post-sleep, before eating, drinking and brushing teeth, and all samples are stored at ambient temperature. Along with NUTRITION (Nutritional Status Assessment), INTEGRATED IMMUNE samples & analyzes participant's blood, urine, and saliva before, during and after flight for changes related to functions like bone metabolism, oxidative damage and immune function to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects. The saliva is collected in two forms, dry and liquid. The dry samples are collected at intervals during the collection day using a specialized book that contains filter paper. The liquid saliva collections require that the crewmember soak a piece of cotton inside their mouth and place it in a salivette bag; there are four of the liquid collections during docked operations.]*

In support of ISS science, CDR Volkov installed the geophysical GFI-1 Relaksatsiya ("relaxation") experiment from six GFI-1 hardware kits, reconfigured the payload

Laptop 3 for the experiment and mounted the UV (ultraviolet) camera with spectrometer unit (SP) at Service Module (SM) window #9. Purpose of the ~2.5hr experiment was to contribute to a hyperspectral space/time study of radiation patterns from the Earth atmosphere and surface from spectra recorded with the camcorder. The UV camera provided a base for the camcorder but was not activated. Afterwards the equipment was stowed again. *[Relaksatsiya normally deals with the study of the chemoluminescent chemical reactions and atmospheric light phenomena (emissions, i.e., molecular relaxation processes), including those that occur during high-velocity interaction between the exhaust products from space vehicles and the atmosphere at orbital altitude and during the entry of space vehicles into the Earth's upper atmosphere.]*

MS4 Hoshide, MS1 Nyberg & FE-2-17 Chamitoff completed final deployment of the JEM RMS (Japanese Experiment Module/Robotic Manipulator System) after connecting the drag-thru power cable and powering on the two RMS monitors and CCP (Camera Control Panel). *[Aki, Karen & Greg first maneuvered the RMS MA (Main Arm) to the final deploy position, then to the stowed position, checked out of the arm's brakes on SY (Shoulder yaw) joint, SP (Shoulder Pitch) joint, and EP (Elbow Pitch) joint, deactivated the RMS, and put the three HRMs (Hold & Release Mechanisms) on Hold.]*

Later, CDR Mark Kelly maneuvered the SRMS (Shuttle Remote Manipulator System) into the Discovery cargo bay to OBSS (Orbiter Boom Sensor Systems) Undock position.

In the Lab, Garrett Reisman set up the video camera to cover his subsequent placing of electrodes for a functional ECG (Electrocardiogram) checkout with a Holter Digital Recorder, as used for blood pressure studies. *[The ECG data, taken over a period of 5 minutes, were to be downlinked and analyzed by the experiment team and flight surgeon to support research on the blood-pressure medication Midodrine.]*

Reisman conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. *[Updated "cue cards" based on the crew's water calldowns are sent up every other week. The current cue card (17-0002J) lists 36 CWCs (~1456.4 L total) for the four types of water identified on board: technical water (693.8 L, for Elektron, flushing, hygiene, including 509.4 L non-usable water because of Wautersia bacteria), potable water (706.7 L, incl. 260.6 L currently on hold), condensate water (48 L), waste/EMU dump and other (7.9 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]*

The FE-2 also collected ITCS (Internal Thermal Control System) fluid samples from the COL (Columbus Orbital Laboratory) while coordinating with COL-CC/Oberpfaffenhofen on proper valve settings.

Also in the COL, Garrett removed & replaced the DPSB-2 (Delta Pressure Sensor Block 2), installed at the COL1OF4 position in a stand-off.

Reisman and Chamitoff reviewed familiarization material on the correct procedures for DCB (Double Coldbag) packing scheduled for tomorrow. *[The DCB/Icepacs will be used for returning frozen samples to Earth as middeck cargo after their transfer from the MELFI (Minus-Eighty Laboratory Freezer for ISS) dewars.]*

Working in the Soyuz TMA-12/16S, Sergey Volkov removed the spacecraft's used ASU toilet collector and replaced it with an empty spare from Progress 29P. The dismantled collector was prepacked for disposal.

In the "Quest" A/L, Kelly & Fossum removed the two aged BCMs (Battery Charger Modules) and replaced them with new BCMs in slots 1 & 2. The R&R necessitated rotating the A/L Avionics Rack forward and later returning it to its upright position. *[The new BCMs, delivered on STS-124, were discovered to have a flawed LCD (Liquid Crystal Display) circuit board with a resistor which could overheat and thereby defeat the LED (Light-Emitting Diode) backlight capability of the new units. Kelly & Ham modified them on 6/6 by carefully opening up the BCMs (16 fasteners each), cutting the resistor leads and re-assembling the boxes. The BCMs are used to charge EMU batteries. The old BCMs had an increased toxicity level (Tox-4) due to their age, and the R&R today allows them to be returned on Discovery.]*

Hoshide & Nyberg finished up outfitting the JPM/JLP vestibule, installing remaining utility jumpers essential to JLP activation, i.e., for IMV (Intermodule Ventilation) and ARS (Atmosphere Revitalization System). Afterwards, Aki & Karen ingressed the JLP, configured the IMV air ducting and installed a PFE (Portable Fire Extinguisher) from JPM and a PBA (Portable Breathing Apparatus) from Node-2.

Later tonight, Aki & Mark Kelly will install four soft dummy panels in the Kibo JPM (at JLP1A2, JLP1P1, JLP1P2, JLP1F2) and Hoshide will take a documentary photo of a standoff (JPM1OF6). *[The latter was reported by the crew to lack Velcro for securing its soft dummy panel.]*

Kelly worked with Chamitoff on accessing OGS (Oxygen Generation System) hardware stowage by temporarily removing the OGS WDS (Water Delivery System), to retrieve a failed hydrogen sensor to be returned on 1J and transferred a number of OGS items from a Lab rack to the OGS stowage volume.

The SM thruster firing test for IWIS (Internal Wireless Instrumentation System) structural dynamics data taking was conducted this morning at 6:22am-6:38am EDT, preceded by ISS attitude mode to free drift at 6:19am. *[At 6:38am, attitude control authority was handed over to RS MCS (Russian Segment Motion Control System) for maneuvering back to TEA (Torque Equilibrium Attitude), and attitude control returned to USOS momentum management at ~7:14am.]*

Later, after FE-1 Kononenko downloaded the IWIS data, CDR Volkov tore down the IWIS network for stowage, including removing the RSU (Remote Sensor Unit) in the Orbiter airlock and its cabling.

Oleg also conducted the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS hatchways, including the passageways PrK (SM Transfer Compartment)–ATV, PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1. *[This checkup is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons, and one of the two Russian SKV air conditioners off (SKV-1).]*

The FE-1 had an hour set aside on his schedule to look for a jumper cable which could not be located during the installation of VSPLESK (“Burst”) science hardware on 5/27.

Later, Kononenko conducted the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Oleg also completed the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The ISS crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-1, FE-2, FE-2-17), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR). Day 3 of CEVIS physical exercise for Greg Chamitoff.

Afterwards, Oleg & Greg copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM

storage medium (done six times a week).

Reisman, slated for return on the Discovery on 6/14, and Chamitoff, who replaces him as ISS FE-2, had another 1.5 hrs scheduled for standard joint handover activities.

Kelly & Ham spent several hours on cargo transfers from/to the Shuttle middeck. At ~4:32pm, Mark & Ken will have a transfer tagup with ground specialists. *[Transfers are on schedule. As of this morning, the crews were 84% complete on resupply transfers, 57% complete on return cargo, and 66% complete overall. The remaining transfers were divided into today & tomorrow.]*

At ~5:02pm, all ISS & Shuttle crewmembers will participate in the traditional joint TV news conference with US media at the NASA centers & Japanese media at JSC.

Afterwards, the crews have an additional 20 min. reserved to take the standard crew photo (foto ekipazha)

Note on no O₂ Transfer: Based on pre-flight agreements to conserve the lifetime-limited ORCA (Oxygen Recharge Compressor Assembly), not enough ullage (free volume) was created in the ISS high-pressure tanks to make an oxygen transfer from the Shuttle worthwhile. The operational cycles allowed under Flight Rule for the ORCA's diaphragm pump have already been modified by waiver from 280,000 to 373,000 cycles. A replacement ORCA will be delivered to KSC late this year.

Preview of tomorrow's main activities: Waste water dump from the Orbiter, installation of JEM RMS Backup drive system in JPM, PAO event, crew farewell & hatches closing, ODS leak check.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (as of this noon, 12:24pm EDT [= epoch]):

Mean altitude -- 339.7 km

Apogee height -- 343.5 km

Perigee height -- 335.8 km

Period -- 91.33 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0005706

Solar Beta Angle -- -0.4 deg (magnitude leveling off)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 40 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 54734

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

STS-124 docked timeline

- 6/10 – FD11 – “Sayonara” ~4:00pm, hatch close ~4:30pm
- 6/11 – FD12 - Undocking ~7:33am; Greg remains, Garrett leaves; OBSS survey/inspection
- 6/12 – FD13 - Mostly off-duty
- 6/13 – FD14 - Stowing; deorbit preps
- 6/14 – FD15 - Deorbit burn

06/14/08 -- STS-124/Discovery landing (KSC: ~11:02am EDT, nominal)

ISS On-Orbit Status 06/08/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday -- Flight Day 9 (FD9) of STS-124/1J. Ahead: Week 8 of Increment 17.*

ISS crew work cycle shifted another 30 min. to the left: wake-up 5:32am EDT; sleep 8:32pm (Shuttle crew 30 min later: 9:02pm).

Crew activities aboard the ISS centered on three major areas: (1) Spacewalk #3 (EVA-3), (2) more JLP (JEM Logistics Pressurized Module) outfitting, and (3) sample collections from Kibo air & surfaces plus Node-2 ITCS coolant.

Mission 1J's EVA-3 was completed successfully by Mike Fossum & Ron Garan in 6h 33min, accomplishing all its objectives.

[During the spacewalk, Fossum (EV1) & Garan (EV2) –

- (1) Removed the old NTA (Nitrogen Tank Assembly) at S1 truss,*
- (2) Retrieved the new NTA from ESP-3 (External Stowage Platform 3),*
- (3) Installed new NTA on S1, stowed the old NTA & connected NTA FQD (Fluid Quick Disconnect) jumper,*
- (4) Collected two debris samples (not grease) at Port SARJ, using Kapton tape,*
- (5) Re-installed the ETVCG (External TV Camera Group) camera, reworked with new power supply, at CP9 (Camera Port 9) on the left truss,*
- (6) Removed thermal covers & launch locks from JEMRMS WVE/EVE (Wrist & Elbow Vision Equipment) cameras,*
- (7) Removed JPM aft window launch locks,*
- (8) Deployed fwd & aft MMOD (Micrometeoroid/Orbital Debris) shields on ACBM (Active Common Berthing Mechanism), and*
- (9) Inspected & tightened a loose bolt on the fwd JTVE camera boom's JPM mounting which "wobbled" yesterday while panning & tilting (late-added get-ahead task).*

Official start time of the spacewalk was 9:55am EDT, about 37 minutes ahead of timeline, and it ended at 4:28pm. Total EVA duration (PET = Phase Elapsed Time) was 6h 33min.]

After wakeup at ~5:32am, ending the 8.5-hr sleep period before the spacewalk, the A/L CL (Airlock Crewlock) hatch was cracked (~6:57am) for a hygiene break/with mask prebreathe for Fossum & Garan, after spending the night on 10.2 psi campout. Around 7:22am, the hatch was closed again by IVs (Intravehicular Crewmembers) for EVA preparations in 10.2 psi, followed by EMU (Extravehicular Mobility Unit) purge & prebreathe. Sergey Volkov, Mark Kelly & Greg Chamitoff assisted the spacewalkers during EMU purge, EMU prebreathe and CL depressurization. EV1/EV2 egress followed after the EMUs were switched to batteries at 9:55am.

Prior to EVA start, CDR Volkov checked two Kodak DCS760 digital cameras with 28mm lens for the EVA (one with flash for the SARJ task) and verified deactivation of all onboard ham radio equipment (Kenwood in SM/Service Module, Ericsson in FGB) to prevent RF interference with the EMUs, as well as proper closure of the protective Lab window shutters.

Volkov serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out" cycle to vacuum on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated tonight at ~7:50pm EDT. Filter bed #1 was regenerated yesterday. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle is regularly done every 20 days.]*

As part of regular preventive maintenance of RS (Russian Segment) ventilation systems, Sergey replaced the four dust filters (PF1-4) in the SM.

Preventive maintenance was also performed by FE-1 Oleg Kononenko in the Soyuz TMA-12/16S at the DC1 nadir port, cleaning the screen of the BVN fan/heater assembly in the Orbital Module (BO).

FE-2 Reisman worked on the ITCS (Internal Thermal Control System) in Node-2, using the new 1J-delivered CQMK (Coolant Quality Monitoring Kit) to collect return-to-ground fluid samples from the LTL (Low Temperature Loop) and MTL (Moderate Temperature Loop) sample ports after flushing (ammonia or OPA/Ortho-Phthalaldehyde test samples not required).

Later, Garrett floated into the Kibo laboratory and used the MAS (Microbial Air Sampler) kit to obtain microbiology air samples from mid-module, and the SSK (Surface Sample Kit) to collect/incubate microbiology samples from two prime

surface sites for return to ground.

Sergey unstowed the two Russian pilot sighting instruments VP-2 & “Puma” and installed them at SM window #8 for functional testing. *[The Puma Portable Zoom Viewfinder is used to view remote objects and determine their angular position in the SM coordinate system in order to provide geographical reference of observed terrestrial objects, and to determine the target vector in a specified coordinate system. The 240K Pilot Sight (VP-2) is a collimator-type device for determining the direction to observed reference points relative to the station coordinate for geographical reference of observed terrestrial objects and to determine the direction vector to controlled & uncontrolled objects and measure their angular sizes.]*

Oleg Kononenko conducted the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS (Russian Segment) hatchways, including the passageways PrK (SM Transfer Compartment)–ATV, PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1. *[This checkup is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons, and one of the two Russian SKV air conditioners off (SKV-1).]*

Kononenko also continued the current work with the Russian KPT-2 science payload BAR-RM, Kelvin, Ira and TTM from the RSE1 laptop, started by Oleg last Friday. *[Measurements are being taken in the RS, behind panels, near welds along SM structural rings and near the shell ring in the FGB for subsequent downlinking via BSR-TM channel. At the FGB pressurized shell ring, the cosmonauts were to inspect structural elements, equipment, and cable bundles for moisture, mold, or evidence of corrosion. The data, collected at locations such as feedthroughs, windows, hatches etc., are being used to get proficient in experimenting with ISS leak detection based on environmental data anomalies (temperature, humidity, and ultrasound emissions) at potential leak locations. The BAR-RM payload uses a remote infrared thermometer (Kelvin-Video), a thermohygrometer (Iva-6A), a heat-loss anemometer/thermometer (TTM-2), an ultrasound analyzer (AU-01), and a leak detector (UT2-03) to determine physical background signs of loss of ISS pressure integrity which could be indicative of leaks in the working compartments of the station. Measurements are taken in specific zones (13 in SM PkhO and 4 in DC1), both with lights, fans & ASU pump turned on and off.]*

For hardware familiarization/handover, Sergey Volkov & Greg Chamitoff inspected and checked out the HMS RSP (Health Maintenance System/Respiratory Support Pack).

FE-2 Reisman performed calibration on the new CSA-O₂ (CSA -Oxygen sensor) units #1043 & #1059 delivered on 1J. The old CSA-O₂ instruments (#1041 & #1052) were packed for return to Earth.

Garrett, slated for return on the Discovery on 6/14, and MS5 Greg Chamitoff, who replaces him as ISS FE-2, had about 3.5 hrs scheduled for standard joint handover activities, to be continued through the docked period ahead.

MS1 Karen Nyberg & MS4 Aki Hoshide first operated the SSRMS (Space Station Remote Manipulator System) to “fly” & support Ron Garan during the S1 NTA remove/install, then moved to the JLP container module to conduct Part 1B outfitting by removing CBM (Common Berthing Mechanism) hardware, e.g. CPAs (Controller Panel Assemblies), and installing avionics jumpers.

The FE-1 conducted the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

The CDR completed the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Aki & Karen spent several hours on cargo transfers from & to the Shuttle middeck.

The ISS crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-1, FE-2, FE-2-17), and TVIS treadmill (CDR, FE-1), RED resistive exercise device (FE-2). Day 2 of CEVS physical exercise for Greg Chamitoff.

Afterwards, Sergey copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Preview of tomorrow’s main activities: SM & ATV thruster firings for IWIS, crew conference & photo, JEM RMS final deployment, installation of two new BMCs (Battery Charger Modules) in rotated Airlock Avionics Rack (A/L1F1), JLP outfitting part 2 & ingress.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 7:18am EDT [= epoch]*):

Mean altitude -- 339.7 km

Apogee height -- 343.4 km

Perigee height -- 336.0 km

Period -- 91.33 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0005524

Solar Beta Angle -- 3.8 deg (magnitude decreasing, leveling off tomorrow)

Orbits per 24-hr. day -- 15.77

Mean altitude gain in the last 24 hours -- 70 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54714

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

STS-124 docked timeline

- 6/09 – FD10 - JRMS checkouts, JLP Vestibule outfitting, A/L BCM R&R, DTF (Dedicated Thruster Firing)
- 6/10 – FD11 – "Sayonara" ~4:00pm, hatch close ~4:30pm
- 6/11 – FD12 - Undocking ~7:33am; Greg remains, Garrett leaves; OBSS survey/inspection
- 6/12 – FD13 - Mostly off-duty
- 6/13 – FD14 - Stowing; deorbit preps
- 6/14 – FD15 - Deorbit burn

06/14/08 -- STS-124/Discovery landing (KSC: ~11:02am EDT, nominal)

07/10/08 -- Russian EVA-20 (7/10-11)

09/05/08 -- ATV1 undocking

09/09/08 -- Progress M-64/29P undocking (from FGB nadir)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/23/08 -- Soyuz TMA-12/16S undocking (DC1 nadir)

11/03/08 -- Soyuz TMA-13/17S relocation

11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 06/07/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday -- Flight Day 8 (FD8) of STS-124/1J.*

ISS crew work cycle shifted another 30 min to the left: wake-up 6:02am EDT; sleep 9:02pm (Shuttle crew 30 min later: 9:32pm).

Crew activities aboard the ISS centered on three major areas: (1) Initial deployment of JEM RMS (Japanese Experiment Module Robotic Manipulator System) activation & checkout, (2) JLP (JEM Logistics Pressurized Module) post-relocation outfitting (Part 1), (3) Preparations for EVA-3 & EV1/EV2 Campout.

Before breakfast, FE-2 Reisman & FE-2-17 Chamitoff collected a "wet" saliva sample (the third for Greg) for the biomed experiment INTEGRATED IMMUNE (Validating Procedures for Monitoring Crew member Immune Function). *[IMMUNE protocol requires the collection to occur first thing post-sleep, before eating, drinking and brushing teeth, and all samples are stored at ambient temperature. Along with NUTRITION (Nutritional Status Assessment), INTEGRATED IMMUNE samples & analyzes participant's blood, urine, and saliva before, during and after flight for changes related to functions like bone metabolism, oxidative damage and immune function to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects. The saliva is collected in two forms, dry and liquid. The dry samples are collected at intervals during the collection day using a specialized book that contains filter paper. The liquid saliva collections require that the crewmember soak a piece of cotton inside their mouth and place it in a salivette bag; there are four of the liquid collections during docked operations.]*

CDR Volkov conducted the periodic service of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The regen process will be terminated before sleeptime, at ~7:32m EDT. Regeneration of bed

#2 follows tomorrow. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle is regularly done every 20 days.]*

Garrett Reisman, in charge of the JLP fine leak check, determined that a valve for the overnight procedure was incorrectly set. A repeat of the hermeticity check is being scheduled after Shuttle departure. *[This is not a problem for ingress into JLP (on FD10), but for long term operations.]*

FE-1 Kononenko conducted the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS (Russian Segment) hatchways, including the passageways PrK (SM Transfer Compartment)–ATV, PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1. *[This checkup is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons, and one of the two Russian SKV air conditioners off (SKV-1).]*

Volkov and later Kononenko spent several hours continuing their current work with the Russian KPT-2 science payload BAR-RM, Kelvin, Ira and TTM from the RSE1 laptop, started by Oleg yesterday. *[Measurements are being taken in the RS, behind panels, near welds along SM structural rings and near the shell ring in the FGB for subsequent downlinking via BSR-TM channel. At the FGB pressurized shell ring, the cosmonauts were to inspect structural elements, equipment, and cable bundles for moisture, mold, or evidence of corrosion. The data, collected at locations such as feedthroughs, windows, hatches etc., are being used to get proficient in experimenting with ISS leak detection based on environmental data anomalies (temperature, humidity, and ultrasound emissions) at potential leak locations. The BAR-RM payload uses a remote infrared thermometer (Kelvin-Video), a thermohygrometer (Iva-6A), a heat-loss anemometer/thermometer (TTM-2), an ultrasound analyzer (AU-01), and a leak detector (UT2-03) to determine physical background signs of loss of ISS pressure integrity which could be indicative of leaks in the working compartments of the station. Measurements are taken in specific zones (13 in SM PkhO and 4 in DC1), both with lights, fans & ASU pump turned on and off.]*

In the FGB, Kononenko removed three IPK-1M gas masks, intended for fire suppression, and replaced them with new units. *[The masks were removed along with their holding brackets on panels 230, 404 and overhead in the GA (Pressurized Adapter). The new masks were installed on Velcro in the area of the old ones.]*

The FE-2 performed the regular monthly & quarterly maintenance of the TVIS (Treadmill with Vibration Isolation & Stabilization), inspecting the condition of harnesses, belt slats, corner bracket ropes, IRBAs (Isolation Restorative Bungee

Assemblies) and gyroscope wire ropes for any damage or defects, lubricating as required plus recording time & date values.

For MS4 Aki Hoshide, today's activities with Kibo's own RMS (Robotic Manipulator System) began right after his wake-up and post-sleep period (~9:00am EDT), proceeding along the following steps:

- *Powering up RMS Monitors 1 & 2 and CCP (Camera Control Panel) by connecting to drag-thru power cable from Node-2,*
- *Checking Joint Limit Database and powering on the Ext-2 jumper to supply electricity to RMS motor mechanisms,*
- *Initiating (later terminating) warm-up on the #3 RMS HRM (Hold & Release Mechanism),*
- *Release HRM,*
- *Initial deploying of RMS, with minimal checkout of the WP (wrist pitch), then moving clear of the HRM, to allow EVA-3 spacewalkers to remove MA TVC MLIs (Main Arm/Television Camera/Multi-Layer Insulation) and LLs (Launch Locks),*
- *Deactivating the RMS Monitors 1 & 2 and CCP for saving power resources, and*
- *Disconnecting the drag-thru power cable.*

MS1 Karen Nyberg maneuvered the SRMS (Shuttle Remote Manipulator System) to EVA-3 viewing position and later also the SSRMS (Space Station RMS) to EVA-3 egress start configuration.

Later today, JLP vestibule outfitting, Part 1, by Karen Nyberg and Aki Hoshide is involving removal of thermal covers and installation of power jumpers for JLP warm-up.

In the Lab (LAB105), Karen removed the AmiA (Antimicrobial Applicator), brought up on STS-124, from the ITCS (Internal Thermal Control System). *[AmiA was used to introduce OPA (Ortho-Phthalaldehyde), an antimicrobial agent, into the Lab ITCS coolant. Later a sample of the fluid will be taken and returned for analysis.]*

FE-2 Reisman filled out the regular FFQ (Food Frequency Questionnaire), his 11th, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The*

FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]

Mark Kelly & Ken Ham again are spending several hours on cargo transfers from & to the Shuttle middeck. *[As of last night, 52% of transfers were complete.]*

The CDR conducted the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Volkov also gathered weekly data on Total Operating Time & "On" durations of the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem for reporting to TsUP.

Later, Sergey completed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Garrett, slated for return on the Discovery on 6/14, and MS5 Greg Chamitoff, who is to replace him as ISS FE-2, had about 5 hrs scheduled for standard joint handover activities, to be continued through the docked period ahead.

The CDR conducted his third run with the Russian DZZ-2 "Diatomeya" ocean observations program, using the HDV (high-definition) video camcorder from SM windows 8 for ~30 min to record bioluminescent glow of high production zones in the South China Sea, the straits of Indonesia and the Gulf of Carpenteria (in Australia's north).

Sergey also had ~15 min set aside for another Russian "Uragan" (hurricane) earth-imaging session, using the Nikon D2X digital camera with 300-800 mm telephoto lens from SM window 9 and the RSK1 laptop for picture download. *[Targets uplinked for today were the Alps, the Allaline Glacier, general views of the Carpathian mountains, forests of Central Russia Ugra National Park, water release through the Volgograd hydropower plant, and general views of the Southern Urals.]*

The ISS crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2, FE-2-17), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR, FE-1) and VELO cycle with bungee cord load trainer (FE-1). Physical exercise regimen for Greg Chamitoff began today on the CEVIS.

Afterwards, Oleg & Greg copied the exercise data file to the MEC laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Fossum, Garan, Kelly, Ham, Volkov and Chamitoff conducted a one-hour review of timeline & procedures for tomorrow's EVA-3 by Mike Fossum (EV1) & Ron Garan (EV2).

Later, at ~5:30pm, after completing Airlock Equipment Lock (A/L EL) configuration for EVA-3, including recharging batteries, configuring two DCS760 cameras (one with flash for the port SARJ task) and checking EMU equipment, Mike & Ron will begin their "campout" in the "Quest" A/L, starting mask prebreathe, while configuring EVA tools, at ~7:57pm, then closing hatches and initiating depressurization of the CL (Crewlock) from 14.7 to 10.2 psi. Sleep for them and the ISS crew will commence at ~9:32pm, for the Shuttle crew at ~10:02pm. *[The overnight Campout in the A/L CL for denitrogenation/pre-breathe at 10.2 psi lasts about 8.5 hrs. First, the two spacewalkers will perform PBA (Portable Breathing Apparatus) mask prebreathe for denitrogenation, while readying their tools & equipment, then depress the CL from 14.7 to 10.2 psi for their sleep period, to last until ~5:32am EDT tomorrow. The CL hatch will then be cracked at ~6:12am (i.e., temporarily repressurized) for a hygiene break/with mask prebreathe for Fossum & Garan. Around 7:22am, the hatch will be closed again for EVA preps in 10.2 psi, followed by EMU purge & prebreathe. Afterwards, Mark Kelly will support CL depressurization from the EL until space egress.]*

EVA-3, beginning tomorrow nominally at ~10:32am EDT (likely earlier), will last an estimated 6h 30min, i.e., ending at 5:02pm. PLT Ken Ham will again be IV (Intravehicular) crewmember.

--- EVA-3 main objectives are to:

- Remove old NTA (Nitrogen Tank Assembly) at S1 truss,
- Retrieve spare NTA from ESP-3 (External Stowage Platform 3),
- Install new NTA on S1 truss & stow old NTA,
- Connect NTA FQD (Fluid Quick Disconnect) jumper,
- Re-install reworked (with new power supply) ETVCG (External TV Camera Group) camera at CP9 (Camera Port 9) on the left truss,

- *Remove thermal covers & launch locks from JEMRMS WVE/EVE (Wrist/Elbow Vision Equipment),*
- *Remove JPM aft window launch locks,*
- *Deploy fwd & aft MMOD (Micrometeoroid/Orbital Debris) shields on ACBM (Active Common Berthing Mechanism), and*
- *Collect debris samples at Port SARJ (as a get-ahead).*

Waste Water Dump: At ~9:15am, PLT Ham conducted the periodic waste water dump from the Orbiter, the fourth since mission start. Two more water ventings are scheduled. *[The water vent involved the waste water tank, 5 PWRs (Payload Water Reservoirs), and 2 CWCs (Contingency Water Containers). For the venting, the ISS/Shuttle stack was maneuvered from the current TEA (Torque Equilibrium Attitude) to the proper attitude (nozzles facing retrograde) and returned later to TEA.]*

Port SARJ Update: Ground specialists believe the possible source of the grease-like substance observed by Fossum & Garan during EVA-2 in the portside Solar Alpha Joint is Braycote-601, a lubricant used in space, from the trundle bearings. Similar indications can be seen in imagery from the inspections performed during Mission 10A. A get-ahead task was added to tomorrow's EVA-3 to collect samples from the SARJ from debris on a tang, a second site for debris, debris mixed with grease, and the purest sample of the grease-like matter.

At ~2:07pm EDT, the STS-124 flight crew participated in three live interactive PAO TV interviews with CNN (Miles O'Brien), WCBS-TV (Erminia Vacirca), New York, NY, and WDAY-TV (Kevin Wallevand), Fargo ND.

Tonight at ~7:02pm (8:02am, 6/8, in Tokyo), the crew, Aki Hoshide & Mark Kelly, representing the crew, will receive a VIP call from Japanese Prime Minister Yasuo Fukuda, joined by Minister of Education, Culture, Sports, Science and Technology Kisaburo Tokai, Miraikan-Director and former Astronaut Dr. Mamoru Mohri, the U.S. Ambassador in Japan J. Thomas Shieffer, plus two primary school students, and two junior high school students, all located at the Miraikan (National Museum of Emerging Science and Innovation) in Tokyo.

Weekly Science Update (*Expedition Seventeen -- Week 7*)

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):
Measurements continue in FGB module.

ANITA (Analyzing Interferometer for Ambient Air): Continuing.

BCAT-3 (Binary Colloidal Alloy Test 3): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System):
In progress.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): The experiment platform continues to operate nominally. Its power feeder #1 has been de-activated to support the JEM install activities (EVA-2). The graceful shutdown of the platform was commanded some hours ahead of schedule, due to instabilities of the Ground Segment at COL-CC. After the EVA-2, the EuTEF instruments have then been re-activated nominally. A DHPU (Data Handling Processing Unit) software patch is currently developed to fix the link error issues encountered with DEBIE-2 and FIPEX instruments. - DEBIE-2: Link error still under investigation; - DOSTEL: On-going science acquisition; - EuTEMP: Currently inactive as planned; - EVC: Inactive, high rate data downlink needs further troubleshooting; - EXPOSE: On-going science acquisition; - FIPEX: A new script has been started after the re-activation of the EuTEF platform, now acquiring science; - MEDET: Acquiring science since 6/5; - PLEGPAY: Several measurements have been performed with the Langmuir probe instrument during the STS-124 (1J) docking manoeuvre. The instrument is now powered on, but not in science acquisition mode; - TRIBOLAB: The Pin On Disk run #3 (POD#3) has been nominally completed on 5/31. The

instrument has been put in Thermal Stabilisation Mode after EuTEF power feeder #1 re-activation.

FSL (Fluid Science Laboratory): FSL MIL Bus cable repair was successfully performed on 5/5. After FSL Rack Activation from ground on 5/8, the ground confirmed that the FSL cables repair activities were successful. Further troubleshooting activities will be required with CEM-U (Upper) Optical Module.

GEOFLOW: Further troubleshooting activities with CEM-U(pper) Optical Module are required. A new lamp was sent up on STS-124 (1J). The start of GEOFLOW is pending further FSL troubleshooting and remaining commissioning activities (check of FSL optical modes) and it will not occur prior to the end of the 1J flight.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION w/REPOSITORY: Complete.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SAMPLE: Inc16 samples have been downloaded with 15S and handed over to science team.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): “Garrett, your only remaining activity will be to doff your Actiwatch on the Shuttle with the other two participating crewmembers. Any additional Sleep Logging on the SSC while on ISS is above and beyond and greatly appreciated by the PI. No Sleep logging is required while you are on the Shuttle.” “Greg, you have completed your first Sleep Activity by donning the Actiwatch. You will have five download/initialization sessions and three weeks of Sleep logging remaining for your Increment 17 activities. Any additional sleep logging into the SSC will be above and beyond and greatly appreciated by the PI.”

SOLAR (Solar Monitoring Observatory): A new Sun observation period started on 6/03. Since then, the SOLAR measurements have been impacted by the ISS Attitude change and the STS-124 (1J) docking approach. Moreover, we have faced severe Telemetry and Telecommanding problems at COL-CC, leading to the postponement of science acquisition and of SOLAR criss-cross manoeuvres execution over the last days. SOLAR has been gracefully shutdown by the crew on 6/4. It was the only feasible and quick solution to safe SOVIM prior to thruster firings of the Orbiter. After the JEM activation, SOLAR power feeder #1 has been reactivated, and we are now acquiring science nominally. On 6/6, we plan to execute some criss-cross manoeuvres. - SOVIM: Acquiring science; - SOLSPEC: Acquiring science; - SOLACES: Acquiring science.

SOLO: Planned.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

3-D SPACE : A crew conference is currently planned on 6/12. First session with Greg Chamitoff is currently planned for 6/13.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): The four ECs (Experiment Containers) of Rotor B are yet to be retrieved by the crew from the blocked Rotor B. BLB (BIOLAB) could not be activated from ground yet,

pending resolution of the Smoke Detector issue. After the 1J Flight, the remaining WAICO-#1 ECs will be disposed and replaced by six Reference ECs on Rotor B.

CEO (Crew Earth Observations): Ongoing.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 8:12am EDT [= epoch]*):

Mean altitude -- 339.6 km

Apogee height -- 343.3 km

Perigee height -- 336.0 km

Period -- 91.33 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.000549

Solar Beta Angle -- 8.1 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 80 m

/Revolutions since FGB/Zarya launch (Nov. 98) -- 54699

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

STS-124 docked timeline

- 6/08 – FD9 - EVA-3 (10:32am, 7 hrs), S1 NTA R&R, compl JPM outfit (RMS cvr remv), P1 CP9 ETVCG install
- 6/09 – FD10 - JRMS checkouts, JLP Vestibule outfitting, A/L BCM R&R, DTF
- 6/10 – FD11 – "Sayonara" (~4:00pm), hatch close (~4:30pm)
- 6/11 – FD12 - Undocking (~7:33am); Greg remains, Garrett leaves; OBSS survey/inspection
- 6/12 – FD13 - Mostly off-duty
- 6/13 – FD14 - Stowing; deorbit preps
- 6/14 – FD15 - Deorbit burn

06/14/08 -- STS-124/Discovery landing (KSC: ~11:02am EDT, nominal)

07/10/08 -- Russian EVA-20 (7/10-11)

09/05/08 -- ATV1 undocking

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (at DC1 nadir)

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 06/06/08

All ISS systems continue to function nominally, except those noted previously or below. *Flight Day 7 (FD7) of STS-124/1J. ISS crew work cycle shift begins with an earlier sleeptime: wake 6:32am EDT; sleep 9:32pm (Shuttle crew remaining at 10:02pm).*

Crew activities aboard the ISS today centered on three major areas: (1) JLP (JEM Logistics Pressurized Module) relocation, (2) JPM (Japanese Pressurized Module) Kibo outfitting, and (3) start of JEM RMS (Robotic Manipulator System) activation & checkout.

JLP was successfully installed at its final location on the Kibo JPM at 4:04pm EDT. *[After JLP/Node-2 vestibule demating and depressurization, MS1 Nyberg and FE-2-17 Chamitoff used the SSRMS (Space Station Remote Manipulator System) to grapple, unberth, transfer and reberth the JLP on Kibo's overhead port (1st stage capture 3:54pm, SSRMS wrist limped 3:58pm, 2nd stage capture with all 16 bolts 4:04pm). Karen, Greg & Aki Hoshide then latched the JPM overhead hatch via ratchet & crank handle, pressurized the connecting vestibule partially and initiated the standard vestibule gross leak check, later configuring the gear for the usual overnight fine leak check. After the installation, ISS attitude was maneuvered to the new TEA (Torque Equilibrium Attitude) which the addition of the JLP has changed. JLP was delivered on orbit by STS-123/Endeavour and docked at the Node-2 zenith port on 3/14.]*

In support of the JLP transfer & berthing –

- CDR Volkov connected the accelerometer in the Shuttle airlock to the IWIS RSU (Internal Wireless Integrated System/Remote Sensor Unit) and programmed/activated the system for taking structural dynamics data during the JLP relocation. *[IWIS RSUs are currently deployed in the SM (Service Module), FGB, Node-1, Lab, Node-2 and Discovery. IWIS will also collect data during the upcoming DTF (Dedicated Thruster Firing) on FD10 (6/9)],*

- FE-2 Reisman powered up the CBCS (Centerline Berthing Camera System) which he installed yesterday at the JPM hatch, then worked with MS4 Akihiko Hoshide to configure and depressurize the JLP/Node-2 vestibule for demating,
- Aki supported the demating of the Node-2 zenith CBM (Common Berthing Mechanism), petals to be closed at a later time,
- CDR Mark Kelly provided camera support during the relocation,
- Hoshide removed the sample port cap from the PPRV (Positive Pressure Relief Valve) in the JPM overhead hatch,
- Nyberg then detached the PPRV from the JPM hatch, now no longer required, and replaced it with an MPEV (Manual Pressure Equalization Valve), and
- Reisman deactivated and dismantled the no longer needed CBCS.

After yesterday's outfitting, the SSIPC (Space Station Integrated Promotion Center) activated the JPM Power Channel A last night. The activation was nominal and now both channels, A & B, are functional.

Continuing Kibo laboratory outfitting activities today –

- Karen Nyberg & Greg Chamitoff rotated the ECLSS/TCS2 (Thermal Control System 2) rack down to close the manual inlet valve of the ATCS TCA (Active TCS Thermal Control Assembly) accumulator, then moved the rack back up, and
 - Mark Kelly & Ken Ham worked on the DMS2 (Data Management Systems 2), EPS2 (Electrical Power Systems 2) and TCS1 (Thermal Control System 1) racks in the JPM, reconfiguring each with a pivot pin and K-BAR (Knee-Brace Assembly Replacement) capture mechanism.

FE-1 Kononenko set up new Bubble dosimeters for recording radiation traces as an additional component of the RS (Russian Segment) radiation payload suite "Matryoshka-R" (RBO-3-2), initializing and deploying the detectors. Proper function of the setup was later verified with the LULIN-5 electronics box. *[A total of seven Bubble dosimeter detectors (A01-A08, A05 not used) were initialized in the Bubble dosimeter reader in the SM and positioned at their exposure locations, three at the spherical "Phantom" unit on the DC1 panel and four in the SM starboard crew cabin on both sides of the MOSFET (metal oxide semiconductor field-effect transistor) dosimeter detector unit. The setup was photo-documented with the NIKON D2X camera and also reported to TsUP via log sheet on the BSR-TM payload channel. The complex Matryoshka payload suite is designed for sophisticated radiation studies. Note: Matryoshka is the name for the traditional Russian set of nested dolls.]*

CDR Mark Kelly & PLT Ken Ham had 2.5 hrs reserved for reworking two new A/L

BCMs (Airlock Battery Charge Modules) before their installation in lieu of failed units. The BCMs will be installed in slots 1 & 2 in the A/L on FD10. *[The BCMs, delivered on STS-124, were discovered to have a flawed LCD (Liquid Crystal Display) circuit board with a resistor which could overheat and thereby defeat the LED (Light-Emitting Diode) backlight capability of the new units. The modification consisted in carefully opening up the BCMs (16 fasteners each), cutting the leads of the resistor and re-assembling the boxes.]*

MS4 Hoshide swapped the onboard voltage/current MultiMeter with a new unit.

Garrett Reisman retrieved the RFCA FSE (Rack Flow Control Assembly/Flight Support Equipment) accumulator which on 6/4 was removed in the JPM from the LTL (Thermal Control System/Low Temperature Loop) of the TCS/EPs1 rack, installed it on the failed RFCA from Node-2 (removed 5/28) and transferred both to the Orbiter for return.

In the SM, Sergey Volkov completed the IMF (Inflight Maintenance) on the two Russian SKV air conditioners started yesterday, installing six new retainers and restoring the nominal mounting structures for the SKVs' heat exchanger-condenser fans VTK1 & VTK2. *[The outfitting involved temporary deactivation of a SIGNAL-VM (DS-7A) smoke detector (#2), removing & reinstalling panels, and dismantling the old ventilator mounts for relegation to trash.]*

Using the RSE1 laptop, FE-1 Kononenko spent 3.5 hrs with the new KPT-2 science payload BAR-RM, Kelvin, Ira and TTM, set up 6/4-5 for battery charging, today running tests and taking the first measurements (temperatures, relative humidity, dew point temperatures), using the RSE1 laptop. *[Measurements were taken behind panels, near welds along SM structural rings and near the shell ring in the FGB for subsequent downlinking via BSR-TM channel. At the FGB pressurized shell ring, Oleg also inspected structural elements, equipment, and cable bundles for moisture, mold, or evidence of corrosion. The data, collected at locations such as feedthroughs, windows, hatches etc., are being used to get proficient in experimenting with ISS leak detection based on environmental data anomalies (temperature, humidity, and ultrasound emissions) at potential leak locations. The BAR-RM payload uses a remote infrared thermometer (Kelvin-Video), a thermohygrometer (Ira-6A), a heat-loss anemometer/thermometer (TTM-2), an ultrasound analyzer (AU-01), and a leak detector (UT2-03) to determine physical background signs of loss of ISS pressure integrity which could be indicative of leaks in the working compartments of the station. Measurements are taken in specific zones (13 in SM PkhO and 4 in DC1), both with lights, fans & ASU pump turned on and off.]*

CDR Volkov conducted his second recharging of the Motorola Iridium-9505A satellite phone brought up on Soyuz 16S, a monthly routine job. *[After retrieving it from its location in the TMA-12/16S descent module (BO), Sergey initiated the recharging of its lithium-ion battery, monitoring the process every 10-15 minutes as it took place. Upon completion at ~11:15am, the phone was returned inside its SSSP Iridium kit and stowed back in the BO's operational data files (ODF) container. The satphone accompanies returning ISS crews on Soyuz reentry & landing for contingency communications with SAR (Search-and-Rescue) personnel after touchdown (e.g., after an "undershoot" ballistic reentry, as happened during the recent 15S return). The Russian-developed procedure for the monthly recharging has been approved jointly by safety officials. During the procedure, the phone is left in its fire-protective fluoroplastic bag with open flap. The Iridium 9505A satphone uses the Iridium constellation of low-Earth orbit satellites to relay the landed Soyuz capsule's GPS (Global Positioning System) coordinates to helicopter-borne recovery crews. The older Iridium-9505 phones were first put onboard Soyuz in August 2003. The newer 9505A phone, currently in use, delivers 30 hours of standby time and three hours of talk, up from 20 and two hours, respectively, on the older units.]*

The CDR also conducted his second run with the Russian DZZ-2 "Diatomeya" ocean observations program, using the NIKON F-5 digital still camera with 80-200 mm lens and the HDV (high-definition) video camcorder from SM windows 7 & 8 to record color fields in oceanic waters attributed to phytoplankton blooming and observation conditions along the flight path. *[June is a period of extensive phytoplankton blooming in the waters of the Northern hemisphere and is also associated with the end of a dry season and the start of a rainy season in the largest river basins of India, West Africa, and South America. Uplinked target zones were along the Honduras coastline.]*

The FE-1 conducted the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS (Russian Segment) hatchways, including the passageways PrK (SM Transfer Compartment)–ATV, PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1. *[This checkup is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons, and one of the two Russian SKV air conditioners off (SKV-1).]*

Later, Kononenko completed the periodic (about twice a month) replenishing of the Elektron oxygen generator's water supply for electrolysis, filling the KOV EDV container with water collected in CWCs (Contingency Water Containers) #1075 & #1043 from the Lab CCAA (Common Cabin Air Assembly) dehumidifier. *[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]*

FE-2 Reisman performed periodic 40-min. maintenance on the U.S. OGS (Oxygen Generation System), recharging the WDS (Water Delivery System) from a filled PWR (Payload Water Reservoir), leaving the PWR stowed in front of it. *[Like the Russian Elektron, OGS produces O₂ from water by electrolysis, dumping the also generated H₂ (hydrogen) through venting.]*

In the SM, Oleg completed the routine maintenance of the SOZh/ECLSS system, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Sergey also handled the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Shuttle crewmembers Kelly & Ham had several hours set aside for working on transfers of cargo from and to the Discovery middeck, “choreographed” by an uplinked detailed transfer list.

With the SSRMS parked by Karen & Greg at the JEMRMS viewing position, Aki Hoshide will perform steps later tonight for relieving any mechanical strain from the Japanese RMS main arm. *[This consists of turning on the arm’s RTL (Robotic Laptop Terminal) and CCP (Camera Control Panel), then resetting JEU (Joint Expedited Undocking) resolvers and powering on the Ext-2 power line which provides electricity to the RMS motor mechanisms.]*

Afterwards, Aki will use the laptop for checking out the arm’s MUX (Data Multiplexer) and its THC (Translational Hand Controller) in the x-axis (for single-joint ops), in a partial deploy to the EVA-3 start position, and for checking out the performance of the video systems.

Earlier today, Greg Chamitoff terminated the GN₂ (gaseous nitrogen) transfer from the Shuttle to the HPT (high-pressure tank) on the “Quest” A/L by closing the manual isolation valve. Total N₂ transferred: ~14 lbs.

The FE-2-17 again had about an hour for himself for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for

the first two weeks after starting station residence.

The ISS crew performed physical workout on the TVIS treadmill (CDR, FE-2) and RED resistive exercise device (FE-1).

Afterwards, Oleg copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~9:51am EDT, Oleg & Sergei powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply) and at 9:56am conducted a ham radio exchange with students at the Kursk State Polytechnic University in Kursk, central Russia.

At 12:27pm, the two Commanders, Sergey Volkov & Mark Kelly, participated in three live interactive PAO TV interviews with KMSB-TV in Tucson, AZ (Deanna Morgan), NPR (National Public Radio, Scott Simon), and APTV (Associated Press Television, Marcia Dunn).

Port SARJ Inspection Update: As a get-ahead task during yesterday's EVA-2, Fossum and Garan spent some time on the port Solar Alpha Rotary Joint, removing cover #2, inspecting the bearing surface and replacing the cover. Photos were taken and downlinked for review. The crew reported that there are no metal shavings visible in the area nor is there visible bearing damage as was discovered in the starboard SARJ bearing. No divots were seen on the bearing surface. A grease-like substance appears to be smeared on Datum A, circumferentially distributed about 1/2" from the edge, but this is not currently considered to be detrimental to the operation of the SARJ. The origin of this substance is under investigation. The port SARJ was last inspected during the Expedition 16 Stage EVA.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (as of this morning, 8:10am EDT [= epoch]):

Mean altitude -- 339.7 km

Apogee height -- 343.5 km

Perigee height -- 335.9 km

Period -- 91.33 min.

Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.000563
Solar Beta Angle -- 12.deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.77
Mean altitude gain in the last 24 hours -- 35 m
/Revolutions since FGB/Zarya launch (Nov. 98) -- 54684

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

STS-124 docked timeline

- 6/07 – FD8 - JLP Vestibule outfitting; CP9 ETVCG TVCIC R&R, Campout
- 6/08 – FD9 - EVA-3 (10:32am, 7 hrs), S1 NTA R&R, compl JPM outfit (RMS cvr remv), P1 CP9 ETVCG install
- 6/09 – FD10 - JRMS checkouts, JLP Vestibule outfitting, A/L BCM R&R, DTF
- 6/10 – FD11 – “Sayonara” (~4:00pm), hatch close (~4:30pm)
- 6/11 – FD12 - Undocking (~7:33am); Greg remains, Garrett leaves; OBSS survey/inspection
- 6/12 – FD13 - Mostly off-duty
- 6/13 – FD14 - Stowing; deorbit preps
- 6/14 – FD15 - Deorbit burn

06/14/08 -- STS-124/Discovery landing (KSC: ~11:02am EDT, nominal)

07/10/08 -- Russian EVA-20 (7/10-11)

09/05/08 -- ATV1 undocking

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (at DC1 nadir)

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)

11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking

12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment

12/06/08 -- STS-119/Discovery/15A docking

12/15/08 -- STS-119/Discovery/15A undocking

2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 06/05/08

All ISS systems continue to function nominally, except those noted previously or below. *Flight Day 6 (FD6) of STS-124/1J. ISS crew work cycle remains unchanged: wake 6:32am EDT; sleep 10:02pm.*

Crew activities aboard the ISS today centered on three major areas: (1) The second 1J spacewalk, (2) activation of the JPM (Japanese Pressurized Module) Kibo, and (3) preparations for tomorrow's relocation of the JLP (Japanese Logistics Pressurized Module).

Mission 1J's EVA-2 was completed successfully by Mike Fossum & Ron Garan in 7h 11min, accomplishing all its objectives. *[During the spacewalk, Fossum (EV1) & Garan (EV2) –*

- (1) Installed Fwd/Aft JTVEs (JEM Television Equipment, i.e., 2 cameras) for monitoring JEM RMS ops (~12:19pm),*
- (2) Removed 7 thermal covers from each of the JEM RMS' six joints & one end effector (~1:02pm),*
- (3) Prepared the JPM zenith ACBM (Active Common Berthing Mechanism) for JLP relocation on FD7 (removed ACBM cover; released MMOD/Micrometeoroid Orbital Debris shield launch restraints),*
- (4) Cleared up late-discovered MLI (Multi-Layer Insulation) cover anomaly on the JPM zenith CBM (could have interfered with the 4 capture latches during JLP relocation/berthing tomorrow) (~1:55pm),*
- (5) Installed JPM trunnion and keel pin thermal covers (~2:15pm),*
- (6) Prepared the old S1 Nitrogen Tank Assembly on S1 truss and new spare on ESP-3 (External Stowage Platform 3) for R&R during EVA 3 (~3:45pm), and*
- (7) Retrieved an ETVCG (External TV Camera Group) camera from CP9 (Camera Port 9) on the left truss.*

Official start time of the spacewalk was 11:04am EDT, about 28 minutes ahead of timeline, and it ended at 6:15pm. Total EVA duration (PET = Phase Elapsed Time)

was 7h 11min. It was the 111th spacewalk for ISS assembly & maintenance and the 83rd from the station (61 from Quest, 22 from Pirs, plus 28 from Shuttle) totaling 512h 48min, the second for Expedition 17 and the 11th so far this year. After today's EVA, a total of 143 spacewalkers (111 NASA astronauts, 21 Russians, and 11 astronauts representing Japan-1, Canada-4, France-1, Germany-2 and Sweden-3) have logged a total of 701h 10min outside the station on building, outfitting & servicing. It was the 133rd spacewalk involving U.S. astronauts.]

After wakeup at ~6:32am, ending the 8.5-hr sleep period before the spacewalk, the A/L CL (Airlock Crewlock) hatch was cracked (~7:12am) for a hygiene break/with mask prebreathe for Fossum & Garan, after spending the night on 10.2 psi campout. Around 8:22am, the hatch was closed again by IVs (Intravehicular Crewmembers) for EVA preparations in 10.2 psi, followed by EMU (Extravehicular Mobility Unit) purge & prebreathe. Sergey Volkov, Mark Kelly & Greg Chamitoff assisted the spacewalkers during EMU purge, EMU prebreathe and CL depressurization. EV1/EV2 egress followed after the EMUs were switched to batteries at 11:04am.

Before breakfast, Chamitoff collected his second “wet” saliva sample for the biomed experiment INTEGRATED IMMUNE (Validating Procedures for Monitoring Crew member Immune Function). *[IMMUNE protocol requires the collection to occur first thing post-sleep, before eating, drinking and brushing teeth, and all samples are stored at ambient temperature. Along with NUTRITION (Nutritional Status Assessment), INTEGRATED IMMUNE samples & analyzes participant's blood, urine, and saliva before, during and after flight for changes related to functions like bone metabolism, oxidative damage and immune function to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects. The saliva is collected in two forms, dry and liquid. The dry samples are collected at intervals during the collection day using a specialized book that contains filter paper. The liquid saliva collections require that the crewmember soak a piece of cotton inside their mouth and place it in a salivette bag; there are four of the liquid collections during docked operations.]*

Prior to EVA start, CDR Volkov activated two Kodak DCS760 digital cameras with 28mm lens for the EVA and verified deactivation of all onboard ham radio equipment (Kenwood in SM/Service Module, Ericsson in FGB) to prevent RF interference with the EMUs, as well as proper closure of the protective Lab window shutters.

As the spacewalk went on, monitored by Ken Ham & Mark Kelly, crewmembers Hoshide, Nyberg, Reisman, Volkov, Kononenko & Chamitoff worked in the JPM at various times on carefully choreographed outfitting of Kibo. Major transfers from

JLP and commensurate installation activities in JPM included –

- EPS1 (Electrical Power Systems 1) rack & mating of its umbilicals,
- DMS1 (Data Management Systems 1) rack & mating of its umbilicals,
- WS (Workstation) rack and checking out its C&W (Caution & Warning) panel,
- ICS (Interorbit Communication System) rack,
- SAIBO (“biologic cell”) payload rack after installing two monitor display covers (CB/Clean Bench; CBEF/Cell Biology Experiment Facility),
- RYUTAI (“fluid”) payload rack,
- JRSR (JEM Resupply Stowage) rack,
- Mating umbilicals for the JEMRMS (Japanese Experiment Module Robotic Manipulator System) console rack transferred last night from the JLP, checking out its C&W (Caution & Warning) panel, and configuring its console (deploying two cue cards),
- Removing launch restraints of the pre-installed EPS2 & DMS racks, and
- Relocating two dummy hard panels from JPM to locations in JLP.

For the JPM outfitting, Hoshide & Nyberg also –

- Deployed the remaining Photo/TV drag-thru cable from Node-2,
- Reconfigured both the “B” string & “A” string HCTLs (Heater Controllers) from LTA (Launch-to-Activation) to On-Orbit, reconnecting appropriate power cables,
- Installed the JPM Channel “A” power jumper (W3009) in the Vestibule (after transfer & connection of EPS1 & DMS1), allowing TKSC (Tsukuba Space Center)/Japan to assume Kibo control,
- Moved the JPM PCS (Portable Computer System) laptop from its temporary location to the JEMRMS rack and mounted it on the rack’s right side,
- Set up two SSC (Station Support Computer) laptops in the JPM, one hard-wired, the other off a drag-thru cable (to enable Japanese language, IP Phone, etc.), and
- Configured the DOUG (Dynamic Onboard Ubiquitous Graphics) application on the PCS for the upcoming activation of the RMS in front of Kibo, to receive & display SRMS/SSRMS/JEMRMS joint angle telemetry from the laptop. *[DOUG is a software application that provides a graphical birdseye-view image of the external station configuration and the JEMRMS, showing its real-time location and configuration on a laptop during its operation.]*

In preparation for tomorrow’s relocation of the JLP module from Node-2 zenith to JPM with the SSRMS (Space Station Remote Manipulator System) --

- Nyberg deactivated the JLP MKAM (Minimum Keep Alive Monitor) fan which had been turned on temporarily by Reisman earlier this morning as usual to allow ingress into JLP,
- Aki Hoshide unlatched the JPM’s overhead hatch,

- Garrett Reisman installed & checked out the CBCS (Centerline Berthing Camera System) at the JPM hatch, and
- Karen & Oleg installed the CPA (Controller Panel Assembly) at the Node-2 zenith hatch so that Flight Controllers at MCC-Houston can make preparations for the JLP relocation during crew sleep,
- Sergey walked off the SSRMS, i.e., ungrappled the JPM PDGF (Power & Data Grapple Fixture), which had provided vital keep-alive power to the JPM, and maneuvered the arm to grapple, at 6:08pm, the MBS (Mobile Base System) PDGF-3 for a ground-commanded base change later tonight (the MT/Mobile Transporter with the MBS was moved yesterday from WS4/Worksite 4 to WS6).

In the US Lab, MS-1 Nyberg installed the AmiA (Antimicrobial Applicator), brought up on STS-124, in the ITCS (Internal Thermal Control System) and removed its insulation blanket to allow temperature equalization. Later tonight, AmiA will be removed again. *[AmiA is introducing OPA (Ortho-Phthalaldehyde), an antimicrobial agent, into the Lab ITCS coolant.]*

Sergey Volkov terminated battery charging for the “Kelvin-Video” and TTM-2 instruments for another operational run of the Russian KPT-2 science payload BAR-RM, starting tomorrow (6/6) TTM-2 using the RSE-1 laptop, with downlinking via BSR-TM channel. *[Objective of the payload is to experiment with ISS leak detection based on environmental data anomalies (temperature, humidity, and ultrasound emissions) at leak locations. The payload uses a remote infrared thermometer (Kelvin-Video), a thermohygrometer (Iva-6A), a heat-loss anemometer/thermometer (TTM-2), an ultrasound analyzer (AU-01), and a leak detector (UT2-03) to determine physical background signs of loss of ISS pressure integrity which could be indicative of leaks in the working compartments of the station. Measurements are taken in specific zones (13 in SM PkhO and 4 in DC1), both with lights & fans turned on and off.]*

The FE-1 conducted the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS (Russian Segment) hatchways, including the passageways PrK (SM Transfer Compartment)–ATV, PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1. *[This checkup is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons, and one of the two Russian SKV air conditioners off (SKV-1).]*

In preparation for a major RS outfitting activity scheduled tomorrow, involving the nominal restoration of mounting structures for the heat exchanger-condenser fans VTK1 & VTK2 of the two Russian SKV air conditioners, the CDR unstowed and readied necessary tooling and reviewed procedures.

After the spacewalkers' return on board at 6:15pm, post-EVA activities by Fossum, Garan, Kelly and Chamitoff in the A/L consist of --

- Recharging the EMU/spacesuits with water from PWR (Payload Water Reservoir),
- Reconnecting the LTAs (Lower Torso Assemblies) to the EMUs,
- Capping the UIA (Umbilical Interface Assembly (no METOX regeneration required),
- Setting up the METOX (Metal Oxide) CO₂ absorbers for regeneration in the A/L bake-out oven,
- Downlinked EVA imagery from the Kodak DCS760 camera & readying the camera for EVA-3, and
- Initiating recharge of the EMU (Extravehicular Mobility Unit) batteries in the A/L BSA (Battery Stowage Assembly).

Kononenko switched the Russian Vozdukh CO₂ removal system to manual Mode 5 via the on-board computer system. *[Mode 5 uses two adsorbent cartridges with 10 min cycle time, a vacuum pump cycle time of 1 min, plus 40% airflow during sleep, 60-80% during the day, and 100% during physical exercise, for 3-4 crewmembers.]*

In the SM, Volkov completed the routine maintenance of the SOZh/ECLSS system, including ASU toilet facilities systems/replaceables (see below for update). *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

The CDR also performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

FE-2-17 Chamitoff spent more time (~15 min.) on familiarizing himself with the onboard CMS (Crew Medical Systems) exercise equipment.

In addition, Greg had another hour for himself for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residency.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS

cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1, FE-2), RED resistive exercise device (CDR, FE-1) and VELO cycle with bungee cord load trainer (CDR, FE-1).

Afterwards, Sergey copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~8:15pm EDT, Chamitoff is scheduled for another regular PMC (Private Medical Conference) via S- & Ku-band audio/video.

CDRA Update: After yesterday's R&R of its #2 desiccant/sorbent (#202), the Carbon Dioxide Removal Assembly was declared operational. The fan speed was commanded to 130,000 RPM (revolutions per minute) and will remain at that speed for the remainder of the docked mission.

ASU Update: After the replacement of the failed MNR-NS gas/liquid separator pump of the Russian ASU toilet system by FE-1 Kononenko yesterday, the crew performed several flushes with water to verify a successful R&R, after which ground specialists declared the ASU "Go" for use. Prior to replacement of the pump, the crew had been using the backup Wring Receptacle Assembly instead of the ASU. The crew requested instructions on how to package the failed pump on Flight 1J. ■

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 5:13am EDT [= epoch]*):

Mean altitude -- 339.7 km

Apogee height -- 343.5 km

Perigee height -- 335.9 km

Period -- 91.33 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0005651

Solar Beta Angle -- 17.2 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.77

Mean altitude gain in the last 24 hours -- 80 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54666

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

STS-124 docked timeline

- 6/06 – FD7 - JLP relocate to JPM; JLP Vestibule leak check; Focused inspection
- 6/07 – FD8 - JLP Vestibule outfitting; CP9 ETVCG TVCIC R&R
- 6/08 – FD9 - EVA-3 (10:32am, 7 hrs), S1 NTA R&R, compl JPM outfit (RMS cvr remv), P1 CP9 ETVCG install
- 6/09 – FD10 - JRMS checkouts, JLP Vestibule outfitting, A/L BCM R&R
- 6/10 – FD11 – “Sayonara” (~4:00pm), hatch close (~4:30pm)
- 6/11 – FD12 - Undocking (~7:33am); Greg remains, Garrett leaves; OBSS survey/inspection
- 6/12 – FD13 - Mostly off-duty
- 6/13 – FD14 - Stowing; deorbit preps
- 6/14 – FD15 - Deorbit burn

06/14/08 -- STS-124/Discovery landing (KSC: ~11:02am EDT, nominal)

07/10/08 -- Russian EVA-20 (7/10-11)

09/05/08 -- ATV1 undocking

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (at DC1 nadir)

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)

11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking

12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment

12/06/08 -- STS-119/Discovery/15A docking

12/15/08 -- STS-119/Discovery/15A undocking

2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD

3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation

05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**

3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2

4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola

1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)

1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)

2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 06/04/08

All ISS systems continue to function nominally, except those noted previously or below. *Flight Day 5 (FD5) of STS-124/1J. ISS crew work cycle remains unchanged: wake 6:32am EDT; sleep 10:02pm.*

Arigato Gozaimasu! Congratulations, JAXA! There is Hope in space! At ~5:09pm EDT, the JPM (Japanese Pressurized Module) of the JEM "Kibo" laboratory complex was opened and ingressed by Aki Hoshide and Karen Nyberg for the first time, joined later by the rest of the crew who clearly enjoyed the voluminous super laboratory. *[Kibo is permanently attached at the Node-2 (Harmony) portside hatch since last night.]*

FE-1 Oleg Kononenko performed the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS (Russian Segment) hatchways, including the DC1-to-Soyuz tunnel, and the FGB-to-Node passageway. *[This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons, and one of the two Russian SKV air conditioners off (SKV-1).]*

After last night's successful gross leak check of the Kibo/Node-2 vestibule by MS1 Karen Nyberg following the berthing of Kibo to the Node-2 port hatch (7:01pm), FE-2 Garrett Reisman this morning terminated the overnight fine leak check, which confirmed successful hermeticity of the linkup.

Afterwards, MS4 Aki Hoshide & Nyberg were the principal crewmembers charged with today's opening up of the Japanese laboratory. Before hatch opening and first ingress in Kibo at 5:09pm, --

- Hoshide & Nyberg spent ~6 hrs between them on JPM-to-Node-2 vestibule outfitting, setting up equipment including stringing & connecting power cables for routing electricity to Kibo,
- Reisman & Hoshide activated Channel "B" power to provide initial

environmental conditions inside the laboratory for human access; this also allowed transfer of command capability for Kibo from MCC-Houston to JAXA's TKSC (Tsukuba Space Center) in Japan which will activate the A-string systems tomorrow (FD6),

- Kononenko replaced the aft NPRV (Negative Pressure Relief Valve) in the Node-2 port hatch with the regular IMV (Intermodule Ventilation) valve, and
- Aki completed Kibo vestibule outfitting by installing the nitrogen (N₂) supply jumper/hose between Node-2 and JPM.

After ingressing the laboratory wearing PPE (Personal Protective Equipment, i.e., surgical masks plus goggles) for the first few minutes until it was determined that the cabin air was clean of any debris, the crewmembers set up the JPM by –

- Completing the purge of the N₂ system to remove any contamination from the lines,
- Collecting air samples in the JPM using the AK-1M sampler kit before air duct installation,
- Disconnecting and removing the FSE (Flight Support Equipment) Accumulator from the TCS LTL (Thermal Control System/Low Temperature Loop),
- Reconfiguring the TCA GN2 (Thermal Control Assembly Gaseous Nitrogen) Manual Accumulator by opening its isolation valve,
- Transferring & installing two hard dummy panels from the JLP (Japanese Logistics Pressurized Module) and installing them in the JPM in preparation of EPS1 (Electrical Power Systems 1) Rack & WS (Work Station) Rack installation (access to JLP requiring temporary activation of the JLP MKAM/Minimum Keep Alive Monitor fan as usual),
- Transferring the JEMRMS (JEM Robotic Manipulator System) Rack from the JLP to the JPM,
- Deploying necessary drag-through cables from Node-2 into Kibo,
- Removing stowage bags from in front of the EPS2 & DMS2 (Data Management System 2) Racks and stowing them near the JEM AL (Airlock), and
- Configuring the Kibo lab with two PFEs (Portable Fire Extinguishers) from Node-1 & FGB stowage, plus one PBA/QDMA (Portable Breathing Apparatus/Quick-Don Mask Assembly), a second PBA/QDMA to be added on FD9 after EVA-3.

FE-1 Kononenko had two hours set aside for working a major IFM (In-flight Maintenance) on the Russian ASU toilet facility in the SM (Service Module), removing the failed MNR-NS gas/liquid separator pump of the facility and replacing it with a new unit delivered on STS-124. As of now, the IFM appears to have been

successful: the ASU is working nominally, so far.

Major IFM was also performed by FE-2 Reisman who removed the failed desiccant/sorbent bed #2 (202) of the US CDRA (Carbon Dioxide Removal Assembly) and replaced it with a new unit delivered on STS-124. FE-2-17 Chamitoff assisted in the task as per "dedicated handover".

CDR Sergey Volkov continued the annual inspection and photo-documentation of window panes in the SM, started earlier (5/28). The observed defects were recorded in image and text files on the RSK1 laptop for subsequent downlink via U.S. OCA assets. *[Objective of the inspection, which uses a digital still camera (Nikon D1X w/SB-28DX flash) and voice recorder, today was to assess the pane surfaces on SM windows 2, 3, 5, 8, 9 for any changes (new cavities, scratches, new or expanded old stains or discolorations affecting transparency properties) since the last inspection, performed by Oleg Kotov on 6/26/07. The new assessment will be compared to the earlier observations. Defects are measured with the parallax method which uses eyeball-sighting with a ruler and a right isosceles triangle to determine the defects' size and position with respect to the window's internal surface (parallax being the apparent change in an object's position resulting from changing the observer's position).]*

Kononenko serviced the Matryoshka-R (RBO-3-2) radiation payload, which has taken over the ESA/RSC-Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS/ALC) with its Spectrometer (AST) and ALC equipment on DC1 panel 429, performing the periodic test on the AST and its current ALC-948 PCMCIA memory card, using the RSK1 laptop for checking the #948 PCMCIA (Portable Computer Memory Card International Adapter).

CDR Mark Kelly & PLT Ken Ham worked in the Node-1 starboard alcove, installing a check valve-hose for A/L CCAA (Common Cabin Air Assembly) safing.

Volkov set up the TTM-2 and "Kelvin-Video" batteries for charging for another operational run of the Russian KPT-2 science payload BAR-RM. Charging will be terminated tomorrow (6/5), with data gathering starting Friday (6/6) using the RSE-1 laptop, with downlinking via BSR-TM channel. *[Objective of the payload is to experiment with ISS leak detection based on environmental data anomalies (temperature, humidity, and ultrasound emissions) at leak locations. The payload uses a remote infrared thermometer (Kelvin-Video), a thermohygrometer (Iva-6A), a heat-loss anemometer/thermometer (TTM-2), an ultrasound analyzer (AU-01), and a leak detector (UT2-03) to determine physical background signs of loss of ISS pressure integrity which could be indicative of leaks in the working compartments of the station. Measurements are taken in specific zones (13 in SM PkhO and 4 in DC1), both with lights & fans turned on and off.]*

Sergey also collected Elektron feed water samples from downstream of the BKO multifiltration unit in a drinking bag (paket dlya napitkov) for return to Earth, to monitor the quality of the water being fed from the KOV EDV container through the BKO to the Elektron-VM oxygen generator.

Oleg removed existing tapes from both VDS VTRs (Video Distribution Subsystem/ Video Tape Recorders), labeled them for stowage & return to Houston, then loaded the VTRs with fresh tapes.

At ~9:22am EDT, Volkov & Kononenko linked up with MBI-8 PROFILAKTIKA specialists at TsUP-Moscow via VHF/audio to discuss physical exercise needs for the MBI-8 experiment. *[Data yields from the TVIS treadmill exercises have been insufficient for analysis. Since the Russian VB-3 VELO ergometer does not record exercise data, the discussion focused on ways for the crew to measure and downlink adequate VELO exercise data for MBI-8.]*

FE-2 Reisman spent about 3 hrs on generic handover activities with Greg Chamitoff (who assumes Garrett's FE-2 position after Shuttle departure), starting with Crew Safety Handovers, using a detailed "handover book". *[During these periods crewmembers are scheduled together to complete various designated standard tasks for familiarizing the new station resident with procedures, caveats, etc. There are also dedicated handovers for selected critical activities.]*

Greg Chamitoff also had time reserved for familiarizing himself with the onboard CMS (Crew Medical Systems) exercise equipment.

Kononenko performed the regular updates of onboard SODF (Station Operations Data File) emergency/warning & procedures books with new material delivered on STS-124. *[These include specific Emergency Books deployed in the Lab, Soyuz, SM, A/L (normally in FGB) and Node-2, Warning Books in the Lab, SM and FGB, a Leak Pinpoint Repair Kit in the PMA-1 (Pressurized Mating Adapter 1), plus a POC (Portable Onboard Computer) Book and Printer Cue Cards.]*

Volkov had 30 min set aside for reviewing the new DOUG (Dynamic Onboard Ubiquitous Graphics) software setups for the upcoming SSRMS (Space Station Remote Manipulator System) and JEM RMS (Robotic Manipulator System) operations planned for tomorrow (FD6)

With assistance by Reisman, Greg Chamitoff performed the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling a CWC (Contingency Water Container, #1062) with the collected water slated for processing. No samples were required. *[Transferred quantity is determined by*

allowing tank and CWC equalize with each other. Tank quantity stabilizes at a value higher than the neutral point. Waiting time ~30 min.]

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2, TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-2) and VELO cycle with bungee cord load trainer (FE-1).

Afterwards, Oleg copied the exercise data file to the MEC (Medical Equipment Computer) laptop for downlink, including the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

In the SM, the FE-1 completed the routine maintenance of the SOZh/ECLSS system, including ASU toilet facilities systems/replaceables. Removal & replacement of the failed separator pump is on tomorrow's schedule for Kononenko at ~9:30-11:30am EDT. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

CDR Volkov performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

FE-2-17 Chamitoff had another 2.5 hrs for himself for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residency.

Kononenko was to check in Node-2 to verify proper installation of the CVIU (Common Video Interface Unit) VCP J01 video cap at the S3 video camcorder port that is required for transmitting video from the Shuttle to ISS.

Fossum, Garan, Kelly, Ham, Volkov and Chamitoff conducted a one-hour review of timeline & procedures for tomorrow's EVA-2 by Mike Fossum (EV1) & Ron Garan (EV2).

Later, after completing Airlock Equipment Lock (A/L EL) configuration for the spacewalk, including recharging batteries and checking EMU equipment, Mike & Ron will begin their "campout" in the "Quest" A/L, starting mask prebreathe, while configuring EVA tools, at ~8:57pm, then closing hatches and initiating depressurization of the CL (Crewlock) from 14.7 to 10.2 psi. Sleep for them and

the ISS crew will commence at 10:02pm, for the Shuttle crew at ~10:32pm. [The overnight Campout (*nachalo desaturatsiy* = desaturation start) in the A/L CL (Crewlock) for denitrogenation/pre-breathe at 10.2 psi lasts about 8.5 hrs. First, the two spacewalkers will perform PBA (Portable Breathing Apparatus) mask prebreathe for denitrogenation, while readying their tools & equipment, then depress the CL from 14.7 to 10.2 psi for their sleep period, to last until ~6:32am EDT tomorrow. The CL hatch will then be cracked at ~7:12am (i.e., temporarily repressurized) for a hygiene break/with mask prebreathe for Fossum & Garan. Around 8:22am, the hatch will be closed again for EVA preps in 10.2 psi, followed by EMU purge & prebreathe. Afterwards, Mark Kelly will support CL depressurization until egress.]

EVA-2, beginning tomorrow nominally at ~11:32am EDT, will last an estimated 6h 30min, i.e., ending at 6:02pm. PLT Ken Ham will again be IV (Intravehicular) crewmember.

--- EVA-1 main objectives are to:

- Install Fwd/Aft JTVEs (JEM Television Equipment, i.e., 2 cameras) for monitoring JEM RMS ops,
- Remove 7 thermal covers from each of the JEM RMS' six joints & one end effector,
- Prepare the JPM zenith ACBM (Active Common Berthing Mechanism) for JLP relocation on FD7 (remove ACBM cover; release MMOD/Micrometeoroid Orbital Debris shield launch restraints),
- Clear up late-discovered MLI (Multi-Layer Insulation) cover anomaly on the JPM zenith CBM (could interfere with the 4 capture latches during JLP relocation/berthing),
- Install JPM trunnion and keel pin covers,
- Prepare S1 Nitrogen Tank Assembly on S1 truss and spare on ESP-3 (External Stowage Platform 3) for R&R during EVA 3, and
- Retrieve ETVCG (External TV Camera Group) camera from CP9 (Camera Port 9) on the left truss.

At ~5:35pm, Greg is scheduled for another regular PMC (Private Medical Conference) via S- & Ku-band audio/video.

Transfers Update: N₂ transfer from the Shuttle began today. No O₂ transfer is planned for 1J. One filled water CWC (#1098) was transferred to the ISS. As of FD3, middeck resupply transfers were 37% of total, overall cargo transfers 12% of total.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 12:21pm EDT [= epoch]*):

Mean altitude -- 339.6 km

Apogee height -- 343.2 km

Perigee height -- 336.0 km

Period -- 91.33 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0005373

Solar Beta Angle -- 21.8 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 300 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54655

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

STS-124 docked timeline

- 6/05 – FD6 - EVA-2 (11:32am, 7 hrs), JPM outfit (JTVE install, JRMS cvr remv), S1 NTA prep, CP 9 ETVCG retrv
- 6/06 – FD7 - JLP relocate to JPM; JLP Vestibule leak check; Focused inspection
- 6/07 – FD8 - JLP Vestibule outfitting; CP9 ETVCG TVCIC R&R
- 6/08 – FD9 - EVA-3 (10:32am, 7 hrs), S1 NTA R&R, compl JPM outfit (RMS cvr remv), P1 CP9 ETVCG install
- 6/09 – FD10 - JRMS checkouts, JLP Vestibule outfitting, A/L BCM R&R
- 6/10 – FD11 – "Sayonara" (~4:00pm), hatch close (~4:30pm)
- 6/11 – FD12 - Undocking (~7:33am); Greg remains, Garrett leaves; OBSS survey/inspection
- 6/12 – FD13 - Mostly off-duty
- 6/13 – FD14 - Stowing; deorbit preps
- 6/14 – FD15 - Deorbit burn

06/14/08 -- STS-124/Discovery landing (KSC: ~11:02am EDT, nominal)

07/10/08 -- Russian EVA-20 (7/10-11)

09/05/08 -- ATV1 undocking

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (at DC1 nadir)

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 06/03/08

All ISS systems continue to function nominally, except those noted previously or below. *Flight Day 4 (FD4) of STS-124/1J. ISS crew work cycle remains unchanged: wake 6:32am EDT; sleep 10:02pm. Welcome to Expedition 17, Greg Chamitoff!*

Mission 1J's EVA-1 was completed successfully by Mike Fossum & Ron Garan in 6h 48min, accomplishing all its objectives. *[During the spacewalk, Fossum (EV1) & Garan (EV2) –*

- (1) released an SRMS (Shuttle Remote Manipulator System) elbow camera launch lock,*
- (2) supported the transfer of the OBSS (Orbiter Boom Sensor System) from ISS to Shuttle RMS (~1:45pm),*
- (3) checked out MCAS RTL (Mobile Servicing System Common Attach System/Ready-to-Latch) operation (in preparation for ULF-2),*
- (4) prepared Node-2 port ACBM (Active Common Berthing Mechanism) for the installation of the JPM (Japanese Pressurized Module) laboratory,*
- (5) opened Node-2 the nadir hatch window cover (in preparation for ULF-2),*
- (6) prepared the JPM for installation, i.e., disconnected/stowed an LTA (Launch-to-Activation) cable, removed Passive CBM contamination covers, and released the JPM forward window launch lock (~4:10pm)*
- (7) inspected the "Datum A" surface of the Starboard SARJ (Solar Alpha Rotary Joint),*
- (8) performed a Stbd SARJ cleaning test using a scraper, wipes and a special grease, and*
- (9) re-installed the Stbd SARJ TBA-5 (Trundle Bearing Assembly #5) ~4:42pm.*

Official start time of the spacewalk was 12:22pm EDT, about 50 minutes behind the timeline (due to an issue with Fossum's "Snoopy" comm cap), and it ended at 7:10pm. Total EVA duration (PET = Phase Elapsed Time) was 6h 48min. It was

the 110th spacewalk for ISS assembly & maintenance and the 82nd from the station (60 from Quest, 22 from Pirs, plus 28 from Shuttle) totaling 505h 37min, the first for Expedition 17 and the 10th so far this year. After today's EVA, a total of 139 spacewalkers (107 NASA astronauts, 21 Russians, and 11 astronauts representing Japan-1, Canada-4, France-1, Germany-2 and Sweden-3) have logged a total of 693h 59min outside the station on building, outfitting and servicing. It was the 131st spacewalk involving U.S. astronauts. Today was also the 43rd anniversary of the first US EVA, by Ed White on Gemini 4 (June 3, 1965).]

Early in the EVA-1, **the Orbiter Boom Sensor System (OBSS) was relocated** from its temporary location on the ISS truss to the Shuttle on Discovery's SRMS. *[After Garan released stanchions & removed a protective bag, with Fossum detaching a KAU (Keep Alive Umbilical), MS4 Akihiko Hoshide and MS1 Karen Nyberg operated the SSRMS (Space Station Remote Manipulator System) to grapple and unberth the OBSS (~1:27pm), then handed it over to the SRMS (Shuttle RMS).]*

Later, the 37-ft long, 14.5-ft wide **JPM Kibo was successfully transferred and installed** on the Node-2 "Harmony" portside dock at 7:01pm (1st stage capture 6:42pm, SSRMS wrist limped 6:43pm, 2nd stage capture 7:01pm). *Aki Hoshide: "Houston, we have a new 'Hope' on the space station!"* After the installation, ISS attitude was maneuvered to the new TEA (Torque Equilibrium Attitude) which Kibo's addition has changed. *[Hoshide & Nyberg operated the SSRMS to grapple, unberth, transfer and reberth the JPM at the Node-2 Port CBM (Common Berthing Mechanism) with the SSRMS in "limp" mode. All motorized bolts have engaged to firmly hold the science laboratory at its place, and leak checks were then initiated on the vestibule between JPM and the Node-2 port. Ingress in Kibo is scheduled for tomorrow at ~ 4:47pm EDT.]*

After wakeup at ~6:32am (by a recording of high school friends of Aki Hoshide singing "Hold Me With The Robot Arm"), ending the 8.5-hr sleep period before the spacewalk, the A/L CL (Airlock Crewlock) hatch was cracked at ~7:12am for a hygiene break/with mask prebreathe for Fossum & Garan, after spending the night on 10.2 psi campout. Around 8:35am, the hatch was closed again by IVs (Intravehicular Crewmembers) for EVA preparations in 10.2 psi, followed by EMU (Extravehicular Mobility Unit) purge & prebreathe. IVs Reisman & Chamitoff assisted the spacewalkers during EMU purge, EMU prebreathe and CL depressurization. EV1/EV2 egress followed after the EMUs were switched to batteries at 12:22pm.

Before breakfast, Chamitoff performed his first session with the biomed experiment INTEGRATED IMMUNE (Validating Procedures for Monitoring Crew member

Immune Function), collecting wet saliva samples. *[IMMUNE protocol requires the collection to occur first thing post-sleep, before eating, drinking and brushing teeth, and all samples are stored at ambient temperature. Along with NUTRITION (Nutritional Status Assessment), INTEGRATED IMMUNE samples & analyzes participant's blood, urine, and saliva before, during and after flight for changes related to functions like bone metabolism, oxidative damage and immune function to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects. The saliva is collected in two forms, dry and liquid. The dry samples are collected at intervals during the collection day using a specialized book that contains filter paper. The liquid saliva collections require that the crewmember soak a piece of cotton inside their mouth and place it in a salivette bag; there are four of the liquid collections during docked operations.]*

Prior to EVA start, FE-1 Oleg Kononenko verified deactivation of onboard ham radio equipment (Kenwood in SM & Ericsson in FGB) to prevent RF interference with the EMUs, as well as proper closure of the protective Lab window shutters.

At the Node-2 port hatch, MS4 Hoshide powered up the CBCS (Centerline Berthing Camera System) in preparation for today's Kibo JPM berthing. Tonight before sleep time, Aki will disassemble the CBCS again and remove it.

Pre-dock activities by FE-2 Garrett Reisman included transferring a PBA (Portable Breathing Apparatus) from its location in Node-1 into the Airlock (A/L) for EVA support.

Kononenko conducted the standard functional check of the IP-1 airflow sensors in the various RS (Russian Segment) hatchways.

With the docked Discovery adding to the station's interior spaces, Garrett checked up on air flow by taking Velocicalc measurements between Shuttle, Node 2 and the Lab.

Afterwards, the FE-1 connected the accelerometer in the Shuttle airlock to an IWIS RSU (Internal Wireless Instrumentation System/Remote Sensor Unit). *[This enabled a total of 6 RSUs throughout the stack to collect data for three 1J events: today's JPM berthing, the JLP (Japanese Logistics Pressurized Module) relocation on FD7, and the dedicated Russian thruster firing on FD10. IWIS is an SDTO (Station Development Test Objective) that records structural measurements to validate math models used in loads analysis. The data will be used to reduce conservatism and might allow relaxation of operational constraints on activities such as crew exercise, vehicle dockings and reboosts that impart structural loads to ISS. The data will also provide more accurate fatigue calculations that could result in an extension of the ISS life.]*

Kononenko also conducted the periodic/long-term inspection of the SM RO (Service Module Working Compartment)'s pressure hull and ring, looking for any moisture, deposits, mold, corrosion and pitting behind panels 130, 134, 135, 138, 139, 454, also underneath the TVIS treadmill (where deposit was discovered earlier) and the cold plates (where SNT and STR lines are installed). *[The inspection of the hull surface, which is coated with a primer and dark-green enamel, is done using cleaning napkins to wipe the area in question if required and reporting results to the ground. The hull inspection looks for changed color and cavities; if cavities are found, they are to be measured for depth (with chewing gum) after cleaning. Digital photographs of the shell before and after the removal of deposits were to be made for documentation.]*

Also during the spacewalk, Garrett Reisman performed the periodic activation & checkout on the CSA-CP (Compound Specific Analyzer-Combustion Products) instruments. *[This included the current prime unit (#1044), three backup units (#1045, #1051, #1058), sampling pumps (#1021, #1019), and four new CSA-CPs delivered on STS-124 (#1028, #1029, #1030, #1031), transferred yesterday from the Orbiter. The four new units received new batteries and, were verified to be free of contamination, plus zero-calibrated for use on ISS.]*

In the SM, Kononenko took the periodic readings of potentially harmful atmospheric contaminants with the CMS (Countermeasure System) component of the GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite which uses preprogrammed microchips to measure H₂CO (Formaldehyde, methanal), CO (Carbon Monoxide) and NH₃ (Ammonia), taking one measurement per microchip. *[CMS is a subsystem of the Russian SKDS Pressure Control & Atmosphere Monitoring System.]*

Garrett Reisman conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. *[Updated "cue cards" based on the crew's water calldowns are sent up every other week. The current cue card (17-00021) lists 31 CWCs (~1199.5 L total) for the four types of water identified on board: technical water (619.6 L, for Elektron, flushing, hygiene, including 423.2 L non-usable water because of Wautersia bacteria), potable water (534.8 L, incl. 88.7 L currently on hold), condensate water (39.3 L), waste/EMU dump and other (5.8 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]*

CDR Volkov, with Chamitoff assisting, performed the standard leak check on Greg's new Sokol pressure suit (to be used in case of TMA-12 contingency return, then set

it up in the Soyuz BO (Orbital Module) for airing out, i.e., drying out any humidity. Kononenko later repeated the process on the Sokol gloves and stowed them with the suit in the BO.

After the spacewalkers' return on board at 7:10pm, post-EVA activities by CDR Volkov and FE-2-17 Chamitoff in the A/L will consist of --

- Recharging the EMU/spacesuits with water from PWR (Payload Water Reservoir), then
- Reconnecting the LTAs (Lower Torso Assemblies) to the EMUs and
- Capping the UIA (Umbilical Interface Assembly (no METOX regeneration required),
- Preparing the CVIU (Common Video Interface Unit) in Node-2, and
- Taking photographs of the EMU gloves for downlink and inspection.

Other post-EVA activities by crewmembers include --

- Returning the PBA unit from the A/L to its original stowage location in Node-1 (FE-2),
- Downlinking EVA photography (FE-2),
- Manual closure of the nitrogen (N₂) supply valve at the A/L in preparation for the N₂ line depress during FD5 activities (FE-2-17), and
- Disconnecting the IWIS RSU cable to the Shuttle airlock (FE-1).

In the SM, Sergey Volkov completed the routine maintenance of the SOZh/ECLSS system, including ASU toilet facilities systems/replaceables. Removal & replacement of the failed separator pump is on tomorrow's schedule for Kononenko at ~9:30-11:30am EDT. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

FE-1 Kononenko performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The ISS crew completed their physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1). *[For load reasons, no exercise is allowed on ISS or Shuttle while both robotarms are grappled.]*

Later, Oleg copied the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Greg Chamitoff had ~2.5 hrs for himself for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residency.

At ~8:00pm, Greg is scheduled for his first regular PMC (Private Medical Conference) via S- & Ku-band audio/video.

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 6:04am EDT [= epoch]*):

Mean altitude -- 339.6 km

Apogee height -- 343.3 km

Perigee height -- 336.0 km

Period -- 91.33 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0005391

Solar Beta Angle -- 26.6 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 265 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54635

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

STS-124 docked timeline

- 6/04 – FD5 - JPM Vestibule outfitting, JPM ingress (~4:47pm), Reisman/Chamitoff handovers
- 6/05 – FD6 - EVA-2 (11:32am, 7 hrs), JPM outfit (JTVE install, JRMS cvr remv), S1 NTA prep, CP 9 ETVCG retrv
- 6/06 – FD7 - JLP relocate to JPM; JLP Vestibule leak check; Focused inspection
- 6/07 – FD8 - JLP Vestibule outfitting; CP9 ETVCG TVCIC R&R
- 6/08 – FD9 - EVA-3 (10:32am, 7 hrs), S1 NTA R&R, compl JPM outfit (RMS cvr remv), P1 CP9 ETVCG install
- 6/09 – FD10 - JRMS checkouts, JLP Vestibule outfitting, A/L BCM

R&R

- 6/10 – FD11 – “Sayonara” (~4:00pm), hatch close (~4:30pm)
- 6/11 – FD12 - Undocking (~7:33am); Greg remains, Garrett leaves;

OBSS survey/inspection

- 6/12 – FD13 - Mostly off-duty
- 6/13 – FD14 - Stowing; deorbit preps
- 6/14 – FD15 - Deorbit burn

06/14/08 -- STS-124/Discovery landing (KSC: ~11:02am EDT, nominal)

07/10/08 -- Russian EVA-20 (7/10-11)

09/05/08 -- ATV1 undocking

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (at DC1 nadir)

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)

11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking

12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment

12/06/08 -- STS-119/Discovery/15A docking

12/15/08 -- STS-119/Discovery/15A undocking

2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD

3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation

05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**

3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2

4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola

1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)

1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)

2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 06/02/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 7 of Increment 17. Flight Day 3 (FD3) of STS-124/1J. ISS crew work cycle today: wake 6:32am EDT; sleep 10:02pm.*

STS-124/Discovery docked smoothly at the PMA-2 (Pressurized Mating Adapter-2) port at 2:03pm EDT, nine minutes behind timeline, in darkness (orbital sunset ~1:23pm), after successfully completing the RPM (R-Bar Pitch Maneuver) in daylight at ~1:08pm and arriving at +V-Bar (straight in front of ISS) at ~1:11pm. The station now hosts ten occupants again as Mission 1J is underway. *[The combined crew is comprised of ISS CDR Volkov, FE-1 Oleg Kononenko, FE-2 Garrett Reisman, STS CDR Mark Kelly, PLT Ken Ham, MS1 Karen Nyberg, MS2 Ron Garan, MS3 Mike Fossum, MS4 Akihiko Hoshide (Japan), and MS5/FE-2-17 Greg Chamitoff who replaces Reisman as FE-2, as the latter returns on Discovery as MS-5.]*

Hook closure to rigidize the Shuttle-ISS linkup was at ~2:10pm. After the docking, the station was reoriented as planned to minimize the risk of micrometeoroid/debris impacts upon the Shuttle (-XVV = -x-axis in velocity vector, +z-axis in local vertical). *[Earlier, at ~10:33am, the ISS maneuvered to docking attitude after attitude control authority was handed over from USOS (US Segment) to RS MCS (Russian Segment Motion Control System).]*

Preparatory to the Shuttle arrival, FE-2 Reisman verified closure of the Lab science window shutter as protection against thruster plumes. *[The window shutter must remain closed when Shuttle is within 3000 ft/915m of the ISS. It may be opened for no more than 15 minutes for photo documentation if the Shuttle is in free drift.]*

Early in the morning, after wakeup and breakfast, the FE-2 set up for INTEGRATED IMMUNE saliva collection for his final session of the assessment which includes a blood draw before undocking. His saliva and blood collections will be aligned with

IMMUNE collections by Shuttle crewmembers Fossum, Hoshide and Chamitoff.

[Integrated Immune is a 24-hr.assessment of human immune system changes, with the objective to investigate immune neuro-endocrine reactions in the space environment by studying samples of saliva, blood and urine using collection kits and the biomedical (MBI) protection kit, to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects. The saliva is collected in two forms, dry and liquid. The dry samples are collected at intervals during the collection day using a specialized book that contains filter paper. The liquid saliva collections require that the crewmember soak a piece of cotton inside their mouth and place it in a salivette bag; there are four of the liquid collections during docked operations. The on-orbit blood samples are collected right before undocking and returned on the Shuttle so that analysis can occur with 48 hours of the sampling. This allows assays that quantify the function of different types of white blood cells and other active components of the immune system. Saliva samples are secured in the MELFI (Minus-Eighty Laboratory Freezer for ISS). Also included are entries in a fluid/medications intact log, and a stress-test questionnaire to be filled out by the subject at begin and end. Urine is collected during a 24-hour period, conventionally divided into two twelve-hour phases: morning-evening and evening-morning.]

Before the docking, FE-1 Kononenko performed final STTS communications configuration checks for the docking. Upon docking, Oleg switched USOS/RS comm systems to their mated-flight mode.

Reisman installed the IWIS (Internal Wireless Instrumentation System) hardware preparatory to the 1J docked period docking. *[This enables a total of 6 RSUs (Remote Sensor Units), including one RSU to be attached to an accelerometer in the Orbiter airlock, to collect data for three 1J events: JPM (Japanese Pressurized Module) Berthing on FD4 (Flight Day 4), JLP (Japanese Logistics Pressurized Module) Relocation on FD7, and Dedicated Russian Thruster Firing on FD10. IWIS is a Station Development Test Objective (SDTO) that records structural measurements to validate math models used in loads analysis. The data will be used to reduce conservatism and might allow relaxation of operational constraints on activities such as crew exercise, vehicle dockings and reboosts that impart structural loads to ISS. The data will also provide more accurate fatigue calculations that could result in an extension of the ISS life.]*

Other pre-docking preparations:

- Oleg performed the standard functional check of the IP-1 airflow sensors in the various RS hatchways;
- Garrett hooked up the UOP DCP (Utility Outlet Panel/Display & Control Panel) power bypass cable at the CUP RWS (Cupola Robotic Work Station) to allow video coverage of the Shuttle's approach and docking with the SSRMS

(Space Station Remote Manipulator System) cameras;

- Sergey & Garrett readied RPM (R-Bar Pitch Maneuver) photo/video equipment, including camera battery checks, for Orbiter TPS (Thermal Protection System) documentation [*Reisman wielded the 400mm-lens camera, Volkov the 800mm-lens camera for documenting the tile acreage and bottom-side door seals*], and
- Oleg set up & later activated the camera timers upon Orbiter RPM initiation [*timers indicate beginning and end of the bottom-side photography window*].

Shortly before the docking, the crew configured the Russian MCS for the automatic “PMA-2 Arrival” mode, an operational sequence used to monitor Orbiter arrival at the PMA-2. [*At “Capture Confirmed”, ISS attitude was immediately set to freedrift for about 27 min. to allow dampening out relative motions of ISS and Discovery (with the ODS (Orbiter Docking System) dampers/shock absorbers), then maneuvered to “Mated TEA” (Torque Equilibrium Attitude) to account for the new overall configuration with Discovery docked.*]

Docking took place at 2:03pm. After leak checks of the ODS vestibule for about an hour, ISS/STS hatches will be opened at (nominally) ~3:16pm.

After hatch opening, before installation of the ventilation airduct between station and Discovery, Oleg Kononenko will be performing the standard collection of air samples with the Russian AK-1M sampler in the SM, FGB, Lab, and then also in the Orbiter.

After the traditional welcome ceremony (~4:00pm), the new arrivals are to receive the mandatory 25-min. safety briefing.

FE-2 Reisman, along with CDR Kelly and PLT Ham, will then work on the Node-2 O₂ (oxygen) supply line, purging it with N₂ (nitrogen) and configuring it to allow Shuttle to supply O₂ to the ISS PBAs (Portable Breathing Apparatus) in support of pre-EVA mask prebreathe for denitrogenation.

Greg Chamitoff will transfer his IELK (Individual Equipment Liner Kit) from the Shuttle to the Soyuz TMA-12/16S crew return vehicle where Sergey Volkov installs it for the new FE-2. Garrett Reisman’s IELK will be pulled out and temporarily stowed for return to Earth.

Kononenko is scheduled to deploy and activate the SSC WRLS (Station Support Computer/ Wireless Router) laptop in Node-2 to joint the Shuttle & Station LANs (Local Area Networks) during the 1J docked period,

In preparation for tomorrow's EVA-1, the FE-1 will also prepare a DCS760 camera for EVA use, leaving it connected to vehicle power until the EMU/prebreathe.

First cargo transfers from the Shuttle middeck to the ISS are scheduled for Ham, Garan, Fossum, Nyberg, Hoshide and Chamitoff. *[Transfers will include EVA hardware (EMU/spacesuits #3015 & #3017 for Fossum & Garan, Systems 1 bag, Tools Transfer bag), new ODFs (Operations Data Files), CHeCS CTB (Crew Health Care Systems/Cargo Transfer Bag 1) for FD4 CSA-CP activities, two mesh bags loaded with items before docking, etc.]*

Later tonight, Kononenko is work in Node-2 to prepare CVIUs (Common Video Interface Units) to allow transmission of video from the Shuttle for camcorder operations in Node-2. *[This will require the installation of the VCP J01 video cap at the Node-2 video port S3 (camcorder port).]*

After completing Airlock Equipment Lock (A/L EL) configuration for the first spacewalk tomorrow and conducting a joint review of EVA-1 timeline & procedures with all crewmembers at ~6:25pm tonight, the two spacewalkers, Mike Fossum (EV1) & Ron Garan (EV2), will begin their "campout" in the "Quest" A/L, starting mask prebreathe, while configuring EVA tools, at ~8:55pm, then closing hatches and initiating depressurization of the CL (Crewlock) from 14.7 to 10.2 psi. Sleep for them and the ISS crew will commence at 10:02pm, for the Shuttle crew at ~10:32pm. *[The overnight Campout (nachalo desaturatsiy = desaturation start) in the A/L CL (Crewlock) for denitrogenation/pre-breathe at 10.2 psi lasts about 8.5 hrs. Before, the two spacewalkers will perform PBA (Portable Breathing Apparatus) mask prebreathe for denitrogenation, while readying their tools & equipment, then depress the CL from 14.7 to 10.2 psi for their sleep period, to last until ~7:12am EDT tomorrow. The CL hatch will then be cracked (i.e., temporarily repressurized) for a hygiene break/with mask prebreathe for Fossum & Garan. Around 8:35am, the hatch will be closed again for EVA preps in 10.2 psi, followed by EMU purge & prebreathe. Afterwards, Garret, Mark & Greg will support CL depressurization until egress.]*

EVA-1, beginning tomorrow nominally at ~11:32am EDT, will last an estimated 6h 30min, i.e., ending at 6:02pm. Ken Ham will be IV (Intravehicular) crewmember.

---EVA-1 main objectives are:

- Release SRMS (Shuttle Remote Manipulator System) elbow camera launch lock;
- Transfer OBSS (Orbiter Boom Sensor System) from ISS to Shuttle;
- Check out MCAS RTL (Mobile Servicing System Common Attach System/Ready-to-Latch) operation (in preparation for ULF-2);
- Prepare Node-2 port ACBM (Active Common Berthing Mechanism) for JPM install;

- *Open Node 2 nadir hatch window cover (in preparation for ULF-2);*
- *Prep JPM for install (disconnect/stow LTA (Launch-to-Activation) cable, remove Passive CBM contamination covers, release JPM forward window launch lock);*
- *Inspect Datum A surface of Starboard SARJ (Solar Alpha Rotary Joint);*
- *Perform Stbd SARJ cleaning test; and*
- *Install Stbd SARJ TBA-5 (Trundle Bearing Assembly #5).*

Earlier today, the ISS crew completed their physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), RED resistive exercise device (FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR). *[For load reasons, no exercise is allowed on ISS or Shuttle while both robotarms are grappled.]*

Later, Reisman copied the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

In the SM, Kononenko completed the routine maintenance of the SOZh/ECLSS system, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Oleg also performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 5:43am EDT [= epoch]):*

Mean altitude -- 339.9 km

Apogee height -- 343.5 km

Perigee height -- 336.3 km

Period -- 91.33 min.

Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0005378
Solar Beta Angle -- 31.3 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 78 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 54619

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

STS-124 docked timeline

- 6/03 – FD4 - EVA-1 (11:32am, 6.5 hrs.), OBSS transfer, JPM prep, S3/S4 SARJ TBA install, JPM install; Fossum/Garan (EV1/EV2)
- 6/04 – FD5 - JPM Vestibule outfitting, Reisman/Chamitoff handovers
- 6/05 – FD6 - EVA-2 (11:32am, 7 hrs), JPM outfit (JTVE install, JRMS cvr remv), S1 NTA prep, CP 9 ETVCG retrv
- 6/06 – FD7 - JLP relocate to JPM; JLP Vestibule leak check;
Focused inspection
- 6/07 – FD8 - JLP Vestibule outfitting; CP9 ETVCG TVCIC R&R
- 6/08 – FD9 - EVA-3 (10:32am, 7 hrs), S1 NTA R&R, compl JPM outfit (RMS cvr remv), P1 CP9 ETVCG install
- 6/09 – FD10 - JRMS checkouts, JLP Vestibule outfitting, A/L BCM R&R
- 6/10 – FD11 – “Sayonara” (~4:00pm), hatch close (~4:30pm)
- 6/11 – FD12 - Undocking (~7:33am); Greg remains, Garrett leaves;
OBSS survey/inspection
- 6/12 – FD13 - Mostly off-duty
- 6/13 – FD14 - Stowing; deorbit preps
- 6/14 – FD15 - Deorbit burn

06/14/08 -- STS-124/Discovery landing (KSC: ~11:02am EDT, nominal)

07/10/08 -- Russian EVA-20 (7/10-11)

09/05/08 -- ATV1 undocking

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking (at DC1 nadir)

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)

11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking

12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment

12/06/08 -- STS-119/Discovery/15A docking

12/15/08 -- STS-119/Discovery/15A undocking

2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD

3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation

05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**

3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2

4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola

1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)

1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)

2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 06/01/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – a busy pre-docking day for CDR Volkov, FE-1 Kononenko & FE-2 Reisman. Ahead: Week 7 of Increment 17.*

Aboard ISS, the shifted wake/sleep cycle began this morning at 6:32am EDT, with sleep time tonight at 10:02pm. *[Setting the crew up for tomorrow's docking.]*

STS-124/Discovery (ISS-1J) continues its catch-up flight for the FD3 docking at ~1:54pm, to begin ISS Stage 1J. (Catch-up rate ~480 nmi. per revolution of ~91.5 min.). *[Hatch opening expected at ~3:10pm, followed by Safety Briefing (~4:02pm), Soyuz seat liner transfer (for the Reisman/Chamitoff exchange), and preparations for the first spacewalk, EVA-1, by EV1 Fossum & EV2 Garan on 6/3, preceded by their overnight Campout tomorrow night in the Airlock (A/L) for denitrogenation/pre-breathe. Objectives of the nominal 14-day mission: Delivering & installing the JAXA Kibo laboratory, delivering new ISS-17 crewmember Greg Chamitoff, bringing Garrett Reisman back home and conducting a total of three EVAs. Landing will nominally be at KSC on FD15 (6/14) at ~11:02am EDT. OMS Anomaly: During ascent, the left OMS (Orbital Maneuvering System) secondary TVC (Thrust Vector Control) positions failed to null in both pitch and yaw, most likely due to a failure in its (independent) power supply. Left OMS is now parked, aligned through EOM CG (End-of-Mission Center-of-Gravity). Remaining on-orbit OMS burns will be single-engine using right OMS only. The deorbit burn will be dual-engine using the (active) primary TVC of the left OMS Primary TVC.]*

CDR Volkov, like his crewmates, had his hands full to prepare for the 1J arrival, starting out with the all-day formatting of the necessary P/TV (Photo/Video) storage devices for the Orbiter RPM (R-bar Pitch Maneuver) photo shoot tomorrow. *[Rbar = along the radius vector of the ISS, downward. During the RPM at ~600 ft from the station, the ISS crew will have only ~90 seconds for taking high-resolution digital photographs, using the 400mm & 800mm telephoto lenses, of all tile areas and door*

seals on the Discovery from SM windows 6 & 8, to be downlinked for launch debris assessment. Thus, time available for the shooting will be very limited, requiring great coordination between the two headset-equipped photographers and the Shuttle. Sergey formatted, in a Kodak DCS 760 camera on station power, eight 1GB PCMCIA (Portable Computer Memory Card International Adapter) flash cards, each one taking ~20 minutes. Afterwards, the reformatted cards were transferred to the SM (Service Module) for the DCS 760 camera configuration to get ready for the RPM documentation.]

For the high-pressure P/TV activity, the CDR also recharged a total of 4 batteries for two DCS digital still cameras (plus one backup), all four simultaneously for at least three hours. The three cameras were then configured and stowed ready for use in the SM. *[The three DCS760 cameras are #1019 (800mm lens), #1012 (400mm lens), #1038 (backup).]*

In Node-2, FE-2 Reisman used the FFTD (Fluid Fitting Torque Device) tool to remove the PPRV (Positive Pressure Relief Valve) sample port cap and replaced its metal Gamah fitting seal with a soft Gamah seal.

Volkov performed the regular bi-weekly reboots of the SSC (Station Support Computer) OCA Comm Router and File Server A31p laptops.

FE-1 Kononenko spent time in the US Airlock (A/L) on staging and relocating EMU (Extravehicular Mobility Unit) hardware in preparation for the 1J EVAs. *[EMUs 3003, 3004 (backup for Garan) and 3018 were readied, with old cuff checklists, mini workstations, tethers & helmet light/EMU TV assemblies removed from the spacesuits on the EDDAs (EMU Don Doff Assemblies); EMUs 3003 & 3004 were then taken off the EDDAs), etc.]*

The FE-1 also readied the equipment required for prebreathe using O₂ (oxygen) piped over from the Shuttle. *[Activities included removal of a closeout panel, tool pre-gathering and relocating a PBA (Portable Breathing Apparatus) from the COL (Columbus Orbital Laboratory) to the Lab for stowage near the ORCA (Oxygen Recharge Compressor Assembly). Background: For the upcoming 1J activities, specialists have developed a detailed "Musical Chairs" plan for moving PFE/PBA fire safety devices around the station's interior as required for quick access.]*

Also in support of upcoming 1J activities, Kononenko powered on PCS (Portable Computer System) laptops in the Node-2, Lab (Cupola) and A/L.

FE-2 Reisman set up the all-important OSTPV (Onboard Short Term Plan Viewer) application for the correct MET (Mission Elapsed Time) from yesterday's launch

(GMT 152/2008 21:02) plus modifications to account for the Discovery crewmembers' timelines.

Later, Garrett conducted the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling a CWC (Contingency Water Container, #1054) with the collected water slated for processing. Two samples were required this time, for return to Earth on STS-124. *[Estimated offload time before reaching the tank's neutral point (leaving ~6 kg in the tank): ~30 min.]*

Return-to-ground fluid samples were also collected by Volkov of the US ITCS (Internal Thermal Control System) from the LAB1D5 MTL (Moderate Temperature Loop) sample port after flushing. *[No ammonia or OPA (Ortho-Phthalaldehyde) test samples required.]*

Afterwards, the CDR consolidated ITCS sampling hardware, labeling and organizing sample bags and OPA test strips in the CQMK (Coolant Quality Monitoring Kit) in preparation for the addition of a second Nomex CQMK arriving on 1J.

In the JLP (Japanese Experiment Module Logistics Pressurized Module), Reisman performed the periodical HCTL (Heater Controller) status and shell temperature check from the MKAM (Minimum Keep-Alive Monitor).

In preparation for 1J, Garrett supported the ground in pressurizing & leak-checking the PMA-2 (Pressurized Mating Adapter 2) for ingress, hatch opening and stowage after the Shuttle's arrival. *[PMA-2 will be the docking port for Discovery tomorrow.]*

The FE-2 also had another hour set aside for more personal departure preparations.

To increase Shuttle ventilation, Sergey Volkov installed a temporary THC IMV (Temperature & Humidity Control/Intermodule Ventilation) airduct in Node-2 and then also configured the IMV diffuser in the Lab to optimize Lab airflow for the "docked stack" configuration.

In the SM, Kononenko completed the routine maintenance of the SOZh/ECLSS system, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Oleg performed the daily IMS maintenance, updating/editing its standard "delta file"

including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (CDR, FE-1, FE-2), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

At ~11:50am EDT, CDR Volkov has his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop).

Tonight, the three crewmembers are scheduled for their regular periodic PMCs (Private Medical Conferences) via S- & Ku-band audio/video, Sergey at ~7:40pm, Oleg at ~7:58pm, Garrett at ~8:40pm.

Working off the discretionary "if time permits" task list, Kononenko had his fifth run with the Russian DZZ-2 "Diatomeya" ocean observations program, using the NIKON F-5 digital still camera with 80-200 mm lens and the HDV (high-definition) video camcorder from SM windows 7 & 8 to identify areas with intensive bioproduction confined to the largest upwelling of oceanic floors. *[June is a period of extensive phytoplankton blooming in the waters of the Northern hemisphere.*

Also, June is associated with the end of a dry season and the start of a rainy season in the largest river basins of India, West Africa, and South America. Uplinked target zones were in the Pacific Ocean (geographic point to the west of Chile, Costa Rica seashore) and in the North Atlantic (Panamanian seashore, geographic point to the east of Newfoundland).]

Also off the Russian suggestions list, Oleg was to perform a session of the Russian GFI-8 "Uragan" (hurricane) earth-imaging program, using the D2X to take telephotos. *[Uplinked target zones were the Kazbek volcano with glaciers on the northern slope, including the Kolka glacier, oil slicks in the floodplain of the river Terek all the way to the estuary, looking for drill platforms in the Caspian Sea, conditions of the coastal line of the drying Aral Sea, general views of the Balkan countries from various angles for EPO, and Moldavian river beds (series of overlapping shots from lagoons near the sea, upstream).*

No CEO (Crew Earth Observation) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 4:01am EDT [= epoch]*):

Mean altitude -- 340.0 km

Apogee height -- 343.6 km

Perigee height -- 336.4 km

Period -- 91.33 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.000539

Solar Beta Angle -- 36.1 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 72 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54602

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

06/02/08 -- FD3 - STS-124/Discovery/1J docking (1:54pm)

-- *STS-124 docked timeline:*

- 6/03 -- FD4 - EVA-1 (11:30am, 6.5 hrs.), OBSS transfer, JPM prep, S3/S4 SARJ TBA install, JPM install; Fossum/Garan (EV1/EV2)
- 6/04 -- FD5 - JPM Vestibule outfitting, Reisman/Chamitoff handovers
- 6/05 -- FD6 - EVA-2 (11:30am, 7 hrs), JPM outfit (JTVE install, JRMS cvr remv), S1 NTA prep, CP 9 ETVCG retrv
- 6/06 -- FD7 - JLP relocate to JPM; JLP Vestibule leak check; Focused inspection
- 6/07 -- FD8 - JLP Vestibule outfitting; CP9 ETVCG TVCIC R&R
- 6/08 -- FD9 - EVA-3 (10:30am, 7 hrs), S1 NTA R&R, compl JPM outfit (RMS cvr remv), P1 CP9 ETVCG install
- 6/09 -- FD10 - JRMS checkouts, JLP Vestibule outfitting, A/L BCM R&R
- 6/10 -- FD11 -- "Sayonara" (~4:00pm), hatch close (~4:30pm)
- 6/11 -- FD12 - Undocking (~7:33am); Greg remains, Garrett leaves; OBSS survey/inspection
- 6/12 -- FD13 - Mostly off-duty
- 6/13 -- FD14 - Stowing; deorbit preps
- 6/14 -- FD15 - Deorbit burn

ISS On-Orbit Status 05/31/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – light-duty but long day for CDR Volkov, FE-1 Kononenko & FE-2 Reisman.*

STS-124/Discovery (ISS-1J) lifted off right on time (5:02pm EDT) with all systems performing nominally, for ISS rendezvous on Monday (6/2), to dock at ~1:54pm EDT. At launch, the ISS was off Halifax/Canada, at 42.8 deg N Lat, 57.6 deg W Long. The Orbiter is carrying the seven-member crew of CDR Mark Kelly, PLT Ken Ham, MS1 Karen Nyberg, MS2 Ron Garan, MS3 Mike Fossum, MS4 Akihiko Hoshide & MS5 Greg Chamitoff. Chamitoff will replace ISS Flight Engineer 2 Garrett Reisman who returns on 6/14 (nominal) with STS-124. STS-124 is the 123rd space shuttle flight, the 35th flight for Discovery, the 26th flight to the station and the third Shuttle flight in 2008. Its primary payload, the largest so far, is the 32,000-lbs, 36.7-f long JPM (Japanese Pressurized Module) with its RMS (Remote Manipulator System). We are off to another great mission! ***[For the eighth crewmember on board, a stow-away, see picture below.]***

For the ISS crew, the new wake/sleep cycle shift begins tonight with a late bedtime of 10:00pm EDT (wake-up this morning: 2:00am). *[Wake/sleep tomorrow (Sunday): 6:32am-10:02pm; on Monday (docking day): 6:32am-10:02pm.]*

Volkov, Kononenko & Reisman performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

As part of the house cleaning, the crew also performed regular maintenance inspection & cleaning on fan grilles in the FGB (FS5 & FS6, TsV2), SM (VPkH & VPrK), DC1 (V3) and in the COL (Columbus Orbital Laboratory).

Garrett Reisman stopped sampling mode on the ANITA (Analyzing Interferometer for Ambient Air) payload, exited its software and powered down the ANITA laptop. Later, at ~2:00pm, ANITA was turned back on.

The FE-2 then supported SAMS (Space Acceleration Measurement System) ground commanding by activating its ICU (Interim Control Unit) in Rack LAP2/Drawer 1. *[SAMS acquires acceleration data relevant to characterization of the dynamic vibratory environment on the ISS.]*

In preparation for Discovery's arrival on 6/2, the crew jointly conducted a refresher review of RPM (R-Bar Pitch Maneuver) documentation. *[The review prepared the crewmembers for the bottom-side mapping of the Orbiter at its arrival on 6/2. During the RPM at ~600 ft from the station, the "shooters" have only ~90 seconds for taking high-resolution digital photographs of all tile areas and door seals on Discovery, to be downlinked for launch debris assessment. Thus, time available for the shooting will be very limited, requiring great coordination between the two headset-equipped photographers and the Shuttle pilot.]*

Performing "get-aheads" for JPM "Kibo" laboratory arrival, FE-2 Reisman worked in the JLP (JEM Logistics Module) after activating the JLP MKAM (Minimum Keep Alive Monitor) fan and temporarily moving the JLP's PBA (Portable Breathing Apparatus) from its location COL1PF in the COL (Columbus Orbital Laboratory) to the JLP endcone (JLP1F3). *[For the upcoming 1J activities, specialists have developed a "PFE/PBA Musical Chairs" plan for moving these fire safety devices around the station's interior as required for quick access.]*

Reisman's work in the JLP was to retrieve two panels for the JPM from behind payload racks, which he had to rotate down for access and later return to the upright position, a ~10-min task each time. *[For a hard decorative panel, stowed at JLP1SA2, Garrett unlocked & rotated the Ryutai rack, for a soft protective panel, at JLP1FP2, the EPS-1 (Electrical Power Systems 1) rack. Ryutai ("fluid") is a Japanese multipurpose experiment/payload rack system to support the FPEF (Fluid Physics Experiment Facility), SCOF (Solution Crystallization Observation Facility), PCRF (Protein Crystallization Research Facility) and the IPU (Image Processing Unit) by providing structural interfaces, power, data, cooling, water and other items needed to operate science experiments in micro-G.]*

The FE-2 then removed a front bracket from the JLP WS (Work Station) Rack and bundled it together with the two panels. Afterwards, he deactivated the JLP MKAM fan and returned the PBA to the COL1PF location.

In the SM, Volkov completed the routine maintenance of the SOZh/ECLSS system, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

The FE-2 had another hour set aside for more personal departure preparations. *[Garrett returns to Earth with STS-124 on 6/14, departing from the ISS on 6/11 (FD12).]*

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1).

Afterwards, Garrett transferred the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~10:15am EDT, Kononenko had his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop).

Working off the discretionary "if time permits" task list, Sergey Volkov completed another EKON KPT-3 session, making observations and taking aerial photography of environmental conditions (water contamination in the Kerch Strait) for Russia's Environmental Safety Agency (EKON) using the Nikon D2X digital camera with SIGMA 300-800mm telephoto lens.

Also off the Russian suggestions list, Oleg Kononenko performed a session of the Russian GFI-8 "Uragan" (hurricane) earth-imaging program, using the D2X to take telephotos. *[Uplinked target zones were the Pamir mountain range (glacier tongues located to the west of the largest Fedchenko glacier), large glaciers of Tien-Shan located to the east of lake Issyk-Kul, oil slicks in the Caspian Sea, condition of drying out shores of the Aral sea, logging sites and burnt out forest, the Caucasus mountains forest cover condition from the coast to Stavropol plain, the Volga-Akhtubinsk flood plain situation during hydropower plant water spillover (general view and close-up shots).]*

WDS Update: An updated Water Delivery System "cue card" was uplinked for the crew's reference. *[The new card (17-0002H) lists 32 CWCs (~1182.2 L total) for the four types of water identified on board: technical water (619.6 L, for Elektron, flushing, hygiene), potable water (534.8 L), condensate water (23 L), waste/EMU dump and other (5.8 L). Of the 32 containers, 11 CWCs with technical water (423.2 L) can only be used for flushing due to Wautersia bacteria contamination, and 2 CWCs with potable water (88.7 L) are also not cleared for use except for flushing.]*

ASU Toilet System Update: Detailed instructions were uplinked to the crew on the use of US HRF UCDs (Human Research Facility/Urine Collector Devices) with the Russian Wring Receptacle Assembly using a special adapter and RSQD (Rubber Stopper/Quick Disconnect). After the urine transfer, the Wring Receptacle will be connected to the EDV container for disposal. Wring collectors and UCDs are carried on STS-124, along with a replacement pump for the Russian ASU toilet system's air/water separator (MNR-NS).

Weekly Science Update (*Expedition Seventeen -- Week 6*)

ALTCRISS (*Alteino Long Term monitoring of Cosmic Rays on the ISS*): Measurements continue in FGB module.

ANITA (*Analyzing Interferometer for Ambient Air*): Continuing.

BCAT-3 (*Binary Colloidal Alloy Test 3*): Reserve.

CARDIOCOG-2: Completed.

CCISS (*Cardiovascular & Cerebrovascular Control on Return from ISS*): Reserve.

CFE (*Capillary Flow Experiment*): Reserve.

CW/CR (*Cell Wall/Resist Wall*) in **EMCS** (*European Modular Cultivation System*): In progress.

CSI-2/CGBA (*CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus*): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): The experiment platform continues to operate nominally, although the platform is rather cold due to unfavourable Beta angles. A DHPU (Data Handling Processing Unit) software patch is currently developed to fix the link error issues encountered with DEBIE-2 and FIPEX instruments. - DEBIE-2: Link error still under investigation; - DOSTEL: On-going science acquisition. Mode-2 (faster acquisition sampling rate) was used from 5/27 to 5/29; - EuTEMP: Currently inactive as planned; - EVC: Inactive, and could not be powered up due to very low temperature; - EXPOSE: On-going science acquisition; - FIPEX: A science acquisition script has run nominally until 5/26. On 5/28, a new script has been started almost nominally – there is a minor glitch with “fast measure” commands; - MEDET: Since 5/18, the instrument had to be switched off because it reached the low temperature limit. On 5/28, MEDET was powered back on is now acquiring science; - PLEGPAY: Instrument is powered on, but not in science acquisition mode; - TRIBOLAB: The POD#3 (Pin On Disk run#3) was restarted nominally on 5/17 and has been running nominally since then.

FSL (Fluid Science Laboratory): FSL MIL Bus cable repair was successfully performed on 5/5. After FSL Rack Activation from ground on 5/8, the ground confirmed that the FSL cables repair activities were successful. Further troubleshooting activities will be required with CEM-U (Upper) Optical Module.

GEOFLOW: Further troubleshooting activities with CEM-U (Upper) Optical Module are required. A new lamp set is manifested on STS-124/1J. GEOFLOW start is pending further FSL troubleshooting, and remaining commissioning activities (check of FSL optical modes). This will not occur prior to 1J flight.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION w/REPOSITORY: Complete.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SAMPLE: Inc16 samples have been downloaded with 15S and handed over to science team.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): "Garrett, thanks for completing your last Actiwatch Download/Initialization session. Your Sleep Actiwatch that you are wearing will be doffed and stowed on the Shuttle with the other Sleep subjects' Actiwatchs. Any additional sleep logging you perform between now and the Shuttle undocking is welcome. Thanks and enjoy the trip home."

SOLAR (Solar Monitoring Observatory): The last Sun observation period has closed on 5/10. On 5/28, SOLAR was ground commanded to test its CPD (Coarse Pointing Device) and get additional telemetry from the end switches. The collected data will support investigation of the so-called "Zero-Procedure" anomaly. The next observation window will start on 6/3. - SOVIM: Waiting for the Sun; - SOLSPEC: Waiting for the Sun; - SOLACES: Waiting for the Sun.

SOLO: Planned.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

3-D SPACE : First session with Inc17 FE-2 is currently planned for 6/13.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): On 5/15, a caution signal was encountered with the BIOLAB Smoke Detector while activating BIOLAB from ground after the Reference ECs insertion to Rotor A crew activity. Engineering teams are analyzing the telemetry and are preparing a recovery plan. On 5/27, the BIOLAB Rotor B Locking Pin actuator was exchanged successfully by Garrett. After that, it was confirmed that the Rotor B (stuck since 1E Stage) can be manually rotated again. Unfortunately, BIOLAB could not be activated from the ground yet, pending resolution of the Smoke Detector issue. After the 1J flight, the remaining WAICO #1 ECs will be disposed of and replaced by six Reference ECs on Rotor B.

CEO (Crew Earth Observations): Through 5/22 the ground has received a total of 1,780 of ISS/

CEO images for review and cataloging. "No new imagery in response to our target list request was received this past week. We fully appreciate your demanding schedule in preparation for next week. Your interesting, high-oblique view of the southeastern Hawaiian Islands will be published in NASA/GSFC's Earth Observatory website this weekend. Your view illustrated the emission and spread of caustic, volcanic fog – known as *vog* – that occasionally plagues islanders. It also showed cloud formations that result from the impact of these isolated islands on the regional trade winds and local land/sea breezes. Very nice educational picture! We will resume CEO operations and reporting after STS-124."

CEO (Crew Earth Observation) photo targets uplinked for today were **Yellow River Delta, China** (*weather was predicted to be clear over this dynamic delta, which historically has changed its extent and morphology on almost a daily basis. ISS had a nadir pass over the center of the delta region. High-resolution imagery of the delta region was requested to map its current configuration*), and **Lake Nasser, Toshka Lakes, Egypt** (*looking to the left of track for the man-made Toshka Lakes, located to the west of Lake Nasser. Imagery of the current shorelines of the Lakes was requested in order to track changes in water level and extent*).

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 9:50am EDT [= epoch]*):

Mean altitude -- 340.0 km
Apogee height -- 343.7 km
Perigee height -- 336.4 km
Period -- 91.34 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0005388
Solar Beta Angle -- 40.9 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 72 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 54590

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

06/02/08 – FD3 - STS-124/Discovery/1J docking (1:54pm)

-- Preliminary STS-124 docked timeline:

- 6/03 – FD4 - EVA-1 (11:30am, 6.5 hrs.), OBSS transfer, JPM prep, S3/S4 SARJ TBA install, JPM install; Fossum/Garan (EV1/EV2)
- 6/04 – FD5 - JPM Vestibule outfitting, Reisman/Chamitoff handovers
- 6/05 – FD6 - EVA-2 (11:30am, 7 hrs), JPM outfit (JTVE install, JRMS cvr remv), S1 NTA prep, CP 9 ETVCG retrv
- 6/06 – FD7 - JLP relocate to JPM; JLP Vestibule leak check; Focused inspection
- 6/07 – FD8 - JLP Vestibule outfitting; CP9 ETVCG TVCIC R&R
- 6/08 – FD9 - EVA-3 (10:30am, 7 hrs), S1 NTA R&R, compl JPM outfit (RMS cvr remv), P1 CP9 ETVCG install
- 6/09 – FD10 - JRMS checkouts, JLP Vestibule outfitting, A/L BCM R&R
- 6/10 – FD11 - Sayonara (~4:00pm), hatch close (~4:30pm)
- 6/11 – FD12 - Undocking (~7:33am); Greg remains, Garrett leaves; OBSS survey/inspection

- 6/12 – FD13 - Mostly off-duty
- 6/13 – FD14 - Stowing; deorbit preps
- 6/14 – FD15 - Deorbit burn

06/14/08 -- STS-124/Discovery landing (KSC: ~11:02am EDT, nominal)
 07/10/08 -- Russian EVA-20 (7/10-11)
 09/05/08 -- ATV1 undocking
 09/09/08 -- Progress M-64/29P undocking (from DC1)
 09/10/08 -- Progress M-65/30P launch
 09/12/08 -- Progress M-65/30P docking (at DC1 nadir)
 10/01/08 -- **NASA 50 Years**
 10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
 10/12/08 -- Soyuz TMA-13/17S launch
 10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
 10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
 11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
 11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
 11/12/08 -- STS-126/Endeavour/ULF2 docking
 11/20/08 -- **ISS 10 Years**
 11/26/08 -- Progress M-66/31P launch
 11/28/08 -- Progress M-66/31P docking
 12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
 12/06/08 -- STS-119/Discovery/15A docking
 12/15/08 -- STS-119/Discovery/15A undocking
 2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
 05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
 3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
 4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
 1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
 1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
 2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm

Buzz Lightyear, hitching a ride on STS-124.

Date: Friday, May 30, 2008 1:40:00 PM

Attachments:

ISS On-Orbit Status 05/30/08

All ISS systems continue to function nominally, except those noted previously or below.

FE-2 Reisman conducted "Week 6" sampling of potable water for chemical and microbial analysis from the SVO-ZV tap and two SRV-K taps, the latter after preliminary heating of the water (four heating cycles) and flushing. *[Garrett collected three 450 mL samples (for postflight microbial analysis) and two 750 mL samples (for postflight chemical analysis) from each of three ports (SRV-K hot, SRV-K warm, SVO-ZV) for return on STS-124/1J. The small amounts of water used for flushing the equipment were later reclaimed from the flush bag.]*

CDR Volkov serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out" cycle to vacuum on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated tonight at ~5:15pm EDT. Filter bed #1 was regenerated yesterday. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods.]*

FE-1 Kononenko completed the troubleshooting of RS (Russian Segment) condensate processing, begun yesterday, removing the line-2 BRPK Condensate Separation & Pumping Unit of the SRVK-2M Multifiltration Kit, then installing it on line-1 to replace the failed BRPK-1 separator. The latter was discarded as trash and logged in the IMS (Inventory Management System). The BRPK is now processing US condensate.

Volkov performed maintenance on the #1 loop (KOB-1) of the Russian Thermal Control System (SOTR) in the Service Module (SM), using a manual pump, hose adapters and a pressure gauge (VK-316M). *[Purpose: to determine the volume of free air in KOB-1 and check the leak tightness of the KOB-1 accumulator bellows; also: to perform preventive maintenance on the SOTR loops' solenoid valves.]*

Later, Sergey transferred US condensate, collected from the US CCAA (Common Cabin Air Assembly) air conditioner in a CWC (Contingency Water Container), to a Russian EDV container for processing as technical water for the Elektron oxygen (O₂) generator.

Kononenko meanwhile continued the current round of the monthly preventive maintenance of RS ventilation systems in the *Funktsionalnyi-Grusovoi Blok* (FGB), cleaning the grilles of its interior panels, the mesh screen of its central ventilation fan TsV1, and the detachable fan screens 1, 2, and 3 of the three SOTR gas-liquid heat exchangers (GZhT4) and the fixed grill of GZhT #4.

In the Lab, the FE-2 serviced the EMCS (European Modular Cultivation System).

[The periodic maintenance was performed in three steps: (1) replacing the water reservoir of Rotor A (#FM001) with a fresh reservoir (#FM005), replacing the RBLSS (Rotor Based Life Support System) module #FM008 on Rotor B with #FM004, closing the EMCS main door and verifying that all EMCS and EXPRESS locker switches are in the On position.]

In the SM, Sergey completed the routine maintenance of the SOZh/ECLSS system, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Oleg performed the daily IMS maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Garrett filled out the regular FFQ (Food Frequency Questionnaire), his tenth, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

In preparation for the EVA (Extravehicular Activities) prebreathe periods next week,

Reisman completed the periodic calibration of two CSA-O₂ (Compound Specific Analyzer-Oxygen sensor) instruments (#1041 & #1052), using a calibration tank with accurately known pressure (2100 psi).

Later, Reisman used the hand-held CDMK (Carbon Dioxide Monitoring Kit, #1002) to collect measurements for the regular atmospheric status check for ppCO₂ (Partial Pressure Carbon Dioxide) in the Lab, SM (at panel 449) and COL (Columbus Orbital Laboratory), and recording CO₂ readings and battery “ticks”. *[Batteries were to be replaced if necessary. After all readings were taken, the CDM was deactivated and returned to its stowage place at LAB1S2.]*

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Reisman transferred the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

From their discretionary task suggestion list, CDR Volkov & FE-1 Kononenko were to perform more Progress 29P unloading & cargo transfers “as time permits”, logging movements in the IMS.

Garrett Reisman had another hour set aside for more personal departure preparations.

Yesterday, the FE-2 replaced the failed LHA (Lamp Housing Assembly) in the US Airlock, using the last LHA spare on board.

At ~4:20am EDT, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU; *[Glavnaya operativnaya gruppа upravleniya = “Main Operative Control Group”]*), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~4:35am, Sergey & Oleg linked up with TsUP-Moscow stowage specialists via S-band to conduct the weekly IMS tagup, discussing stowage issues and equipment locations. *[Topics of the exchange included necessary ASU toilet repair/transfer updates in the IMS, recommended stowage locations for ASU components, confirmation of the new Sokol spacesuit’s serial number, bagging & pre-packing of the zipper-damaged Sokol for return on the 1J Shuttle, etc.]*

At ~11:00am, Garrett Reisman held a CDE (Crew Discretionary Event) via S-band/audio & Ku-band/video.

At ~3:00pm, the ISS crew is scheduled for their regular weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. *[S/G-2 (Space-to-Ground 2) phone patch via SSC (Station Support Computer)].*

WDS Update: An updated Water Delivery System “cue card” was uplinked for the crew’s reference. *[The new card (17-0002G) lists 35 CWCs (~1257.3 L total) for the four types of water identified on board: technical water (650.7 L, for Elektron, flushing, hygiene), potable water (534.8 L), condensate water (66 L), waste/EMU dump and other (5.8 L). Of the 35 containers, 12 CWCs with technical water (454.3 L) can only be used for flushing due to Wautersia bacteria contamination, and 2 CWCs with potable water (88.7 L) are also not cleared for use except for flushing.]*

STS-124/1J Launch: Preparations are progressing smoothly at KSC for tomorrow’s launch of Discovery on Mission STS-124/1J. Weather outlook is “promising” for launch, with an 80 pct. chance of being favorable at launch time. 1J carries the **largest payload so far** to the ISS and is the second of three missions with components to complete the JAXA (Japan Aerospace Exploration Agency) JEM laboratory “Kibo” (Hope). Some highlights are:

- *Crewed by CDR Mark Kelly (IV- in suit), PLT Ken Ham (IV-tasks, Rob1/2), MS1 Karen Nyberg (Rob1), MS2 Ron Garan (EV2, Rob1/2), MS3 Mike Fossum (EV1, Rob1/2), MS4 Akihiko Hoshide (J1, JEM), & MS5 Greg Chamitoff (Exp 17);*
- *Starting 6/2 (FD2), wake/sleep cycle for the ISS crew will be shifted from 2:00am EDT to 6:32am. Since the early undock time on FD12 (7:33am) drives crew wakeup 2.5 hrs earlier, crew sleep will be shifted 30 min earlier each night starting FD7;*
- *JPM (Japanese Experiment Module Pressurized Module) will be installed at Node-2 on port on FD4, followed by an overnight leak check. JPM is launched with four racks (ECLSS/TCS-1, ECLSS/TCS-2, EPS-2, DMS-2) already installed; the remaining racks are already on orbit in the JLP (JEM Logistics Module);*
- *JLP will be transferred to the JPM zenith on FD7;*
- *Three EVAs (see below), with Reisman & Chamitoff in the A/L supporting EVA-1 campout;*
- *Reisman & Chamitoff’s “generic” face-to-face handover time will be 16 hrs max;*
- *ISS will provide power to the Discovery via the SSPTS (Station-Shuttle Power Transfer System) from post-docking to just before undocking;*

- *Focused inspection of the Orbiter will be on FD7.*

CEO (Crew Earth Observation) photo targets uplinked for today were **Typhoon Nakri, Pacific Ocean** (*Dynamic Event. Looking to the right and ahead of track as ISS passed over the Philippines for this compact and powerful typhoon.*

Investigators suggested beginning the photography session using a 50 mm lens during approach to capture the entire storm system, then switching to the 800 mm for detailed images of the typhoon eye as ISS drew close to the storm), **South Tibesti Megafans, Africa** (*the crew had a nadir pass through the center of this site.*

Looking for discontinuous and overlapping dry river channels as the signature of the megafans. Overlapping frames, taken along track, were requested), and **Mt. Etna, Sicily** (*weather was predicted to be clear over this volcano at the time of the ISS overpass. The massive volcanic edifice of Mt. Etna is the largest in Italy, and the most historically active. High resolution, near-nadir imagery of the volcano's summit and flanks was requested).*

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 7:45am EDT [= epoch]):*

Mean altitude -- 340.1 km

Apogee height -- 343.7 km

Perigee height -- 336.5 km

Period -- 91.34 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0005368

Solar Beta Angle -- 45.6 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 71 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54573

Significant Events Ahead (*all dates Eastern Time, some changes possible.):*

05/31/08 – STS-124/Discovery/1J launch – JEM PM (JPM) "Kibo", racks, RMS (5:02pm EDT nominal)

06/02/08 – FD3 - STS-124/Discovery/1J docking (1:49pm)

-- *Preliminary STS-124 docked timeline:*

- 6/03 – FD4 - EVA-1 (11:30am, 6.5 hrs.), OBSS transfer, JPM prep, S3/S4 SARJ TBA install, JPM install; Fossum/Garan (EV1/EV2)
- 6/04 – FD5 - JPM Vestibule outfitting, Reisman/Chamitoff handovers
- 6/05 – FD6 - EVA-2 (11:30am, 7 hrs), JPM outfit (JTVE install, JRMS cvr remv), S1 NTA prep, CP 9 ETVCG retrv

- 6/06 – FD7 - JLP relocate to JPM; JLP Vestibule leak check; Focused inspection
- 6/07 – FD8 - JLP Vestibule outfitting; CP9 ETVCG TVCIC R&R
- 6/08 – FD9 - EVA-3 (10:30am, 7 hrs), S1 NTA R&R, compl JPM outfit (RMS cvr remv), P1 CP9 ETVCG install
- 6/09 – FD10 - JRMS checkouts, JLP Vestibule outfitting, A/L BCM R&R
- 6/10 – FD11 - Sayonara (~4:00pm), hatch close (~4:30pm)
- 6/11 – FD12 - Undocking (~7:33am); Greg remains, Garrett leaves; OBSS survey/inspection
- 6/12 – FD13 - Mostly off-duty
- 6/13 – FD14 - Stowing; deorbit preps
- 6/14 – FD15 - Deorbit burn

06/14/08 -- STS-124/Discovery landing (KSC: ~11:02am EDT, nominal)

07/10/08 -- Russian EVA-20 (7/10-11)

09/05/08 -- ATV1 undocking

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)

11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking

12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment

12/06/08 -- STS-119/Discovery/15A docking

12/15/08 -- STS-119/Discovery/15A undocking

2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD

3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation

05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**

3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2

4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola

1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)

1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)

2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 05/29/08

All ISS systems continue to function nominally, except those noted previously or below.

Upon wake-up, CDR Sergey Volkov terminated his third MBI-12 SONOKARD experiment session for the long-term Russian sleep study, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

Afterwards, the CDR conducted the periodic servicing of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The regen process will be terminated before sleeptime, at ~5:15pm EDT. Regeneration of bed #2 follows tomorrow. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. The BMP's regeneration cycle is regularly done every 20 days.]*

FE-1 Oleg Kononenko supported the ground's activation of the Elektron O₂ generator at 32 amps by monitoring the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there is no overheating. *[During nominal operations a gas analyzer is utilized to detect hydrogen (H₂) in the O₂ line (which could cause overheating) but is not included in the control algorithm until 10 minutes after Elektron startup.]*

FE-2 Garrett Reisman conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. *[Updated "cue cards" based on the crew's water calldowns are sent up every other week. Three empty CWCs (#1039, #1079, #10650) were moved from Node-1 to a mesh bag in the Lab with other pre-gathered CWCs for fill-up during 1J.]*

In the JLP (JEM Logistics Module Pressurized Section), the FE-2 continued JTVE (JEM TV Camera Equipment) installation preparations, today completing the work on the second set, i.e., gathering components, configuring the second boom for camera installation and returning everything to stowage. *[Assembly of the Forward & Aft JTVE booms and cameras involved rack rotation in the JLP for boom removal, followed later by pre-1J boom assembly including MLI (Multi-Layer Insulation) cover retrieval & installation, and installation of each camera onto its launch lock bolt. After the external JTVE installation by the spacewalkers, the ground will perform a checkout on each of them.]*

Also in the JLP, the FE-2 repositioned the front bracket of the DMS1 rack to eliminate future interference with the rack's fire port. *[This task was deferred from yesterday.]*

Working on the Russian BVS computer system, Volkov first upgraded the RSK1 laptop with new software (Vers. 1.4) from a DVD running on the RSE1 machine. *[The upgrade includes the software for the new Neurolab experiment (NEURON32), an update for the SIGMA ballistics routine, etc.]*

Later, Sergey replaced the RS3 laptop with the RS1 laptop for the KTSP1 (CPC1, Central Post Computer #1), while RS2 continued supporting nominal operations by the KTSP2 (CPC2).

After removing an EDV container-full of water from the ATV "Jules Verne" to check out this WDS (Water Delivery System) function, Kononenko continued setting up for more transfer of US condensate water to empty ATV WDS tanks, today first checking the hermeticity of the cargo ship's WCP2 tank bladder with a pump for one hour, then configuring the transfer gear. *[The WCP3 tank was filled on 5/26 with ~88 liters. WCP1 contains potable water.]*

Reisman used the electronic Velocicalc instrument to take THC IMV (Temperature & Humidity Control/Intermodule Ventilation) air flow measurements of relative humidity (dew point, wet bulb temp), temperature and velocity (flow rate) of the air from Node-1 Stbd Aft and Node-2 Overhead Port locations. *[Today's activity was to retake the measurements collected by Garrett on 5/7, as a double-check (or*

correction) for the ground of some unexpected results, in order to verify good IMV flow during 1J next week.]

In the Soyuz TMA-12/16S spacecraft, docked at the DC1 Docking Compartment, Volkov turned off the spacecraft's gas analyzer (GA) which he had activated on 5/26. *[Monitoring the atmosphere of the CRV (Crew Return Vehicle) with the GA is a periodic procedure.]*

The FE-2 prepared the POC-DOUG (Portable Onboard Computers/Dynamic Onboard Ubiquitous Graphics) application with a new software load for the upcoming 1J Robotics activities and verified correct function of the system. *[DOUG is a special application running on the MSS (Mobile Service System) RWS laptops that provides a graphical birdseye-view image of the external station configuration and the SSRMS (Space Station Remote Manipulator System), showing its real-time location and configuration on a laptop during its operation. During 1J, the SSRMS will be used on FD4 for the OBSS (Orbiter Boom Sensor System) transfer & JPM installation, on FD6 for JPM grapple release & walkoff, on FD7 for Node-2 release, Focused Inspection support, & JLP relocation, on FD8 to maneuver to EVA-3 start position, on FD9 for NTA (Nitrogen Tank Assembly) R&R & JEM RMS deployment video support, and on FD8/FD10 for video support of JEM RMS deployment.]*

Afterwards, Garrett performed the periodic battery check and reboot of all active US PCS (Portable Computer System) and COL PWS (Columbus Orbital Laboratory/Portable Workstation) laptops, a once-a-month activity.

The crew conducted a joint 1-hr timeline review of the upcoming STS-124/1J EVAs, followed by a tagup/teleconference with ground specialists at ~10:55am EDT. *[Timeline overview see below. The EVAs will be performed by Mike Fossum (EV1) & Ron Garan (EV2). EVA prep & prebreathe support will be provided during the three EVAs by Chamitoff, Reisman & Volkov, while Shuttle PLT Ken Ham serves as IV crewmember.]*

Later, the FE-2 continued EVA preparations in the Airlock (A/L) deferred from 5/23. *[Garrett "de-gassed" PWRs (Payload Water Reservoirs) #1007 & #1023 and returning them to stowage in the EL (Equipment Lock). "De-gassing" = removing air bubbles from the PWR water that will be used to refill the EMU water tanks, by centripetal force, i.e., swinging to produce temporary "artificial gravity".]*

Continuing the current round of periodic preventive maintenance of RS (Russian Segment) ventilation systems, Sergey spent ~50 min. in the DC1 (Docking Compartment), cleaning the PF1,2 dust collector cartridges and V1 & V2 ventilator grilles.

The CDR completed the routine maintenance of the SM's SOZh/ECLSS system, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Oleg performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Garrett Reisman had another hour set aside for more personal departure preparations.

At ~2:20pm EDT, Volkov & Reisman linked up with ground specialists at MCC-H for a 15-min debrief to discuss the images downlinked from their recent (5/26) Shuttle RPM (R-bar Pitch Maneuver) skill training. *[The skill training prepares the crew for the bottom-side mapping of the Discovery upon its arrival on 6/2. During the RPM at ~600 ft from the station, the ISS crew will have only ~90 seconds for taking high-resolution digital photographs of all tile areas and door seals on the Orbiter, to be downlinked for launch debris assessment. Thus, time available for the shooting will be very limited, requiring great coordination between the two headset-equipped photographers and the Shuttle.]*

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-1), TVIS treadmill (CDR, FE-1, FE-2), and RED resistive exercise device (CDR, FE-1, FE-2).

Afterwards, Kononenko transferred the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~3:47pm, FE-2 Reisman is scheduled for his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop),

ASU Toilet System Update: At KSC, the replacement pump for the Russian ASU toilet system's air/water separator (MNR-NS) and a supply of wring collectors were stowed this morning on STS-124/Discovery. RSC-Energia/Moscow has scheduled

the R&R (removal & replacement) on 6/4.

CEO (Crew Earth Observation) photo target uplinked for today was **Mt.**

Kilimanjaro, Kenya (*looking to the right of track for Mount Kilimanjaro, one of Africa's most famous volcanoes. There was probably cloud cover surrounding the volcano, but the upper slopes and peak are usually visible above the clouds.*

Photography of summit glaciers, snow cover, and dark lava flows was requested),

Lake Nasser, Toshka Lakes, Egypt (*weather was predicted to be clear over the man-made Toshka Lakes. Looking to the left of track for the Lakes, which are located to the west of Lake Nasser. Imagery of the Toshka Lakes was requested to track water level and shoreline changes), and Lake Poopo, Bolivia* (*looking to the right of track for this large saline lake located to the west of the Andes Mountains.*

The white expanse of Salar de Uyuni – the world's largest salt flat – should have been visible to the SW of Lake Poopo. Imagery of Lake Poopo's shorelines is useful to track changes in water level resulting from regional changes in precipitation).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 7:24am EDT [= epoch]*):

Mean altitude -- 340.2 km

Apogee height -- 343.8 km

Perigee height -- 336.7 km

Period -- 91.34 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0005288

Solar Beta Angle -- 50.3 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 42 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54557

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

05/31/08 – STS-124/Discovery/1J launch – JEM PM (JPM) "Kibo", racks, RMS (5:02pm EDT nominal)

06/02/08 – FD3 - STS-124/Discovery/1J docking (1:49pm)

-- Preliminary STS-124 docked timeline:

- 6/03 – FD4 - EVA-1 (11:30am, 6.5 hrs.), OBSS transfer, JPM prep, S3/S4 SARJ TBA install, JPM install; Fossum/Garan (EV1/EV2)
- 6/04 – FD5 - JPM Vestibule outfitting, Reisman/Chamitoff handovers
- 6/05 – FD6 - EVA-2 (11:30am, 7 hrs), JPM outfit (JTVE install, JRMS

cvr remv), S1 NTA prep, CP 9 ETVCG retrv

- 6/06 – FD7 - JLP relocate to JPM; JLP Vestibule leak check;
Focused inspection
- 6/07 – FD8 - JLP Vestibule outfitting; CP9 ETVCG TVCIC R&R
- 6/08 – FD9 - EVA-3 (10:30am, 7 hrs), S1 NTA R&R, compl JPM outfit
(RMS cvr remv), P1 CP9 ETVCG install
- 6/09 – FD10 - JRMS checkouts, JLP Vestibule outfitting, A/L BCM
R&R
- 6/10 – FD11 - Sayonara (~4:00pm), hatch close (~4:30pm)
- 6/11 – FD12 - Undocking (~7:33am); Greg remains, Garrett leaves;
OBSS survey/inspection
- 6/12 – FD13 - Mostly off-duty
- 6/13 – FD14 - Stowing; deorbit preps
- 6/14 – FD15 - Deorbit burn

06/14/08 -- STS-124/Discovery landing (KSC: ~11:02am EDT, nominal)

07/10/08 -- Russian EVA-20 (7/10-11)

09/05/08 -- ATV1 undocking

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)

11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/12/08 -- STS-126/Endeavour/ULF2 docking

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking

12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment

12/06/08 -- STS-119/Discovery/15A docking

12/15/08 -- STS-119/Discovery/15A undocking

2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD

3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation

05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**

3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2

4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola

1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)

1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)

2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 05/28/08

All ISS systems continue to function nominally, except those noted previously or below.

For the long-term Russian sleep study, FE-1 Oleg Kononenko terminated his third MBI-12 SONOKARD experiment session upon wake-up by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground.

CDR Sergey Volkov in turn will start his third overnight MBI-12 session tonight. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

To provide cooling for the ground-commanded activation of the U.S. CDRA (Carbon Dioxide Removal Assembly), FE-2 Reisman connected the regular ITCS LTL (Internal Thermal Control System/Low Temperature Loop) coolant jumper connection to the LAB1D6 rack. *[CDRA was activated today at 4:15am-4:45am EDT to reduce cabin CO₂ levels.]*

After CDR Volkov set up the NOA/Nitric Oxide Analyzer (MBI-21) experiment, he and Kononenko completed a data take session (his second, Oleg's first), later filling in the electronic log book on the RSE1 laptop for downlink and restowing the hardware. Each subject took two NO (Nitric Oxide) measurements in exhaled air. *[Purpose of the ESA experiment ESANO1, consisting of the "Platon" analyzer and its power supply, is to monitor expired NO in the subject's exhaled air to detect signs of airway inflammation and indications of venous gas emboli (bubbles) that*

may be caused by inhalation of pollutants in the closed environment of the ISS cabin and increased risk of decompression sickness.]

FE-2 Reisman made further preparations for the arrival of the JPM (Japanese Experiment Module Pressurized Module) next week by attaching the JTVE (JEM TV Camera Equipment) on the boom and returning it to stowage. *[For his work in the JLP (JEM Logistics Module Pressurized Section), Garrett briefly activated the JLP MKAM (Minimum Keep-Alive Monitor) fan and temporarily moved the JLP's PBA (Portable Breathing Apparatus) from its location COL1PF in the COL (Columbus Orbital Laboratory) to the JLP endcone (JLP1F3). Afterwards, Garrett deactivated the JLP MKAM fan and returned the PBA to its COL location.]*

Also in the JLP, the FE-2 repositioned the front bracket of the DMS1 rack to eliminate future interference with the rack's fire port.

Starting a new round of preventive ventilation system maintenance in the Russian Segment (RS), Volkov cleaned Group A fan screens in the Service Module (SM) and inspected equipment & structural elements in the maintenance areas to check for residue & condensate, taking photographs of the latter if found, for subsequent downlink.

Reisman meanwhile performed the periodic 5-min checkup on active U.S. payloads, i.e., cleaning the ANITA (Analyzing Interferometer for Ambient Air) inlet plus inspecting and filter cleaning of the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. *[The CGBA incubator is controlled from the ground, with automatic video downlinked to Earth. ANITA monitors low levels of potential gaseous contaminants in the ISS cabin atmosphere with a capability of simultaneously monitoring 32 gaseous contaminants. The experiment is testing the accuracy and reliability of this technology as a potential next-generation atmosphere trace-gas monitoring system for ISS and future spacecraft. This is a cooperative investigation with ESA.]*

The CDR completed the routine maintenance of the SM's SOZh/ECLSS system, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

As part of the ECLSS servicing, Sergey also performed the periodic functional check of the IP-1 airflow sensors in the various RS hatchways. *[The inspection includes the passageways PrK (SM Transfer Compartment)–ATV, PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB*

PGO, FGB PGO–FGB GA, FGB GA–Node-1.]

FE-1 Kononenko ran a standard checkout/test on the AST spectrometer of the Matryoshka-R (RBO-3) radiation payload on FGB panel 429 and its ALC-948 memory card, using the RSK-1 laptop. *[Purpose of the test was to ascertain the continued usability of the 948 memory card and the AST at its FGB location. RBO-3 has taken over the former ESA/RSC-Energia experiment ALC (ALTCRISS/Alteino Long Term monitoring of Cosmic Rays on the ISS) with its AST Spectrometer and ALC equipment.]*

In preparation for the subsequent R&R (removal & replacement) of the BSV-M Master Clock unit in the SM, Kononenko switched the Russian Vozdukh CO₂ removal system to automated mode on both beds. After the R&R, the system was returned to manual Mode 5 via the on-board computer system. *[Mode 5 uses 2 adsorbent cartridges with 10 min cycle time, a vacuum pump cycle time of 1 min, plus 40% airflow during sleep, 60-80% during the day, and 100% during physical exercise, for 3-4 crewmembers.]*

The R&R, by Oleg, of one (A1) of the two redundant BSV-M (Frequency & Time Synchronization System, i.e., Master Clock) units has been pending since last December, awaiting the arrival of a new BSV-MA1 unit on the last Progress cargo ship. After the installation of the new clock unit (with the BITS2-12 Onboard Telemetry Measurement System turned off), the clock was activated on TsUP Go and adjusted manually. Upon nominal operation, Vozdukh was to be switched back to manual mode. *[BSV-M A1 is needed for nominal operation with the payload server which had temporarily been switched to BSV-M A2 by FE-1 Malenchenko on 12/23.]*

Later, with the IK0501 GA (Gas Analyzer) of the SOGS Pressure Control & Atmospheric Monitoring System deactivated, Sergey Volkov installed and connected a new BKS (Onboard Cable Network) telemetry cable harness between the IK0501 and the BITS2-12.

Volkov completed the periodic (about twice a month) replenishing of the Elektron oxygen generator's water supply for electrolysis, filling the KOV EDV container with water collected in CWC (Contingency Water Container) #1050 from the Lab CCAA (Common Cabin Air Assembly) dehumidifier. *[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]*

Garrett conducted the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling a CWC (Contingency Water

Container, #1054) with the collected water slated for processing. No samples were required this time. *[Estimated offload time before reaching the tank's neutral point (leaving ~6 kg in the tank): ~20 min.]*

During the untended filling process, Reisman had 30 min reserved for personal departure preparations.

Garrett also had an additional hour set aside for more equipment repacking for return on the Shuttle.

The FE-2 activated the SAMS ICU (Space Acceleration Measurement System Interim Control Unit) in its Drawer 1 in the LAP2 Rack. *[SAMS measures structural dynamics (vibrational) data.]*

In preparation for the upcoming STS-124 spacewalks, the two Flight Engineers spent time in the US Airlock checking out three PGTs (Pistol Grip Tools, #1001, #1005, #1008), including inspection of their collars and also two SAFER (Simplified Aid for EVA Rescue) units (#1004 & #1007.)

CDR Volkov meanwhile had ~2 hrs set aside for continuing the annual inspection and photo-documentation of window panes in the SM, started earlier (5/14). The observed defects were recorded in image and text files on the RSK1 laptop for subsequent downlink via U.S. OCA assets. *[Objective of the inspection, which uses a digital still camera (Nikon D1X w/SB-28DX flash) and voice recorder, was to assess the pane surfaces on SM windows 6, 7, 8, 12, and EV hatch VP2 for any changes (new cavities, scratches, new or expanded old stains or discolorations affecting transparency properties) since the last inspection, performed by Oleg Kotov on 6/26/07. The new assessment will be compared to the earlier observations. Defects are measured with the parallax method which uses eyeball-sighting with a ruler and a right isosceles triangle to determine the defects' size and position with respect to the window's internal surface (parallax being the apparent change in an object's position resulting from changing the observer's position).]*

Garrett retrieved two EGSAs (Element Ground Strap Assemblies) from their stowage bag for relocation to a JPM/JLP-designated bag in Node-2.

Also in Node-2, Reisman uninstalled and removed a failed RFCA (Rack Flow Control Assembly) of the ITCS (Internal Thermal Control System). During the 1J docked period, an accumulator from one of the JEM racks is to be installed in its place, and the failed RFCA will be returned.

Oleg performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular

weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Working on the MELFI (Minus Eighty Degree Laboratory Freezer for the ISS), Reisman moved the Japanese CW/RW (Cell Wall/Resist Wall) KFT kits with their harvested RNA samples from the +2C dewar to a -95C dewar.

From their discretionary “time permitting” task list, CDR Volkov & FE-1 Kononenko performed more Progress 29P unloading & cargo transfers, logging movements in the IMS.

Garrett completed the periodic (monthly) inspection of the RED (Resistive Exercise Device) canister cords and accessories.

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED (CDR, FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR).

Afterwards, Reisman transferred the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~10:00am EDT, the ISS crew held its weekly teleconference with ISS Program Management at JSC/Houston via Private S/G2, S-band/audio.

At ~4:40pm, FE-2 Reisman is scheduled for his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop),

ATV Water Transfer Update: The amount of US condensate water transferred to the ATV “Jules Verne” tanks from 4 EDV containers was about 88 liters

CEO (Crew Earth Observation) photo target uplinked for today was **South Tibesti Megafans, Chad** (*ISS had a nadir pass over the Tibesti megafans of Chad.*

Looking for discontinuous and overlapping stream channels - interpreted to be the result of shifting river courses in the region during a wetter climate [approximately 8000 years ago]. Overlapping frames, taken along track, were requested).

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 8:36am EDT [= epoch]):*

Mean altitude -- 340.2 km

Apogee height -- 343.9 km

Perigee height -- 336.6 km

Period -- 91.34 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0005462

Solar Beta Angle -- 54.9 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 40 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54542

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

05/31/08 -- STS-124/Discovery/1J launch -- JEM PM (JPM) "Kibo", racks, RMS (5:02pm EDT nominal)

06/02/08 -- FD3 - STS-124/Discovery/1J docking (1:49pm)

-- *Tentative STS-124 docked timeline:*

- 6/03 -- FD4 - EVA-1 (11:30am, 6.5 hrs.), OBSS transfer, JPM prep, S3/S4 SARJ TBA install, JPM install
- 6/04 -- FD5 - JPM Vestibule outfitting, Reisman/Chamitoff handovers
- 6/05 -- FD6 - EVA-2 (11:30am, 6.5 hrs), JPM outfit (JTVE install, JRMS cvr remv), S1 NTA prep, CP 9 ETVCG retrv
- 6/06 -- FD7 - JLP relocate to JPM; JLP Vestibule leak check; Focused inspection
- 6/07 -- FD8 - JLP Vestibule outfitting; CP9 ETVCG TVCIC R&R
- 6/08 -- FD9 - EVA-3 (10:30am, 6.3 hrs), S1 NTA R&R, compl JPM outfit (RMS cvr remv), P1 CP9 ETVCG install
- 6/09 -- FD10 - JRMS checkouts, JLP Vestibule outfitting, A/L BCM R&R
- 6/10 -- FD11 - Sayonara (~4:00pm), hatch close (~4:30pm)
- 6/11 -- FD12 - Undocking (~7:33am); Greg remains, Garrett leaves; OBSS survey/inspection
- 6/12 -- FD13 - Mostly off-duty
- 6/13 -- FD14 - Stowing; deorbit preps
- 6/14 -- FD15 - Deorbit burn

06/14/08 -- STS-124/Discovery landing (KSC: ~11:02am EDT, nominal)

07/10/08 -- Russian EVA-20 (7/10-11)

09/05/08 -- ATV1 undocking

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**
 10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
 10/12/08 -- Soyuz TMA-13/17S launch
 10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
 10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
 11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
 11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
 11/20/08 -- **ISS 10 Years**
 11/26/08 -- Progress M-66/31P launch
 11/28/08 -- Progress M-66/31P docking
 12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
 12/06/08 -- STS-119/Discovery/15A docking
 12/15/08 -- STS-119/Discovery/15A undocking
 2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
 05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
 3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
 4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
 1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
 1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
 2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 05/27/08

All ISS systems continue to function nominally, except those noted previously or below.

FE-2 Garrett Reisman continued activities in the COL (Columbus Orbital Laboratory), today replacing a failed locking actuator on BLB (Biolab) and taking detailed photos of the bellows & shutter above rotor A.

Later, Reisman deactivated the COL EDR (European Drawer Rack) and PCDF EU (Protein Crystallization Diagnostic Facility Electronic Unit), concluding with some close-up imaging using the COL's VCA1 (Video Camera Assembly 1).

In preparation for the subsequent VSPLESK installation (which required turning off the BITS2-12 Onboard Telemetry Measurement System), FE-1 Kononenko supported TsUP-Moscow in deactivating the Elektron O₂ generator. As part of the standard deactivation process the Elektron was purged with N₂ (nitrogen), controlled from laptop. *[Elektron will be reactivated on 5/29.]*

Afterwards, Kononenko and CDR Volkov had several hours for routing, installing and connecting SBI (Onboard Measurement System) control cables for the new VSPLESK ("Burst") payload, behind wall panels in the Service Module (SM). The BITS2-12 was then reactivated to allow ground checkout of the outfitting.

[VSPLESK, along with the BTN-M1 "NEUTRON" science payload, will create a physical model of charged and neutral particles generated during solar bursts and of the neutron albedo of the Earth atmosphere considering solar and geophysical aspects.]

After deactivating the MedOps cardiac defibrillator at the HRF1 (Human Research Facility 1) rack, the CDR performed its periodic checkout, which was to be recorded on video and later dumped to the ground (last time done: 3/24/08). *[This routine*

maintenance task is scheduled as soon as possible from Expedition start and every 60 days thereafter. For the checkout, the defib is connected to the 120V outlet, equipped with its battery (#1021) and then allowed to charge, for about five seconds, to a preset energy level (e.g., 100 joules). After the button-triggered discharge, a console indicator signals success or failure of the test. The pacing signal is downlinked via S-band for 1 min. The HRF was powered down afterwards.]

Sergey Volkov also conducted the periodic data transfer and time synchronization between the RSS1 and the BSPN payload server, after testing functionality by checking data comm between the two computers and synching RSS1 to station time, in support of payload data transfers from the BSPN for subsequent downlink on OCA comm (via the Russian RSS1 laptop to a PCMCIA flash card). The transfer pertained to a parameter table that was copied from BSPN into the RBO-3-3 Matryoshka radiation hardware. *[Before RSS1/BSPN synchronization, the RSS1 is updated with the exact time as per the station clock (which in turn is synchronized daily from RGS/Russian Ground Site). Experiment control application is a payload file transfer program called ShellForKE.]*

Garrett Reisman undertook the monthly FDS PEP (Fire Detection & Suppression/ Portable Emergency Provisions) safety inspection/audit in the ISS modules. *[The JLP (Japanese Experiment Module Experiment Logistics Module Pressurized Section) contains only a PFE (Portable Fire Extinguisher). The US Airlock holds 2 PHA QDMAs (Prebreathe Hose Assembly/Quick-Don Mask Assemblies). The IMS (Inventory Management System)-supported inspection involves verification that PFEs, PBAs (Portable Breathing Apparatus), QDMAs and EHTKs (Extension Hose/ Tee Kits) are free of damage to ensure their functionality, and to track shelf life/life cycles on the hardware (QDMA harness inspection was not required this time).]*

In the SM, Volkov took the periodic readings of potentially harmful atmospheric contaminants with the CMS (Countermeasure System) component of the GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite which uses preprogrammed microchips to measure H₂CO (Formaldehyde, methanal), CO (Carbon Monoxide) and NH₃ (Ammonia), taking one measurement per microchip. *[CMS is a subsystem of the Russian SKDS Pressure Control & Atmosphere Monitoring System.]*

Later, the CDR also spent time with the GANK-4M system of the SM pressure control & atmospheric monitoring system (SOGS), adjusting a measurement coefficient ("Coefficient B") and taking atmospheric readings. *[GANK tests for Methane (CH₄), NH₃, CO, H₂CO, Nitrogen Oxides (NO, NO₂), Hydrogen Chloride (HCl), Hydrogen Fluoride (HF), and Hydrogen Cyanide (HCN).]*

The crew had an hour reserved for reviewing the uplinked flight plan overview of STS-124/1J joint activities next week. Afterwards, they linked up with the ground to discuss the timeline. Some highlights follow:

- *STS-124/1J/Discovery will be crewed by CDR Mark Kelly (IV-suit), PLT Ken Ham (IV-tasks, Rob1/2), MS1 Karen Nyberg (Rob1), MS2 Ron Garan (EV2, Rob1/2), MS3 Mike Fossum (EV1, Rob1/2), MS4 Aki Hoshide (J1, JEM), & MS5 Greg Chamitoff (Exp 17);*
- *ISS wake/sleep cycle will be shifted from 2:00am EDT to 6:32am on FD2 (6/2). Since the early undock time on FD12 (7:33am) drives crew wakeup 2.5 hrs earlier, crew sleep will be shifted 30 min earlier each night starting FD7;*
- *The JPM (Japanese Experiment Module Pressurized Module) will be installed at Node-2 on port on FD4, followed by an overnight leak check. It is launched with four racks (ECLSS/TCS-1, ECLSS/TCS-2, EPS-2, DMS-2) already installed; the remaining racks are already on orbit in the JLP;*
- *The JLP will be transferred to the JPM zenith on FD7;*
- *There will be three EVAs (see below), with Garrett & Greg in the A/L supporting EVA-1 campout;*
- *Generic face-to-face handover time between Reisman & Chamitoff will be 16 hrs max;*
- *Discovery will be powered by the SSPTS (Station-Shuttle Power Transfer System) from post-docking to just before undocking;*
- *Focused inspection of the Orbiter will be on FD7.]*

The three crewmembers had their regular periodic PMCs (Private Medical Conferences) via S- & Ku-band audio/video, Sergey at ~9:45am, Oleg at ~10:00am, Garrett at ~1:30pm.

Garrett Reisman conducted the regular 45-min OBT (Onboard Training) session for supporting CBM (Common Berthing Mechanism) capture/ABOLT activities on 6/3 during the JPM berthing at the Node-2 Port hatch.

The CDR completed the routine maintenance of the SM's SOZh/ECLSS system, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Sergey also performed the daily IMS maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-1, FE-2), TVIS treadmill (CDR, FE-1), and RED resistive exercise device (CDR, FE-1, FE-2).

Afterwards, Volkov transferred the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Reisman had another hour set aside for his departure preparations.

At ~5:20pm, just before sleep time, Oleg will again set up the Russian MBI-12 SONOKARD (Sonocard) payload and start his third experiment session, using a sports shirt from the SONOKARD kit with a special device in the pocket for testing a new method for acquiring physiological data without using direct contact on the skin. Measurements are recorded on a data card for return to Earth. Sergey will start his third MBI-12 session tomorrow evening. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

ASU Update: Troubleshooting continues on the Russian ASU toilet facility. Almost all system components have been changed out at this time, including the separator with no improvement in function. Specialists feel the problem is with the separator pump, though they have never before seen this failure signature. New procedures for temporary manual operation of the pump are in work, and the crew is using a backup system of wring collectors which are functioning nominally. Since they are a consumable, 1J is being last-minute manifested with additional wring collectors and a new ASU separator pump (KSC ground unit).

SM Condensate Processing Update: SM condensate processing troubleshooting continues. SM pressure sensor checkout for the condensate line was successful, as was the installation of a new condensate transfer unit for the SRVK (Multifiltration Unit). Condensate transfer still not working because of BRPK (Condensate Separation & Pumping Unit) failure. Russian teams are still assessing.

No CEO (Crew Earth Observations) targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 8:14am EDT [= epoch]*):

Mean altitude -- 340.3 km

Apogee height -- 343.9 km

Perigee height -- 336.6 km

Period -- 91.34 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0005442

Solar Beta Angle -- 59.8 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 60 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54526

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

05/31/08 – STS-124/Discovery/1J launch – JEM PM (JPM) "Kibo", racks, RMS (5:02pm EDT nominal)

06/02/08 – FD3 - STS-124/Discovery/1J docking (1:49pm)

Tentative STS-124 docked working timeline:

- 6/03 – FD4 - EVA-1 (11:30am, 6.5 hrs.), OBSS transfer, JPM prep, S3/S4 SARJ TBA install, JPM install
- 6/04 – FD5 - JPM Vestibule outfitting, Reisman/Chamitoff handovers
- 6/05 – FD6 - EVA-2 (11:30am, 6.5 hrs), JPM outfit (JTVE install, JRMS cvr remv), S1 NTA prep, CP 9 ETVCG retrv
- 6/06 – FD7 - JLP relocate to JPM; JLP Vestibule leak check; Focused inspection
- 6/07 – FD8 - JLP Vestibule outfitting; CP9 ETVCG TVCIC R&R
- 6/08 – FD9 - EVA-3 (10:30am, 6.3 hrs), S1 NTA R&R, compl JPM outfit (RMS cvr remv), P1 CP9 ETVCG install
- 6/09 – FD10 - JRMS checkouts, JLP Vestibule outfitting, A/L BCM R&R
- 6/10 – FD11 - Sayonara (~4:00pm), hatch close (~4:30pm)
- 6/11 – FD12 - Undocking (~7:33am); Greg remains, Garrett leaves; OBSS survey/inspection
- 6/12 – FD13 - Mostly off-duty
- 6/13 – FD14 - Stowing; deorbit preps
- 6/14 – FD15 - Deorbit burn

06/14/08 -- STS-124/Discovery landing (KSC: ~11:02am EDT, nominal)

07/10/08 -- Russian EVA-20 (7/10-11)

09/05/08 -- ATV1 undocking

09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-65/30P launch
09/12/08 -- Progress M-65/30P docking

ISS On-Orbit Status 05/26/08

All ISS systems continue to function nominally, except those noted previously or below. *US Holiday: Memorial Day. Ahead: Week 6 of Increment 17.*

FE-2 Garrett Reisman worked on the EDR (European Drawer Rack) in the COL (Columbus Orbital Laboratory), installing a restraint on the EDR seat track for the PCDF EU (Protein Crystallization Diagnostic Facility Electronic Unit). Later, the PCDF EU was activated by the ground with crew support.

Afterwards, Reisman performed the periodical status and shell temperature check In the JLP (Japanese Experiment Module Experiment Logistics Module Pressurized Section) from the MKAM (Minimum Keep-Alive Monitor).

The CDR performed major 1.5-hour IFM (in-flight maintenance) in the Service Module (SM) by removing one of the module's eight 800A storage batteries (#3) and replacing it with a spare Blok 800A. The removed unit was prepared for disposal on the next Progress. *[The ZRU charge/discharge unit #3 was deactivated by TsUP/Moscow beforehand and later reactivated. The new battery #3 is currently being conditioned in Cycle mode. This restores the full set of eight SM batteries to operation.]*

FE-1 Oleg Kononenko conducted the long-planned transfer of US condensate water from four CWCs (Contingency Water Containers) to the empty WCP3 tank of the ATV (Automated Transfer Vehicle)'s water delivery system (WDS), first assembling the equipment with a pump for purging from the tank and conducting standard leak checking for one hour, then activating the transfer. *[The WCP1 tank contains potable water. ATV water tank #2 integrity check is scheduled for 5/29.]*

Reisman set up the SLEEP experiment for end-of-increment Actiwatch downloading and initializing, then marked his Actiwatch and stowed it. *[The NASA/JSC experiment is supported by the HRF1 laptop. To monitor the crewmembers' sleep/*

wake patterns and light exposure, their special Actiwatch device measure the light levels encountered by them as well as their patterns of sleep and activity throughout the Expedition.]

Volkov & Kononenko spent about three hours working jointly on cargo transfers & stowage from Progress 29P, tracking the moves in the IMS (Inventory Management System).

Reisman had two hours for unpacking and stowing US cargo items delivered on 29P, as per the 29P Unpack List.

Sergey & Garrett performed their third standard 30-min Shuttle RPM (R-bar Pitch Maneuver) skill training, using the DCS-760 digital still cameras with 400 & 800mm lenses to take in-cabin target imagery. Afterwards, the obtained OBT (onboard training) images were downlinked to the ground for analysis (~11:45am). *[The RPM drill prepares crewmembers for the bottom-side mapping of the Orbiter at the arrival of the Shuttle (STS-124/1J) on 6/2. During the RPM at ~600 ft from the station, the “shooters” have only ~90 seconds for taking high-resolution digital photographs of all tile areas and door seals on Discovery, to be downlinked for launch debris assessment. Thus, time available for the shooting will be very limited, requiring great coordination between the two headset-equipped photographers and the Shuttle pilot.]*

Also in preparation for the RPM photo shoot, the FE-2 checked out all four DCS (Digital Camera System) cameras by taking blank images, storing them on a PCMCIA flash memory card and later downlinking them to MCC-Houston for analysis. *[Blank images are used to identify “dead” pixels for each camera.]*

In the Soyuz TMA-12/16S spacecraft, docked at the DC1 Docking Compartment, Volkov turned on the spacecraft's gas analyzer (GA), a periodic procedure to monitor the atmosphere of the CRV (Crew Return Vehicle).

Performing some outfitting in the SM, the CDR installed a Progress-delivered protective cover on the PPS-31 Systems Power Panel of the SUBA Onboard Equipment Control System.

The FE-2 had another hour set aside for his departure preparations.

The CDR completed the routine maintenance of the SM's SOZh/ECLSS system, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the*

Lab humidifier.]

Oleg also performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1).

Afterwards, Kononenko transferred the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~4:55am EDT, Garrett conducted a 15-min teleconference with ground specialists to discuss JLP stowage issues.

At ~10:30am, the CDR & FE-1 downlinked a Russian PAO TV message of greetings to TsUP-Moscow for the participants of the Star Relay Race Competition

At 1:30pm, Volkov & Kononenko held a regular PMC (Private Medical Conference) to discuss their physical exercise with a specialist via Ku- & S-band.

No CEO (Crew Earth Observations) targets uplinked for today.

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

ISS On-Orbit Status 05/25/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – crew off duty. Ahead: Week 6 of Increment 17.*

The CDR conducted the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Sergey also gathered weekly data on Total Operating Time & “On” durations of the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem for reporting to TsUP.

At ~10:30am EDT, FE-2 Garrett Reisman had his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop),

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2) and resistive exercise device (CDR, FE-1, FE-2).

Working off his discretionary “time permitting” task list, Oleg had his fourth run with the Russian DZZ-2 "Diatomeya" ocean observations program, using the NIKON F-5 digital still camera with 80-200 mm lens and the HDV (high-definition) video camcorder from SM windows 7 & 8 to identify areas with intensive bioproduction confined to the largest upwelling of oceanic floors. *[Uplinked target zones were in the Indian Ocean (Agulhas underwater plateau – water area of the Central Depression) and the South Atlantic (Falklands plateau water area – costal area of Gabon).]*

For Sergey Volkov, the Russian voluntary task list suggested another ECON KPT-3 session, making observations and taking aerial photography of environmental conditions for Russia's Environmental Safety Agency (ECON) using the Nikon D2X digital camera with SIGMA 300-800mm telephoto lens. *[Today's target zone: the contaminated coastal area in the Persian Gulf.]*

More unpacking of US cargo from Progress 29P was on Reisman's "job jar" task list for today.

RS ASU Update: While using the SM toilet facility (ASU) on Wednesday last week, the crew heard a loud noise and later received the separation LED (Light Emitting Diode) indication. They removed & replaced the separator which is a part of the whole pump package, but the system was still exhibiting degraded suction. The decision was made today to have the crew R&R the MNR (Micropump Separator) with the last spare they had onboard. Preliminary indications are that the R&R of the MNR has fixed the problem, although specialists continue to monitor the situation. Preparations are in work to fly a replacement MNR on 1J if requested.

SKV-2 Troubleshooting Update: A small amount of coolant was discharged in the morning of 5/23 while the crew attempted to re-fill the SM SKV-2 air conditioner with Freon-218 (Khladon). The crew reported that a valve did not fit correctly resulting in the discharge. The crew quickly realized this and plugged the fitting. Ground specialists had the crew stand down on this activity for today and were assessing the leaky fitting. The SKV-2 coolant was delivered via 29P, to recharge the unit after it experienced a leak on 4/29.

Weekly Science Update (*Expedition Seventeen -- Week 5*)

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): Measurements continue in FGB module.

ANITA (Analyzing Interferometer for Ambient Air): Continuing.

BCAT-3 (Binary Colloidal Alloy Test 3): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System):

Harvesting of B3 and B4 was completed on 05/23. "Thank you for your diligent work on CW/RW and also for the last-minute gathering of EMCS hardware for return on 1J. The final activity remaining for CW/RW is the relocation of the KFTs from the +2C dewar to a -95C dewar in MELFI.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed.

EuTEF (European Technology Exposure Facility): The experiment platform continues to operate nominally, although the platform is rather cold due to unfavourable beta angles. A DHPU (Data Handling Processing Unit) software patch is currently developed to fix the link error issues encountered with DEBIE-2 and FIPEX instruments. - DEBIE-2: Link error still under investigation; - DOSTEL: On-going science acquisition; - EuTEMP: Currently inactive as planned; - EVC: Inactive; - EXPOSE: On-going science acquisition; - FIPEX: A new script was uplinked on 05/19, but it stopped too quickly on 05/20. A modified script was then uplinked on 05/21, started on 05/22 and is now scheduled to run up to 05/27; - MEDET: On 05/18, the instrument had to be switched off because it reached the low temperature limit. Awaiting more favourable thermal conditions to restart science acquisition; - PLEGPAY: Instrument is powered on, but not in science acquisition mode; - TRIBOLAB: The Pin On Disk run #3 (POD#3) was restarted nominally on 05/17 and has been running nominally since then.

FSL (Fluid Science Laboratory): FSL MIL Bus cable repair was successfully performed on 5/5. After FSL Rack Activation from ground on 5/8, the ground confirmed that the FSL cables repair activities were successful. Further troubleshooting activities will be required with CEM-U (Upper) Optical Module.

GEOFLOW: Further troubleshooting activities with CEM-U (Upper) Optical Module are required. A new lamp set is manifested on STS-124/1J. GEOFLOW start is pending further FSL troubleshooting, and remaining commissioning activities (check

of FSL optical modes). This will not occur prior to 1J flight.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION w/REPOSITORY: "Garrett, thanks for your continued attention to detail in completing your FD60 Nutrition/Repository session. This was your final in-flight sample collection. We appreciate your efforts in keeping to the science/timeline constraints during blood draw procedures. Thanks for your participation!"

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SAMPLE: Inc16 samples have been downloaded with 15S and handed over to science team.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): "Garrett, per the schedule, you have completed your last week of required sleep logging. Next week you will have your last Actiwatch download/initialization session. During your last download session, the PI did not like the way the data was scaling. As of

now you are not at risk of being lost as a subject, but we would like to preserve as much data as we can for later troubleshooting or ground analysis. Therefore, during this session, you will remove the Li battery in your Actiwatch to assist in ground troubleshooting. You will download, initialize, and don Peggy's CDR Actiwatch. We greatly appreciate your participation."

SOLAR (Solar Monitoring Observatory): The last Sun observation period has closed on 05/10. The next observation windows will start on 06/03. - SOVIM: Waiting for the Sun. During last week, the ground teams performed troubleshooting on the SOVIM covers, but with no luck; - SOLSPEC: Waiting for the Sun; - SOLACES: Waiting for the Sun.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): The 4 EC's of Rotor B are yet to be retrieved by the crew from the blocked Rotor B. The first troubleshooting activity, which consists of inserting back 6 Reference Experiment Containers (ECs) into the Rotor A, has been performed on 05/15. Unfortunately, while activating BIOLAB from ground after this crew activity, a caution signal was encountered with the BIOLAB Smoke Detector. Engineering teams are analyzing the telemetry. The next BIOLAB activity (Rotor B Locking Pin actuator exchange) is currently planned on 05/27.

CEO (Crew Earth Observations): Through 5/20 the ground has received a total of 1,768 of ISS/CEO images for review and cataloging. "We are currently reviewing imagery with camera times corresponding to the following target list requests: Riachao Ring Impact Crater, Brazil (not apparent yet in your views); Serra da Cangalha Impact Crater, Brazil (not apparent yet in your views); High Central Andean Glaciers (many excellent views of a number of rarely-photographed icefields and small glaciers); and Antarctic Ice Pack (poor weather and lighting reveals only a few small icebergs). Very poor lighting conditions for daylight awake passes have persisted in the Southern Hemisphere this week with your orbit tracks staying near the terminator. Hang in there! Viewing conditions and opportunities should improve dramatically next week. Your striking image of the Zion National Park area, acquired late last month, will be posted on NASA/GSFC's Earth Observatory website this weekend. The extent and orientation of the erosion

pattern and linear “joint” fractures are beautifully documented”.

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

05/31/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS (5:02pm EDT nominal)

06/02/08 -- STS-124/Discovery/1J docking (1:49pm)

Tentative STS-124 docked working timeline:

- 6/03 -- EVA-1 (11:30am, 6.5 hrs.), OBSS transfer, JPM prep, S3/S4 SARJ TBA install, JPM install
- 6/04 -- JPM Vestibule outfitting, Reisman/Chamitoff handovers
- 6/05 -- EVA-2 (11:30am, 6.5 hrs), JTVE install, JRMS cvr remv, NTA prep, CP 9 ETVCG retrv
- 6/06 -- JLP relocate to JPM; JLP Vestibule leak check
- 6/07 -- JLP Vestibule outfitting
- 6/08 -- EVA-3 (10:30am, 6.3 hrs), S1 NTA install, CP9 ETVCG install, JRMS cover remove
- 6/09 -- JRMS checkouts, JLP Vestibule outfitting, A/L BCM R&R
- 6/10 -- Sayonara (~4:00pm), hatch close (~4:30pm)
- 6/11 -- Undocking (~9:04am); OBSS survey/inspection
- 6/12 -- Mostly off-duty
- 6/13 -- Stowing; deorbit preps
- 6/14 -- Deorbit burn (~9:56am);

06/14/08 -- STS-124/Discovery landing (KSC: ~10:59am EDT, nominal)

07/10/08 -- Russian EVA-20 (7/10-11)

09/05/08 -- ATV1 undocking

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)

11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 05/24/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – off-duty day for CDR Volkov, FE-1 Kononenko & FE-2 Reisman.*

The crew performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

The crew also performed regular maintenance inspection & cleaning on fan grilles in the FGB (FS5 & FS6, TsV2), SM (VPkhO & VPrK), DC1 (V3) and in the COL (Columbus Orbital Laboratory) for ESA.

Additionally, CDR Volkov conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables, the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP and today also the periodic cleaning of the pre-filter of the POTOK air filtration system. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

At ~10:05am EDT, the crewmembers held their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP/Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit

events.

The three crewmembers conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1).

Afterwards, Garrett transferred the crew's exercise data file to the MEC for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

The Russian crewmembers had their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop), Oleg at ~7:25am, Sergey at ~8:30am.

At ~3:00am, Oleg Kononenko held a telephone conference with Conference with Vladimir Stepanovich Krivtsov, the President of Kharkov Aviation Institute. Oleg is a KhAI alumnus. *[Every year at the end of May KhAI alumni, employees of enterprises and organizations of Russia, Ukraine, and other countries, also KhAI faculty and students, are celebrating a holiday, the Khai Day, which takes place on 5/24.]*

At ~11:30am, the crew downlinked two PAO TV messages of greetings, one for veteran cosmonaut V. I. Tereshkova, the other for the 10th International Festival Childhood without Borders. *[The city of Yaroslavl is getting ready for the 45th anniversary celebration of the first female-cosmonaut flight into space. The Vostok-6 space vehicle with Valentina Vladimirovna Tereshkova on board was launched into near-Earth orbit on June 16, 1963. The flight continued for almost three days. At the same time with Vostok-6, Vostok-5 with Valery Bykovski was on orbit as well. The International festival "Childhood without Borders" is held in Moscow on an annual basis. This festival is an open forum to demonstrate abilities and creativity of children, children's organizations and groups, and adults working with children to support their creative forces and initiative. On the eve of 6/1, the International Children's Day, children and adults from various regions of Russia and abroad get together in Moscow to demonstrate a need for a constructive dialog regarding the present and the future for children and young adults.]*

New items on the discretionary task lists for Garrett, Sergey and Oleg for today were unpacking of 29P US cargo & CHeCS rack audit/survey by Reisman, and another EKON earth observation session for Volkov.

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

05/31/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS (5:02pm EDT nominal)

06/02/08 -- STS-124/Discovery/1J docking (1:49pm)

Tentative STS-124 docked working timeline:

- 6/03 -- EVA-1 (11:30am, 6.5 hrs.), OBSS transfer, JPM prep, S3/S4 SARJ TBA install, JPM install
- 6/04 -- JPM Vestibule outfitting, Reisman/Chamitoff handovers
- 6/05 -- EVA-2 (11:30am, 6.5 hrs), JTVE install, JRMS cvr remv, NTA prep, CP 9 ETVCG retrv
- 6/06 -- JLP relocate to JPM; JLP Vestibule leak check
- 6/07 -- JLP Vestibule outfitting
- 6/08 -- EVA-3 (10:30am, 6.3 hrs), S1 NTA install, CP9 ETVCG install, JRMS cover remove
- 6/09 -- JRMS checkouts, JLP Vestibule outfitting, A/L BCM R&R
- 6/10 -- Sayonara (~4:00pm), hatch close (~4:30pm)
- 6/11 -- Undocking (~9:04am); OBSS survey/inspection
- 6/12 -- Mostly off-duty
- 6/13 -- Stowing; deorbit preps
- 6/14 -- Deorbit burn (~9:56am);

06/14/08 -- STS-124/Discovery landing (KSC: ~10:59am EDT, nominal)

07/10/08 -- Russian EVA-20 (7/10-11)

09/05/08 -- ATV1 undocking

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)

11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking

12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment

12/06/08 -- STS-119/Discovery/15A docking

12/15/08 -- STS-119/Discovery/15A undocking

2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD

3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 05/23/08

All ISS systems continue to function nominally, except those noted previously or below.

Before breakfast, CDR Volkov, FE-1 Kononenko and FE-2 Reisman began their workday with the periodic session of the Russian biomedical routine assessments PZEh-MO-7/Calf Volume Measurement and PZEh-MO-8/Body Mass Measurement (second for CDR & FE-1, third for FE-2), using the IM mass measurement device which Oleg Kononenko afterwards broke down for stowage. *[Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference pints, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures. For determining body mass in zero-G, where things are weightless but not massless, the Russian IM "scales" measure the inertial forces that arise during the oscillatory motion of a mass driven by two helical metering springs with known spring constants. By measuring the time period of each oscillation of the unknown mass (the crewmember) and comparing it to the period of a known mass, the crewmember's mass is calculated by the computer and displayed.]*

The CDR serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out" cycle to vacuum on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated tonight at ~5:15pm EDT. Filter bed #1 was regenerated yesterday. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. Filter bed 1 was regenerated yesterday. In order to assist in atmosphere scrubbing after the Freon-218 spill from the SKV-2 air conditioner on 4/29, the BMP's regeneration cycle was moded to 5 days instead of the regular 20 days.]*

Today was the periodic water sample collection & processing day for the crew (Week 5). *[FE-2 Reisman collected potable water samples for microbial in-flight analysis at the SRV-K Hot port, SRV-K Warm port & SVO-ZV taps, plus two*

chemical/archival post-flight samples from SRV-K Warm & SVO-ZV, using jointly approved Russian sampling procedures with the U.S. WS&A (Water Sampler & Archiver) kit for collection. The samples will be returned on 1J.]

CDR Volkov spent several hours on refueling the Russian SKV-2 air conditioner with fresh Khladon (Freon-218) delivered on Progress 29P, after conducting a detailed procedures review.

FE-1 Kononenko meanwhile worked on the Matryoshka-R radiation measuring suite, transferring and installing new payload components delivered on 29P, taking documentary photography and verifying proper function of the setup with the LULIN-5 electronics box.

The FE-2 retrieved and stowed the four passive FMK (Formaldehyde Monitoring Kit) sampling assemblies deployed by him on 5/21 in the Lab (at P3, below CEVIS) and Service Module (SM, at the most forward handrail, on panel 307), to catch any atmospheric formaldehyde on a collector substrate for subsequent analysis on the ground. *[Two monitors each are usually attached side by side, preferably in an orientation with their faces perpendicular to the direction of air flow.]*

FE-1 Kononenko set up BKS (Onboard Cable Network) connections in the SM for the new “Vsplesk” experiment. *[“Vsplesk”, along with the BTN-M1 “NEUTRON” science equipment, will create a physical model of charged and neutral particles generated during solar bursts and of the neutron albedo of the Earth atmosphere considering solar and geophysical aspects.]*

Reisman had another hour for 1J cargo transfer prepacking. Later, Garrett spent a second hour on private preparations and prepacking for his return.

Garrett continued EVA preparations in the Airlock (A/L) for the STS-124/1J spacewalks. *[The FE-2 “de-gassed” PWRs (Payload Water Reservoirs) #1007 & #1023 for STS-124 and returning them to stowage in the EL (Equipment Lock). “De-gassing” = removing air bubbles from the PWR water that will be used to refill the EMU water tanks, by centripetal force, i.e., swinging to produce temporary “artificial gravity”.]*

Still in the A/L, Reisman also terminated the recharge of the second batch of EMU batteries in the BSA (Battery Stowage Assembly).

CDR Volkov worked on the Russian SRVK-2M water condensate processor, installing a new BPK transfer pump delivered on 29P.

In the COL (Columbus Orbital Laboratory), Reisman supported ESA ground

controllers in troubleshooting the IRFA (Intermodule Return Fan Assembly). *[The IRFA is located on the COL sidewall opposite to the ISFA (Intermodular Ventilation Supply Fan Assembly), both behind cover panels.]*

Oleg completed the routine maintenance of the SM's SOZh/ECLSS system, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Sergey performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1).

Afterwards, Volkov transferred the crew's exercise data file to the MEC (*Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Kononenko completed the periodic (about twice a month) replenishing of the Elektron oxygen generator's water supply for electrolysis, filling the KOV EDV container with water collected in CWC (Contingency Water Container) #1050 from the Lab CCAA (Common Cabin Air Assembly) dehumidifier. *[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]*

The FE-1 performed the regular bi-weekly reboots of the SSC (Station Support Computer) File Server and OCA Comm Router laptops.

Later, Reisman used the hand-held CDMK (Carbon Dioxide Monitoring Kit, #1002) to collect measurements for the regular atmospheric status check for ppCO₂ (Partial Pressure Carbon Dioxide) in the Lab, SM (at panel 449) and COL (Columbus Orbital Laboratory), and recording CO₂ readings and battery "ticks". *[Batteries were to be replaced if necessary. After all readings were taken, the CDM was deactivated and returned to its stowage place at LAB1S2.]*

At ~4:40am EDT, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU; [Glavnaya operativnaya gruppа upravleniya = “Main Operative Control Group”]), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~4:55am, Sergey & Oleg linked up with TsUP-Moscow stowage specialists via S-band to conduct the weekly IMS tagup, discussing stowage issues and equipment locations.

At ~3:20pm, the ISS crew linked up with the Lead Flight Director at JSC/MCC-H via S-band/audio to conduct their first weekly tagup. *[S/G-2 (Space-to-Ground 2) phone patch via SSC (Station Support Computer)].*

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

05/31/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS (5:02pm EDT nominal)

06/02/08 -- STS-124/Discovery/1J docking (1:49pm)

Tentative STS-124 docked working timeline:

- 6/03 -- EVA-1 (11:30am, 6.5 hrs.), OBSS transfer, JPM prep, S3/S4 SARJ TBA install, JPM install
- 6/04 -- JPM Vestibule outfitting, Reisman/Chamitoff handovers
- 6/05 -- EVA-2 (11:30am, 6.5 hrs), JTVE install, JRMS cvr remv, NTA prep, CP 9 ETVCG retrv
- 6/06 -- JLP relocate to JPM; JLP Vestibule leak check
- 6/07 -- JLP Vestibule outfitting
- 6/08 -- EVA-3 (10:30am, 6.3 hrs), S1 NTA install, CP9 ETVCG install, JRMS cover remove
- 6/09 -- JRMS checkouts, JLP Vestibule outfitting, A/L BCM R&R
- 6/10 -- Sayonara (~4:00pm), hatch close (~4:30pm)
- 6/11 -- Undocking (~9:04am); OBSS survey/inspection
- 6/12 -- Mostly off-duty
- 6/13 -- Stowing; deorbit preps
- 6/14 -- Deorbit burn (~9:56am);

06/14/08 -- STS-124/Discovery landing (KSC: ~10:59am EDT, nominal)

07/10/08 -- Russian EVA-20 (7/10-11)

09/05/08 -- ATV1 undocking

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/10/08 -- STS-126/Endeavour/ULF2 launch – MPLM Leonardo, LMC
11/12/08 -- STS-126/Endeavour/ULF2 docking
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 05/22/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Volkov conducted the periodic servicing of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The regen process will be terminated before sleeptime, at ~5:15pm EDT. Regeneration of bed #2 follows tomorrow. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. In order to assist in atmosphere scrubbing after the Freon-218 (Khladon) spill from the SKV-2 air conditioner on 4/24, the BMP's regeneration cycle was moded to 5 days instead of the regular 20 days.]*

Volkov & Kononenko spent another 2 hrs working jointly on cargo transfers & stowage from Progress 29P, tracking the moves in the IMS (Inventory Management System).

Reisman meanwhile performed the periodic checkup on active U.S. payloads, i.e., cleaning the ANITA (Analyzing Interferometer for Ambient Air) inlet plus inspecting and filter cleaning of the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. *[The CGBA incubator is controlled from the ground, with automatic video downlinked to Earth. ANITA is now back up again and running in support of the on-going Freon-218 scrubbing from the cabin air, collecting data every six seconds and downlinking the data daily to the ground team. ANITA monitors low levels of potential gaseous contaminants in the ISS cabin atmosphere with a capability of simultaneously monitoring 32 gaseous contaminants. The experiment is testing the accuracy and reliability of this technology as a potential next-generation atmosphere trace-gas monitoring system for ISS and future spacecraft. This is a cooperative investigation with ESA.]*

Afterwards, the FE-2 worked in the Node-2 reconfiguring the food container stowage in “Harmony”.

Volkov upgraded the Russian RSK1 laptop with new software and ran a test on the fresh load.

Afterwards, Sergey performed monthly maintenance on the deactivated Russian IK0501 GA (Gas Analyzer) of the SOGS Pressure Control & Atmospheric Monitoring System by replacing its CO₂ filter assembly (BF) with a new unit from FGB stowage (done last: 4/11), then reactivating the unit.

FE-1 Kononenko completed another routine radiation data monitoring & logging session for flow & dose power data with the MATRYOSHKA-R and AST spectrometer radiation payload. *[Data were downloaded via OCA and the memory storage card was replaced.]*

Continuing the extended leak checking of the spare BZh Liquid Unit (#056) for the Elektron O₂ generator, Kononenko charged the unit once again with pressurized N₂ from the BPA Nitrogen Purge Unit (#23) to 1 atm (1 kg/cm²). The last test pressurization was on 4/13. *[During Elektron operation, the inert gas locked up in the BZh has the purpose to prevent dangerous O₂/H₂ mixing. A leaking BZh cannot be used.]*

In the Airlock (A/L), the crew connected EMUs (Extravehicular Mobility Units) #3003 & #3004 to their SCUs (Service & Cooling Umbilicals) and initiated the standard 1-hr scrubbing process on the spacesuit’s cooling water loops, filtering ionic and particulate matter (via a 3-micron filter). The cooling loops were afterwards reconfigured and the EMU water processing kit disassembled and stowed.

Volkov serviced the MSG (Microgravity Science Glovebox), conducting the periodic performance test on the 7SD MOK pressure sensor.

The FE-1 set up the pumping equipment and initiated (later closed out) the periodic 3-hr transfer of urine from EDV-U containers in the SM to the Rodnik BV tanks of Progress M-64/29P (emptied of potable water yesterday).

Garrett Reisman conducted the weekly 10-min. CWC audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. *[Updated “cue cards” based on the crew’s water calldowns are sent up every other week. The current cue card (17-0002E) lists 39 CWCs (~1378.8.1 L total) for the four types of water identified on board: technical water (756.7 L, for Elektron, flushing,*

hygiene, including 470.3 L non-usable water because of Wautersia bacteria), potable water (534.8 L, incl. 88.7 L currently on hold), condensate water (81.5 L), waste/ EMU dump and other (5.8 L). Wautersia bacteria are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]

Later, the FE-2 filled out the regular FFQ (Food Frequency Questionnaire), his ninth, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA/ESA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

Sergey and Garrett reviewed the 400mm & 800mm training videos for photographing the Shuttle RPM (R-bar Pitch Maneuver), then, at 11:15am EDT, linked up with ground specialists at MCC-H for a 15-min debrief to discuss the images downlinked from their recent (5/16) Shuttle RPM skill training. *[The skill training prepares the crew for the bottom side mapping of the Discovery upon its arrival on 6/2. During the RPM at ~600 ft from the station, the ISS crew will have only ~90 seconds for taking high-resolution digital photographs of all tile areas and door seals on the Orbiter, to be downlinked for launch debris assessment. Thus, time available for the shooting will be very limited, requiring great coordination between the two headset-equipped photographers and the Shuttle.]*

Reisman had another hour for his departure preparations and prepacking.

Volkov completed the routine maintenance of the SM's SOZh/ECLSS system, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Kononenko performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew conducted their regular 2.5-hr. physical workout program (about half of

which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exercise device (CDR, FE-1, FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1).

Afterwards, Oleg transferred the crew's exercise data file to the MEC for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Garrett conducted the periodic atmospheric sampling in the center of the Lab, SM and JLP with the GSC (Grab Sample Container, #1052, #1095, plus one new from 29P). The three GSCs were then prepacked for return on STS-124/1J.

At ~12:50am, Reisman supported a PAO event downlink for the "G Word" program on the Discovery Home Network which focused on the crew's thoughts on the environment and the planet from orbit.

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

05/31/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS (5:02pm EDT nominal)

06/02/08 -- STS-124/Discovery/1J docking (1:49pm)

Tentative STS-124 docked working timeline:

- 6/03 -- EVA-1 (11:30am, 6.5 hrs.), OBSS transfer, JPM prep, S3/S4 SARJ TBA install, JPM install
- 6/04 -- JPM Vestibule outfitting, Reisman/Chamitoff handovers
- 6/05 -- EVA-2 (11:30am, 6.5 hrs), JTVE install, JRMS cvr remv, NTA prep, CP 9 ETVCG retrv
- 6/06 -- JLP relocate to JPM; JLP Vestibule leak check
- 6/07 -- JLP Vestibule outfitting
- 6/08 -- EVA-3 (10:30am, 6.3 hrs), S1 NTA install, CP9 ETVCG install, JRMS cover remove
- 6/09 -- JRMS checkouts, JLP Vestibule outfitting, A/L BCM R&R
- 6/10 -- Sayonara (~4:00pm), hatch close (~4:30pm)
- 6/11 -- Undocking (~9:04am); OBSS survey/inspection
- 6/12 -- Mostly off-duty
- 6/13 -- Stowing; deorbit preps
- 6/14 -- Deorbit burn (~9:56am);

06/14/08 -- STS-124/Discovery landing (KSC: ~10:59am EDT, nominal)

07/10/08 -- Russian EVA-20 (7/10-11)

09/05/08 -- ATV1 undocking

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking
10/01/08 -- **NASA 50 Years**
10/08/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/10/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 05/21/08

All ISS systems continue to function nominally, except those noted previously or below.

Oleg Kononenko initiated the transfer of the potable water supplies brought up by Progress M-64 to the Service Module (SM)'s Rodnik water tanks (BV1, BV2). Later, the pumping equipment was dismantled and the activities were closed out. *[After hooking up the plumbing connecting the 29P water tanks with the SM Rodnik tankage, the water was transferred at first in self-flow (under its own tank pressure), then using a compressor pump via a GZhS gas/liquid separator, to remove air bubbles in the water. The subsequent filling of the empty Progress tanks with urine will be scheduled later.]*

After CDR Volkov prepared the auditory test equipment, he, FE-1 Kononenko & FE-2 Reisman took the periodic O-OHA (on-orbit hearing assessment) test, a 30-min. NASA environmental health systems examination to assess the efficacy of acoustic countermeasures, using a special MEC (Medical Equipment Computer) laptop application. It was the second session for the three crewmembers. *[The O-OHA audiography test involves minimum audibility measurements for each ear over a wide range of frequencies (0.25-10 kHz) and sound pressure levels, with the crewmembers using individual-specific Prophonics earphones, Bose ANC headsets and the SLM (sound level meter). To conduct the testing, the experimenter is supported by special EarQ software on the MEC, featuring an up/down-arrow-operated slider for each test frequency that the crewmember moves to the lowest sound pressure level at which the tone can still be heard. The baseline test is required not later than about Flight Day 14 for each new Expedition and is then generally performed once per month. Note: There have been temporary hearing deficits documented on some U.S. and Russian crewmembers, all of which recovered to pre-mission levels.]*

Reisman performed the periodic offloading of the Lab CCAA (Common Cabin Air

Assembly) dehumidifier's condensate tank, filling a CWC (Contingency Water Container) with the collected water slated for processing. No samples were required. *[Transferred quantity is determined by allowing tank and CWC equalize with each other. Tank quantity stabilizes at a value higher than the neutral point.]*

Kononenko serviced the Matryoshka-R (RBO-3-2) radiation payload, which has taken over the ESA/RSC-Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS) with its AST Spectrometer, which Oleg rotated through 90 deg, and ALC (ALTCRISS laptop) equipment on DC1 panel 429.

The FE-2 conducted the periodic (monthly) CSA-CP (Compound Specific Analyzer-Combustion Products) maintenance/checkout, today on all four units. *[The CSA-CP is a passive cabin atmosphere monitor that provides quick response capability during a combustion event (fire). Its collected data are stored on a logger. Garrett checked batteries, then zero-calibrated all instruments (to eliminate drift in the combustion sensors). Following zero calibration, the backup units were stowed in the Node, along with the sampling pump, while the prime unit was deployed at the SM Central Post.]*

The CDR had an hour reserved for replacing and updating RODF (Russian Operations Data File) procedures pages.

Garrett relocated the IVCPDS/TEPC (Intravehicular Charged Particle Directional Spectrometer/Tissue Equivalent Proportional Counter), the primary radiation measurement tool in the ISS, from the COL (Columbus Orbital Laboratory) to the Lab at position LAB1S4, plugging its power cable in the CHeCS power/data outlet - port J1 on the PS-120 Junction Box at UOP #2. *[TEPC was installed on the COL1A3 panel by Peggy Whitson at 3/3, powered from the J01 outlet on the COL1AD1 panel. Before that, Dan Tani had relocated TEPC to the SM (panel 410) on 1/23/08 after it had been running in Node-2 since 12/24/07.]*

Sergey unpacked the newly arrived Sokol pressure suit from Progress M-64, conducted a leak check on it and then set it up in the Soyuz BO (Orbital Module) for airing out, i.e., drying out any humidity, later repeating the process on the Sokol gloves. Volkov also prepacked the Sokol with torn zipper for return to Earth. Afterwards, the equipment was stowed.

Reisman & Volkov concluded the Robotics ops begun yesterday by releasing the SSRMS LEE (Space Station Remote Manipulator System/Latching End Effector) at the Node-2 PDGF (Power & Data Grapple Fixture) and maneuvering it to the 1J Docking position. *[The base change to the MBS (Mobile Base System) PDGF was completed yesterday by ground commanding.]*

Oleg Kononenko had another 2 hrs for cargo transfers from 29P to the ISS, keeping track of the moves in the IMS (Inventory Management System).

The FE-2 performed the periodic deployment of four passive FMK (formaldehyde monitoring kit) sampling assemblies in the Lab (at P3, below CEVIS) and SM (at the most forward handrail, on panel 307) for two days, to catch any atmospheric formaldehyde on a collector substrate for subsequent analysis on the ground.

[Two monitors each are usually attached side by side, preferably in an orientation with their faces perpendicular to the direction of air flow.]

In the US Airlock, Reisman continued EVA suit/tool battery maintenance, terminating the discharge process on the first batch of batteries and initiating it on the second group. *[The charged batteries were removed from the BSA (Battery Stowage Assembly) and stowed in a bag.]*

Later, Garrett had an hour set aside for his departure preparations.

As part of their standard fitness evaluation, Kononenko & Volkov undertook the Russian MO-5 MedOps protocol of Cardiovascular Evaluation during Graded Exercises on the VELO cycle ergometer, assisting each other as CMO (Crew Medical Officer). *[The 50-min assessment, supported by ground specialist tagup via VHF and telemetry monitoring, uses the Gamma-1 ECG equipment with biomed harness, skin electrodes and a blood pressure and rheoplethysmograph cuff wired to the cycle ergometer's instrumentation panels. For the graded exercise, the subject works the pedals after a prescribed program at load settings of 125, 150, and 175 watts for three minutes each. Data output involves a kinetocardiogram, rheoplethysmogram, rheoencephalogram and a temporal pulsogram.]*

The CDR completed the routine maintenance of the SM's SOZh/ECLSS system, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

The FE-1 performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (FE-

2), and VELO bike with bungee cord load trainer (CDR/ MO-5, FE-1/MO-5).

Afterwards, Reisman transferred the crew's exercise data file to the MEC for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Hard-scheduled for Garrett today was the periodic audit/inventory of CDs in the CD Library II kit stowed in the Lab, going by a master list inside the case, to be hard-scheduled tomorrow if not completed today. *[Any discrepancies and required updates were to be reported to MCC-H.]*

Also on Reisman's timeline today was the periodic survey/inspection of the contents of the CHeCS (Crew Health Care Systems) Rack.

A new item on the US "job jar" task list was the reconfiguration of food stowage containers in Node-2.

At ~12:55pm EDT, the FE-2 supported a live PAO TV interview with the Major League Baseball feature "This Week in Baseball" on Fox TV, to be aired before the "Saturday Game of the Week".

Russian ASU Malfunction: While using the ASU toilet system in the SM, the crew heard a loud noise and the fan stopped working. After some troubleshooting the crew reported that the air/water Separator (MNR-RS) was not working. The crew then replaced the separator with a spare unit but reported afterwards that the ASU lacked suction. The crew next replaced the F-V filter insert, which provided good suction for a while but again exhibited weak suction. TsUP/Moscow instructed the crew to deactivate the ASU and use the toilet facility in the Soyuz spacecraft.

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

05/31/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS (5:02pm EDT nominal)

06/02/08 -- STS-124/Discovery/1J docking (1:49pm)

Tentative STS-124 docked working timeline:

- 6/03 -- EVA-1 (11:30am, 6.5 hrs.), OBSS transfer, JPM prep, S3/S4

SARJ TBA install, JPM install

- 6/04 -- JPM Vestibule outfitting, Reisman/Chamitoff handovers
- 6/05 -- EVA-2 (11:30am, 6.5 hrs), JTVF install, JRMS cvr remv, NTA prep, CP 9 ETVCG retrv
- 6/06 -- JLP relocate to JPM; JLP Vestibule leak check
- 6/07 -- JLP Vestibule outfitting
- 6/08 -- EVA-3 (10:30am, 6.3 hrs), S1 NTA install, CP9 ETVCG install, JRMS cover remove
- 6/09 -- JRMS checkouts, JLP Vestibule outfitting, A/L BCM R&R
- 6/10 -- Sayonara (~4:00pm), hatch close (~4:30pm)
- 6/11 -- Undocking (~9:04am); OBSS survey/inspection
- 6/12 -- Mostly off-duty
- 6/13 -- Stowing; deorbit preps
- 6/14 -- Deorbit burn (~9:56am);

06/14/08 -- STS-124/Discovery landing (KSC: ~10:59am EDT, nominal)

07/10/08 -- Russian EVA-20 (7/10-11)

??/?/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/05/08 -- ATV1 undocking

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC

10/18/08 -- STS-126/Discovery/ULF2 docking

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking

12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment

12/06/08 -- STS-119/Discovery/15A docking

12/15/08 -- STS-119/Discovery/15A undocking

2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD

3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation

05/?/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**

3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2

4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola

1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)

1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)

2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 05/20/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Volkov & FE-1 Kononenko had several hours between them for Progress 29P unloading and cargo transfers, while logging movements in the IMS (Inventory Management System).

FE-2 Reisman meanwhile spent 2.5 hrs in the US Airlock (A/L) completing the previously initiated EVA tool configuration in preparation for the STS-124/1J spacewalks.

Later, Reisman used the G1 video camcorder to take documentary footage of the EVA tools in their final configuration and the current state of the A/L, including mini workstations and contents of the ORU bags to be used, for review by EVA specialists on the ground.

With the SSRMS (Space Station Remote Manipulator System) powered up and the VDS (Video Distribution Subsystem) configured by ground commanding, the FE-2 conducted the pre-launch checkout of the RWS (Robotics Workstations).

Afterwards, CDR Volkov & FE-1 Kononenko started up and tested the POC-DOUG (Portable Onboard Computers/Dynamic Onboard Ubiquitous Graphics) application. *[DOUG is a special application running on the MSS (Mobile Service System) RWS laptops that provides a graphical birdseye-view image of the external station configuration and the SSRMS arm, showing its real-time location and configuration on a laptop during its operation.]*

Reisman & Volkov then took the SSRMS on an automated joint maneuver sequence (OCAS mode = Operator Commanded Auto Sequence) to use the LEE

(Latching End Effector)'s video camera to inspect two areas on the ATV (Automated Transfer Vehicle) for possible MLI (Multi-Layered Insulation) damage.

Subsequently, the SSRMS was maneuvered to grapple the MBS PDGF-3 (Mobile Base System/Power & Data Grapple Fixture 3), followed by a ground-commanded base change to prepare for tomorrow's Robotics ops (during which the other end of the arm will be released at the Node-2 PDGF and maneuvered to the 1J Docking position).

In preparation for the upcoming transfer of potable water from Progress M-64/29P to the Service Module (SM), Oleg Kononenko set up pumping equipment and initiated the compression of the SM Rodnik BV1 tank bladder, monitoring air flow to check for leak tightness (hermeticity). *[Each of the spherical Rodnik tanks BV1 & BV2 consists of a hard shell with a soft membrane (bladder) composed of elastic fluoroplastic. The bladder is used to expel water from the tank by compressed air pumped into the tank volume surrounding the membrane and is leak-tested before water transfer.]*

To provide cooling for the ground-commanded activation of the U.S. CDRA (Carbon Dioxide Removal Assembly), FE-2 Reisman connected the regular ITCS LTL (Internal Thermal Control System/Low Temperature Loop) coolant jumper connection to the LAB1D6 rack. *[CDRA was activated today to test a new half cycle time and increasing the Lab CCAA fan speed. These modifications may be used during the 1J mission so the ground tested them to ensure there are no unforeseen issues. Lab1P6 CCAA fan speed was increased from its nominal 5740 rpm to 6000 rpm. Afterwards, Reisman was to determine if the increase in fan speed caused an unacceptable increase in noise. The purpose of this increase is to improve the Lab air mixing, specifically near the Lab1P1 IMV intake that feeds Node 2.]*

CDR Volkov performed the routine task of taking close-up photos of a scuff mark left by the probe of the Progress 29P's active docking mechanism on the internal part of the FGB passive docking cone mechanism. The pictures were then transferred to OCA for subsequent downlinking. These images are used to refine current understanding of docking conditions. *[The passive drogue (docking cone) ring of the SSVP-StM docking mechanism is rotated out of the passageway and thus accessible for inspection. As other crewmembers before him, the CDR used the Nikon D1X digital still camera to take several pictures with the hatch closed down.]*

The FE-2 completed the monthly run with the MedOps experiment WinSCAT

(Windows Spaceflight Cognitive Assessment Tool) by logging in on the MEC (Medical Equipment Computer) and performing the psychological evaluation exercise on the laptop-based WinSCAT experiment. It was Garrett's third onboard session. *[WinSCAT is a time-constrained questionnaire test of cognitive abilities, routinely performed by astronauts aboard the ISS every 30 days before or after the PHS (periodic health status) test or on special CDR's, crewmembers or flight surgeons request.]*

Sergey completed the routine maintenance of the SM's SOZh/ECLSS system, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Oleg performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), and RED resistive exercise device (CDR, FE-1, FE-2).

Afterwards, the FE-2 transferred the crew's exercise data file to the MEC for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Volkov & Kononenko had their regular periodic PMCs (Private Medical Conferences) via S- & Ku-band audio/video (Reisman had his yesterday).

Working off the voluntary "job jar" task list, Garrett conducted the periodic audit/inventory of CDs in the CD Library II kit stowed in the Lab, going by a master list inside the case, to be hard-scheduled tomorrow or not completed today. *[Any discrepancies and required updates were to be reported to MCC-H.]*

Also on Garrett's discretionary job list is the periodic survey/inspection of the contents of the CHeCS (Crew Health Care Systems) Rack.

CEO (Crew Earth Observations) photo target uplinked for today was **Antarctic Ice Pack** *(as ISS orbit tracked into the Southern Hemisphere, the crew had*

opportunities to photograph large rafted ice blocks moving northwards from Antarctica. Looking to the right of track as the station approached Antarctica for breaks in cloud cover – ice may have been visible through these "slots").

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 7:35am EDT [= epoch]*):

Mean altitude -- 340.7 km

Apogee height -- 344.4 km

Perigee height -- 337.0 km

Period -- 91.35 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0005568

Solar Beta Angle -- 68.4 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 40 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54415

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

05/31/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS (5:02pm EDT nominal)

06/02/08 -- STS-124/Discovery/1J docking (1:49pm)

Tentative STS-124 docked working timeline:

- 6/03 -- EVA-1 (11:30am, 6.5 hrs.), OBSS transfer, JPM prep, S3/S4 SARJ TBA install, JPM install
- 6/04 -- JPM Vestibule outfitting, Reisman/Chamitoff handovers
- 6/05 -- EVA-2 (11:30am, 6.5 hrs.), JTVE install, JRMS cvr remv, NTA prep, CP 9 ETVCG retrv
- 6/06 -- JLP relocate to JPM; JLP Vestibule leak check
- 6/07 -- JLP Vestibule outfitting
- 6/08 -- EVA-3 (10:30am, 6.3 hrs), S1 NTA install, CP9 ETVCG install, JRMS cover remove
- 6/09 -- JRMS checkouts, JLP Vestibule outfitting, A/L BCM R&R
- 6/10 -- Sayonara (~4:00pm), hatch close (~4:30pm)
- 6/11 -- Undocking (~9:04am); OBSS survey/inspection
- 6/12 -- Mostly off-duty
- 6/13 -- Stowing; deorbit preps
- 6/14 -- Deorbit burn (~9:56am);

06/14/08 -- STS-124/Discovery landing (KSC: ~10:59am EDT, nominal)

07/10/08 -- Russian EVA-20 (7/10-11)

??/??/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
09/05/08 -- ATV1 undocking
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-65/30P launch
09/12/08 -- Progress M-65/30P docking
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 05/19/08

All ISS systems continue to function nominally, except those noted previously or below. *Crew off-duty day. Underway: Week 5 of Increment 17.*

In the JLP (Japanese Experiment Module Experiment Logistics Module Pressurized Section), FE-2 Reisman performed the periodical status and shell temperature check from the MKAM (Minimum Keep-Alive Monitor).

The crew jointly reviewed the Robotics pre-launch checkout activities ahead, including the updated DOUG (Dynamic Onboard Ubiquitous Graphics) software uplinked for tomorrow's scheduled SSRMS (Space Station Remote Manipulator System) operations and the procedures for starting up the DOUG. *[Tomorrow (5/20) Reisman will check out both RWS (Robotics Workstations), as during the 1 JA prelaunch checkouts. Afterwards, the CDR and FE-2 also have some DOUG setup time and then maneuver the SSRMS into an ATV survey position using a Joint OCAS (Operator Commanded Auto Sequence) to look at two areas for possible MLI (Multi-Layered Insulation) damage. After the survey, the SSRMS will be maneuvered to grapple the MBS PDGF-3 (Mobile Base System/ Power & Data Grapple Fixture 3), followed by a base change by ground commanding to prepare for the next day. On 5/21, the crew will release the other end of the arm at the Node-2 PDGF and maneuver to the 1J Docking position. DOUG is a special application running on the MSS (Mobile Service System) RWS laptops that provides a graphical birdseye-view image of the external station configuration and the SSRMS arm, showing its real-time location and configuration on a laptop during its operation.]*

The FE-2 also set up the video configuration for the Robotics ops by putting in place the necessary cable hook-up of the UOP DCP (utility outlet panel/display & control panel) power bypass cable at the CUP RWS (Cupola Robotic Work Station).

In preparation for the STS-124 spacewalks, Garrett initiated recharge procedures on REBA (Rechargeable EVA Battery Assemblies), HL (Helmet Light), PGT (Pistol Grip Tool), and EMU (Extravehicular Mobility Unit) batteries in the US Airlock. *[This is the first of two recharges that will be required to prepare all batteries for flight, including three contingency batteries for return on STS-124.]*

Kononenko completed the routine maintenance of the SM's SOZh/ECLSS system, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (FE-2), and VELO bike with bungee cord load trainer (CDR, FE-1).

Afterwards, Reisman transferred the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~5:30am EDT, Sergey Volkov & Oleg Kononenko downlinked a PAO TV message of greetings to the participants of the joint conference "Space for Mankind" of the International Astronautics Academy (IAA) and the K. E. Tsiolkovsky Russian Cosmonautics Academy in Korolev near Moscow, to be replayed at the conference opening on 5/21. *["...The ISS is a place where human achievements in space exploration for the past 50 years have special appreciation. Scientific experiments and practical results obtained in this field have already produced significant impact on the development of the world civilization and on life on Earth and will be doing so in the future....We are proud to note that such a representative conference is taking place in Korolev, the birth place of practical cosmonautics, a place where MCC-M is located, which along with Houston and other centers, controls and operates the ISS; Korolev also is the home base of Energia corporation, whose Soyuz vehicles are used for ISS crew rotations..."]*

At ~5:30am EDT, the crew conducted a telephone conference radio exchange with the editor of the Russian COSMOS Magazine, Yekaterina Timofeyevna Beloglazova

At ~4:10pm EDT, Garrett had his weekly PFC (Private Family Conference) via S-

band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop).

US Condensate Processing Update: Troubleshooting continued on Lane 3 of the SRVK. The failure of the separator unit was confirmed; to be replaced next week. Teams are working on procedure for pumping US condensate into ATV tanks. ISS will have condensate tanks empty prior to 1J if possible without the water dump. ATV to check whether they can support prep tasks for pumping of US condensate into ATV tanks as early as May 22.

No (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 8:42am EDT [= epoch]*):

Mean altitude -- 340.7 km

Apogee height -- 344.5 km

Perigee height -- 337.0 km

Period -- 91.35 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0005648

Solar Beta Angle -- 65.0 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 37m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54400

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

05/31/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS (5:02pm EDT nominal)

06/02/08 -- STS-124/Discovery/1J docking (1:49pm)

Tentative STS-124 docked working timeline:

- 6/03 -- EVA-1 (11:30am, 6.5 hrs.), OBSS transfer, JPM prep, S3/S4 SARJ TBA install, JPM install
- 6/04 -- JPM Vestibule outfitting, Reisman/Chamitoff handovers
- 6/05 -- EVA-2 (11:30am, 6.5 hrs.), JTVE install, JRMS cvr remv, NTA prep, CP 9 ETVCG retrv
- 6/06 -- JLP relocate to JPM; JLP Vestibule leak check
- 6/07 -- JLP Vestibule outfitting
- 6/08 -- EVA-3 (10:30am, 6.3 hrs), S1 NTA install, CP9 ETVCG install, JRMS cover remove

- 6/09 -- JRMS checkouts, JLP Vestibule outfitting, A/L BCM R&R
- 6/10 -- Sayonara (~4:00pm), hatch close (~4:30pm)
- 6/11 -- Undocking (~9:04am); OBSS survey/inspection
- 6/12 -- Mostly off-duty
- 6/13 -- Stowing; deorbit preps
- 6/14 -- Deorbit burn (~9:56am);

06/14/08 -- STS-124/Discovery landing (KSC: ~10:59am EDT, nominal)

07/10/08 -- Russian EVA-20 (7/10-11)

??/??/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/05/08 -- ATV1 undocking

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC

10/18/08 -- STS-126/Discovery/ULF2 docking

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking

12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment

12/06/08 -- STS-119/Discovery/15A docking

12/15/08 -- STS-119/Discovery/15A undocking

2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD

3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation

05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**

3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2

4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola

1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)

1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)

2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

Attachments:

ISS On-Orbit Status 05/18/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – crew off duty. Ahead: Week 5 of Increment 17.*

Crew wake/sleep cycle is back on the regular 2:00am – 5:30pm EDT period.

The crew performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

As part of the house cleaning, CDR Volkov conducted the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP and today also the periodic cleaning of the pre-filter of the POTOK air filtration system. The crew also performed regular maintenance inspection & cleaning on fan grilles in the FGB (FS5 & FS6, TsV2), SM (VPkhO & VPrK), DC1 (V3) and in the COL (Columbus Orbital Laboratory).

FE-2 Reisman ended his FD60 session with the NASA/JSC experiment NUTRITION w/Repository, his second, by collecting a final urine sample upon wakeup for storage in the MELFI (Minus-Eighty Laboratory Freezer for ISS). The sampling kit was then stowed away. *[The current NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative*

markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]

FE-1 Kononenko serviced the Russian BMP (Harmful Impurities Removal System), terminating the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system and starting the process on bed #2. The regen process will be terminated tonight at ~4:55pm EDT. *[Regeneration of each of the two cartridges takes about 12 hours. Filter bed #1 was regenerated overnight. In order to assist in atmosphere scrubbing after the Freon-218 spill from the SKV-2 air conditioner on 4/29, the BMP's regeneration cycle was moded to 5 days instead of the regular 20 days.]*

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exerciser (FE-1 FE-2) and VELO bike with bungee cord load trainer (CDR). *[The RED, as an anaerobic muscle exerciser, allows a variety of routines: squat, heel raises, bent-over rowing, abdominal crunches, deadlift, bench presses, upright rowing, etc. For Sergey & Oleg, who are using RED three times a week, each session features four different routines which vary from day to day to target different muscle groups.]*

At ~6:35am EDT, the ISS crew linked up with the Lead Flight Director at JSC/MCC-H via S-band/audio to conduct their first weekly tagup. *[S/G-2 (Space-to-Ground 2) phone patch via SSC-10 (Station Support Computer 10)].*

At ~9:15am, the crewmembers held their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP/Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

The CDR and FE-1 had their weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop), Sergey at ~7:00am, Oleg at ~8:20am.

No CEO photography can be studied at this "Gateway" website: <http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

05/31/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS (5:02pm EDT nominal)

06/02/08 -- STS-124/Discovery/1J docking (1:49pm)

Tentative STS-124 docked working timeline:

- 6/03 -- EVA-1 (11:30am, 6.5 hrs.), OBSS transfer, JPM prep, S3/S4 SARJ TBA install, JPM install
- 6/04 -- JPM Vestibule outfitting, Reisman/Chamitoff handovers
- 6/05 -- EVA-2 (11:30am, 6.5 hrs), JTVE install, JRMS cvr remv, NTA prep, CP 9 ETVCG retrl
- 6/06 -- JLP relocate to JPM; JLP Vestibule leak check
- 6/07 -- JLP Vestibule outfitting
- 6/08 -- EVA-3 (10:30am, 6.3 hrs), S1 NTA install, CP9 ETVCG install, JRMS cover remove
- 6/09 -- JRMS checkouts, JLP Vestibule outfitting, A/L BCM R&R
- 6/10 -- Sayonara (~4:00pm), hatch close (~4:30pm)
- 6/11 -- Undocking (~9:04am); OBSS survey/inspection
- 6/12 -- Mostly off-duty
- 6/13 -- Stowing; deorbit preps
- 6/14 -- Deorbit burn (~9:56am);

06/14/08 -- STS-124/Discovery landing (KSC: ~10:59am EDT, nominal)

07/10/08 -- Russian EVA-20 (7/10-11)

??/??/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/05/08 -- ATV1 undocking

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC

10/18/08 -- STS-126/Discovery/ULF2 docking

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking

12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment

12/06/08 -- STS-119/Discovery/15A docking

12/15/08 -- STS-119/Discovery/15A undocking

2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD

3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation

05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**

3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2

4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola

1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)

1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)

2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at

http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 05/17/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – light duty day for CDR Volkov, FE-1 Kononenko & FE-2 Reisman.*

Due to last night's extended duty after the Progress 29P arrival (5:39pm EDT), the crew had an additional 3.5 hrs sleep time this morning, i.e., wakeup – 5:30am EDT; sleep time tonight is back at the regular 5:30pm.

For the ongoing US Sleep study, currently on his voluntary "job jar" task list, FE-2 Garrett Reisman downloaded the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data after wakeup and before breakfast from his Actiwatch to the HRF-1 (Human Research Facility 1) laptop. *[To monitor his sleep/wake patterns and light exposure, the Flight Engineer wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout this week, for the last time. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

After opening the two hatches between FGB and 29P last night (~8:20pm), Volkov & Kononenko first installed the QD (quick disconnect) screw clamps (BZV) of the docking & internal transfer mechanism (SSVP) to rigidize the coupling and assembled the ventilation/heating air duct.

Next, Kononenko performed the standard air sampling inside the Progress with the Russian AK-1M air sampler, then deactivated the cargo ship.

Much of today's work by Oleg and Sergey focused on Progress M-64/29P unloading, starting with the cosmonauts dismantling the docking mechanism (StM, Stykovochnovo mekhanizma) between the cargo ship and the FGB. *[The StM is the "classic" probe-and-cone type, consisting of an active docking assembly (ASA) with a probe (SSh), which fits into the cone (SK) on the passive docking assembly (PSA)]*

for initial soft dock and subsequent retraction to hard dock. The ASA is mounted on the Progress' cargo module (GrO), while the PSA sits on the docking ports of the SM, FGB and DC1.]

Working in the TKG cargo ship, Volkov installed the LKT local temperature sensor commutator (TA251MB) of the BITS2-12 onboard telemetry measurement system, along with its ROM unit (read-only memory, TA765B), a 1-hr. job. The LKT was subsequently switched on by the ground to complete the basic configuration. *[At a later time, Sergey will complete the electronic integration of 29P into the ISS by installing the standard US-21 matching unit, another 1-hr. task. The US-21 matching unit connects the SM with the Progress motion control and DPO thrusters systems, so that they can be commanded by the SM computer system (BVS). After bolting the box down, the CDR will hook up its the telemetry (TM) connector to the BITS2-12 onboard TM system on Go from TsUP, after Moscow had inhibited data output to the VD-SU control system mode, powered off the BITS and deactivated the SKV-2 air conditioner. These systems will subsequently be turned back on. Afterwards, the Progress thrusters will be test fired to insure their functionality in providing attitude control for ISS. 29P is then fully incorporated into the steering logic for the ISS.]*

FE-1 Kononenko attended to the periodic servicing of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The regen process will be terminated tomorrow, followed by regeneration of bed #2. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. In order to assist in atmosphere scrubbing after the Freon-218 (Khladon) spill from the SKV-2 air conditioner on 4/24, the BMP's regeneration cycle was moded to 5 days instead of the regular 20 days.]*

Having reached Day 60 of his flight, Garrett Reisman began his second session with the NASA/JSC experiment NUTRITION w/Repository (the FD30 session having been his first), for which he had to forego exercising and food intake for eight hours. Today's protocol consisted of two blood draws (for Serum & Heparin). Later, the FE-2 set up the equipment for the 24-hour urine collections which start with the first void early tomorrow morning and continue through Sunday morning.

[After performing self-phlebotomy, i.e., drawing blood samples (from an arm vein), the samples were first allowed to coagulate in the Repository for 20-30 minutes, then spun in the HRF RC (Human Research Facility/Refrigerated Centrifuge) and finally placed in MELFI (Minus-Eighty Laboratory Freezer for ISS). No thruster activity was allowed during the blood drawing. The RC was later powered off after a temperature reset to limit wear on the compressor, and cleaned. Background: NUTRITION is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight;

this includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes. The Clinical Nutritional Assessment profile currently required on all U.S. Astronauts collects blood and urine samples preflight and postflight. NUTRITION expands this protocol by also capturing inflight samples and an additional postflight sample. Furthermore, additional measurements are included for samples from all sessions, including additional markers of bone metabolism, vitamin status, and hormone and oxidative stressor tests. The results will be used to better understand the impact of countermeasures (exercise and pharmaceuticals) on nutritional status and nutrient requirements. The Clinical Nutritional Assessment profile (MR016L), first started on two Mir crewmembers and then on all ISS US crews, nominally consists of two pre-flight and one post-flight analysis of nutritional status, as well as an in-flight assessment of dietary intake using the FFQ (Food Frequency Questionnaire). The current NUTRITION project expands MR016L testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]

Volkov & Kononenko had an hour set aside for transfers from the Progress, going by an uplinked Cargo Transfer List of individual items and their intended stowage locations.

Special attention was given by the FE-1 to the transfer, setup & situational photography of the new BIO-12 REGENERATSIYA (regeneration) payload and its ULITKA (snail) container, designed to study how zero gravity impacts structural and functional recovery of damaged organs and tissues in animal tests.

The FE-2 meanwhile started the downloading of IWIS (Internal Wireless Instrumentation System) structural dynamics data recorded during the docking activities. When completed, Garrett dismantled and stowed the IWIS hardware.

[Structural dynamics data of the docking were also captured by the three RSUs of the EWIS (External Wireless Instrumentation System).]

Reisman performed the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling a CWC (Contingency Water Container, #1062) with the collected water slated for processing. No samples were required. *[Transferred quantity is determined by allowing tank and CWC equalize with each other. Tank quantity stabilizes at a value higher than the neutral point.]*

Sergey completed the routine maintenance of the SM's SOZh/ECLSS system, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and*

processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), and RED resistive exercise device (FE-2).

Afterwards, Volkov transferred the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Correction: The STS-124/1J EVA preparations in the Airlock (A/L) scheduled yesterday for Reisman, erroneously reported here as completed, were not done but deferred.

Weekly Science Update (*Expedition Seventeen -- Week 4*)

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):

Measurements continue in FGB module. Inc16 science data returned on 15S have been handed over to Science Team.

ANITA (Analyzing Interferometer for Ambient Air): Continuing.

BCAT-3 (Binary Colloidal Alloy Test 3): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System):

B3 & B4 plants are growing. B3 growth is slower than estimated. Some of the B1 plants are still alive.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed. Inc16 science data returned on 15S and have been handed over to Science Team.

EuTEF (European Technology Exposure Facility): The experiment platform continues to operate nominally. A DHPU (Data Handling Processing Unit) software patch is currently developed to fix the link error issues encountered with DEBIE-2 and FIPEX instruments. - DEBIE-2: Link error still under investigation; - DOSTEL: On-going science acquisition; - EuTEMP: Currently inactive as planned; - EVC: Further troubleshooting is on-going; Still problems to get high-rate data downlink; - EXPOSE: On-going science acquisition; - FIPEX: A new script was uplinked on 5/7 and terminated nominally on 5/11; a new script has been uplinked on 5/14 but not started yet; - MEDET: On-going science acquisition, running nominal; some commanding activities to adjust parameters took place on 5/15; - PLEGPAY: Instrument is powered on, but not in science acquisition mode. New Langmuir probe runs will be started in conjunction with Progress 29P docking on 5/16; - TRIBOLAB: TRIBOLAB Pin On Disk#2 (POD#2) ran nominally until 5/9. The instrument has been put in Thermal Stabilization Mode (TSM) to prepare for an attempt to restart the Pin On Disk#1 (POD#1) run that took place on 5/9.

Unfortunately, the POD#1 run went immediately to Non-Nominal Mode (NNM), for the same reason as before (friction coefficient too high); Science team is now planning to start the next POD#3 run on 5/17.

FSL (Fluid Science Laboratory): FSL MIL Bus cable repair was successfully performed on 5/5. After FSL Rack Activation from ground on 5/8, the ground confirmed that the FSL cables repair activities were successful. Further troubleshooting activities will be required with CEM-U (Upper) Optical Module.

GEOFLOW: Further troubleshooting activities with CEM-U (Upper) Optical Module are required. A new lamp set is manifested on STS-124/1J. GEOFLOW start is pending further FSL troubleshooting, and remaining commissioning activities (check of FSL optical modes). This will not occur prior to 1J flight.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal

Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION w/REPOSITORY: In progress.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SAMPLE: Inc16 samples have been downloaded with 15S and handed over to science team.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): "Garrett, thanks for completing your Actiwatch download/initialization activity. You are also task listed to complete your third week of required Sleep logging this week. Any additional Sleep logging is above and beyond and greatly appreciated by the PI. After completing the Sleep log, you will have one more Actiwatch download session, and then the Actiwatch doff on the Shuttle."

SOLAR (Solar Monitoring Observatory): During the last Sun observation period, the SOLAR platform, SOVIM and SOLSPEC Sun sensors' positions have been correlated during a so-called "criss-cross" procedure manoeuvre on 5/5 and 5/8. The last Sun observation period has closed on 5/10. - SOVIM: Waiting for the Sun – some glitches observed in the instrument telemetry during last week; - SOLSPEC: Waiting for the Sun; - SOLACES: Waiting for the Sun, some recurrent

synchronization problems between its microcontrollers during last week.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): The 4 ECs (Experiment Containers) of Rotor B are yet to be retrieved by the crew from the blocked Rotor B. The first troubleshooting activity, which reinserts 6 RECs (Reference ECs) into Rotor A, has been performed on 5/15. Unfortunately, while activating BIOLAB from ground after this crew activity, a caution signal was encountered. Engineering teams are analyzing the telemetry.

CEO (Crew Earth Observations): Through 5/14 the ground has received a total of 1,383 of ISS/CEO images for review and cataloging. "We are currently reviewing imagery with camera times corresponding to the following target list requests: Galeras Volcano, Colombia (preliminarily not acquired); Lake Nasser, Egypt (excellent coverage, this target can be pulled as completed); and Vredefort Impact Crater, South Africa (preliminarily acquired with great coverage). Nice work! Your efforts to acquire imagery of Cologne, Germany have netted partly cloudy views of several cities along the Rhine: Karlsruhe, Mainz, and Koblenz, all too far south. One of your Cologne attempts captured some striking views of the world-famous vineyards along the Moselle River about 50 miles southwest of Koblenz, Germany. One of these frames will be published on NASA/GSFC's Earth Observatory website this weekend. Good eye! Clearly you are making a most diligent effort to respond to our target requests (nearly 400 frames so far). Thank you!"

CEO (Crew Earth Observations) photo target uplinked for today were **High Central Andean Glaciers, S. America** (*weather was favorable for photography of the summit glaciers of the Peruvian Andes. Looking to the left of track as ISS orbit paralleled the South American coastline. Imagery of the upper flanks and summits of the mountains was requested in order to track changes in ice extent and snow cover.*

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 4:46am EDT [= epoch]*):

Mean altitude -- 340.8 km

Apogee height -- 344.6 km

Perigee height -- 337.0 km

Period -- 91.35 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0005697

Solar Beta Angle -- 56.6 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 50 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54366

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

05/31/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS (5:02pm EDT nominal)

06/02/08 -- STS-124/Discovery/1J docking (1:49pm)

Tentative STS-124 docked working timeline:

- 6/03 -- EVA-1 (11:30am, 6.5 hrs.), OBSS transfer, JPM prep, S3/S4 SARJ TBA install, JPM install
- 6/04 -- JPM Vestibule outfitting, Reisman/Chamitoff handovers
- 6/05 -- EVA-2 (11:30am, 6.5 hrs.), JTVE install, JRMS cvr remv, NTA prep, CP 9 ETVCG retrv
- 6/06 -- JLP relocate to JPM; JLP Vestibule leak check
- 6/07 -- JLP Vestibule outfitting
- 6/08 -- EVA-3 (10:30am, 6.3 hrs), S1 NTA install, CP9 ETVCG install, JRMS cover remove
- 6/09 -- JRMS checkouts, JLP Vestibule outfitting, A/L BCM R&R
- 6/10 -- Sayonara (~4:00pm), hatch close (~4:30pm)
- 6/11 -- Undocking (~9:04am); OBSS survey/inspection
- 6/12 -- Mostly off-duty
- 6/13 -- Stowing; deorbit preps
- 6/14 -- Deorbit burn (~9:56am);

06/14/08 -- STS-124/Discovery landing (KSC: ~10:59am EDT, nominal)

07/10/08 -- Russian EVA-20 (7/10-11)

??/??/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/05/08 -- ATV1 undocking

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at

ISS On-Orbit Status 05/16/08

All ISS systems continue to function nominally, except those noted previously or below.

Yest kasaniye! Progress M-64 (29P), approaching from below the station, docked smoothly at the FGB nadir port at 5:39pm EDT, followed by docking probe retraction and hook closure ("sborka") after motion damp-out, while the ISS was in LVLH (local vertical/local horizontal) attitude. All Progress systems operated nominally from Automated Rendezvous start. *[Launched on 5/14 (4:22:56pm EDT), the 29P resupply drone delivered about 2.5 tons (4657 lbs) of cargo for the ISS crews, including propellants (~770 lbs) for the Russian thrusters, fresh water (~925 lbs), oxygen and air (~100 lbs), food, and dry cargo (~2850 lbs), i.e., spare parts, repair gear, life support and science experiment hardware.]*

Since the time of docking was the crew's regular bedtime, their work/sleep cycle was shifted this morning by 3.5 hrs, i.e., wakeup – 5:30am EDT, sleep – 9:00pm. *[Tomorrow: Wakeup – 5:30am; sleep back at 5:30pm]*

For the ongoing US Sleep study, currently on his voluntary "job jar" task list, FE-2 Garrett Reisman downloaded the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data after wakeup and before breakfast from his Actiwatch to the HRF-1 (Human Research Facility 1) laptop. *[To monitor his sleep/wake patterns and light exposure, the Flight Engineer wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout this week, for the last time. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

Reisman continued EVA preparations in the Airlock (A/L) for the STS-124/1J spacewalks. *[The FE-2 first consolidated PWRs (Payload Water Reservoirs) by transferring the contents of PWR #1025 to #1005 (leaving #1025 empty) and restowing the containers in their E/L (Equipment Lock) location, then "de-gassing"]*

PWRs #1007 & #1023 for STS-124 and returning them to stowage. "De-gassing" = removing air bubbles from the PWR water that will be used to refill the EMU water tanks, by centripetal force, i.e., swinging to produce temporary "artificial gravity".]

FE-1 Kononenko meanwhile continued troubleshooting activities on the Russian SRVK-2M(Multifiltration Unit) of the BRPK (Condensate Separation & Pumping Unit), offnominal since 5/6. After tagging up with ground specialists via S-band, Oleg checked out condensate lines to/from the SRVK, purged the lines of the connected filters, turned the NOK-2 condensate pump on/off and finally restored SRVK configuration for running on the second string (KI3). *[Russian specialists are confident that SRVK functionality can be restored by next week. As of now, one of two SRVK strings is operational (KI3). Today's troubleshooting focused string 1, followed by refilling of the SKV-2 air conditioner with coolant (Freon-218) next week upon delivery by 29P. Until restoration of SRVK condensate processing, European and Russian specialists are in agreement that transferring about 2 EDVs of US condensate to ATV tanks is a viable option. A water dump into space will thus be avoided.]*

CDR Volkov had again several hours for conducting the periodic inspection & audit of lighting fixtures in the RS (Russian Segment), testing each light by turning it on and checking fixtures that show one or both light bulbs inoperative with a working light unit from spares. *[There are close to two dozen lighting fixtures in the SM (Service Module), about a dozen lights in the FGB and 3 in the DC1 (plus two portable units). An audit of the available light spares will be conducted at a later date.]*

The CDR also continued the periodic inventory of SUBA Onboard Equipment Control System plug-in locations in the RS, supported by an uplinked 4-page checklist, started on 4/29. *[The standard audit establishes what hardware is plugged in at which electrical RS outlets. SUBA controls, monitors, and diagnoses RS systems status. It operates using sensor output signals and command radio link SM functional outputs, onboard computer system (BVS) units, SM control panels, and system relay outputs. Its software resides in the SM central computer (TsVM) and terminal computer (TVM). The BSKs are used to switch electrical power and protect electrical circuits with fuses against overloads.]*

In preparation for the Progress docking and the measurement of structural vibrations caused by it, Reisman earlier installed and programmed IWIS (Internal Wireless Instrumentation System) accelerometer RSUs (Remote Sensing Units) in the Lab, Node-1, Node-2, FGB and SM.

The FE-2 also activated the SSC6 (Station Support Computer 6) A31p laptop in the FGB for handling the video transmission from the RS via the Ku-band assets in the

USOS. *[The A31p used for the routing from the SM is located in the FGB since available cables are not long enough to extend to the Node. The video signal is fed from there via coaxial cable to the SSC Operations LAN (local area network) and from there into the Ku-band system for subsequent conversion from the Russian SECAM format to the American NTSC format on the ground. The video stream, a digital MPEG (Moving Pictures Expert Group 2) transmission originating in the RS by the Russian/ESA encoder, passes via the ISS JSL (Joint Station LAN) through Ku-band to both MCCs.]*

With the U.S. CDRA (Carbon Dioxide Removal Assembly) deactivated by the ground early this morning (~2:00am-7:00am) and its cooling no longer required, Reisman demated and took down the ITCS LTL (Internal Thermal Control System/ Low Temperature Loop) jumper at the CDRA-supporting LAB1D6 rack.

Volkov & Kononenko reviewed ground recommendations and rendezvous/approach data in preparation for the 29P docking, which required their visual confirmation (plus telemetry signal) of KURS-A antenna retraction before the docking at the FGB nadir port. Latest flight info was also required for updating the TORU teleoperated control system, which was on “hot standby” during the linkup, with Sergey & Oleg monitoring the process.

After the cargo ship’s successful docking, activities by the two cosmonauts included

—

- shutting off TORU and reconfiguring the STTS telephone/telegraph subsystem to normal ops *[the "Voskhod-M" STTS enables telephone communications between the SM, FGB, DC1 and U.S. segment (USOS), and also with users on the ground over VHF channels selected by an operator at an SM comm panel, via STTS antennas on the SM's outside. There are six comm panels in the SM with pushbuttons for accessing any of three audio channels, plus an intercom channel. Other modes of the STTS include telegraphy (teletype), EVA voice, emergency alarms, Packet/Email, and TORU docking support];*
- conducting the standard one-hour leak checking of the docking vestibule and fuel/oxidizer transfer line interface between Progress and FGB *[during leak checking and initial clamp installation, Russian thrusters were inhibited (as was the case during docking)];*
- opening the hatches (~7:35pm) and installing the QD (quick disconnect) screw clamps (BZV) of the docking & internal transfer mechanism (SSVP) to rigidize the coupling;
- deactivating Progress and assembling the ventilation/heating air duct (~8:00pm);
- performing the standard air sampling inside the Progress with the Russian

AK-1M air sampler; and

- deactivating and removing the video equipment for the TV Ku-band downlink of the docking.

Later, before sleep time and on TsUP Go, Volkov will also switch hatch KVDs (Pressure Equalization Valves) between FGB and Progress to electric control mode.

In the US Lab, Garrett Reisman set up the hardware associated with urine and blood collections for his first session of NASA's NUTRITION/Repository experiment, scheduled on his timeline tomorrow. For the blood draw, Garrett has to start fasting 8 hrs before, with only water consumption allowed. *[The NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R +30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

Garrett worked in the COL (Columbus Orbital Laboratory), removing & replacing failed MLU LHAs (Module Lighting Unit/Lamp Housing Assemblies).

Reisman also used the hand-held CDMK (Carbon Dioxide Monitoring Kit, #1002) to collect measurements for the regular atmospheric status check for ppCO₂ (Partial Pressure Carbon Dioxide) in the Lab, SM (at panel 449) and COL, and recording CO₂ readings and battery "ticks". *[Batteries were to be replaced if necessary. After all readings were taken, the CDM was deactivated and returned to its stowage place at LAB1S2.]*

Later, the FE-2 filled out the regular FFQ (Food Frequency Questionnaire), his eighth, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA/ESA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

Volkov & Reisman performed their second standard 30-min Shuttle RPM (R-bar

Pitch Maneuver) skill training, using the DCS-760 digital still camera with 400 & 800mm lenses at SM windows 6 & 8 (facing in flight direction) to take CEO (Crew Earth Observations) target imagery using auto focus only, with images having 40-50% overlap and about 20 images in each sequence. Afterwards, the obtained OBT (onboard training) images were downlinked to the ground for analysis (~9:30am). *[The RPM drill prepares crewmembers for the bottom-side mapping of the Orbiter at the arrival of the Shuttle (STS-124/1J) on 6/2 . During the RPM at ~600 ft from the station, the “shooters” have only ~90 seconds for taking high-resolution digital photographs of all tile areas and door seals on Discovery, to be downlinked for launch debris assessment. Thus, time available for the shooting will be very limited, requiring great coordination between the two headset-equipped photographers and the Shuttle pilot.]*

Reisman completed the routine maintenance of the SM's SOZh/ECLSS system, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Kononenko performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (FE-2), and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Garrett transferred the crew's exercise data file to the MEC for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~7:25am EDT, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU [Glavnaya operativnaya gruppa upravleniya = “Main Operative Control Group”]), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

CEO (Crew Earth Observations) photo targets uplinked for today were **Riachao Ring Impact Crater, Brazil** *(weather was predicted to be clear over the Brazilian Highlands, and ISS had a near-nadir pass over this 4.5 km diameter crater. The*

*expression of the crater on the landscape is subtle - it is defined mainly by a semicircular hill mostly covered in vegetation. Overlapping nadir-viewing frames, taken along track, were recommended in order to capture the crater), and **Serra da Cangalha Impact Crater, Brazil** (this 12 km diameter crater is located to the SW of the preceding Riachao Ring target, and likewise is a subtle feature on the landscape. It is mainly defined by a circular drainage pattern surrounding the remnants of a central peak. Overlapping nadir frames, taken along track, were recommended in order to capture the crater).*

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 7:41am EDT [= epoch]*):

Mean altitude -- 340.9 km

Apogee height -- 344.7 km

Perigee height -- 337.0 km

Period -- 91.35 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0005787

Solar Beta Angle -- 53.0 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 50 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54352

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

05/31/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS (5:02pm EDT nominal)

06/02/08 -- STS-124/Discovery/1J docking (1:49pm)

Tentative STS-124 docked working timeline:

- 6/03 -- EVA-1 (11:30am, 6.5 hrs.), OBSS transfer, JPM prep, S3/S4 SARJ TBA install, JPM install
- 6/04 -- JPM Vestibule outfitting, Reisman/Chamitoff handovers
- 6/05 -- EVA-2 (11:30am, 6.5 hrs), JTVE install, JRMS cvr remv, NTA prep, CP 9 ETVCG retrl
- 6/06 -- JLP relocate to JPM; JLP Vestibule leak check
- 6/07 -- JLP Vestibule outfitting
- 6/08 -- EVA-3 (10:30am, 6.3 hrs), S1 NTA install, CP9 ETVCG install, JRMS cover remove
- 6/09 -- JRMS checkouts, JLP Vestibule outfitting, A/L BCM R&R
- 6/10 -- Sayonara (~4:00pm), hatch close (~4:30pm)
- 6/11 -- Undocking (~9:04am); OBSS survey/inspection

- 6/12 -- *Mostly off-duty*
- 6/13 -- *Stowing; deorbit preps*
- 6/14 -- *Deorbit burn (~9:56am);*

06/14/08 -- STS-124/Discovery landing (KSC: ~10:59am EDT, nominal)

07/10/08 -- Russian EVA-20 (7/10-11)

??/??/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/05/08 -- ATV1 undocking

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC

10/18/08 -- STS-126/Discovery/ULF2 docking

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking

12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment

12/06/08 -- STS-119/Discovery/15A docking

12/15/08 -- STS-119/Discovery/15A undocking

2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD

3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation

05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**

3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2

4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola

1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)

1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)

2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 05/15/08

All ISS systems continue to function nominally, except those noted previously or below.

Progress M-64/29P launched nominally yesterday at Baikonur at 4:22:56pm EDT, when ISS was leading with 152 deg phase angle (***see photo below***). Ascent was nominal, all appendages (antennae & solar arrays) deployed nominally, and the vehicle reached orbital insertion at 4:31:41pm. Corrective maneuvers DV1 & DV2 were conducted as per plan at 8:12:27pm (delta-V 22.62 m/s) and 8:50:36pm (23.71 m/s). 29P is scheduled to dock to the ISS FGB nadir port tomorrow evening (5/16) at 5:37pm. *Congratulations, Baikonur! [The cargo ship will deliver more than 2.3 tons of various supplies to the ISS, including oxygen, water and food supplies, propellant, a new Sokol KV-2 spacesuit, consumables, scientific hardware and equipment. The spacecraft was injected into a reference near-earth elliptical orbit with 51.65° inclination, min/max altitudes of 193.9/245.9 km and 88.57 min revolution. Onboard systems are operating as designed as the “chase” is on.]*

For the US Sleep study, currently on his voluntary “job jar” task list, FE-2 Garrett Reisman downloaded the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data after wakeup and before breakfast from his Actiwatch to the HRF-1 (Human Research Facility 1) laptop. *[To monitor his sleep/wake patterns and light exposure, the Flight Engineer wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout this week, for the last time. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

For the Russian Sleep study, CDR Volkov terminated his second MBI-12 SONOKARD experiment session upon wake-up by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through*

computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]

After their 3-hr training course on 5/13 with the TORU teleoperator control system, Volkov & Kononenko today conducted a joint teleconference with ground specialists, discussing the results of the drill, in preparation for tomorrow's 29P docking. *[The TORU provides a manual backup mode to the Progress' KURS automated rendezvous radar system in case of KURS failure. Receiving a video image of the approaching ISS, as seen from a Progress-mounted docking television camera ("Klest"), on a color monitor ("Simvol-Ts", i.e. "symbol center") in the Service Module (SM), which also displays an overlay of rendezvous data from the onboard digital computer, the CDR would steer the Progress to mechanical contact by means of two hand controllers, one for rotation (RUO), the other for translation (RUD), on adjustable armrests. The controller-generated commands are transmitted from the SM's TORU control panel to the Progress via VHF radio. In addition to the Simvol-Ts color monitor, range, range rate (approach velocity) and relative angular position data are displayed on the "Klest-M" video monitor (VKU) which starts picking up signals from Progress when it is still approximately 8 km away. TORU is monitored in real time from TsUP over Russian ground sites (RGS) and via Ku-band from Houston, but its control cannot be taken over from the ground. Tomorrow, Progress KURS-A (active) will be activated at 4:04pm EDT on Daily Orbit 16 (DO16), SM KURS-P (passive) two minutes later. Progress' headlight will be switched on at a range of ~8 km. Flyaround to the FGB nadir docking port (~400 m range, in sunlight) starts at 5:14pm. Start of final approach: 5:27:30pm (DO1). Local sunset: ~5:34pm. Estimated time of contact: 5:36:30pm.]*

FE-2 Reisman had 2 hrs set aside for the periodic updating of the onboard "Red Book" emergency procedures documents. *[Garrett collected the five copies of the 1J/A EMER-1 book (from Soyuz, SM, Airlock, Lab, and Node-2), removed outdated pages, replaced them with new pages and restowed the books at their designated locations.]*

In preparation for the cargo loading/unloading activities ahead during the STS-124/1J docked period (6/2-6/11), the crew conducted a joint review of uplinked material comprising the 1J Transfer List and a summary of the intricate "choreography" of the transfer activities.

FE-2 Reisman afterwards had 1.3 hrs for marshalling and prepacking 1J transfer cargo.

Later (~12:05pm), the FE-2 and his crewmates tagged up with ground specialists to discuss transfer implementation details.

FE-1 Kononenko continued troubleshooting activities on the Russian SRVK (Multifiltration Unit) of the BRPK (Condensate Separation & Pumping Unit), off since 5/6. *[Russian specialists are confident that SRVK functionality can be restored by next week. As of now, one of two SRVK strings is operational. Troubleshooting will continue tomorrow on string 1, followed by refilling of the SKV-2 air conditioner with coolant (Freon-218) next week upon delivery by 29P. Until restoration of SRVK condensate processing, European and Russian specialists are in agreement that transferring about 2 EDVs of US condensate to ATV tanks is a viable option. A water dump into space will thus be avoided.]*

In the COL (Columbus Orbital Laboratory), Reisman supported ground activities on the BLB (Biolab) incubator by installing RECs (Reference Experiment Containers) on Rotor A, then activating COL1A2 rack software. *[Further BLB troubleshooting will require replacement of the locking pin with a new pin manifested on Flight 1J.]*

The CDR had an additional 2.5 hrs reserved to continue the periodic Russian SPOPT (Fire Detection & Suppression System) maintenance in the FGB, started yesterday, by dismantling IDZ-2 smoke detectors, cleaning their ionizing needles and then reinstalling the sensors. *[Part of the job is inspection and cleaning of surrounding areas behind panels. More SPOPT SD maintenance is scheduled tomorrow.]*

Kononenko completed the periodic (about twice a month) replenishing of the Elektron oxygen generator's water supply for electrolysis, filling the KOV EDV container with water collected in CWC (Contingency Water Container) #1050 from the Lab CCAA (Common Cabin Air Assembly) dehumidifier. *[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]*

Meanwhile, Garrett conducted the weekly 10-min. CWC audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. *[Updated "cue cards" based on the crew's water calldowns are sent up every other week. The current cue card (17-0002D) lists 38 CWCs (~1480.1 L total) for the four types of water identified on board: technical water (772.7 L, for Elektron, flushing, hygiene), potable water (625.2 L), condensate water (76.4 L), waste/EMU dump and other (5.8 L). Of the 38 containers, 15 CWCs with technical water (620.5 L) and 4 CWCs with potable water (176.3 L) must be cleared for Wautersia bacteria by MCC-H before they can be used. Follow-up: As of 5/13, partial results of the sample analysis are now available for the five CWCs transferred from STS-123/1J/*

A. Two potable water CWCs (#1094, #1095) and three technical water CWCs (#1043, #1071, #1070) have exhibited no bacterial, coliform or fungi growth after standard incubation periods. One of the three technical water CWC samples indicated some bacterial growth but at a level within the potable water acceptability limit. The Wautersia bacteria of this sample are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.]

Sergey & Oleg underwent their first periodic (generally monthly) health test with the cardiological experiment PZEh MO-1 ("Study of the Bioelectric Activity of the Heart at Rest") on the TVIS (Treadmill with Vibration Isolation System). *[During the 45-min. test, the crewmembers tagged up with ground specialists on an RGS (Russian ground site) pass on DO14 via VHF and downlinked data from the Gamma-1M ECG (electrocardiograph) for about 5-6 minutes.]*

The FE-1 completed the routine maintenance of the SM's SOZh/ECLSS system, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Later, Kononenko performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Oleg also had his third run with the Russian DZZ-2 "Diatomeya" ocean observations program, using the NIKON F-5 digital still camera with 80-200 mm lens and the HDV (high-definition) video camcorder from SM windows 7 & 8 to obtain color blooms in water area and large irregularities in cloud cover above the ocean and in surface wave fields.

In the SM, Reisman deactivated the onboard amateur radio equipment (a Kenwood VHF transceiver with manual frequency selection, headset, and power supply) to prevent radio interference during the prox ops with the arriving Progress spacecraft.

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR/ MO-1, FE-1/ MO-1, FE-2), and RED resistive exercise device (FE-1, FE-2). *[The RED, as an anaerobic muscle exerciser, allows a variety of routines: squat, heel raises, bent-over rowing, abdominal crunches, deadlift, bench presses, upright rowing, etc. For Sergey & Oleg, who are using RED three times a week, each*

session features four different routines which vary from day to day to target different muscle groups.]

Later tonight, Reisman will transfer the crew's exercise data file to the MEC for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~3:45am EDT, Sergey & Oleg linked up with TsUP-Moscow stowage specialists via S-band to conduct the weekly IMS tagup, discussing stowage issues and equipment locations. *[Topics of discussion today included photo equipment listed as stowed in the Soyuz BO "divan", ID number of a battery slated for disposal, location of the kits for two NIKON F5 cameras, etc.]*

At ~4:15pm EDT, Garrett is scheduled for his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop).

ANITA Update: After some helpful troubleshooting by Reisman yesterday, the ANITA (Analyzing Interferometer for Ambient Air) instrument is again downlinking health and status data nominally.

A/L F1 Rack Update: Additional work by Garrett on the Airlock Avionics Rack yesterday completed rotating the rack back into place. *[The lower pivot fittings were removed allowing the top attachment points (knee braces) to be secured. One lower launch restraint was re-installed. The two lower pivot fittings were not re-installed, but were stowed behind the rack. This configuration is acceptable for on-orbit loads. Reisman also returned the stowage into the airlock. Background: The F1 rack had to be rotated away from the A/L wall to allow the (successful) replacement of the failed ATU-6 (Audio Terminal Unit #6) with a spare unit. Afterwards, Garrett was unable to rotate the structure completely back into place.]*

MFCV Adjustment Update: Yesterday's scheduled ITCS MTL (Internal Thermal Control Systems/Moderate Temperature Loop) flow adjustment of four MFCVs (Manual Flow Control Valves) in the Lab could not be completed when it turned out that the non-intrusive Flow Meter, required for the adjustment, would not remain powered. Several attempts to power it were unsuccessful. Ground teams are assessing next troubleshooting steps. The adjustment is required for the Regen ECLSS rack that arrives later this year on ULF2.

CEO (Crew Earth Observations) photo targets uplinked for today were **Vredefort Impact Crater, S. Africa** *(shooting slightly to the left of track for this 300-km diameter impact structure, which is over 2 billion years old. Despite the operation of*

*tectonic and weathering processes over that time, the impact structure is still recognizable. Overlapping frames of the crater and surrounding area were requested to provide context for higher resolution imagery), **Madrean Sky Islands, Mexico** (ISS orbit track paralleled the eastern shoreline of the Gulf of California. As ISS moved SE-ward along the coast, the crew was to aim the camera to the left of track for the prominent mountains of the Sierra Madre [oriented roughly north-south in Mexico]. General context imagery of the mountains is desired as a baseline for assisting in locating of the "sky islands" near the peaks), **Kingman Reef, Hawaiian Island chain** (weather was predicted to be mostly clear over this long narrow reef at the time of this near-nadir pass. High resolution imagery of reefs was requested to track changes in morphology over time), and **Palmyra Atoll, Central Pacific** (located directly to the SE of the previous Kingman Reef target, Palmyra Atoll consists of small islands and submerged reefs. ISS had a near-nadir pass over the atoll. High resolution imagery of the islands and adjacent reefs was requested).*

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 8:52am EDT [= epoch]):*

Mean altitude -- 340.9 km

Apogee height -- 345.0 km

Perigee height -- 336.8 km

Period -- 91.35 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006031

Solar Beta Angle -- 47.3 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 44 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54337

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

05/16/08 -- Progress M-64/29P docking/FGB nadir (5:37pm)

05/31/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS (5:02pm EDT nominal)

06/02/08 -- STS-124/Discovery/1J docking (1:49pm)

Tentative STS-124 docked working timeline:

- 6/03 -- EVA-1 (11:30am, 6.5 hrs.), OBSS transfer, JPM prep, S3/S4 SARJ TBA install, JPM install
- 6/04 -- JPM Vestibule outfitting, Reisman/Chamitoff handovers
- 6/05 -- EVA-2 (11:30am, 6.5 hrs.), JTVE install, JRMS cvr remv, NTA prep, CP 9 ETVCG retrv

- 6/06 -- JLP relocate to JPM; JLP Vestibule leak check
 - 6/07 -- JLP Vestibule outfitting
 - 6/08 -- EVA-3 (10:30am, 6.3 hrs), S1 NTA install, CP9 ETVCG install, JRMS cover remove
 - 6/09 -- JRMS checkouts, JLP Vestibule outfitting, A/L BCM R&R
 - 6/10 -- Sayonara (~4:00pm), hatch close (~4:30pm)
 - 6/11 -- Undocking (~9:04am); OBSS survey/inspection
 - 6/12 -- Mostly off-duty
 - 6/13 -- Stowing; deorbit preps
 - 6/14 -- Deorbit burn (~9:56am);
- 06/14/08 -- STS-124/Discovery landing (KSC: ~10:59am EDT, nominal)
- 07/10/08 -- Russian EVA-20 (7/10-11)
- ??/??/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
- 09/05/08 -- ATV1 undocking
- 09/09/08 -- Progress M-64/29P undocking (from DC1)
- 09/10/08 -- Progress M-65/30P launch
- 09/12/08 -- Progress M-65/30P docking
- 10/01/08 -- **NASA 50 Years**
- 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
- 10/12/08 -- Soyuz TMA-13/17S launch
- 10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
- 10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
- 10/18/08 -- STS-126/Discovery/ULF2 docking
- 10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
- 11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
- 11/20/08 -- **ISS 10 Years**
- 11/26/08 -- Progress M-66/31P launch
- 11/28/08 -- Progress M-66/31P docking
- 12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
- 12/06/08 -- STS-119/Discovery/15A docking
- 12/15/08 -- STS-119/Discovery/15A undocking
- 2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
- 3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
- 05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
- 3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
- 4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
- 1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
- 1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
- 2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 05/14/08

All ISS systems continue to function nominally, except those noted previously or below.

For the US Sleep study, currently on his voluntary "job jar" task list, FE-2 Garrett Reisman downloaded the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data after wakeup and before breakfast from his Actiwatch to the HRF-1 (Human Research Facility 1) laptop. *[To monitor his sleep/wake patterns and light exposure, the Flight Engineer wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout this week, for the last time. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

For the Russian Sleep study, FE-1 Oleg Kononenko terminated his second MBI-12 SONOKARD experiment session upon wake-up by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. CDR Sergey Volkov in turn will start his second overnight MBI-12 session tonight. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

Also before breakfast and first exercise, the three crewmembers completed a brief (15 min.) session each with the Russian MO-9/Biochemical Urinalysis assessment of the crew health monitoring program. *[MO-9 is conducted every 30 days (and also before and after EVAs) and is one of five nominal Russian medical tests adopted by NASA for U.S. crewmembers for IMG PHS (Integrated Medical Group/*

Periodic Health Status) evaluation as part of the "PHS/Without Blood Labs" exam. Afterwards, the analysis results are entered in the MEC (Medical Equipment Computer)'s special IFEP software (In-Flight Examination Program).]

Sergey & Oleg completed the two-hour Part 2 of their second onboard "Profilaktika" (MBI-8, "Countermeasures") series of preventive health maintenance fitness testing on the treadmill, assisting each other in turn. *[Today's fitness test was performed on the TVIS in unmotorized (idle) mode, with free choice of speeds within the range permitted. The test investigates the action mechanism and efficiency of various countermeasures (currently VELO and TVIS) aimed at preventing locomotor system disorders in weightlessness. The test differs from the normal TVIS session by the use of the TEEM-100 gas analyzer (via a mask equipped with a pneumotachometer sensor), measurement of blood lactate level and subjective evaluation of physical exertion levels during the test. The lactate blood samples were taken twice at the end of the session, using the ACCUSPORT analyzer and REFLOTRON-4 accessories. Results were entered on a log sheet. TEEM and ECG (electrocardiograph) data were transferred to the RSE-Med laptop, also on a tape cassette (Cardiocassette-2000), and prepared for later downlink via Regul-Packet comm.]*

In the US Airlock (A/L), Garrett Reisman performed troubleshooting on the Avionics Rack (F1), assisted by Kononenko as required, going by an uplinked list of suggested steps with pictures. *[Yesterday Reisman successfully replaced the failed ATU-6 (Audio Terminal Unit #6) with a spare unit (which had six fasteners on the cold plate that were not present on the failed unit). Voice checks on the ATU-6 and ATU-4 units subsequently confirmed a successful R&R of the ATU-6 – it's working again. However, Reisman was unable to rotate the rack back into place afterwards. Today's crew timeline was modified to complete the rack rotation and A/L restowage in time to have the A/L properly configured for the 29P docking on Friday.]*

The FE-2 also performed a part of the scheduled adjustment of the MFCVs (Manual Flow Control Valves) for the ITCS/MTL (Internal Thermal Control System/Moderate Temperature Loop). The remaining work has been moved to tomorrow to make time for the higher-priority A/L F1 rack rotation & restowing. *[The MFCVs are being adjusted in the Lab with a battery-driven non-intrusive Flow Meter in preparation for the future Regenerative ECLSS (Environment Control & Life Support System). The recently activated OGS (Oxygen Generation System), launched in 2006, is one part of the new Regenerative ECLSS, required for the future six-person occupancy of the station. The second part, the WRS (Water Recovery System), for recycling wastewater into potable water, will be launched later this year on STS-126.]*

Working 2.5 hrs in the FGB, Sergey Volkov performed periodic SPOPT (Fire

Detection & Suppression System) maintenance by dismantling the FGB's IDZ-2 smoke detectors, cleaning their ionizing needles and then reinstalling the sensors.

[Part of the job is inspection and cleaning of surrounding areas behind panels. More SPOPT SD maintenance is scheduled tomorrow.]

Sergey Volkov had ~3 hrs set aside for the annual inspection and photo-documentation of window panes in the SM. The observed defects were recorded in image and text files on the RSK1 laptop for subsequent downlink via U.S. OCA assets. *[Objective of the inspection, which uses a digital still camera (Nikon D1X w/SB-28DX flash) and voice recorder, was to assess the pane surfaces on SM windows 6, 7, 8, 12, and VP2 for any changes (new cavities, scratches, new or expanded old stains or discolorations affecting transparency properties) since the last inspection, performed by Oleg Kotov on 6/26/07. The new assessment will be compared to the earlier observations. Defects are measured with the parallax method which uses eyeball-sighting with a ruler and a right isosceles triangle to determine the defects' size and position with respect to the window's internal surface (parallax being the apparent change in an object's position resulting from changing the observer's position).]*

Oleg Kononenko meanwhile performed a 2-hr audit/inventory of Russian KRP food containers in the FGB, assessing the number of unopened food rations (expired or close-to-expiration) for helping ground specialists to plan upcoming flight manifests.

After FE-2 Reisman set up and configured the necessary equipment, including activating the A31p laptop for video packet/stream conversion, he and the CDR conducted "ping" tests of the TV downlink system in the SM, Soyuz and Node-1 for covering the Progress 29P docking on Friday. The A31p was later deactivated again. *[Objective of the testing was to check out the function of the digital video/multicast downlink from the RS (Russian Segment) through Node-1 and USOS (US Segment) to Ku-band to MCC-Houston to COL-CC/Oberpfaffenhofen to TsUP-Moscow.]*

The FE-1 took the periodic sensor readings of the Russian "Pille-MKS" (MKS = ISS) radiation dosimetry experiment which has ten sensors placed at various locations in the Russian segment (DC1, SM starboard & port cabin windows, ASU toilet facility, control panel, etc.). *[Nine of the ten dosimeters are read manually.]*

Afterwards, Kononenko collected air samples in the SM & FGB using the AK-1M sampler kit, recording date, time & location and restowing the kits and pouches. Special AK-1M samples for Freon-218 were also taken in the SM.

Garrett performed the periodic checkup on active U.S. payloads, i.e., cleaning the ANITA (Analyzing Interferometer for Ambient Air) inlet plus inspecting and filter

cleaning of the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. *[The CGBA incubator is controlled from the ground, with automatic video downlinked to Earth. ANITA is now back up again and running in support of the on-going Freon-218 scrubbing from the cabin air, collecting data every six seconds and downlinking the data daily to the ground team. ANITA monitors low levels of potential gaseous contaminants in the ISS cabin atmosphere with a capability of simultaneously monitoring 32 gaseous contaminants. The experiment is testing the accuracy and reliability of this technology as a potential next-generation atmosphere trace-gas monitoring system for ISS and future spacecraft. This is a cooperative investigation with ESA.]*

Oleg completed the routine maintenance of the SM's SOZh/ECLSS system, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

The FE-1 also performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR/MBI-8, FE-1/MBI-8) and RED resistive exercise device (FE-2).

Later tonight, Volkov will transfer the crew's exercise data file to the MEC for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At 11:25am EDT, Garrett conducted the periodic VHF-1 emergency communications check over NASA's VHF (Very High Frequency) stations, today at the Dryden (11:29:24am – 11:35:50am), talking with Houston/Capcom, MSFC/PAYCOM (Payload Operation & Integration Center Communicator) and Moscow/GLAVNI (TsUP Capcom) in the normal fashion via VHF radio from a handheld microphone and any of the USOS ATUs. *[Purpose of the test is to verify signal reception and link integrity, improve crew proficiency, and ensure minimum required link margin during emergency (no TDRS) and special events (such as a Soyuz relocation).]*

CEO (Crew Earth Observations) photo targets uplinked for today were **Arkenu 1 & Arkenu 2 Impact Craters, Libya** (these two impact structures are thought to have been formed by the same impact event over 140 million years ago. The craters are located to the west of prominent rock outcrops within the extensive dune fields of southeastern Libya. Looking slightly to the left of track for the paired impact structures), **Luquillo Forest, Puerto Rico** (ISS had a nadir pass over this long term ecological research [LTER] site, and weather was predicted to be mostly clear. The site is comprised mainly of the forested slopes of the Luquillo Mountains in the eastern portion of Puerto Rico. Overlapping nadir frames, taken along track, were requested), and **East Venezuela Land Use, S. America** (the orbit track roughly paralleled the Venezuela coastline, providing an opportunity for context imagery of this land use change monitoring site. Looking to the right of track as ISS approached the northern coastline of Venezuela; the northern third of the site area should have been clear, with cloud cover increasing towards the south).

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (as of this morning, 8:31am EDT [= epoch]):

Mean altitude -- 340.9 km
Apogee height -- 345.0 km
Perigee height -- 336.9 km
Period -- 91.35 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0006022
Solar Beta Angle -- 42.4 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 53 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 54321

Significant Events Ahead (all dates Eastern Time, some changes possible.):

05/14/08 -- Progress M-64/29P launch (4:23pm EDT)
05/16/08 -- Progress M-64/29P docking/FGB nadir (5:37pm)
05/31/08 -- STS-124/Discovery/1J launch -- JEM PM "Kibo", racks, RMS (5:02pm EDT nominal)
06/02/08 -- STS-124/Discovery/1J docking (1:49pm)

Tentative STS-124 docked working timeline:

- 6/03 -- EVA-1 (11:30am, 6.5 hrs.), OBSS transfer, JPM prep, S3/S4 SARJ TBA install, JPM install
- 6/04 -- JPM Vestibule outfitting, Reisman/Chamitoff handovers
- 6/05 -- EVA-2 (11:30am, 6.5 hrs.), JTVE install, JRMS cvr remv, NTA

prep, CP 9 ETVCG retrv

- *6/06 -- JLP relocate to JPM; JLP Vestibule leak check*
- *6/07 -- JLP Vestibule outfitting*
- *6/08 -- EVA-3 (10:30am, 6.3 hrs), S1 NTA install, CP9 ETVCG install, JRMS cover remove*
- *6/09 -- JRMS checkouts, JLP Vestibule outfitting, A/L BCM R&R*
- *6/10 -- Sayonara (~4:00pm), hatch close (~4:30pm)*
- *6/11 -- Undocking (~9:04am); OBSS survey/inspection*
- *6/12 -- Mostly off-duty*
- *6/13 -- Stowing; deorbit preps*
- *6/14 -- Deorbit burn (~9:56am);*

06/14/08 -- STS-124/Discovery landing (KSC: ~10:59am EDT, nominal)

07/10/08 -- Russian EVA-20 (7/10-11)

??/?/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/05/08 -- ATV1 undocking

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC

10/18/08 -- STS-126/Discovery/ULF2 docking

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking

12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment

12/06/08 -- STS-119/Discovery/15A docking

12/15/08 -- STS-119/Discovery/15A undocking

2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD

3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation

05/?/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**

3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2

4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola

1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)

1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)

2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at

http://www.hq.nasa.gov/osf/iss_reports/index.htm

Attachments: [image001.gif](#)

ISS On-Orbit Status 05/13/08

All ISS systems continue to function nominally, except those noted previously or below.

From the US voluntary "job jar" task list, after wakeup and before breakfast, FE-2 Reisman downloaded the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data from his Actiwatch to the HRF-1 (Human Research Facility 1) laptop. *[To monitor his sleep/wake patterns and light exposure, Garrett wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout this week, for the last time. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

CDR Volkov completed the periodic servicing of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The regen process will be terminated before sleeptime, at ~5:15pm EDT. Regeneration of bed #2 follows tomorrow. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. In order to assist in atmosphere scrubbing after the Freon-218 (Khladon) spill from the SKV-2 air conditioner on 4/24, the BMP's regeneration cycle was moded to 5 days instead of the regular 20 days.]*

In the SM (Service Module), FE-1 Kononenko took the periodic readings of potentially harmful atmospheric contaminants with the CMS (Countermeasure System) component of the GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, which uses preprogrammed microchips to measure H₂CO (Formaldehyde, methanal), CO (Carbon Monoxide) and NH₃ (Ammonia), taking one measurement per microchip. *[CMS is a subsystem of the Russian SKDS Pressure Control & Atmosphere Monitoring System.]*

After setting up the experiment equipment yesterday, Volkov & Kononenko completed the first part of the onboard "Profilaktika" (MBI-8, "Countermeasures") preventive health maintenance fitness test on the VELO bicycle ergometer, assisting each other in turn. Part 2, on the TVIS treadmill, is scheduled tomorrow.

[Test procedure for MBI-8, which requires workouts on the VELO and TVIS, is identical to the Russian MO-5 assessment, but in addition to the nominal procedure it uses the TEEM-100M gas analyzer with breathing mask, a blood lactate test with the ACCUSPORT analyzer and REFLOTRON-4 accessories, and a subjective evaluation of physical exertion levels during the test (using the Borg Perceived Exertion Scale, viz., 10 steps from very light over hard and very hard to maximum). Results are entered on a log sheet. TEEM and ECG (electrocardiograph) data are transferred to the RSE-Med laptop, also on a tape cassette (Cardiocassette-2000), and prepared for later downlink via Regul-Packet comm. Results are also called down to specialists standing by at TsUP.]

FE-2 Reisman had 30 min set aside to review procedures for tomorrow's MFCV (Manual Flow Control Valve) adjustment activity, for which he charged up three HRF (Human Research Facility) and Flow Meter batteries yesterday. *[The MFCVs will be adjusted in the Lab in preparation for the future Regenerative ECLSS (Environment Control & Life Support System), using a non-intrusive Flow Meter instrument.]*

Afterwards, Reisman worked in the US Airlock, rotating the Avionics rack to gain access and performing troubleshooting on the ATU-6 (Audio Terminal Unit #6) in an attempt to regain the system or determine once and for all the possible cause of its current failures. *[ATU-6 has not performed satisfactorily despite repeated troubleshooting attempts dating back several months. Today's attempt was the third since ATU-6 was installed by Clay Anderson on 10/11/07 in place of a failed unit, which was returned on 10A. The new ATU-6 has been experiencing periodic lockups and PBIT (passive built-in test) faults. Of the three ATUs in the A/L, at least one must be functional for EVAs so long as the suited EVA crew has established UHF (Ultra High Frequency) radio communication.]*

In preparation for Progress M-64/29P docking on 5/16 (Friday), Volkov & Kononenko completed the standard three-hour training course with the TORU teleoperator system, which provides a manual backup mode to the Progress' KURS automated rendezvous radar system. Afterwards, Sergey & Oleg tagged up with TORU specialists at TsUP/Moscow via S-band audio. Another training review is scheduled on 5/15. *[The drill included procedure review, rendezvous, docking data and rendezvous math modeling data review, fly-around, final approach, docking and off-nominal situations (e.g., video or comm loss). Two modes were simulated on the RSK1 laptop: 29P from stationkeeping range (~170 m) in sunlight*

(insolation), and 29P in final approach in darkness (eclipse). The TORU teleoperator control system lets a SM-based crewmember perform the approach and docking of automated Progress vehicles in case of KURS failure. Receiving a video image of the approaching ISS, as seen from a Progress-mounted docking television camera ("Klest"), on a color monitor ("Simvol-Ts", i.e. "symbol center") which also displays an overlay of rendezvous data from the onboard digital computer, the CDR would steer the Progress to mechanical contact by means of two hand controllers, one for rotation (RUO), the other for translation (RUD), on adjustable armrests. The controller-generated commands are transmitted from the SM's TORU control panel to the Progress via VHF radio. In addition to the Simvol-Ts color monitor, range, range rate (approach velocity) and relative angular position data are displayed on the "Klest-M" video monitor (VKU) which starts picking up signals from Progress when it is still approximately 8 km away. TORU is monitored in real time from TsUP over Russian ground sites (RGS) and via Ku-band from Houston, but its control cannot be taken over from the ground. On 5/16, Progress KURS will be activated at 4:04pm EDT on Daily Orbit 16 (DO16), SM KURS two minutes later. Progress headlight will be switched on at a range of ~8 km. Flyaround to the FGB nadir docking port (~400 m range, in sunlight) starts at 5:14pm. Start of final approach: 5:27:30pm (DO1). Local sunset: ~5:34pm. Estimated time of contact: 5:36:30pm.]

Later, on DO13 over RGS (Russian Groundsite) VHF, the two cosmonauts conducted the standard pre-docking test of the TORU, including the BPS Signal Conversion Unit in the SM as well as its RUO & RUD hand controllers. *[The elaborate testing of the digital video/multicast downlink of the 29P docking via RS (Russian Segment) to USOS (US Segment) to Ku-band to MCC-Houston to COL-CC/Oberpfaffenhofen to TsUP-Moscow is scheduled tomorrow.]*

In further troubleshooting of the Russian SRVK-2M Condensate Water Processor, Kononenko checked the performance of the liquid/air separators of the Condensate Separation & Pumping Units BRPK-1 & -2, using a water-filled EDV container. The activity was supported by ground specialist tagup. *[The units have failed to show "filled", "empty" and NOK pump "shutdown" indicators as required, causing liquid to pass through the air connections of the separators.]*

The CDR completed the routine maintenance of the SOZh/ECLSS system in the Service Module (SM), including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Volkov also performed the daily IMS (Inventory Management System) maintenance,

updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), RED resistive exercise device (FE-2) and VELO bike with bungee cord load trainer (CDR/MBI-8, FE-1/MBI-8).

Later tonight, Garrett will download the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~9:45am EDT, Volkov, Kononenko & Reisman joined in two separate televised PAO interview events, one with the Parsippany, NJ Daily Record (Lorraine Ash), the other with CNN Radio (Mike Jones/Christy Henry/Marcia Shipley). *[Parsippany, New Jersey is Garrett’s hometown.]*

At ~11:05am, the crew conducted the standard pre-mission teleconference with members of the STS-124/1J Shuttle crew, via S-band/audio. *[S/G-2 (Space-to-Ground 2) phone patch via SSC (Station Support Computer) laptop].*

The three crewmembers had their regular periodic PMCs (Private Medical Conferences) via S- & Ku-band audio/video.

At ~2:10pm, Garrett Reisman is scheduled for his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop).

At ~5:20pm, just before sleep time, Oleg will again set up the Russian MBI-12 SONOKARD (Sonocard) payload and start his second experiment session, using a sports shirt from the SONOKARD kit with a special device in the pocket for testing a new method for acquiring physiological data without using direct contact on the skin. Measurements are recorded on a data card for return to Earth. Sergey will start his second MBI-12 session tomorrow evening. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember’s physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

VolSci Program: For the Voluntary Science program on the weekend ahead (5/17-5/18), Garrett Reisman was offered two choices for his selection: (1) an “operations improvement” session with SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellites) with all three satellites (single-satellite experiments to test new thrusting algorithms and demonstrate safe trajectories for the inspection of space structures; two-satellite experiments to introduce new controllers and on-line path planning tools for purpose of docking to a complex tumbling satellite; three-satellite runs for formation flight experiments to test initialization of a formation and obstacle avoidance; (2) an EPO (Education Payload Operations) Demo on Space Careers, creating an educational video discussing different careers found at NASA, to be used to produce an educational product to enhance existing education resources for students in grades 9-12. Garrett’s choice is required by tonight.

Microbial Water Sampling Results: Results of the sample analysis from the five transferred STS-123/1J/A CWCs (Contingency Water Containers) are now available. The samples from two potable water CWCs (#1094, #1095) and three technical water CWCs (#1043, #1071, #1070) have exhibited no bacterial, coliform or fungi growth after standard incubation periods. One of the three technical water CWC samples indicated some bacterial growth but at a level within the potable water acceptability limit. The *Wautersia* bacteria of this sample are typical water-borne microorganisms that have been seen previously in ISS water sources. These isolates pose no threat to human health.

Progress M-64/29P Update: At Baikonur, Kazakhstan, the Commission in charge meets tonight to decide on the Go/No Go for tomorrow’s Progress launch. The vehicle is currently undergoing final L-1 day preparations on Launch Pad 1 (**see photo below**). Launch is set for 4:23pm EDT, followed by orbital insertion at 4:31:39pm. There will be three midcourse correction burns (DV1: 5/14 - 7:58pm; DV2: 5/14 - 8:39pm; DV3: 5/15 - 5:06pm). Six more course adjustment “tweaks” will be executed later as required. The Progress KURS-A will be activated Friday afternoon at 4:04pm on Daily Orbit 1 (DO1), followed 2 minutes later by activation of the SM KURS-P transponders on the ISS. Video link and 29P floodlight activation is at ~8 km distance (4:57pm, 5/16); flyaround in sunlight at ~400 m range starts at ~5:14pm, stationkeeping at ~170 m at 5:23pm, final approach at 5:27:30pm and docking at FGB nadir port at ~5:37pm. Orbital sunset occurs at ~5:35pm.

CEO (Crew Earth Observations) photo targets uplinked for today were **Teide Volcano, Canary Islands** (*located on the island of Tenerife, the Teide stratovolcano is the highest point in the Atlantic Ocean. It is located within a large elliptical collapse caldera [La Canada], and was perhaps witnessed in eruption by Christopher Columbus. Looking to the left of track for the islands; a mapping series*

*of the islands as ISS passed was requested), **Vredefort Impact Crater, South Africa** (looking slightly to the left of track for this 300-km in diameter impact structure, which was formed over 2 billion years ago. Despite its great age, some rocks deformed by the impact are still present, suggesting the circular outline of the original structure. Overlapping frames of the crater and surrounding area were requested to provide context for higher resolution imagery), and **Johnston Island reef, Central Pacific** (weather was predicted to be clear over Johnston Island and its associated reefs. Johnston Island is mostly barren and covered only with low vegetation consisting of herbs. A runway is also visible on the island. High resolution imagery of the islands and nearby reefs is requested to monitor island morphology and reef extent).*

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 8:09am EDT [= epoch]):*

Mean altitude -- 341.0 km

Apogee height -- 345.2 km

Perigee height -- 336.8 km

Period -- 91.35 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006252

Solar Beta Angle -- 37.5 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 48 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54305

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

05/14/08 -- Progress M-64/29P launch (4:23pm EDT)

05/16/08 -- Progress M-64/29P docking/FGB nadir (5:37pm)

05/31/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS (5:02pm EDT)

06/02/08 -- STS-124/Discovery/1J docking

06/14/08 -- STS-124/Discovery landing (KSC: ~11:02am EDT)

07/10/08 -- Russian EVA-20 (7/10-11)

??/??/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/05/08 -- ATV1 undocking

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 05/12/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 4 of Increment 17.*

From the US voluntary "job jar" task list, after wakeup and before breakfast, FE-2 Reisman downloaded the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data from his Actiwatch to the HRF-1 (Human Research Facility 1) laptop. *[To monitor his sleep/wake patterns and light exposure, Garrett wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout this week, for the last time. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

CDR Volkov and FE-1 Kononenko set up the hardware for and tagged up with ground specialists in preparation of their first onboard "Profilaktika" (MBI-8, "Countermeasures") preventive health maintenance fitness test, scheduled to start tomorrow on the VELO cycle and running through Wednesday. Activities included a test gas analysis of exhaled air and a health check of the Cardiocassette (KK-2000). *[Test procedure for MBI-8, which requires workouts on the VELO and TVIS, is identical to the Russian MO-5 assessment, but in addition to the nominal procedure it uses the TEEM-100M gas analyzer with breathing mask, a blood lactate test with the ACCUSPORT analyzer and REFLOTRON-4 accessories, and a subjective evaluation of physical exertion levels during the test (using the Borg Perceived Exertion Scale, viz., 10 steps from very light over hard and very hard to maximum). Results are entered on a log sheet. TEEM and ECG (electrocardiograph) data are transferred to the RSE-Med Laptop, also on a tape cassette (KK-2000), and prepared for later downlink via Regul-Packet comm. Results are also called down to specialists standing by at TsUP.]*

After turning on ventilation fans in the JPL (Japanese Experiment Module

Experiment Logistics Module Pressurized Section), in case of CO₂ pockets, the FE-2 took situational photography of current stowage arrangements in the module, such as hard dummy panels, JTVE (JEM Television Equipment) booms, jettison stowage bags, etc.

Afterwards, Reisman performed the periodic JLP status & shell temperature check from the MKAM (Minimum Keep-Alive Monitor) panel and calldown of the temperatures via S-band. Later, the fans were deactivated again.

After configuring the PFE-OUM (Periodic Fitness Evaluation - Oxygen Uptake Measurement) equipment at the HRF-2 (Human Research Facility 2) rack, Reisman conducted his second PFE-OUM session on the CEVIS (Cycle Ergometer with Vibration Isolation) while wearing an HRM (Heart Rate Monitor), with Sergey Volkov as operator to obtain measurements of the subject. *[The equipment includes the HRF PFM/PAM (Pulmonary Function Module/Photoacoustic Analyzer Module), Mixing Bag System and GDS (Gas Delivery System). After calibration of the DPFM (Differential Pressure Flowmeter), Garrett, assisted by Sergey, worked through the protocol, changing the loads on the ergometer and recording data. Later, the FE-2 updated the evaluation protocol, deactivated & stowed the gear, and powered down the PFE-OUM laptop. Purpose of PFE-OUM is to measure aerobic capacity during exercise within 14 days after arrival on ISS, and once monthly during routine PFEs. The data allows exercise physiologists & flight doctors to assess the crew's health & fitness and to provide data for modifying & updating crew-specific exercise regimes. By hooking up a special cable, continuous oxygen uptake measurements can now be taken while riding the CEVIS without requiring access to the CEVIS control panel as before. PFE-OUM is a collaborative effort between NASA and ESA (European Space Agency).]*

Kononenko & Volkov continued the transfer & installation in the FGB of the new stowage enclosures delivered by the ATV1 (Automated Transfer Vehicle 1), which were built in Russia to provide more efficient stowage spaces behind FGB panels and improve airflow/circulation. *[Oleg transferred the components for one container and installed it in FGB zone 36 (behind panels 114-155), while Sergey later equipped FGB zones 31 (panel 420) and 32 (panel 422) with enclosures.]*

Preparatory to the planned troubleshooting of the ATU-6 (Audio Terminal Unit #6), scheduled tomorrow, Reisman installed pivot pin fittings in the Airlock Avionics rack, required to allow rack rotation away from the hull for ATU access. *[ATU-6 has not performed satisfactorily despite repeated troubleshooting attempts dating back several months. ATU-6 was installed by Clay Anderson on 10/11/07 in place of a failed unit, and the failed ATU-6 was returned on 10A. The new ATU-6 has been experiencing periodic lockups and PBIT (passive built-in test) faults. Of the three*

ATUs in the A/L, at least one must be functional for EVAs so long as the suited EVA crew has established UHF (Ultra High Frequency) radio communication.]

Volkov & Reisman took their second CHeCS emergency medical operations OBT (On-Board Training) drill, a 30-min. exercise to refresh their CMO (Crew Medical Officer)'s acuity in applying ACLS (advanced cardio life support) in an emergency. Sergey's proficiency drill today focused on eye treatment, Garrett's on nosebleed treatment. *[The HMS (Health Maintenance Systems) hardware, including ACLS equipment, may be used in contingency situations where crew life is at risk. To maintain proficiency, crewmembers spend one hour per month reviewing HMS and ACLS equipment and procedures via the HMS and ACLS CBT (computer-based training). The training drill, each crewmember for him/herself, refreshes their memory of the on-orbit stowage and deployment locations, equipment etc. and procedures.]*

Continuing the current round of monthly preventive maintenance of RS ventilation systems, Oleg Kononenko cleaned the four "Group B" fan screens (VT1, VTK1, VV1RO & VV2RO) in the SM.

In preparation for the planned MFCV (Manual Flow Control Valve) adjustment activity scheduled on 5/14 (Wednesday), Garrett charged three HRF (Human Research Facility) and Flow Meter batteries. *[The MFCVs will be adjusted in the Lab in preparation for the future Regenerative ECLSS (Environment Control & Life Support System). Today's recharging involved two external HRF batteries and one internal battery of the Non-Intrusive Flow Meter instrument.]*

Volkov conducted the periodic (monthly) functional closure test of the Vozdukh CO₂ removal system's spare emergency vacuum valves (AVK), in the spare parts kit. *[The AVKs are critical because they close the Vozdukh's vacuum access lines in the event of a malfunction in the regular vacuum valves (BVK) or a depressurization in the Vozdukh valve panel (BOA). Access to vacuum is required to vent CO₂ during the regeneration of the absorbent cartridges (PP). During nominal operation, the AVK valves remain open.]*

The FE-2 completed the routine maintenance of the SOZh/ECLSS system in the Service Module (SM), including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

The FE-1 performed the daily IMS (Inventory Management System) maintenance,

updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

In preparation for 1J/A arrival and the docking of the JPM (Japanese Pressurized Module) “Kibo” with its RMS (Remote Manipulator System), Reisman installed the CBCS (Centerline Berthing Camera System) at the Node-2 Port hatch, powered it up and checked it out. Afterwards, he disconnected the CBCS electronics cables to avoid hatch “dragthroughs”. *[Should there be any changes to the CBCS configuration between now and 1J, another CBCS checkout may be required. JPM will be transferred from the Shuttle cargo bay with the SSRMS (Space Station Remote Manipulator System) on FD4 (Flight Day 4) of Mission STS-124/1J and berthed at the Node-2 Port CBM (Common Berthing Mechanism) during EVA-1 (of three EVAs) by Ron Garan (EV1) & Mike Fossum (EV2). The JLP will be relocated on FD7 to its final place atop the JPM, also with the SSRMS.]*

Reisman also conducted the periodic (every two weeks) inspection of the RED (Resistive Exercise Device) canister bolts for re-tightening if required.

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-1, FE-2/PFE), TVIS treadmill (CDR, FE-1), and RED (FE-2).

Later tonight, the FE-2 will download the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~12:20pm EDT, Garrett supported TV downlink exchanges with students at two US educational institutions,- One Stop Richmond Hill Community Center in Richmond Hill, NY, and Valley Christian Elementary School in Bellflower, CA.

[“What is your favorite topic of conversation on the ISS?”; “What language do you all speak on the ISS?”; Why do you need to know a crewmember’s physiological functions during sleep?”; “What have you learned so far working with the Crew Earth Observations program?”; “How comfortable is it so sleep in microgravity?”]

At ~3:10pm, the three crewmembers will convene for their standard bi-weekly teleconference with the JSC Astronaut Office (Steve Lindsey), via S-band S/G-2 audio & phone patch.

Water Dump Update: The US condensate water venting planned for 5/18 has been postponed to 5/26, but alternative options are being worked by the partners (such as storing the surplus water in clean ATV tanks). With the Russian SRVK

(Condensate Processing Unit) currently off (since 5/6), condensate produced by the US Lab CCAA (Common Cabin Air Assembly) air conditioner cannot be processed as usual, but Russian specialists are confident of success of upcoming SRVK troubleshooting.

MT Transfer: For today's MT (Mobile Transporter) translation, Russian thrusters were inhibited at 11:40am (through 5:50pm) due to loads constraints. At ~12:05pm, ground controllers started driving the railcart from WS-4 (Worksite #4) out to WS-6 (through 2:05pm) using string A IMCAs (Integrated Motor/Controller Assemblies) and then back to WS-4 at 3:05pm (through 5:05pm) on string B IMCAs, in order to confirm power & data redundancy at WS-6 before the 1J/docked mission.

Progress 29P Update: RSC-Energia/Moscow reported that the Soyuz launcher with the next Progress cargo ship, M-64/29P, has been moved this morning to the launch pad (launch: 5/14, 4:23pm EDT). L-2 Day activities have started. After reviewing ISS state of readiness, the joint IMMT (ISS Mission Management Team) this morning gave the Go for the docking on 5/16 (5:37pm EDT, two minutes after local sunset).

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 7:48am EDT [= epoch]*):

Mean altitude -- 341.0 km

Apogee height -- 345.3 km

Perigee height -- 336.8 km

Period -- 91.36 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006387

Solar Beta Angle -- 32.6 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 58 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54289

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

05/14/08 -- Progress M-64/29P launch (4:23pm EDT)

05/16/08 -- Progress M-64/29P docking/FGB nadir (5:37pm)

05/31/08 -- STS-124/Discovery/1J launch -- JEM PM "Kibo", racks, RMS (5:02pm EDT)

06/02/08 -- STS-124/Discovery/1J docking

06/14/08 -- STS-124/Discovery landing (KSC: ~11:02am EDT)
 07/10/08 -- Russian EVA-20 (7/10-11)
 ??/??/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
 09/05/08 -- ATV1 undocking
 09/09/08 -- Progress M-64/29P undocking (from DC1)
 09/10/08 -- Progress M-65/30P launch
 09/12/08 -- Progress M-65/30P docking
 10/01/08 -- **NASA 50 Years**
 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
 10/12/08 -- Soyuz TMA-13/17S launch
 10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
 10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
 10/18/08 -- STS-126/Discovery/ULF2 docking
 10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
 11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
 11/20/08 -- **ISS 10 Years**
 11/26/08 -- Progress M-66/31P launch
 11/28/08 -- Progress M-66/31P docking
 12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
 12/06/08 -- STS-119/Discovery/15A docking
 12/15/08 -- STS-119/Discovery/15A undocking
 2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
 05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
 3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
 4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
 1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
 1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
 2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 05/11/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – crew off duty. Ahead: Week 4 of Increment 17.*

CDR Volkov conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including ASU toilet facilities systems/replaceables, the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP and today also the periodic cleaning of the pre-filter of the POTOK air filtration system. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

FE-2 Reisman performed the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling a CWC (Contingency Water Container, #1062) with the collected water slated for processing. No samples were required. *[Transferred quantity is determined by allowing tank and CWC equalize with each other. Tank quantity stabilizes at a value higher than the neutral point.]*

Garrett Reisman also unstowed and set up the PFE-OUM (PFE-Oxygen Uptake Measurement) equipment on the HRF-2 (Human Research Facility 2) rack, including the HRF PFM/PAM (Pulmonary Function Module/Photoacoustic Analyzer Module), Mixing Bag System and GDS (Gas Delivery System), for his second PFE-OUM protocol session tomorrow. *[The PFE-OUM experiment, using the CEVIS ergometer for workout, demonstrates the capability of crewmembers to perform periodic fitness evaluations with continuous oxygen consumption measurements within 14 days after arrival on ISS, and once monthly during routine PFEs. Once the capability of the pulmonary function system (PFS) to perform PFEs is verified, crewmembers will be able to integrate their monthly PFE with oxygen consumption measurements to fulfill the requirement for cardiovascular fitness evaluations during*

long-duration space flight.]

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR), RED resistive exerciser (CDR, FE-1 FE-2) and VELO bike with bungee cord load trainer (FE-1). *[The RED, as an anaerobic muscle exerciser, allows a variety of routines: squat, heel raises, bent-over rowing, abdominal crunches, deadlift, bench presses, upright rowing, etc. For Sergey & Oleg, who are using RED three times a week, each session features four different routines which vary from day to day to target different muscle groups.]*

Working off the discretionary "time permitting" task list, Sergey Volkov completed another EKON KPT-3 session, making observations and taking aerial photography of environmental conditions for Russia's Environmental Safety Agency (EKON) using the Nikon D2X digital camera with SIGMA 300-800mm telephoto lens.

Also from the suggestions list, Kononenko performed a session of the Russian GFI-8 "Uragan" (hurricane) earth-imaging program, using the D2X to take telephotos of the Chaiten volcano eruption in Chile and of the Kuril Islands in nadir.

A third job on the discretionary task list was Oleg's second run of the Russian DZZ-2 "Diatomeya" ocean observations program, using the NIKON F-5 digital still camera with 80-200 mm lens and the SONY PD-150P camcorder from SM windows 7 & 8 to record color bloom patterns in the ocean, sudden changes in cloud cover pattern, swirls, wakes of subsurface waves (sections of parallel bands), water level drop, and smoothing lanes in wave fields. *[Targets today in the North Atlantic were the Newfoundland Island coastline, West Saharan offshore areas, US coastal area, Amazon river runoff and offshore area of Brazil.]*

At ~1:25pm EDT, Reisman had for his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop). *[Main topic for today's phone chat undoubtedly was Mother's Day.]*

Tonight, Garrett will start his last required overnight run with the SLEEP experiment (Sleep-Wake Actigraphy & Light Exposure during Spaceflight), consisting of data logging on the HRF-1 laptop within 15 minutes of awakening for 7 consecutive days, as carried for him on the voluntary "job jar" task list. Any additional SLEEP logging after fulfilling the required week's readings will be appreciated by the PI (Principal Investigator). *[To allow ground study of his sleep/wake patterns and light exposure, Garrett wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition.]*

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 7:43am EDT [= epoch]):*

Mean altitude -- 341.1 km

Apogee height -- 345.5 km

Perigee height -- 336.7 km

Period -- 91.36 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006526

Solar Beta Angle -- 27.6 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 46 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54273

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

05/14/08 -- Progress M-64/29P launch (4:23pm EDT)

05/16/08 -- Progress M-64/29P docking/FGB nadir (5:38pm)

05/31/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS (5:02pm EDT)

06/02/08 -- STS-124/Discovery/1J docking

06/14/08 -- STS-124/Discovery landing (KSC: ~11:02am EDT)

07/10/08 -- Russian EVA-20 (7/10-11)

??/?/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/05/08 -- ATV1 undocking

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC

10/18/08 -- STS-126/Discovery/ULF2 docking

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking

12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 05/10/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – day off for CDR Volkov, FE-1 Kononenko & FE-2 Reisman.*

The crew performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

As part of the house cleaning, Volkov & Kononenko performed regular maintenance cleaning on the fan grilles FS5, FS6, VPkhO, VdPrK, VPrK & TsV2 in the DC1 Docking Module and FGB (*Funktsionalnyi-Grusovoi Blok*).

The CDR conducted the routine daily servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM. *[Regular daily SOZh maintenance consists, among else, of checking the ASU toilet facilities, replacement of the KTO & KBO solid waste containers and replacement of EDV-SV waste water and EDV-U urine containers.]*

Sergey also gathered weekly data on Total Operating Time & "On" durations of the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem for reporting to TsUP.

At ~10:00am EDT, the crewmembers held their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP/Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit

events.

The crew conducted their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exerciser (FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1).

Later, Garrett downloaded the crewmembers' exercise data files to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working off the discretionary "time permitting" task list, Volkov completed another EKON KPT-3 session, making observations and taking aerial photography of environmental conditions for Russia's Environmental Safety Agency (EKON) using the Nikon D2X digital camera with SIGMA 300-800mm telephoto lens.

Also from the suggestions list, Kononenko performed a session of the Russian GFI-8 "Uragan" (hurricane) earth-imaging program, using the D2X to take telephotos of the western slope of the Pyrenees, the Chaiten volcano eruption in Chile as well as of the Kurils Islands in nadir.

A third job on the discretionary job list for the two cosmonauts, as per request from the European partner, still is to take one or two photographs of a Russian crewmember inside the ATV "Jules Verne".

Newly added to the "available time" list was a request to take close-up photography of the two SKK materials exposure payloads mounted on the outside of the station, -SKK-2 on the "Pirs" Docking Compartment (DC-1) from SM window #6, and SKK-9 on the SM hull, from the DC-1 EVA hatch window.

CDRA Update: The Carbon Dioxide Removal Assembly, running since 5/7, was deactivated yesterday by ground commanding after data from the ANITA (Analyzing Interferometer for Ambient Air) instrument showed that CDRA wasn't helping to remove the Freon-218 from the cabin air. The likely cause is that the pore size of the Zeolite bed in CDRA is smaller than Freon molecules, thus preventing the refrigerant from being adsorbed. *[The Freon spill (~600 g) occurred on 4/29 after the replacement of the SKV-2 air conditioner compressor. To clean up quickly, the Russian BMP (Russian Harmful Impurities Removal System) was moded to regenerate its absorbent beds every 5 days instead of the regular 20 days. Freon-218 (Octafluoropropane/C₃F₈, Russian: Khladon) is safe (low toxicity, perhaps some irritation) and noncorrosive if not heated above ~600 degC. Primary hazard is*

oxygen displacement, as witness the Ozone Layer, but there is not enough C_3F_8 on board the ISS to significantly deplete any atmospheric oxygen.]

Water Dump Update: The US condensate water venting planned for 5/18 has been cancelled, as alternative options are being worked (such as storing the surplus water in clean ATV tanks).

PPS P6 Reconditioning Update: The reconditioning (discharge/recharge) maintenance of the P6 battery sets 2B3 and 4B3 was completed on 5/7, and both were returned to nominal operations. *[P6 battery sets 2B2 & 4B2 were reconditioned last January.]*

MSG Update: The annual re-certification of the Microgravity Science Glovebox was successfully completed.

Weekly Science Update (*Expedition Seventeen -- Week 3*)

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):
Measurements continue in FGB module. Inc16 science data returned on 15S, waiting for hand-over to science team.

ANITA: Completed.

BCAT-3 (Binary Colloidal Alloy Test 3): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System):
B3/B4 plants are growing. A1/B1 and A2/B2 swapping was done, but the attempt to hydrate A1 and A2 in the B1 and B2 position is not currently successful.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): Complete.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed. Inc16 science data returned on 15S, waiting for hand-over to science team.

EuTEF (European Technology Exposure Facility): The experiment platform continues to operate nominally. - DEBIE-2: Link error still under investigation;- DOSTEL: On-going science acquisition;- EuTEMP: Currently inactive as planned; EVC: Further troubleshooting is on-going; Still problems to get high-rate data downlink; - EXPOSE: On-going science acquisition; - FIPEX: New science acquisition script has been restarted successfully on 4/30 and terminated nominally on 5/6. A new script was uplinked on 5/7 and is running since then; - MEDET: On-going science acquisition, running nominal; PLEGPAY: Instrument is powered on, but not in science acquisition mode; TRIBOLAB: On 4/25, the very sensitive TRIBOLAB Pin On Disk#2 (POD#2) run could be restarted and ran nominally until 5/9. The instrument has been put in Thermal Stabilization Mode (TSM) to prepare for an attempt to restart the Pin On Disk#1 (POD#1) run.

FSL (Fluid Science Laboratory): FSL MIL Bus cable repair was successfully performed on 5/5. After FSL Rack Activation from ground on 5/8, the ground confirmed that the FSL cables repair activities were successful. "Thank you Garrett for your great work! Teams continue to analyze on ground the Telemetry Logs, and further troubleshooting activities will be required with CEM-U (Upper) Optical Module."

GEOFLOW: Start of GEOFLOW is pending further FSL troubleshooting and remaining commissioning activities (check of FSL optical modes).

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System):

Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION/REPOSITORY: In progress.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SAMPLE: Inc16 samples have been downloaded with 15S and handed over to science team.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): "Garrett you have a couple of Sleep Activities scheduled for next week. You will have your monthly download and your last week of required Sleep logs scheduled as well. Any additional Sleep logging is above and beyond and greatly appreciated by the PI. After these activities are complete, you will have one more download and an Actiwatch doff on the Shuttle as your remaining activities."

SOLAR (Solar Monitoring Observatory): Initial Sun tracking was started on 4/29, but the Sun was not in the proper Beta range to allow for nominal data acquisition, i. e. SOLAR platform went to Stand-By Mode when trying to track the Sun. On 4/30, solar measurements started with SOVIM and SOLSPEC instruments with regular acquisition of spectra and calibration runs. During this Sun observation period, the SOLAR platform, SOVIM and SOLSPEC Sun sensors positions have been correlated during a so-called "criss-cross" procedure manoeuvre. The current Sun observation period will end during this weekend. - SOVIM: Acquiring science data – some glitches observed in the instrument telemetry; - SOLSPEC: Acquiring science data; - SOLACES: Acquiring science data, some recurrent synchronization problems between its microcontrollers.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite):

In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): The 4 ECs (Experiment Containers) of Rotor B are yet to be retrieved by the crew from the blocked Rotor B. The first troubleshooting activity, which consists to insert back 6 Reference ECs into the Rotor A, is currently planned for next week.

CEO (Crew Earth Observations): Through 5/5 the ground has received a total of 982 of ISS/CEO images for review and cataloging. "We are currently reviewing imagery with camera times corresponding to the following target list requests: Santa Barbara Coast, California — preliminarily acquired; and the Madrean Sky Islands, Mexico — not acquired. We have seen a number of photos suggesting your attempts to acquire the cities you requested, especially for Cologne, Germany — but there is no success so far to report. Your recent imagery of the New Orleans-Mississippi River-Lake Pontchartrain DYNAMIC EVENT (opening of the Bonnet Carre Spillway upriver from the city) will be published on NASA/GSFC's Earth Observatory website this weekend. Thanks for a great context view of this man-made event!"

CEO photo targets uplinked for today were **Ouarkiz Impact Crater, Algeria** (*this 3.5-km in diameter impact structure stands out among the folded rocks of the Ouarkiz Monocline due to its well-defined circular crater. ISS had a nadir pass directly over the impact structure. Overlapping frames, using the 400 mm lens, acquired as ISS traversed the mountains from NW to SE were suggested to image both the crater and surrounding geologic structure*), and **Galeras Volcano, Columbia** (*the Galeras stratovolcano is located immediately west of the city of Pasto, and is one of Columbia's most active volcanoes. Numerous small to moderate eruptions have taken place since the first Spanish conquistadores arrived. ISS had a nadir pass directly over the volcano, and some cloud cover may have been present. Imagery of the volcano and surrounding deposits was requested*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 8:36am EDT [= epoch]):*

Mean altitude -- 341.2 km

Apogee height -- 345.4 km

Perigee height -- 336.9 km

Period -- 91.36 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006288

Solar Beta Angle -- 22.7 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 65 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54258

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

05/14/08 -- Progress M-64/29P launch (4:23pm EDT)

05/16/08 -- Progress M-64/29P docking/FGB nadir (5:38pm)

05/31/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS (5:02pm EDT)

06/02/08 -- STS-124/Discovery/1J docking

06/14/08 -- STS-124/Discovery landing (KSC: ~11:02am EDT)

07/10/08 -- Russian EVA-20 (7/10-11)

??/??/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/05/08 -- ATV1 undocking

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC

10/18/08 -- STS-126/Discovery/ULF2 docking

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking

12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment

12/06/08 -- STS-119/Discovery/15A docking

12/15/08 -- STS-119/Discovery/15A undocking

2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD

3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation

05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**

3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2

4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 05/09/08

All ISS systems continue to function nominally, except those noted previously or below. *Off-duty holiday for the crew: Russia's **Victory Day**, one of the most sacred national holidays for the Russian people, commemorating the dozens of millions of their countrymen fallen in the Great Patriotic War (World War II).*

FE-2 Reisman began the day with the periodic (monthly) CSA-CP (Compound Specific Analyzer-Combustion Products) maintenance/checkout, today changing out the battery on the prime unit. *[The CSA-CP is a passive cabin atmosphere monitor that provides quick response capability during a combustion event (fire). Its collected data are stored on a logger. After replacing the battery with a new one (#1119), Garrett zero-calibrated the instrument (to eliminate drift in the combustion sensors), then redeployed the prime unit at the SM (Service Module) Central Post.]*

Afterwards, Reisman also used the hand-held CDMK (Carbon Dioxide Monitoring Kit, #1002) to collect measurements for the regular atmospheric status check for ppCO₂ (Partial Pressure Carbon Dioxide) in the Lab, SM (at panel 449) and COL (Columbus Orbital Laboratory), and recording CO₂ readings and battery "ticks".

[Batteries were to be replaced if necessary. After all readings were taken, the CDM was deactivated and returned to its stowage place at LAB1S2.]

CDR Volkov conducted the daily routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Working off the discretionary "time permitting" task list, Volkov completed another ECON KPT-3 session, making observations and taking aerial photography of environmental conditions for Russia's Environmental Safety Agency (ECON) using the Nikon D2X digital camera with SIGMA 300-800mm telephoto lens.

Also from the suggestions list, FE-1 Kononenko performed a session of the Russian GFI-8 "Uragan" (hurricane) earth-imaging program, using the NIKON D2X to take telephotos of mainland, coastal areas and both shores of Sakhalin Island, as well as of the Kuril Islands in nadir.

A third job on the discretionary task list for the two cosmonauts, as per request from the European partner, was to take one or two photographs of a Russian crewmember inside the ATV "Jules Verne".

The FE-2 filled out the regular FFQ (Food Frequency Questionnaire), his seventh, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA/ESA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

Garrett also performed the regular bi-weekly reboot of the SSC (Station Support Computer) File Server laptop.

The crew is conducting their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exerciser (FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1).

Later tonight, Garrett will download the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

MSS Update: Mobile Service System (MSS) performance yesterday was completely nominal, with Reisman completing SSRMS (Space Station Remote Manipulator System) operations well ahead of schedule. The next MSS operations are scheduled on 5/12 (Monday) when ground controllers translate the MT (Mobile Transporter) railcart from WS-4 (Worksite #4) out to WS-6 and then back to WS-4, in order to confirm power & data redundancy at WS-6 before the 1J/docked mission. SSRMS & MBS (Mobile Base System) pre-launch checkout operations are scheduled to be completed on 5/20 & 5/21.

Condensate Processing Update: After some more fruitless troubleshooting

yesterday to check on the functionality of the NOK-1 condensate evacuation pump working with the BRPK1 & BRPK2 Condensate Separation & Pumping Units, Sergey and Oleg were told to deactivate NOK-1 and stand down while ground specialists continue to assess the results for developing the next steps.

CEO (Crew Earth Observations) photo targets uplinked for today were **Tin Bider Impact Crater, Algeria** (*ISS had a nadir pass over this 6-km diameter impact structure. Looking for a circular crater located at the SW margin of a mountain range between the Grand Erg Oriental and Tifernine dune fields. Overlapping frames, taken along track, should have captured the crater*), **Mount Nyiragongo, Dem. Rep. of Congo** (*looking to the left of track for this notorious volcano, responsible for many deaths when a lava lake drained catastrophically in 1977. Actually a volcanic complex, the low profile of a neighboring shield volcano, Nyamuragira, contrasts with the 3470-m-high Nyiragongo stratovolcano. Looking to the left of track for two lakes [Edwards and Kivu] - the volcano and associated lava flows are located between the lakes. Some scattered clouds were expected*), and **Chaiten Volcano, Chile** (*Dynamic Event. Looking to the right of track as ISS passed over the coastline of Chile for this newly-active volcano. Dormant for the past 9000 years, Chaiten began erupting spectacularly last week, and has caused the evacuation of over 4000 people from the nearby town of Chaiten. Imagery of the volcano - visible as a light gray circular domed area in the midst of rugged hills - and any plumes [if present] was requested*).

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 4:51am EDT [= epoch]*):

Mean altitude -- 341.2 km

Apogee height -- 345.6 km

Perigee height -- 336.8 km

Period -- 91.36 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.000656

Solar Beta Angle -- 17.7 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 95 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54240

Significant Events Ahead (*all dates Eastern Time, some changes possible*):

05/14/08 -- Progress M-64/29P launch (4:23pm EDT)

05/16/08 -- Progress M-64/29P docking/FGB nadir (5:38pm)

05/31/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS (5:01pm EDT)
06/02/08 -- STS-124/Discovery/1J docking
07/10/08 -- Russian EVA-20 (7/10-11)
??/??/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
09/05/08 -- ATV1 undocking
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-65/30P launch
09/12/08 -- Progress M-65/30P docking
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at

ISS On-Orbit Status 05/08/08

All ISS systems continue to function nominally, except those noted previously or below. *Hint: **watch tonight's "The Colbert Report" on Comedy Central, at 11:30pm EDT! (see below)***

Before breakfast, CDR Volkov, FE-1 Kononenko and FE-2 Reisman began their workday with the periodic session of the Russian biomedical routine assessments PZeh-MO-7/Calf Volume Measurement (second for CDR & FE-1, third for FE-2.

[Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference points, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures.]

The FE-1 serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out" cycle to vacuum on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated tonight at ~5:15pm EDT. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. Filter bed 1 was regenerated yesterday. In order to assist in atmosphere scrubbing after the Freon-218 spill from the SKV-2 air conditioner on 4/29, the BMP's regeneration cycle was moded to 5 days instead of the regular 20 days.]*

Kononenko set up the equipment for his first session with the Russian experiment MBI-18 DYKHANIE ("respiration", "breathing"), then conducted the session, controlled from the RSE-Med laptop, followed later by the CDR who also undertook the experiment for the first time. The crewmembers took photographs of each other working the hardware, then closed down the payload and stowed it. *[Dykhanie-1 uses two body belts (PG-T/thoracic, PG-A/abdominal), a calibrator, resistor, mouthpiece, etc., to study fundamental physiological mechanisms of the external breathing function of crewmembers under long-duration orbital flight conditions. During the experiment, physiological measurements are taken and*

recorded with a pneumotachogram, a thoracic pneumogram, an abdominal pneumogram, and pressure data in the oral cavity. All experimentally derived plus salient environmental data along with personal data of the subject are recorded on PCMIA card for return to the ground at end of the Expedition. Objectives include determining the dynamics of the relationship between thoracic (pectoral) and abdominal breathing function reserves and their realization potential during spontaneous breathing, the coordinated spontaneous respiratory movements in terms of thoracic and abdominal components of volumetric, time & rate parameters of spontaneous respiratory cycle, identification of the features of humoral-reflex regulation of breathing by dynamics of ventilation sensitivity of thoracic and abdominal components to chemoreceptor stimuli, etc. Overall, the experiment is intended to provide a better understanding of the basic mechanisms of pulmonary respiration/gas exchange gravitational relations of cosmonauts.]

FE-2 Reisman performed maintenance on the OCA Router laptop, replacing its HDD (hard disk drive) with a spare HDD, reloaded it and configured it successfully for operations.

Volkov completed the periodic maintenance of the Russian telephone/telegraph subsystem (STTS) by switching it from its backup string to nominal mode on the primary string. *[The "Voskhod-M" STTS enables telephone communications between the SM (Service Module), FGB, DC1 Docking Compartment and U.S. segment (USOS), and also with users on the ground over VHF channels selected by an operator at an SM comm panel, via STTS antennas on the SM's outside. There are six comm panels in the SM with pushbuttons for accessing any of three audio channels, plus an intercom channel. Other modes of the STTS include telegraphy (teletype), EVA voice, emergency alarms, Packet/Email, and TORU docking support.]*

As part of regular preventive maintenance of RS (Russian Segment) ventilation systems, Oleg replaced the four dust filters (PF1-4) in the SM and cleaned the fan grilles of the LIV Video Complex hardware and its voltage converter, while Volkov later used vacuum cleaner and soft brush to clean the detachable VT7 fan screens 1, 2 & 3 of the three SOTR (Thermal Control System) gas-liquid heat exchangers (GZhT4) in the FGB (Funktsionalnyi-Grusovoi Blok).

After starting the POC DOUG (Portable Onboard Computers/Dynamic Onboard Ubiquitous Graphics) application, Garrett Reisman took the SSRMS (Space Station Remote Manipulator System) through its planned maneuver sequence. *[The sequence involved first grappling the SPDM (Special Purpose Dexterous Manipulator) "Dextre" to allow ground controllers to derigidize the SPDM LEE (Latching End Effector) to relax the tension in its snare cables. Afterwards, Dextre was released and the SSRMS was reconfigured for the first planned operations*

during Flight 1J, including moving its wrist joint in a position to protect the SSRMS LEE video camera against contamination from thruster plumes during the upcoming Progress 29P docking.]

CDR Volkov continued the current FGB outfitting with new stowage enclosures delivered by the ATV (Automated Transfer Vehicle), built in Russia to provide more efficient stowage spaces behind FGB panels and improve airflow/circulation.

[Today's outfitting involved one more container transferred in pieces from ATV stowage and its installation in the FGB zone (panel 312).]

For the annual sensor verification and cleaning of the European MSG (Microgravity Science Glovebox) rack, FE-2 Reisman first activated the A31p MLC (MSG Laptop Computer), then worked his way through the individual certification steps. The checkout went well. *[Steps included MSG activation and warm-up, checkout of the MSG's temperature sensors without & with MTL (Moderate Temperature Loop) cooling, checkout of the two delta-pressure sensors by on/off switching of the three AHU (Air Handling Unit) fans which provide negative pressure inside the WV (Work Volume) to prevent escape in case of a leak, system inspections, WV cleaning, returning MSG back to delta-P Sensor 1 mode, switching it to Standby, and finally deactivating and reconfiguring the A31p.]*

In preparation of upcoming LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System) experiments, the FE-2 transferred data from the LOCAD reader #002 to storage and installed updated software with new calibration curves (for processing new Glucan LAL cartridges) on both readers (#002 & 003). *[LOCAD uses small, thumb-sized "microfluidic" cartridges that are read by the experiment reader. The cartridges contain dried extract of horseshoe crab blood cells and colorless dye. In the presence of the bacteria, the dried extract reacts strongly to turn the dye a green color. Therefore, the more green dye, the more microorganisms there are in the original sample. The handheld device tests this new analysis technology by sampling for the presence of gram negative bacteria in the sample in about 15 minutes. Lab-on-a-Chip technology has an ever-expanding range of applications in the biotech industry. Chips are available (or in development) which can also detect yeast, mold, and gram positive bacteria, identify environmental contaminants, and perform quick health diagnostics in medical clinics. The technology has been used to swab the MERs (Mars Exploration Rovers) for planetary protection. With expanded testing on ISS, this compact technology has broad potential applications in space exploration--from monitoring environmental conditions to monitoring crew health on long-duration flights.]*

Kononenko conducted the daily routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU

toilet facilities systems/replaceables.

As part of the ECLSS servicing, Oleg also performed the periodic check of the function of the IP-1 airflow sensors in the various Russian segment (RS) hatchways. *[The inspection includes the passageways PrK (SM Transfer Compartment)–ATV, PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1.]*

Working off the Russian “time permitting” task list, Volkov completed the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Also on the discretionary task list for the two cosmonauts remains the software upgrade of the “Sigma” BNO (Ballistic & Navigation Support Program) application on two Russian laptops, RSK1 & RSK2 (in DOS), patching it with a newly uplinked update to get the application running again (which computes real-time position of the ISS over the ground).

Garrett conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. *[Updated “cue cards” based on the crew’s water calldowns are sent up every other week. The current cue card (17-0002C) lists 38 CWCs (~1515.1 L total) for the four types of water identified on board: technical water (772.7 L, for Elektron, flushing, hygiene), potable water (647.2 L), condensate water (89.4 L), waste/EMU dump and other (5.8 L). Of the 38 containers, 15 CWCs with technical water (620.5 L) and 4 CWCs with potable water (176.3 L) must be cleared for Wautersia bacteria by MCC-H before they can be used.]*

Additionally, Reisman completed the periodic checkup on active U.S. payloads, i.e., cleaning the ANITA (Analyzing Interferometer for Ambient Air) inlet plus inspecting and filter cleaning of the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. *[The CGBA incubator is controlled from the ground, with automatic video downlinked to Earth. ANITA is now back up again and running in support of the on-going Freon-218 scrubbing from the cabin air, collecting data every six seconds and downlinking the data daily to the ground team. ANITA monitors low levels of potential gaseous contaminants in the ISS cabin atmosphere with a capability of simultaneously monitoring 32 gaseous contaminants. The experiment is testing the accuracy and reliability of this technology as a potential next-generation atmosphere trace-gas monitoring system for ISS and future spacecraft. This is a cooperative investigation with ESA.]*

Garrett conducted the periodic (every two weeks) inspection of the RED (Resistive

Exercise Device) canister bolts for re-tightening if required.

The crew is conducting their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-1, FE-2), TVIS treadmill (CDR), RED resistive exerciser (FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR). *[The RED, as an anaerobic muscle exerciser, allows a variety of routines: squat, heel raises, bent-over rowing, abdominal crunches, deadlift, bench presses, upright rowing, etc. For Sergey & Oleg, who are using RED three times a week, each session features four different routines which vary from day to day to target different muscle groups.]*

Afterwards, Garrett will download the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~10:50am EDT, Garrett Reisman participated in a live interactive PAO TV interview with Stephen Colbert of Comedy Central's "The Colbert Report". *[Stephen Colbert is the host and executive producer of the Emmy-nominated series "The Colbert Report" on Comedy Central. The "Colbert Report" has garnered huge ratings and critical success as one of the top shows on television. This interview was live-to-tape **to be aired on Comedy Central tonight at 11:30pm EDT.**]*

At ~10:55am EDT, Sergey & Oleg linked up with TsUP-Moscow stowage specialists via S-band to conduct the weekly IMS tagup, discussing stowage issues and equipment locations. *[Topics of discussion today included type and ID number of a found computer cable, identification of two bags reported as stowed in FGB enclosures, current location of discarded mufflers, etc.]*

At ~4:30pm, the crew is scheduled to downlink congratulatory PAO TV messages of greetings to three major Russian events: (1) the Seventh Delphian Youth Games of Russia "Our Future is in the Family"; (2) a conference dedicated to the 90th Anniversary of the Russian Children's Extra-Curricular Education System; and (3) a Gala Assembly in Moscow's Kremlin Palace dedicated to the 90th Anniversary of Russia's Border Security Forces. *[(1) The 7th Delphian Games, 5/16-21 in Novosibirsk, are dedicated this year to the Year of the Family, celebrated in Russia in 2008 per Presidential decree. After reading their message, the crew will unstow the Delphian Games flag, sign & date it, stamp it with the ISS insignia and stow it for return on Soyuz. (2) The 90th anniversary of Pre-School Extra-Curricular Education in Russia will be celebrated on 5/13 in the city of Ulyanovsk. (3) The gala for the Border Troops will be held on 5/28 at the Kremlin: "...We, the ISS crew, have a chance of a lifetime to observe the planet from space. And from here, from Earth orbit, we can appreciate a really huge expanse of Russia, which extends for*

thousands of kilometers from the Baltic Sea to the Pacific Ocean. The ISS is where one truly realizes the actual length of Russian border and how difficult it is to protect it. We know that you doing your job like true professionals, that we can trust you...”]

At ~6:20pm, FE-2 Reisman will have a private CDE (Crew Discretionary Event) phone conference via S-band.

Condensate Processing Issue: The Russian attempt to put the two air conditioner condensate evacuation pumps NOK-1 & NOK-2 into service for processing US condensate through the SM's SRVK (Condensate Processing Unit) failed on 5/6, and specialists at RSC-Energia are suspecting that the separator portion of the BRPK (Condensate Separation & Pumping Unit) may be failing due to end of life. Troubleshooting to restore functionality of the condensate processing system continues.

Condensate Water Management: With US condensate being produced but not processed for Elektron as required, Houston flight controllers have proposed a water dump on 5/18 or 5/19 to get rid of the surplus. The overboard venting would necessitate a temporary change in ISS attitude. Moscow agrees in principle to the attitude maneuver but is suggesting, as an alternate plan, to store the condensate in clean ATV tanks until the SRVK functionality has been restored. The proposal is under joint study.

COL FSL Update: The crew was thanked by COL-CC (Columbus Orbital Laboratory Control Center) for the repair of the FSL (Fluid Science Laboratory), which was successfully activated and performed nominally before being turned off again. Thanks were also extended for Garrett Reisman's support of the activation of the ERNObox, a special computer package with a new type of microchips, to be tested in the space environment, which also provides limited acceleration and temperature measurements. Data are on the ground and under investigation.

FGB KURS Testing Update: Two sets of KURS-P electronics on the FGB were tested on 5/6 for the AR&D (Automated Rendezvous & Docking) of Progress 29P on 5/16. Results were nominal, and the FGB is ready for the docking.

CDRA Activity Update: The US Carbon Dioxide Removal System has been active since yesterday to assist in the scrubbing of the cabin atmosphere after the 4/29 Freon-218 (Khladon) spill from the SKV-2 air conditioner. CDRA operation is planned for 5 days at 100,000 RPM (which will also help in the on-going CDRA dP trending). After the conclusion of CDRA ops, data of the active ESA ANITA instrument are expected to provide verification of the Freon levels in the cabin.

CBM Checkout: A checkout of the Node-2 CBM (Common Berthing Mechanism) in preparation for the JEM (Japanese Experiment Module)

“Kibo” on 1J was successfully completed yesterday.

CEO (Crew Earth Observations) photo targets uplinked for today were **East Haruj Megafans, Africa** (*weather was predicted be clear over this inland delta, caused by migration of stream channels over a depositional surface over 8000 years ago when the region had a wetter climate. These inland deltas ["megafans"] may represent an analog for features of similar appearance on Mars. Overlapping mapping frames, taken along track, were requested to capture the intricate network of ancient stream channels, visible as sinuous features on the land surface*), **S. Mozambique, Africa** (*some popcorn cumulus may have been present over this target area. The site includes is a basin targeted for petroleum extraction - this will cause significant changes to the existing ecosystems and surface processes in the area. Overlapping nadir frames, taken along track, were requested to capture the current state of land cover and land use in the target area*), and **Pilcomayo River dynamics, N Argentina** (*the Pilcomayo River rises in the Andes foothills, and then flows over 2,000 km southeast across central South America. Looking to the right of track for the river; context views along the river course were requested to record current channel configuration and adjacent vegetation and land use patterns*).

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 7:49am EDT [= epoch]*):

Mean altitude -- 341.3 km

Apogee height -- 345.8 km

Perigee height -- 336.7 km

Period -- 91.36 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006742

Solar Beta Angle -- 12.9 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 95 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54226

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

05/14/08 -- Progress M-64/29P launch (4:23pm EDT)

05/16/08 -- Progress M-64/29P docking/FGB nadir (5:38pm)

05/31/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS (5:01pm EDT)

06/02/08 -- STS-124/Discovery/1J docking

07/10/08 -- Russian EVA-20 (7/10-11)

??/??/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
09/05/08 -- ATV1 undocking
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-65/30P launch
09/12/08 -- Progress M-65/30P docking
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-66/31P launch
11/28/08 -- Progress M-66/31P docking
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 05/07/08

All ISS systems continue to function nominally, except those noted previously or below.

FE-1 Kononenko completed the periodic servicing of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The regen process will be terminated before sleeptime, at ~4:55pm EDT. Regeneration of bed #2 follows tomorrow. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. In order to assist in atmosphere scrubbing after the Freon-218 (Khladon) spill from the SKV-2 air conditioner on 4/24, the BMP's regeneration cycle was moded to 5 days instead of the regular 20 days.]*

CDR Volkov continued the current outfitting of the FGB with new stowage enclosures delivered by the ATV1 (Automated Transfer Vehicle 1), built in Russia to provide more efficient stowage spaces behind FGB panels and improve airflow/circulation. *[Today's outfitting involved two more containers transferred in pieces from ATV stowage and their installation in the FGB zones 26 (panel 416) & 23B (panel 414), with bonding straps used for 23B.]*

Later, the FE-1 continued the periodic rearrangement of stowed equipment in the ATV "Jules Verne" to adjust the location of the vehicle's CG (center-of-gravity) for stable flight control, should its separation become necessary in a contingency. The stowage configuration was to be photographed for ground evaluation. *[ATV-1 undocking has now been moved from 8/10 to about 9/5 to allow use of more onboard propellants.]*

FE-2 Reisman used the electronic Velocicalc instrument to take THC IMV (Temperature & Humidity Control/Intermodule Ventilation) air flow measurements of relative humidity (dew point, wet bulb temp), temperature and velocity (flow rate) of

the air from the RS (Russian Segment) BMP inlet to the Lab and on to Node-2.

Afterwards, Reisman performed the periodic AAA (Avionics Air Assembly) fan & filter cleaning on the CHeCS (Crew Health Care Systems) rack at LAB1D4 which required powering down & rotating the rack forward and later reversing these steps, using the Velocicalc to check airflow values.

Using the RSE1 laptop, the FE-1 continued the extensive test program with the new Russian KPT-2 BAR-RM payload equipment begun on 5/5. *[Today's measurements were taken at various locations in the SM & FGB with the AU-1, Kelvin-Video, Iva-6A and TTM-2 instruments to update the list of possible background sources and interferences exceeding expected levels of potential leak signals. The BAR-RM data are being used for experimenting with ISS leak detection based on environmental data anomalies (temperature, humidity, and ultrasound emissions) at possible leak locations, in order to develop a procedure for detecting air leakage from ISS modules. The payload uses a remote infrared thermometer (Kelvin-Video), a thermohygrometer (Iva-6A), a heat-loss anemometer/thermometer (TTM-2), an ultrasound analyzer (AU-1), and a leak detector (UT2-03) to determine physical background signs of loss of ISS pressure integrity which could be indicative of leaks in the working compartments of the station.]*

Continuing his troubleshooting on the FSL (Fluid Science Laboratory) in the Columbus module, Garrett Reisman performed a checkout on the "ERNObox" structure for the FSL A31p laptop, checking switch status, proper mating of cables & connectors as well as the correct functioning of status LEDs (Light Emitting Diodes).

The FE-2 checked out the SSC-7 A31p laptop #1061 by installing a hard drive from an SSC (Station Support Computer) known to work OK.

Afterwards, Garrett had 30 min for reviewing new DOUG (Dynamic Onboard Ubiquitous Graphics) software uplinked for tomorrow's scheduled SSRMS (Space Station Remote Manipulator System) operations. *[DOUG is a special application running on the MSS (Mobile Service System) RWS laptops that provides a graphical birdseye-view image of the external station configuration and the SSRMS arm, showing its real-time location and configuration on a laptop during its operation.]*

Also in preparation for the Robotics activities, Garrett set up the SSRMS videocamera connection by hooking up the UOP DCP (Utility Outlet Panel/Display & Control Panel) power bypass cable at the CUP RWS (Cupola Robotic Work Station).

The FE-2 had another 85 min reserved for more hardware gathering and prepacking for return on the Shuttle at the conclusion of the upcoming STS-124-1J/Discovery mission.

Sergey Volkov completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, plus replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV at the SKV-2 air conditioner for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Later today, Oleg is scheduled for the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Shortly before sleep time tonight, the CDR will conduct a functionality check of the RS STTS onboard radio communications system on the VHF-2 channel over Russian ground stations.

The crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (CDR, FE-1, FE-2), RED resistive exerciser (CDR, FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1).

Afterwards, Garrett was to download the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working off the Russian "time permitting" discretionary task list, Oleg performed another special session of the Russian GFI-8 "Uragan" (hurricane) earth-imaging program, using the NIKON D2X to take telephotos of the fresh eruption of the volcano Chaiten on the southern coast of Chile. *[More than 4000 people have been evacuated as a result of the volcano's eruption. Only 300 people remain in the town of Chaiten located ~10km away from the volcano. Ash has covered an area within 10,000 km radius of the outbreak.]*

Also from the task list, Sergey worked on the "Sigma" BNO (Ballistic & Navigation Support Program) software on two Russian laptops, RSK1 & RSK2 (in DOS), patching it with a newly uplinked update to get the application running again (which computes real-time position of the ISS over the ground).

At ~4:40pm, Garrett Reisman is scheduled for his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop),

Condensate Processing Update: With the SKV-2 air conditioner currently off due to lack of sufficient Freon-218 (to be resupplied by Progress 29P) and SKV-1 out of service for a long time, the air conditioner's condensate evacuation pumps (NOK) were put into service to support the necessary condensate processing. The setup was tested yesterday, and preliminary indications were that the NOKs operated nominally. The pumps were powered off during crew sleep and were reactivated this morning.

CEO (Crew Earth Observations) photo targets uplinked for today were **Lake Nasser, Toshka Lakes, Egypt** (*weather was clear over these man-made lakes, created by overflow from Lake Nasser. Looking to the right of track for opportunities to map the shorelines of the lakes. Collection of frequent repeat imagery of the lakes is useful for tracking fluctuations in water level*), **Shortgrass Steppe, Colorado** (*ISS had a nadir pass over this long term ecological research [LTER] site located to the NE of the Rocky Mountains. The major research focus at this site is the effect of grazing on the existing ecosystems; of particular interest is the extent and character of vegetation cover in the area. Overlapping, nadir-viewing frames, taken along track, are being requested*), and **Volcano Colima, Mexico** (*weather was predicted to be clear over this active volcano - actually comprised of two eruptive centers, Nevado de Colima and Volcano de Colima. In addition to frequent eruptions from the summit vents, slope failures and debris avalanches are also a hazard associated with both cones. ISS had a nadir pass over this volcanic complex; imagery of the cones and surrounding deposits was requested*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 9:03am EDT [= epoch]*):

Mean altitude -- 341.4 km

Apogee height -- 345.8 km

Perigee height -- 336.9 km

Period -- 91.36 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0006638

Solar Beta Angle -- 8.0 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 98 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54211

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (FGB nadir)

05/31/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS (5:01pm EDT)

06/02/08 -- STS-124/Discovery/1J docking

07/10/08 -- Russian EVA-20 (7/10-11)

??/?/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/05/08 -- ATV1 undocking

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-65/30P launch

09/12/08 -- Progress M-65/30P docking

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC

10/18/08 -- STS-126/Discovery/ULF2 docking

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-66/31P launch

11/28/08 -- Progress M-66/31P docking

12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment

12/06/08 -- STS-119/Discovery/15A docking

12/15/08 -- STS-119/Discovery/15A undocking

2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD

3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation

05/?/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**

3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2

4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola

1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)

1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)

2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 05/06/08

All ISS systems continue to function nominally, except those noted previously or below.

Using the RSE1 laptop, CDR Volkov & FE-1 Kononenko spent three more hours on their test program with the new KPT-2 BAR-RM payload equipment begun yesterday. *[Today's measurements were taken with the AU-1, Kelvin-Video, Iva-6A & TTM-2 instruments near welds along SM (Service Module) structural rings and near the shell ring in the FGB for subsequent downlinking via BSR-TM channel. At the FGB pressurized shell ring, the two cosmonauts also inspected structural elements, equipment, and cable bundles for moisture, mold, or evidence of corrosion. The BAR-RM data are being used for experimenting with ISS leak detection based on environmental data anomalies (temperature, humidity, and ultrasound emissions) at possible leak locations, in order to develop a procedure for detecting air leakage from ISS modules. The payload uses a remote infrared thermometer (Kelvin-Video), a thermohygrometer (Iva-6A), a heat-loss anemometer/thermometer (TTM-2), an ultrasound analyzer (AU-1), and a leak detector (UT2-03) to determine physical background signs of loss of ISS pressure integrity which could be indicative of leaks in the working compartments of the station. Measurements are taken in specific zones in SM PkhO, FGB and DC1, both with lights, fans & ASU pump turned on and off.]*

FE-2 Reisman worked in the JLP (JEM Logistics Module Pressurized Section), setting up two A31p laptops and configuring them as SSCs (Station Support Computers) for use in the JEM (Japanese Experiment Module) "Kibo" arriving with STS-124/Discovery on 6/2.

Later, the FE-2 continued his EVA tool & equipment preparations in the US Airlock (A/L) for the 1J spacewalks. Ground commands afterwards deactivated the A/L CCAA (Common Cabin Air Assembly) air conditioner. *[So far, Garrett had completed 4.5 hrs out of the 10 hrs estimated for the 1J EVA tool config. If today's*

planned 3 hrs do not suffice for the remainder, an additional 2.5 hrs can be made available later. The final NBL (Neutral Buoyancy Laboratory) EVA simulation run at JSC/Sonny Carter Training Facility is scheduled for 5/16.]

FE-1 Kononenko continued outfitting in the FGB with new stowage enclosures delivered by the ATV1 (Automated Transfer Vehicle 1), built in Russia to provide more efficient stowage spaces behind FGB panels and improve airflow/circulation.

[Today's outfitting involved the two containers transferred yesterday in pieces from ATV stowage for installation in the FGB zones 30A & 30B (panel 421).]

In the SM, CDR Volkov continued equipping crew cabin air ducts with new mufflers, replacing US-made noise suppressors (blue) with Russian acoustic mufflers (white) and taking documentary photographs for subsequent ground inspection. The blue mufflers were prepared for disposal. *[The muffler replacements were started last January by Peggy Whitson and Dan Tani on various fans in the SM.]*

Volkov completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV at the SKV-2 air conditioner for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Sergey also performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exerciser (FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1).

Afterwards, Garrett downloaded the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

The three crewmembers had their standard periodic PMCs (Private Medical Conferences) via S- & Ku-band audio/video.

Completing a voluntary item from the US "job jar" task list, Reisman recharged the

battery of the PWS (Portable Workstation) in the COL (Columbus Orbital Laboratory) and rebooted the laptop.

VolSci Program: For the Voluntary Science program on the weekend ahead (5/9-5/11), Garrett Reisman was offered two choices for his selection: (1) an “operations improvement” session with SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellites) with all three satellites (single-satellite experiments to test new thrusting algorithms and demonstrate safe trajectories for the inspection of space structures; two-satellite experiments to introduce new controllers and on-line path planning tools for purpose of docking to a complex tumbling satellite; three-satellite runs for formation flight experiments to test initialization of a formation and obstacle avoidance; (2) an EPO (Education Payload Operations) Demo on Space Careers, creating an educational video discussing different careers found at NASA, to be used to produce an educational product to enhance existing education resources for students in grades 9-12. Garrett’s choice is required by tonight.

CEO (Crew Earth Observations) photo targets uplinked for today were **Ouarkziz Impact Crater, Algeria** (*this 3.5 km diameter impact structure is located within folded rocks of the Ouarkziz Monocline in Algeria. ISS had a near-nadir pass over the impact structure; overlapping frames, taken along track as ISS crossed the coastline and passed over the mountains were recommended. This mapping approach should have captured the crater*), **S. Mozambique, Africa** (*weather was predicted to be mostly clear over this ecological monitoring target. Development of petroleum resources over the next several years is expected to significantly alter the existing land cover and land use of the area. Overlapping nadir mapping frames, taken along track as ISS approached the coastline were requested*), **Harvard Forest, Vermont** (*this long term ecological research [LTER] site is focused on study of natural and human disturbances to forest ecosystems.*

Overlapping nadir frames, taken along track, were requested to obtain imagery of the forest canopy, open space, and urbanization), and **High Central Andean Glaciers, S. America** (*the crew had an opportunity to capture context imagery of the eastern front of the Andes Mountains. Looking to the right of track for the mountains and glaciers; orbit track was parallel to the eastern mountain front*).

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 8:39am EDT [= epoch]*):

Mean altitude -- 341.5 km

Apogee height -- 346.1 km

Perigee height -- 336.8 km

Period -- 91.36 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0006885
Solar Beta Angle -- 3.3 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 106 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 54195

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (FGB nadir)
05/31/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS (5:01pm EDT)
06/02/08 -- STS-124/Discovery/1J docking
07/10/08 -- Russian EVA-20 (7/10-11)
08/10/08 -- ATV1 undocking
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
????/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)

2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 05/05/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 3 of Increment 17. >>>Today 47 years ago (1961), the first U.S. Astronaut, Navy Commander Alan B. Shepard Jr., was launched on Mercury/Redstone "Freedom 7" on a suborbital flight of 15 minutes duration, reaching an altitude of 116 miles. This restored faith in the U.S. space program only 23 days after the Soviet space program launched Cosmonaut Yuri Gagarin into orbit around the planet. "Big Al" passed away on 21 July 1998.<<<*

FE-2 Reisman supported the Japanese CW/RW (Cell Wall/Resist Wall) experiment in the MSG EMCS (Microgravity Science Glovebox/European Modular Cultivation System), removing and relocating EC1 (Experiment Container 1) and EC2 on Rotor A and Rotor B. *[CW/RW operates in the EMCS facility in eight special ECs (Experiment Containers) which Garrett recently (3/30) installed on the centrifuges of the facility. The EMCS rack contains two rotating centrifuges, Rotor A & Rotor B, which can support a wide range of small plant & animal experiments under partial gravity conditions.]*

CDR Volkov, later assisted by FE-1 Kononenko, conducted the periodic inspection & audit of lighting fixtures in the RS (Russian Segment), testing each light by turning it on and checking fixtures that show one or both light bulbs inoperative with a working light unit from spares. *[There are close to two dozen lighting fixtures in the SM (Service Module), about a dozen lights in the FGB and 3 in the DC1 (plus two portable units). An audit of the available light spares will be conducted at a later date.]*

In the COL (Columbus Orbital Laboratory), the FE-2 continued his troubleshooting work on the FSL (Fluid Science Laboratory), today focusing on repairing the MIL Bus 1553 jumper connection after last week's LAN cable repair. *[Checkout of the FSL rack is scheduled later this week.]*

FE-1 completed another radiation data monitoring & logging session for flux & dose rate data with the Matryoshka-R radiation payload and its LULIN-5 electronics box. *[Accumulated readings were recorded on a log sheet for subsequent downlink to TsUP/Moscow via the BSR-TM payload data channel.]*

Kononenko also continued the transfer & installation in the FGB of the new stowage enclosures delivered by the ATV1 (Automated Transfer Vehicle 1), which were built in Russia to provide more efficient stowage spaces behind FGB panels and improve airflow/circulation. *[Oleg transferred the components for two containers, to be installed tomorrow in the FGB zones 30A & 30B (panel 421).]*

Reisman took more detailed measurements and photographs of the “divot” discovered earlier on the Node-1 hatch seal for ground analysis.

The FE-2 also inspected spare hatch seal segments currently stowed at the Airlock Port bulkhead to verify that they are in good condition in case they are needed for R&R.

Garrett had another 1.5 hrs set aside to prepare and configure tools and equipment in the US Airlock for the EVAs (Extravehicular Activities) during the upcoming STS-124/1J docked mission.

For the Russian EVA 20, Kononenko gathered tools required during the spacewalk which is currently scheduled for 7/10-11. *[Before stowing the tools at their location, Oleg inspected and checked out diverse ratchet wrenches, adapters, wing keys, wire & MLI (Multi-Layered Insulation) cutters and a hammer.]*

CDR Volkov continued outfitting SM crew cabin air ducts with new mufflers, replacing US-made noise suppressors (blue) with Russian acoustic mufflers (white) and taking documentary photographs for subsequent ground inspection. *[The muffler replacements were started last January by Peggy Whitson and Dan Tani on various fans in the SM.]*

The two Russian crewmembers worked with the Russian KPT-2 science payload BAR-RM, Kelvin, Ira and TTM, set up yesterday for battery charging, today running tests and taking the first measurements (temperatures, relative humidity, dew point temperatures), using the RSE1 laptop. *[The data, collected at locations such as feedthroughs, windows, hatches etc., are being used to get proficient in experimenting with ISS leak detection based on environmental data anomalies (temperature, humidity, and ultrasound emissions) at potential leak locations. After the data gathering, downlinking was via BSR-TM channel. The BAR-RM payload uses a remote infrared thermometer (Kelvin-Video), a thermohygrometer (Iva-6A), a heat-loss anemometer/thermometer (TTM-2), an ultrasound analyzer (AU-01), and*

a leak detector (UT2-03) to determine physical background signs of loss of ISS pressure integrity which could be indicative of leaks in the working compartments of the station. Measurements are taken in specific zones (13 in SM PkhO and 4 in DC1), both with lights, fans & ASU pump turned on and off.]

In the JLP (Japanese Experiment Module Experiment Logistics Module Pressurized Section), Garrett Reisman performed the periodical status and shell temperature check from the MKAM (Minimum Keep-Alive Monitor).

Reisman also conducted the periodic calibration of the two CSA-O₂ (Compound Specific Analyzer-Oxygen sensor) instruments #1041 & #1052, using a calibration tank with accurately known pressure (2100 psi).

Kononenko completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV at the SKV-2 air conditioner for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Volkov performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exerciser (FE-1, FE-2) and VELO bike with bungee cord load trainer (CDR).

Afterwards, Garrett downloaded the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working off the Russian “time permitting” discretionary task list, Oleg performed a special session of the Russian GFI-8 "Uragan" (hurricane) earth-imaging program, using the NIKON D2X to take telephotos of the fresh eruption of the volcano Chaiten on the southern coast of Chile. *[More than 4000 people have been evacuated as a result of the volcano's eruption. Only 300 people remain in the town of Chaiten located ~10km away from the volcano. Ash has covered an*

area within 10,000 km radius of the outbreak.]

At ~4:25am EDT, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU; [Glavnaya operativnaya gruppa upravleniya = "Main Operative Control Group"]), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~11:15am, Garrett Reisman conducted a 30-min "handover" teleconference with Gregory Chamitoff, his planned successor as FE-2. *[As usual for these FE/FE conferences, the purpose is to begin the handover process prior to the arrival on orbit through videocons and data exchanges between the current crew and the upcoming crew. These tagups should start toward the end of the first month on orbit.]*

ISS Orbit *(as of this morning, 8:17am EDT [= epoch]):*

Mean altitude -- 341.6 km

Apogee height -- 346.3 km

Perigee height -- 336.8 km

Period -- 91.37 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007026

Solar Beta Angle -- -1.4 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 106 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54179

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (FGB nadir)

05/31/08 -- STS-124/Discovery/1J launch -- JEM PM "Kibo", racks, RMS (5:01pm EDT)

06/02/08 -- STS-124/Discovery/1J docking

07/10/08 -- Russian EVA-20 (7/10-11)

08/10/08 -- ATV1 undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

????/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 05/04/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – crew off duty. Ahead: Week 3 of Increment 17.*

Flight Engineer Kononenko conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables and the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV at the SKV-2 air conditioner for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

The U.S. CDRA (Carbon Dioxide Removal Assembly) was deactivated by the ground overnight (~9:00pm-2:00am EDT). With cooling no longer required, Flight Engineer Reisman demated and took down the ITCS LTL (Internal Thermal Control System/Low Temperature Loop) jumper at the CDRA-supporting LAB1D6 rack.

Reisman also completed the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling CWC (Contingency Water Container) #1054 with 17 L water and putting an additional 5 L in #1062, all slated for Elektron processing. No samples required this time.

CDR Volkov conducted his first recharging of the Motorola Iridium-9505A satellite phone brought up on Soyuz 16S, a monthly routine job. *[After retrieving it from its location in the TMA-12/16S descent module (BO) at ~10:00am EDT, Sergey initiated the recharging of its lithium-ion battery, monitoring the process every 10-15 minutes as it took place. Upon completion at ~11:15am, the phone was returned inside its SSSP Iridium kit and stowed back in the BO's operational data files (ODF) container. The satphone accompanies returning ISS crews on Soyuz reentry &*

landing for contingency communications with SAR (Search-and-Rescue) personnel after touchdown (e.g., after an “undershoot” ballistic reentry, as happened during the recent 15S return). The Russian-developed procedure for the monthly recharging has been approved jointly by safety officials. During the procedure, the phone is left in its fire-protective fluoroplastic bag with open flap. The Iridium 9505A satphone uses the Iridium constellation of low-Earth orbit satellites to relay the landed Soyuz capsule's GPS (Global Positioning System) coordinates to helicopter-borne recovery crews. The older Iridium-9505 phones were first put onboard Soyuz in August 2003. The newer 9505A phone, currently in use, delivers 30 hours of standby time and three hours of talk, up from 20 and two hours, respectively, on the older units.]

Afterwards, the CDR set up the “Kelvin-Video” battery for charging for the upcoming operation of the Russian KPT-2 science payload BAR-RM. Using the Kelvin, Ira and TTM instruments, objective of the payload is to experiment with ISS leak detection based on environmental data anomalies (temperature, humidity, and ultrasound emissions) at leak locations. Data gathering will take place starting tomorrow using the RSE-1 laptop, with downlinking via BSR-TM channel. *[BAR-RM is designed to develop a procedure for detection of air leakage from ISS modules based on environmental data anomalies (temperature, humidity, ultrasound emissions). The payload uses a remote infrared thermometer (Kelvin-Video), a thermohygrometer (Iva-6A), a heat-loss anemometer/thermometer (TTM-2), an ultrasound analyzer (AU-01), and a leak detector (UT2-03) to determine physical background signs of loss of ISS pressure integrity which could be indicative of leaks in the working compartments of the station. Measurements are taken in specific zones (13 in SM PkhO and 4 in DC1), both with lights & fans turned on and off.]*

The crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exerciser (FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1).

Working off the discretionary “time permitting” task list, Sergey Volkov completed another KPT-3 session to make observations and take aerial photography of environmental conditions for Russia's Environmental Safety Agency (ECON) using the Nikon D2X digital camera with SIGMA 300-800mm telephoto lens.

Also from the suggestions list, FE-2 Kononenko performed a session of the Russian GFI-8 "Uragan" (hurricane) earth-imaging program, using the NIKON D2X to take telephotos of glacier4s on the northern slope of the Caucasus Range, the Kolka glacier and oil spills on the Caspian Sea.

A third job on the discretionary task list was Oleg's first run of the Russian DZZ-2 "Diatomeya" ocean observations program, using the NIKON F-5 digital still camera with 80-200 mm lens and the SONY PD-150P camcorder from SM windows 7 & 8 to record highly productive water areas confined to dynamically active oceanic zones in the North Atlantic (US coastal areas and offshore areas of Brazil and Venezuela).

The two Russian crewmembers had their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop), Sergey at ~7:05am, Oleg at ~8:40am.

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 7:40am EDT [= epoch]*):

Mean altitude -- 341.7 km

Apogee height -- 346.4 km

Perigee height -- 337.0 km

Period -- 91.37 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.000697

Solar Beta Angle -- -5.9 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 98 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54163

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (FGB nadir)

05/31/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS (5:01pm EDT)

06/02/08 -- STS-124/Discovery/1J docking

07/10/08 -- Russian EVA-20 (7/10-11)

08/10/08 -- ATV1 undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

????/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)

ISS On-Orbit Status 05/03/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – half-day off for CDR Volkov, FE-1 Kononenko & FE-2 Reisman.*

To provide cooling for the ground-commanded activation of the U.S. CDRA (Carbon Dioxide Removal Assembly), FE-2 Reisman begun his workday by connecting the regular ITCS LTL (Internal Thermal Control System/Low Temperature Loop) coolant jumper connection to the LAB1D6 rack. *[CDRA activation took place at 4:00am-5:15am EDT. The CDRA will operate over the weekend. Deactivation will occur when ppCO₂ drops to 2.5 mmHG. Deactivation will be Sunday evening or early*

Monday morning.]

The crew conducted the regular weekly three-hour task of thorough house cleaning. *["Uborka", normally done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab. Additionally, as part of the weekly cleaning, Malenchenko performs an inspection of structural elements, cables and instruments behind SM panels for moisture.]*

As part of today's *uborka*, Volkov & Kononenko conducted preventive maintenance cleaning on the FS5, FS6, FS9, VPkhO, VdPrK, & VPrK fan grilles in the SM and the TsV2 fan inlet in the FGB (Funktsionalnyi-Grusovoi Blok, Functional Cargo Block).

At ~10:00am, the crew held their regular WPC (Weekly Planning Conference) with

the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP/Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

Sergey Volkov conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

The crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exerciser (FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1). *[The RED, as an anaerobic muscle exerciser, allows a variety of routines: squat, heel raises, bent-over rowing, abdominal crunches, deadlift, bench presses, upright rowing, etc. For Sergey & Oleg, who are using RED three times a week, each session features four different routines which vary from day to day to target different muscle groups.]*

Afterwards, Garrett transferred the crew's exercise data file to the MEC (Medical Equipment Computer) laptop for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working off the discretionary "time permitting" task list, Volkov completed another KPT-3 session to make observations and take aerial KPT-3 photography of environmental conditions for Russia's Environmental Safety Agency (ECON) using the Nikon D2X digital camera with SIGMA 300-800mm telephoto lens.

Also from the suggestions list, Kononenko performed a session of the Russian GFI-8 "Uragan" (hurricane) earth-imaging program, using the NIKON D2X to take telephotos of the hydrological situation on the Volga Aktyubinsk alluvial plain and oil spills on the Caspian Sea.

Weekly Science Update (*Expedition Seventeen -- Week 2*)

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):
Measurements continue in FGB module. Inc16 science data returned on 15S, waiting for hand-over to science team.

ANITA: Completed.

BCAT-3 (Binary Colloidal Alloy Test 3): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System):
Germination in B3 and B4. A1 plants are still alive. Investigators are evaluating the possibility of EC A1/B1 position change.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): The final run of the CSLM-2 SPU was completed. The data files have been downlinked and the temperature data looks good. Everything appears to have worked as expected. Detailed analysis of the data will be forth coming as well as inspection of the samples once they return to the ground. "Thank you for supporting CSLM-2 research!!"

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): The crew was thanked for supporting the ELITE experiment. The data files were successfully downlinked and data analysis on the ground can now be started.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Completed. Inc16 science data returned on 15S, waiting for hand-over to science team.

EuTEF (European Technology Exposure Facility): On 4/25, EuTEF platform encountered an accidental de-activation of its power feeder #1. Ground operators re-activated all the instruments progressively, with the exception of FIPEX, which got delayed by a couple of days. - DEBIE-2: Link error still under investigation; - DOSTEL: On-going science acquisition; - EuTEMP: Currently inactive as planned; - EVC: Further troubleshooting is on-going; still problems to get high-rate data downlink; - EXPOSE: On-going science acquisition; - FIPEX: Long-duration measurements with sensors RAM1, RAM4 and ZENITH8 has been abruptly

interrupted on 4/25 after the accidental power feeder #1 de-activation. New science acquisition script has been started on 4/30; - MEDET: On-going science acquisition, running nominal; - PLEGPAY: Instrument is powered on, but not in science acquisition mode; - TRIBOLAB: On 4/25, the very sensitive TRIBOLAB Pin On Disk #2 (POD #2) run could be restarted, but science impact assessment is on-going.

FSL (Fluid Science Laboratory): FSL LAN (Local Area Network) was successfully performed on 4/30. Further troubleshooting activities are required after the erroneous telemetry with CEM-Upper) Optical Module. FSL MIL Bus cable has still to be repaired.

GEOFLOW: Start of GEOFLOW is pending further FSL commissioning activities (check of FSL optical modes) currently planned for next two weeks.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Complete.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION/REPOSITORY: In progress.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems):

Ongoing.

SAMPLE: Inc16 samples have been downloaded with 15S and handed over to science team.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): “Garrett, your Increment 17 remaining Sleep activities include: 2 download/initialization sessions, 1 more week of required Sleep logging, and doffing the Actiwatch on the Shuttle on your return home. Any additional sleep logging than the required week is above and beyond and greatly appreciated by the PI. Also, feel free to get a new Actiwatch band from the Actiwatch Supply Kit (#1042) and discard your old one. Just call down so we can track it.”

SOLAR (Solar Monitoring Observatory): Initial Sun tracking was started on 4/29, but the Sun was not in the proper beta range to allow for nominal data acquisition – SOLAR platform went to Stand-By Mode when trying to track the Sun. On 4/30, solar measurements started with SOVIM and SOLSPEC instruments, but were affected by short Sun passes. - SOVIM: Acquiring science data – some glitches observed in the instrument telemetry; - SOLSPEC: Calibration activities (3 out of 4) successfully performed on 5/01. Acquiring science data; - SOLACES: Science acquisition to be restarted on 5/02, after some Command Sequence script was stopped on 5/01. Planned measurements will complement the ones gathered during the NASA Sounding Rocket campaign last April.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): The 4 ECs (Experiment Containers) of Rotor B are yet to be retrieved by the crew from the blocked Rotor B.

CEO (Crew Earth Observations): Through 4/30 the ground has received a total of 560 ISS/CEO images from Inc17 for review and cataloging. Currently under review are images with camera times corresponding to the following target list requests: Harvard Forest, Vermont (target acquisition unverified yet); Tigris-Euphrates Delta (preliminarily-appears somewhat overexposed); Tropical

Cyclone Nargis, Bay of Bengal (good effort); Afar Rift Zone, Ethiopia (preliminarily – very good with much of the area acquired); and Lake Pontchartrain, Mississippi Delta (excellent coverage of this dynamic event – will be published). “We are attempting to respond to your request for support in acquiring good views of the cities of Montreal, Cologne, Philadelphia, and Washington D.C. We have other targets in these areas as well, but have not been able to ask for them either because of poor weather. Now it appears we will have to wait a few weeks before illumination become adequate again for these locations. We will report back if we find any views of them in your imagery. Most of your imagery appears to be focused and well-composed, however please be advised that: a small number of your practice or personal interest images using the long lens settings and having no context views are extremely difficult to catalog and may never be located precisely. Thank you for your great response to our target requests to date!”

CEO (Crew Earth Observations) photo targets uplinked for today were **Tigris-Euphrates Delta, Middle East** (*ISS orbit track brought the station directly over the historically significant region that feeds into the Persian Gulf to the SE. Overlapping frames, taken along track, will provide a useful contextual view of the current configuration of the delta*), **Ile Rouleau Impact Crater, Quebec, Canada** (*weather was predicted to be clear over Ile Rouleau, a 4 km-diameter impact structure that is exposed at the surface as a small island. Looking to the right of track for the long, narrow northeast-southwest oriented Lake Mistassini - in appearance, the lake looks somewhat like claw marks on the landscape; overlapping frames along the extent of the lake will capture the crater near the southern end*), **Montreal, Quebec, Canada** (*Crew Request. Looking to the right of track for Montreal, weather was predicted to be clear*), **Santa Barbara Coast, California** (*ISS had a nadir pass over this long-term ecological research [LTER] site. Overlapping frames, taken along track as approaching the coast, were requested. Continuing to acquire overlapping frames as ISS crossed the urban area of Santa Barbara and crossed the coastline once again*), and **Madrean Sky Islands, Mexico** (*looking to the left of track as the station traversed the Gulf of California towards the Sierra Madre in Mexico. Contextual frames of the mountains, taken as ISS traveled parallel to them from NW to SE, will be useful for assessing the status of the forested "sky islands" on the upper slopes*).

CEO photography can be studied at this “Gateway” website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 4:34am EDT [= epoch]*):
Mean altitude -- 341.8 km

Apogee height -- 346.6 km
Perigee height -- 337.0 km
Period -- 91.37 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0007109
Solar Beta Angle -- -10.4 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 97 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 54145

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (FGB nadir)
05/31/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS (5:01pm EDT)
06/02/08 -- STS-124/Discovery/1J docking
07/10/08 -- Russian EVA-20 (7/10-11)
08/10/08 -- ATV1 undocking
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
????/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola

1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)

1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)

2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 05/02/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Sergey Volkov conducted the periodic auditing and restocking of the Russian SSVP (Docking & Internal Transfer System) accessory kits, located in the Soyuz BO (Orbital Compartment), FGB GA (Pressurized Adapter), FGB PGO (Instrumentation Cargo Compartment), Service Module PrK (SM Transfer Compartment), and DC1 (Docking Compartment). *[Support equipment in the SSVP kits includes handles, caps, screwdrivers, extenders, quick-disconnect clamps, wrenches, etc.]*

FE-1 Oleg Kononenko serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out" cycle to vacuum on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated tonight at ~5:15pm EDT. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. Filter bed 1 was regenerated yesterday. In order to assist in atmosphere scrubbing after last Tuesday's (4/29) Freon-218 spill from the SKV-2 air conditioner, the BMP's regeneration cycle was moded to 5 days instead of the regular 20 days.]*

Before continuing with the current CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) payload activities, FE-2 Garrett Reisman installed a PCMCIA (Personal Computer Memory Card International Association) Ethernet memory card in the MSG (Microgravity Science Glovebox) laptop computer (MLC), attempting to solve a problem with downlinking medium-rate data from the MLC. *[Should the attempt be unsuccessful, Garrett was to copy the MSG & CSLM files over to the OCA for alternate downlink as done previously.]*

Afterwards, Reisman supported the CSLM-2 experiment by concluding the sample run of SPU-7 (Sample Processing Unit 7), transferring the data to the MLC and

stowing the hardware. *[This was the final run of CSLM-2. The equipment is planned to return to Earth with Reisman on STS-124/1J.]*

Kononenko performed maintenance and functionality checks on the Russian VELO cycle ergometer (VB-3), focusing on its pedals, crank arm and internal springs and photographing, disassembling and reassembling the exercise device. *[Done last: 2/17/08.]*

In the FGB, the two Russian crewmembers joined up for a two-hour audit and visual inspection of available stowage spaces in the areas behind Zarya's wall panels.

[The audit took down locations by stowage zone identifiers and available volume in terms of cubic meters or CTBE (Cargo Transfer Bag Equivalents), comparing with and updating existing estimates in the IMS (Inventory Management System).]

In the Lab, FE-2 Reisman meanwhile conducted his own IMS-based partial audit of the CD (Compact Disk) Library (Vol. II), checking and verifying each CD in the Vol. II Library pockets. *[Discrepancies were to be reported to MCC-H for updating the IMS.]*

Sergey Volkov conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Oleg Kononenko performed the daily IMS maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

To support ground-commanded access to the ELITE-S2 experiment for data transfer, the FE-2 powered on the payload's IMU (Interface Management Unit).

[IMU can only be powered 5 hours per day to avoid violating an acoustic constraint.]

The Italian (ASI) experiment ELITE-S2 (Elaboratore Immagini Televisive - Space 2) is a human motion analysis facility for technological characterization and potential application for multifactorial movement analysis, to study the connection between brain, visualization and motion in micro-G. By recording and analyzing the three-dimensional motion of astronauts, this study should help engineers apply ergonomics into future spacecraft designs and determine the effects of weightlessness on breathing mechanisms for long-duration missions.]

Later today, Volkov & Reisman are scheduled for their first standard 30-min Shuttle RPM (R-bar Pitch Maneuver) skill training, using the DCS-760 digital still camera with 400 & 800mm lenses at SM windows 6 & 8 (facing in flight direction) to take CEO (Crew Earth Observations) target imagery with manual focusing only. The practice run involves mapping of ground features with images having 40-59%

overlap and about 20 images in each sequence. Afterwards, the obtained OBT (onboard training) images are to be downlinked to the ground for analysis (~3:20pm). *[The RPM drill prepares crewmembers for the bottom-side mapping of the Orbiter at the arrival of the Shuttle (STS-124/1J) on 6/2 . During the RPM at ~600 ft from the station, the “shooters” have only ~90 seconds for taking high-resolution digital photographs of all tile areas and door seals on Discovery, to be downlinked for launch debris assessment. Thus, time available for the shooting will be very limited, requiring great coordination between the two headset-equipped photographers and the Shuttle pilot.]*

Garrett is scheduled to take measurements for the regular atmospheric status check for ppCO₂ (Carbon Dioxide partial pressure) in the Lab, SM (at panel 449) and COL (Columbus Orbital Laboratory), using the hand-held CDMK (CO₂ Monitoring Kit) #1002). *[The battery pack was to be replaced with the one from unit #1009 if necessary.]*

Conducting his first Increment 17 run of the Russian DZZ-2 "Diatomeya" ocean observations program, the CDR used the HDV (high-definition) video camera at SM window #7, with lights in the SM turned off, aiming for areas showing bioluminescent glow in darkness in the Pacific ocean.

Reisman filled out the regular FFQ (Food Frequency Questionnaire), his sixth, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA/ESA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

The FE-2 performed the regular bi-weekly reboot of the SSC (Station Support Computer) OCA Comm Router laptop.

Garrett also completed the periodic checkup on active U.S. payloads, i.e., cleaning the ANITA (Analyzing Interferometer for Ambient Air) inlet plus inspecting and filter cleaning of the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. *[The CGBA incubator is controlled from the ground, with automatic video downlinked to Earth. ANITA continues to collect data every six seconds and downlinks the data daily to the ground team. ANITA monitors low levels of potential gaseous contaminants in the ISS cabin atmosphere with a*

capability of simultaneously monitoring 32 gaseous contaminants. The experiment is testing the accuracy and reliability of this technology as a potential next-generation atmosphere trace-gas monitoring system for ISS and future spacecraft. This is a cooperative investigation with ESA.]

Sergey & Oleg again spent a full hour each for themselves for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residency.

Reisman had another 2h 45min reserved for more hardware gathering and repacking for return on STS-124/1J, going by an uplinked 1J Prepack List.

The crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exerciser (FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1). *[The RED, as an anaerobic muscle exerciser, allows a variety of routines: squat, heel raises, bent-over rowing, abdominal crunches, deadlift, bench presses, upright rowing, etc. For Sergey & Oleg, who are using RED three times a week, each session features four different routines which vary from day to day to target different muscle groups.]*

Afterwards, Reisman transferred the crew's exercise data file to the MEC laptop for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~3:45am EDT, Sergey & Oleg linked up with TsUP-Moscow stowage specialists via S-band to conduct the weekly IMS tagup, discussing stowage issues and equipment locations.

At ~9:40am, Garrett Reisman supported a 10-min. PAO TV interview with WABC-TV, New York (Lori Stokes/Ken Rosato).

At ~11:30am, Volkov & Kononenko downlinked PAO TV messages of greetings and congratulations from the US Node-2 to two celebratory events in Russia: (1) the annual Radio Day ceremony held 5/5 in the State Kremlin Palace of the Russian Federation in Moscow under the auspices of the Ministry of Information Technologies & Communications, and (2) the 60th Anniversary of the Main Rocket Assembly Shop #439 of RSC-Energia on 5/8. *[Radio Day, officially observed on 5/7, commemorates the first radio communication and demonstration session by Russian physicist Alexander Stepanovich Popov in 1895. Products built by the 60 year old Energia Rocket Assembly Facility and currently in use on the ISS include the "Pirs" DC-1, cargo booms and the narrow beam antenna.]*

Later tonight (~4:35pm), the ISS crew will link up with the Lead Flight Director at JSC/MCC-H via S-band/audio to conduct their first weekly tagup. *[S/G-2 (Space-to-Ground 2) phone patch via SSC-10 (Station Support Computer 10)].*

EMCS Update: After Reisman's replacement of water reservoirs in the MSG EMCS (Microgravity Science Glovebox/European Modular Cultivation System) on 4/22, three ECs (Experiment Containers) on rotor B have been successfully hydrated and are now showing germination in two of them. Hopefully, the third one may also respond. *[The Japanese CW/RW (Cell Wall/Resist Wall) experiment operates in the EMCS facility in eight special ECs (Experiment Containers) which Garrett installed on 3/30 on the facility's centrifuges. The EMCS rack contains two rotating centrifuges, Rotor A & Rotor B, that can support a wide range of small plant & animal experiments under partial gravity conditions.]*

CWC Update: A new updated CWC (Contingency Water Container) "cue card" was uplinked for the crew's reference. *[The new card (17-0002B) lists 38 CWCs (~1489.8 L total) for the four types of water identified on board: technical water (772.7 L, for Elektron, flushing, hygiene), potable water (647.2 L), condensate water (64.1 L), waste/EMU dump and other (5.8 L). Of the 38 containers, 15 CWCs with technical water (620.5 L) and 4 CWCs with potable water (176.3 L) must be cleared for Wautersia bacteria by MCC-H before use.]*

CEO (Crew Earth Observations) photo targets uplinked for today were **Western Pamirs, central Asia** *(the mountains of the western Pamirs boast several impressive glaciers with banded moraines, and rock glaciers are present in some valleys. Snow cover should be starting to diminish, and the ground requested context views of the mountains and glaciers as ISS traversed the range from NW to SE), Karakoram, central Asia* *(as ISS left the Pamirs [preceding target], its orbit track brought it over the Karakoram Range. These mountains are also extensively glaciated, and requested were short-lens imagery taken along-track to assess the degree of snow cover), and Georgia Coastal Ecosystems, USA* *(weather was predicted to be clear over this long-term ecological research [LTER] site).*

Overlapping nadir frames, taken along track as the station approached the coast were requested. Images of coastal vegetation, beach morphology, and offshore sediment are of particular interest).

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 8:43am EDT [= epoch]):*
Mean altitude -- 341.9 km

Apogee height -- 346.6 km
Perigee height -- 337.1 km
Period -- 91.37 min.
Inclination (to Equator) -- 51.64 deg
Eccentricity -- 0.0007032
Solar Beta Angle -- -14.6 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 97 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 54132

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (FGB nadir)
05/31/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS (5:01pm EDT)
06/02/08 -- STS-124/Discovery/1J docking
07/10/08 -- Russian EVA-20 (7/10-11)
08/10/08 -- ATV1 undocking
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
????/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola

1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)

1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)

2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at

ISS On-Orbit Status 05/01/08

All ISS systems continue to function nominally, except those noted previously or below. *Russian holiday: Spring & Labor Day. Also: Labor Day in Europe.*

Upon wake-up, CDR Volkov terminated his first MBI-12 SONOKARD experiment session, started last night, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

FE-1 Kononenko began his workday with the routine checkup of DC1 (Docking Compartment) circuit breakers and fuses as part of his regular morning inspection tour. *[The monthly checkup in the "Pirs" DC1 looks at AZS circuit breakers on the BVP Amp Switch Panel (they should all be On) and the LEDs (light-emitting diodes) of 14 fuses in fuse panels BPP-30 & BPP-36.]*

Today was RS (Russian Segment) ventilation systems cleanup day. The regular periodic preventive maintenance on fan grilles and airducts was conducted by the FE-1 in the DC1 on the V1, V2 & V3 ventilators, VD1 & VD2 airducts and also included the filter replacement for the dust collectors PF1 & PF2, and by the CDR in the FGB on interior wall panel ventilation screens.

Volkov completed the periodic servicing of the active Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The regen

process will be terminated before sleeptime, at ~4:55pm EDT. Regeneration of bed #2 follows tomorrow. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. In order to assist in atmosphere scrubbing after last Thursday's Freon-218 spill from the SKV-2 air conditioner, the BMP's regeneration cycle was moded to 5 days instead of the regular 20 days+. With about 1 g/m³ concentration, the pollutant stayed an order of magnitude under the SMAC (Spacecraft Maximum Allowable Concentration) level. Since SKV-2 remains off until fresh Freon-218 can be delivered on Progress 29P (and SKV-1 nonfunctional), plans are to do condensate processing with the air conditioner's condensate evacuation pump (NOK-2) which, being an untested configuration, should go into operation next week.]*

In the Service Module (SM), Kononenko took the periodic readings of potentially harmful atmospheric contaminants with the CMS (Countermeasure System) part of the GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, which uses preprogrammed microchips to measure H₂CO (Formaldehyde, methanal), CO (Carbon Monoxide) and NH₃ (Ammonia), taking one measurement per microchip.

[CO not measured today. CMS is part of the Russian SKDS Pressure Control & Atmosphere Monitoring System.]

FE-2 Garrett Reisman conducted his third session with the ELITE-S2 (Elaboratore Immagini Televisive - Space 2) payload, after detaching the CEVIS (Cycle Ergometer with Vibration Isolation) from the ER3 (EXPRESS Rack 3) and moving it out of the field of view of the cameras crucial to of the experiment, which he set up for capturing his movement protocol. This was followed by powering up the IMU (Interface Management Unit) and calibrating the work area for the cameras (half of the work area facing one way, the other half facing the other way). The FE-2 then had ~80 min to perform the test operations, followed by stowing the test camera, turning off the IMU and re-installing the CEVIS in the Lab. *[The Italian (ASI) experiment ELITE-S2 is a human motion analysis facility for technological characterization and potential application for multifactorial movement analysis, to study the connection between brain, visualization and motion in micro-G. By recording and analyzing the three-dimensional motion of astronauts, this study should help engineers apply ergonomics into future spacecraft designs and determine the effects of weightlessness on breathing mechanisms for long-duration missions. For each of three protocols (e.g., MOVE, IMAGINE), a set of body landmarks are identified and reflective markers are applied on the subject who then performs prescheduled movements with the index finger tips then returns to the initial position (for example, the subject has to reach and brush, without exerting forces). The video cameras trace the trajectories of the body parts of the astronaut catching the light reflected by the markers, thus recording the kinetic and trajectory data of the movement.]*

After yesterday's prepacking conference with MCC-Houston, Reisman today had about an hour reserved to start gathering and prepacking equipment for return on STS-124/1J, going by an uplinked 1J Prepack List.

While Garrett prepacked return hardware, the two Russian crewmembers had ~1hr set aside for a commemorative ("symbolic") activity for Espace Lollini, a French stamp collecting company, stamping 600 postage envelopes with a Russian ISS onboard seal and inscribing them with their signatures.

Sergey Volkov conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Oleg Kononenko performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exerciser (FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1). *[The RED, as an anaerobic muscle exerciser, allows a variety of routines: squat, heel raises, bent-over rowing, abdominal crunches, deadlift, bench presses, upright rowing, etc. For Sergey & Oleg, who are using RED three times a week, each session features four different routines which vary from day to day to target different muscle groups.]*

Afterwards, Reisman transferred the crew's exercise data file to the MEC (Medical Equipment Computer) laptop for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Sergey & Oleg again had the regular full hour each for themselves for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residency.

CEO (Crew Earth Observations) photo targets uplinked for today were **Tropical Cyclone Nargis, Bay of Bengal** (*Dynamic event. Looking left for the center of this downgraded "Strong Category 2" storm which is heading slowly ENE*), **Lake Nasser, Toshka Lakes, Egypt** (*nadir pass, with Toshka lakes right and Lake Nasser nadir and left of track; crew was to shoot shorelines*), **Afar Rift Zone, Ethiopia** (*looking just left of track for the volcanoes and numerous parallel fault*

lines in black rocks. A mapping swath was requested), Washington D.C. and Philadelphia (crew requests. Both cities appeared at the same time, with Philadelphia further off track. Looking left), and Lake Pontchartrain, Mississippi River delta (Dynamic event. The look geometry was almost exactly the same as in the last request for this target: looking left for water color changes in Lake Pontchartrain from the influx of Mississippi R. water [especially near the spillway where the river comes closest to the lake]).

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 8:21am EDT [= epoch]*):

Mean altitude -- 342.0 km

Apogee height -- 346.8 km

Perigee height -- 337.1 km

Period -- 91.37 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007243

Solar Beta Angle -- -18.7 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 97 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54116

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (FGB nadir)

05/31/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS (5:01pm EDT)

06/02/08 -- STS-124/Discovery/1J docking

07/10/08 -- Russian EVA-20 (7/10-11)

08/10/08 -- ATV1 undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC

10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 04/30/08

All ISS systems continue to function nominally, except those noted previously or below.

Upon wake-up, FE-1 Kononenko terminated his first MBI-12 SONOKARD experiment session, started last night, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. At ~5:20pm EDT, just before sleep time, CDR Volkov will start his first overnight MBI-12 session.

[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]

As part of regular preventive maintenance of RS (Russian Segment) ventilation systems, Volkov cleaned Group A, B & C fan screens in the SM (Service Module) and inspected close-by equipment & structural elements for residue and condensate, prepared to take photographs with the NIKON D2X for downlink if found.

Kononenko completed ventilation maintenance in the FGB (Functional Cargo Block), cleaning the mesh screens of its TsV1 ventilation fan.

In the COL (Columbus Orbital Laboratory), FE-2 Garrett Reisman continued troubleshooting the FSL (Fluid Science Laboratory), removing & replacing the facility's LAN (Local Area Network) P46 cable and MIL Bus 1553B-A jumper.

The FE-1 continued the transfer & installation in the FGB of the new stowage enclosures delivered by the ATV1 (Automated Transfer Vehicle 1), which were built

in Russia to provide more efficient stowage spaces behind FGB panels and improve airflow/circulation. *[Today's outfitting was in FGB Zone 23A (behind panel 412) and Zone 28B (panel 419).]*

Reisman had 3 hrs. reserved which he spent in the US Airlock (A/L) for pre-gathering, collecting and configuring all EVA tools available for STS-124/1J. The A/L CCAA (Common Cabin Air Assembly) air conditioner was activated by ground command at ~7:15am to support Garrett's stay in the A/L.

Kononenko serviced the Matryoshka-R (RBO-3-2) radiation payload, which has taken over the ESA/RSC-Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS) with its AST Spectrometer and ALC equipment on DC1 panel 429. *[Oleg removed PCMCIA card #946 from the AST slot and replaced it with a new memory card, #947, from the ALC kit.]*

Volkov completed the periodic (about twice a month) replenishing of the Elektron oxygen generator's water supply for electrolysis, filling the KOV EDV container with water collected in CWC (Contingency Water Container) #1076 from the Lab CCAA (Common Cabin Air Assembly) dehumidifier. *[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]*

Reisman set up the ELITE-S2 (Elaboratore Immagini Televisive - Space 2) payload in the ER2 (EXPRESS Rack 2) for his upcoming third session, connecting camera cables to the experiment's IMU (Interface Management Unit) and routing cables in the Lab for the ER2 configuration. *[The Italian (ASI) experiment ELITE-S2 is a human motion analysis facility for technological characterization and potential application for multifactorial movement analysis, to study the connection between brain, visualization and motion in micro-G. By recording and analyzing the three-dimensional motion of astronauts, this study should help engineers apply ergonomics into future spacecraft designs and determine the effects of weightlessness on breathing mechanisms for long-duration missions.]*

Afterwards, the FE-2 supported the CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) experiment in the MSG (Microgravity Science Glovebox) facility, terminating the final vacuum draw started yesterday and initiating the first sample run, for SPU-7 (Sample Processing Unit 7). *[SPU-7 will process for 24 hrs overnight before Garrett resumes activities tomorrow. CSLM-2 examines the kinetics of competitive particle growth within a liquid matrix. During this process, small particles shrink by losing atoms to larger particles, causing the larger particles to grow (coarsen) within a liquid lead/tin matrix. This study defined the mechanisms and rates of coarsening that govern the manufacture with metals from turbine blades to dental amalgam fillings.]*

The CDR had another hour to continue his extensive periodic audit of SUBA (Onboard Equipment Control System) plug-in locations in the RS, started yesterday, supported by an uplinked 4-page checklist. *[The standard audit establishes what hardware is plugged in at which electrical RS outlets. SUBA controls, monitors, and diagnoses RS systems status. It operates using sensor output signals and command radio link SM functional outputs, onboard computer system (BVS) units, SM control panels, and system relay outputs. Its software resides in the SM central computer (TsVM) and terminal computer (TVM). The BSKs are used to switch electrical power and protect electrical circuits with fuses against overloads.]*

Sergey also conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Oleg performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

FE-2 Reisman conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. *[Updated "cue cards" based on the crew's water calldowns are sent up every other week. The current cue card (17-0002A) lists 38 CWCs (~1595.6 L total) for the four types of water identified on board: technical water (853.8 L, for Elektron, flushing, hygiene), potable water (647.2 L), condensate water (88.8 L), waste/EMU dump and other (5.8 L). Of the 38 containers, 15 CWCs with technical water (672.6 L) and 4 CWCs with potable water (176.3 L) must be cleared for Wautersia bacteria by MCC-H before use.]*

The crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exerciser (FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1). *[The RED, as an anaerobic muscle exerciser, allows a variety of routines: squat, heel raises, bent-over rowing, abdominal crunches, deadlift, bench presses, upright rowing, etc. For Sergey & Oleg, who are using RED three times a week, each session features four different routines which vary from day to day to target different muscle groups.]*

Afterwards, Reisman transferred the crew's exercise data file to the MEC (Medical Equipment Computer) laptop for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Volkov & Kononenko again had the regular full hour for themselves for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residency.

At ~8:30am EDT, the crew participated in a teleconference with MCC-Houston to discuss STS-124/1J prepacking requirements, based on an uplinked 1J Prepack List. *[While at present only Garrett is scheduled for prepack activities, Sergey and Oleg will probably also be scheduled in the future.]*

At ~10:20am, Volkov, Kononenko & Reisman joined in two separate televised PAO interview events, with KTRH Radio (J.P. Pritchard/Lana Hughes), Houston, and WINS Radio (Alice Stockton-Rossini), New York.

SKV-2 R&R Update: Yesterday, during the IFM (Inflight Maintenance) on the Russian SKV-2 air conditioner to replace its compressor with a spare, a Freon-218 spill occurred, releasing about 600 g of the refrigerant into the cabin (~1gram/cubic meter). To clean up quickly, the Russian BMP (Russian Harmful Impurities Removal System) was moded to regenerate its absorbent beds every 5 days instead of the regular 20 days, and all users have verified that no equipment on board is operating with internal temperatures above 600 degC (which would degrade the chemical). The US TCCS (Trace Contaminant Control System) operates nominally. *[Freon-218 (Octafluoropropane/C₃F₈, Russian: Khladon) is safe (low toxicity, perhaps some irritation) and noncorrosive. Primary hazard is oxygen displacement, as witness the Ozone Layer, but there is not enough C₃F₈ on board the ISS to significantly deplete any atmospheric oxygen.]*

PPS P6 Reconditioning: At ~11:00am EDT, reconditioning (discharge/recharge) maintenance has started on the truss P6 battery sets 2B3 (channel 2B) and 4B3 (channel 4B), simultaneously. The approximate timeframe for the reconditioning is about 5-7 days from today. After today's start of discharge, the batteries will be transitioned to recharge, followed by a second discharge/recharge cycle and a subsequent capacity test. *[P6 battery sets 2B2 & 4B2 were reconditioned last January.]*

CEO (Crew Earth Observations) photo targets uplinked for today were **Tropical Cyclone Nargis, Bay of Bengal** *(Dynamic event. Looking right for this Category 4 storm which is starting to control the weather in the whole of the Bay of Bengal. Nargis is predicted to move towards Burma, but Bangladesh, situated at the head of the bay, fears Nargis may ruin this year's crops, as did Cyclone Sidr last November), Georgia Coastal Ecosystems* *(the study area is a barrier island and marsh complex located on the central Georgia coast in the vicinity of Sapelo Island,*

one of the largest and least developed rivers on the east coast of the United States), and **Jornada Basin, New Mexico** (this Long Term Ecological Research [LTER] project focuses on changes in the distribution of soil resources (soil color as seen from low earth orbit) as an index of vegetation change in semiarid lands. Look near nadir just after you cross the Rio Grande. Other visual cues are White Sands and Las Cruces, NM).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (as of this morning, 7:48am EDT [= epoch]):

Mean altitude -- 342.1 km

Apogee height -- 347.0 km

Perigee height -- 337.1 km

Period -- 91.38 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007412

Solar Beta Angle -- -22.6 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 105 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54100

Significant Events Ahead (all dates Eastern Time, some changes possible.):

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (FGB nadir)

05/31/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS (5:01pm EDT)

06/02/08 -- STS-124/Discovery/1J docking

07/10/08 -- Russian EVA-20 (7/10-11)

08/07/08 -- ATV1 undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC

10/18/08 -- STS-126/Discovery/ULF2 docking

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 04/29/08

All ISS systems continue to function nominally, except those noted previously or below.

CDR Volkov worked a major IFM (Inflight Maintenance) in replacing the compressor unit of the Russian SKV-2 air conditioner with a spare, after first verifying deactivation of SKV-2 and the associated NOK-2 condensate evacuation pump.

The separation & reconnection of hydraulic lines required several leak checks during the IFM. The activities were supported by tagup with ground specialists via S-band and photo documented. *[The SKV-2 shut down yesterday morning due to high temperature, but the compressor R&R had already been scheduled for some time.]*

With the BITS2-12 onboard telemetry system's still disconnected at the SKV-2 and the Elektron ST-64 current stabilizer (BD-SU control mode remaining active), FE-1 Kononenko replaced the ST-64 with a spare unit to check out the latter's operability.

Later, Sergey & Oleg reconnected the BITS2-12, and the Elektron was restarted in 32A mode by the ground, with Kononenko monitoring the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating. The activities were supported by tagup with ground specialists via S-band. *[When the FE-1 disconnected the BITS2-12 telemetry connector at the ST-64, an "SM Elektron Catastrophic Failure" alarm alerted the crew but was quickly identified by TsUP-Moscow as having been generated by erratic data caused by the cable disconnection. The message was unexpected since it had not annunciated previously in ground tests of the R&R.]*

FE-2 Reisman completed Part 2 of the extended troubleshooting of the COL (Columbus Orbital Laboratory) condensate water separator blockage started yesterday: After modification of the condensate recovery system "T" connector by Kononenko, Reisman removed the Node-2/COL waste water jumper to allow the temporary hookup of a one-liter sample bag, then inspected its accumulating

contents periodically during the day for evidence of the blockage. The troubleshooting ended with equipment teardown. *[Since first activation of the COL condensate system, ground specialists have suspected a partial blockage of the condensate line from COL through Node-2 into the Lab. Ground-commanded troubleshooting has had inconclusive results. The ISS crew was required to temporarily disconnect the condensate (waste water) jumper in the Node-2/COL vestibule in order to obtain flow rate data as a step towards possibly locating the site of the blockage.]*

The FE-1 continued the transfer & installation in the Functional Cargo Block (FGB) of the first set of stowage enclosures delivered by the ATV1 (Automated Transfer Vehicle1), which were built to provide more efficient stowage spaces behind FGB panels. *[Today's outfitting was in FGB Zone 41 (behind panel 218).]*

The CDR conducted the extensive periodic audit of SUBA (Onboard Equipment Control System) plug-in locations in the Russian segment (RS), supported by an uplinked 4-page checklist. *[The standard audit establishes what hardware is plugged in at which electrical RS outlets. SUBA controls, monitors, and diagnoses RS systems status. It operates using sensor output signals and command radio link SM functional outputs, onboard computer system (BVS) units, SM control panels, and system relay outputs. Its software resides in the SM central computer (TsVM) and terminal computer (TVM). The BSKs are used to switch electrical power and protect electrical circuits with fuses against overloads.]*

In the Lab, FE-2 supported the CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) experiment in the MSG (Microgravity Science Glovebox) facility by continuing the vacuum venting (evacuation) sequence of the sample chamber in preparation for experiment operations scheduled tomorrow. *[Evacuation activities consisted in closing vacuum vent valves, checking for acceptable humidity levels, and opening the SPU (Sample Processing Unit) water valve to initiate unattended vacuum prep, followed later by closing the SPU water valve, checking again for humidity levels in the sample chamber, and opening the vent valve and vacuum valve to initiate a vacuum draw on the sample chamber. The steps were later repeated for another SPU. CSLM-2 examines the kinetics of competitive particle growth within a liquid matrix. During this process, small particles shrink by losing atoms to larger particles, causing the larger particles to grow (coarsen) within a liquid lead/tin matrix. This study defined the mechanisms and rates of coarsening that govern the manufacture with metals from turbine blades to dental amalgam fillings.]*

FE-2 Reisman updated the three deployed Warning books in their Payload and TCS (Thermal Control System) sections, in particular by replacing pages and making P&I (Pen & Ink) changes for possible NH₃ (ammonia) spills/leaks. The

books were then restowed at their Lab, SM & FGB locations.

Garrett also conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Oleg completed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The three crewmembers had their standard periodic PMC (Private Medical Conference) via S- & Ku-band audio/video.

The crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED (FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1). *[The RED, as an anaerobic muscle exerciser, allows a variety of routines: squat, heel raises, bent-over rowing, abdominal crunches, deadlift, bench presses, upright rowing, etc. For Sergey & Oleg, who are using RED three times a week, each day features four different routines which vary from day to day to target different muscle groups.]*

Afterwards, Garrett transferred the crew's exercise data file to the MEC (Medical Equipment Computer) laptop for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Volkov & Kononenko again had the regular full hour for themselves for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residency. *[Today also used as backup for completing the complex IFMs in case of time overrun.]*

At ~5:20pm, just before sleep time, Kononenko will set up the Russian MBI-12 SONOKARD (Sonocard) payload and start his first experiment session, using a sports shirt from the SONOKARD kit with a special device in the pocket for testing a new method for acquiring physiological data without using direct contact on the skin. Measurements are recorded on a data card for return to Earth. Volkov will start his first MBI-12 session tomorrow evening. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless*

acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]

Soyuz TMA-12 Relocation Update: The Soyuz 16S relocation from DC1 to FGB, originally set for 5/7, has been deferred to a later date. Consequently, Progress 29P on 5/16 will have to dock to the FGB nadir port instead of the DC1. If its KURS antenna fails to retract nominally (as happened on 10/26/06 with Progress M-58/23P), Flight Rules currently would not allow the docking at this port. Also, if the Soyuz relocation does not take place before the next Russian EVA (7/10-11), Reisman, as IVA crewmember, will have to remain in the Soyuz vehicle, docked at the DC1, during the spacewalk.

Soyuz TMA-11 Anomaly Update: The Russian commission investigating the Soyuz 15S ballistic re-entry (4/19) has been elevated to a State Commission headed by Roskosmos, with RSC-Energia participating. The team has been directed to conclude the investigation by the end of May.

CEO (Crew Earth Observations) photo targets uplinked for today were **Tropical Cyclone Nargis, Bay of Bengal** (*Dynamic event. ISS track passed over the predicted center of this storm, which should have reached Category 3 strength. It is a relatively small, well-structured storm. The ground suggested oblique views looking directly forward, with short lenses, to capture the entire cloud mass in one image*), **Afar Rift Zone, Ethiopia** (*looking left from track for the volcanoes [black rock masses] and numerous straight fault lines in this famous rift zone [one of the few places on Earth where an oceanic spreading center can be seen above sea level]*), and **Lake Pontchartrain, Mississippi Delta** (*Dynamic event. Looking left for water color changes in Lake Pontchartrain which lies immediately north of New Orleans and the Mississippi River. The spillway between the present high water of the Mississippi River and Lake Pontchartrain has been opened to reduce pressure on New Orleans's dikes. Looking for turbid water in the lake*).

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 8:58am EDT [= epoch]*):

Mean altitude -- 342.3 km

Apogee height -- 347.1 km

Perigee height -- 337.2 km

Period -- 91.38 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007324

Solar Beta Angle -- -26.2 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.76
Mean altitude loss in the last 24 hours -- 107 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 54085

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (FGB nadir)
05/31/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS (5:01pm EDT)
06/02/08 -- STS-124/Discovery/1J docking
07/10/08 -- Russian EVA-20 (7/10-11)
08/07/08 -- ATV1 undocking
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 04/28/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 2 of Increment 17.*

First thing in the morning, FE-2 Garrett Reisman worked in the JLP (Japanese Experiment Module Experiment Logistics Module Pressurized Section), performing the periodical status & shell temperature check from the MKAM (Minimum Keep-Alive Monitor) panel and calling down the temperatures via S-band.

Later Reisman continued his support of the CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) experiment in the activated MSG (Microgravity Science Glovebox) facility, initiating another evacuation sequence in preparation for final experiment operations scheduled Wednesday (4/30). *[Evacuation activities consisted in closing vacuum vent valves, checking for acceptable humidity levels, and opening the SPU (Sample Processing Unit) water valve to initiate unattended vacuum prep, followed later by closing the SPU water valve, checking again for humidity levels in the sample chamber, and opening the vent valve and vacuum valve to initiate a vacuum draw on the sample chamber. The steps were later repeated for another SPU. CSLM-2 examines the kinetics of competitive particle growth within a liquid matrix. During this process, small particles shrink by losing atoms to larger particles, causing the larger particles to grow (coarsen) within a liquid lead/tin matrix. This study defined the mechanisms and rates of coarsening that govern the manufacture with metals from turbine blades to dental amalgam fillings.]*

CDR Sergey Volkov performed a 2-hr maintenance job on the Service Module's Internal Thermal Loop 2 (SM KOB2) to restore it to nominal service by replacing the failed 4SPN1 pump panel with a spare unit. *[On 3/18, RSC-Energia declared micro pump #1 (one of two) in the 4SPN1 replaceable pump panel of the SM TCS (SOTR, Thermal Control Systems)'s KOB-2 loop failed. A replacement unit was delivered on ATV1 "Jules Verne". Each of the two SOTR KOB loops has two redundant pump panels with two redundant pumps each. While in the early years of Mir and*

ISS the pumps were integral to the SPN panels, the current design allows them to be replaced without requiring an entire new SPN block.]

Volkov also spent some time searching for and gathering equipment/tools required for a planned replacement of the Russian SKV-2 air conditioner's compressor assembly, scheduled tomorrow. *[SKV-2 was shut down last week due to high temperature. SKV-1 has been off for a long time.]*

FE-1 Oleg Kononenko unloaded three stowage enclosures/containers from the ATV, transferred them to the FGB and installed them later in its Pressurized Adapter (GA) compartment.

Garrett Reisman prepared Node-2 for the arrival of the JEM (Japanese Experiment Module) on STS-124 by unlatching the hatch of its portside docking port.

In the US Airlock, Reisman replaced both FDS QDMAs (Fire Detection & Suppression/Quick-Don Mask Assemblies) for the PHAs (Prebreathe Hose Assemblies), which have reached the inflation cycle limit, with two new units.

Later, Garrett also undertook the monthly FDS PEP (Portable Emergency Provisions) safety inspection/audit in the ISS modules. *[The JLP contains only a PFE (Portable Fire Extinguisher). The IMS (Inventory Management System)-supported inspection involves verification that PFEs, PBAs (Portable Breathing Apparatus), QDMAs and EHTKs (Extension Hose/Tee Kits) are free of damage to ensure their functionality, and to track shelf life/life cycles on the hardware (QDMA harness inspection was not required this time).]*

After a review by the two Flight Engineers of an uplinked description of the planned COL (Columbus Orbital Laboratory) condensate collection system troubleshooting, Reisman removed the CWWDF (Contingency Waste Water Dump Filter) in the Lab forward end-cone from the waste water bus. *[Purpose: to protect the filter from the pressures that are possible during the troubleshooting (>20 psi). Background: Since activation of the Columbus condensate system, ground specialists have suspected a partial blockage of the condensate line from COL through Node-2 into the Lab. Ground-commanded troubleshooting has had inconclusive results. Starting today, the crew performs a two-day sequence of troubleshooting steps: Today, safing the waste water bus, which involved rotating the LAB1D1 rack for access, plus initial setup of the sample bag for collecting condensate; and tomorrow the final setup for the troubleshooting with periodic checks of the condensate collected within the sample bag, followed by the tear-down.]*

Volkov conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, while Kononenko performed the

monthly 30-min. servicing of the toilet facility (ASU), changing out replaceable ASU parts with new components, i.e., the urine receptacle (MP) and a filter insert (F-V). The old parts were discarded as trash.

The FE-2 completed the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling a CWC (Contingency Water Container, #1054) with the collected water slated for processing. No samples were required this time. *[Estimated offload time before reaching the tank's neutral point (leaving ~6 kg in the tank): ~20 min.]*

The CDR performed the daily IMS maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Oleg had ~15 min set aside for another Russian "Uragan" (hurricane) earth-imaging session, using the Nikon D2X digital camera with 300-800 mm telephoto lens from SM window 9 and the RSK1 laptop for picture download. *[Targets uplinked for today were general views of Moldova and Transdnistria in nadir, the Kerch Strait, and overlapping snapshots along the Greater Caucasus Mountain Range including Olympic tracks.]*

Garrett did the periodic (monthly) inspection of the RED (Resistive Exercise Device) canister cords and accessories.

The crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED (FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1).

Afterwards, Reisman transferred the crew's exercise data file to the MEC (Medical Equipment Computer) laptop for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Volkov & Kononenko again had the regular full hour for themselves for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residency.

After setting up the Russian TV equipment, the two cosmonauts downlinked cordial messages of greetings and congratulations to a number of popular events in Russia. *[Downlinks were transmitted - (1) for the 70th Anniversary of the 43rd Independent Naval Air Force Strike Regiment stationed in Sevastopol (the regiment of fallen cosmonauts Georgy Dobrovolsky & Valentin Bondarenko), (2) to*

participants in the “Svyaz-Ekspokomm 2008” trade show for telecommunications, navigational equipment, control systems and information technology in Moscow on May 12-16, (3) for the 75th Anniversary of OAO Izhevskiy Motozavod Aksion-Holding Company, manufacturer of missile & spaceflight equipment since 1949, and (4) for the 85th birthday of Isaak Iosifovich Shvarts, composer of the music for the famous film “White Sun of the Desert”, a lucky talisman for all cosmonauts who traditionally view a screening of the film before their launch.]

At ~4:30pm EDT, Garrett Reisman is scheduled for his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop).

Soyuz TMA-12 Relocation: RSC-Energia is reviewing a possible deferral of the 16S relocation from DC1 to FGB and a commensurate change of Progress 29P linkup to the FGB nadir docking port.

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this “Gateway” website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 8:38am EDT [= epoch]*):

Mean altitude -- 342.3 km

Apogee height -- 347.3 km

Perigee height -- 337.3 km

Period -- 91.38 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007433

Solar Beta Angle -- -29.4 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 124 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54069

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

05/07/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port) – **Under Review**

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1) – **Under Review**

05/31/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS (5:01pm EDT)

06/02/08 -- STS-124/Discovery/1J docking

07/10/08 -- Russian EVA-20 (7/10-11)
 08/07/08 -- ATV1 undocking
 08/12/08 -- Progress M-65/30P launch
 08/14/08 -- Progress M-65/30P docking (SM aft port)
 08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
 09/09/08 -- Progress M-64/29P undocking (from DC1)
 09/10/08 -- Progress M-66/31P launch
 09/12/08 -- Progress M-66/31P docking (DC1)
 10/01/08 -- **NASA 50 Years**
 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
 10/12/08 -- Soyuz TMA-13/17S launch
 10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
 10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
 10/18/08 -- STS-126/Discovery/ULF2 docking
 10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
 11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
 11/20/08 -- **ISS 10 Years**
 11/26/08 -- Progress M-67/32P launch
 11/28/08 -- Progress M-67/32P docking (SM aft port)
 12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
 12/06/08 -- STS-119/Discovery/15A docking
 12/15/08 -- STS-119/Discovery/15A undocking
 2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
 05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
 3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
 4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
 1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
 1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
 2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 04/27/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday – crew off duty. Ahead: Week 2 of Increment 17.*

Russian Holiday:

Orthodox Easter (*Pravoslavnaya Paskha*)

[always 1st Sunday after 1st full moon].

At ~5:23am EDT, CDR Volkov & FE-1 Kononenko conducted a teleconference via VHF with Patriarch Alexis II of the Russian Orthodox Church who extended best wishes on the occasion of today's Easter celebration.

The CDR completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including ASU toilet facilities systems/replaceables and today also number & dates of water & urine containers, counter readings of water consumption (SPK-U, SVO) & urine collection, plus data and total operating time of the Russian POTOK-150MK (150 micron) air filter unit of the SOGS air revitalization subsystem.

Working from the Russian voluntary "time permitting" task list, the FE-1 performed Part 2 of the latest Russian "Uragan" (hurricane) earth-imaging session, using the Nikon D2X digital camera with 300-800 mm telephoto lens. *[Targets uplinked for today were Ugra National Park, the Tien-Shan mountains with glaciers to the east of lake Issyk-Kul, the Volga-Akhtubinsk alluvial plain (overall hydrological situation), and oil spills on the Caspian Sea].*

Also as a discretionary task, Oleg Kononenko conducted his first run of the Russian DZZ-2 "Diatomeya" ocean observations program. *[Using the NIKON F-5 digital still camera with 80-200 mm lens and the HDV (high-definition) video camcorder, Oleg focused on color bloom patterns in the ocean, highly pronounced cloud cover anomalies, swirls, wakes of subsurface waves, water level drop, smoothing lanes in wave fields. Target zones in the Atlantic Ocean were the coastal area of Canada,*

the English Channel, the Newfoundland Island coastline and the West Sahara offshore areas.]

For Sergey Volkov, the “time permitting” job list today suggested more KPT-3 observations and aerial photography for Russia's Environmental Safety Agency (ECON) using the Nikon D2X digital camera with SIGMA 300-800mm telephoto lens.

The crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1).

No CEO (Crew Earth Observations) photo targets uplinked for today.

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 8:22am EDT [= epoch]*):

Mean altitude -- 342.4 km

Apogee height -- 347.5 km

Perigee height -- 337.3 km

Period -- 91.38 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.00076

Solar Beta Angle -- -32.1 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 120 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54053

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

05/07/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/31/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS (5:01pm EDT)

06/02/08 -- STS-124/Discovery/1J docking

07/10/08 -- Russian EVA-20 (7/10-11)

Attachments:

ISS On-Orbit Status 04/26/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – half-day off for CDR Volkov, FE-1 Kononenko & FE-2 Reisman.*

The crew performed the regular weekly three-hour task of thorough station cleaning. *["Uborka", usually done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab.]*

As part of the house cleaning, CDR Volkov conducted preventive maintenance cleaning on the VPkhO & VPrK fan grilles in the SM, V3 screen in the DC1 Docking Module and TsV2 grille in the FGB (*Funktsionalnyi-Grusovoi Blok*).

The CDR later completed the routine servicing of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM including ASU toilet facilities systems/replaceables and today also the periodic cleaning of the pre-filter of the POTOK air filtration system.

At ~9:15am EDT, the crewmembers held their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP/Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

After Houston flight controllers deactivated the CDRA (Carbon Dioxide Removal Assembly) yesterday and cooling is no longer required, Flight Engineer Reisman

today disconnected the ITCS LTL QD (Internal Thermal Control System/Low Temperature Loop/Quick Disconnect) jumper to the CDRA rack (at loc. LAB1D6).

For his VolSci (Voluntary Science) program today, Garrett reviewed OBT (Onboard Training) material for the SLAMMD (Space Linear Acceleration Mass Measurement Device) equipment on the HRF1 (Human Research Facility 1) rack, set up the equipment and performed a configuration check (control runs with no assistance) of the hardware to verify calibration & communication for upcoming experiment ops. *[As "Operator", Garrett will be the safety "spotter" for SLAMMD. The experiment provides an accurate means of determining the on-orbit mass of humans spanning the range from the 5th percentile Japanese female and the 95th percentile American male. The procedure, in accordance with Newton's 2nd Law of Motion, finds the mass by dividing force, generated by two springs inside the SLAMMD drawer, by acceleration measured with a precise optical instrument that detects the position versus time trajectory of the SLAMMD guide arm and a micro controller which collects the raw data and provides the precise timing. The final computation is done via portable laptop computer with SLAMMD unique software. To calculate their mass, crewmembers wrap their legs around a leg support assembly, align the stomach against a belly pad and either rest the head or chin on a head rest. For calibration, an 18-lbs. mass is used at different lengths from the pivot point, to simulate different mass values. Allowable crew mass range is from 90 to 240 lbs. During the SLAMMD control run, cables or other crew members must be out of the way so the hardware moves freely.]*

The FE-2 finished the first session for Inc-17 (and the 28th aboard ISS) of the experiment EarthKAM (Earth Knowledge Acquired by Middle School Students) from the University of California in San Diego, by disassembling and stowing the hardware. *[EarthKAM was activated on 4/19, for the first time in Node-2, at the nadir hatch window, since the Lab science window still needs to be shuttered to protect it against outgassing from the SPDM (Special Purpose Dexterous Manipulator) Dextre. EarthKAM is an education program that enables thousands of students to photograph and examine Earth from the unique perspective of space, integrating the excitement of ISS with middle-school education. The student requests are uplinked in a camera control file to an A31p SSC (Station Support Computer) laptop which then activates the camera, a DCS 760 electronic still camera with 50mm (f/1.4) lens, at specified times and receives the digital images from the camera's storage card on its hard drive, for subsequent downlink via OPS LAN. EarthKAM captured 1033 images for the data-gathering session from 4/22 to 4/26. During this go-around, 60 schools participated (approximately 2800 students) from Argentina, Canada, Columbia, Germany, Japan, Mexico, Spain, South Korea and the United States. 681 images were taken with the 50mm lens and 352 were captured with the 180mm lens after Garrett's lens change on 4/24.]*

Afterwards, Reisman returned the two stowage bags #1007 & 1009 from their temporary location at NOD2P2 (to make room for EarthKAM) to the NOD2D2 nadir hatch stowage location.

Volkov & Kononenko had their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop), Sergey at 7:10am, Oleg at 8:40am.

The crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1).

Afterwards, Garrett downloaded the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working from the Russian voluntary "time permitting" task list, Kononenko performed a session of the Russian "Uragan" (hurricane) earth-imaging program, using the Nikon D2X digital camera with 300-800 mm telephoto lens. *[Targets uplinked for today were Ugra National Park, the Don river valley, general views of the Southern Urals & the Volga-Akhtubinsk river flood plain from Volgograd to the Caspian Sea, water flooding followed hydropower plant gate opening, oil spills on the Caspian Sea, overall views of the Aral Sea with dust storms (if visible), the tips of Pamir glacier tongues (in nadir), mountain peaks of Tibet with glaciers, major peaks of the Himalayas, the Dniestr River valley, the Kerch Strait, Mzyt river valley, the site of future Olympic games from Adler airport to the upper reach of the river, glaciers on the north slope of the Greater Caucasus Range, the Kolka glacier, and general views of the Caspian Sea].*

Also from the discretionary task list, Oleg conducted a KPT-3 session to make observations and take aerial KPT-3 photography of water contamination in the Kerch Strait for Russia's Environmental Safety Agency (ECON) using the Nikon D2X digital camera with SIGMA 300-800mm telephoto lens.

Weekly Science Update (*Expedition Seventeen -- Week 1*)

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):
Measurements continue in FGB module. Inc16 science data returned on 15S.

ANITA: Completed.

BCAT-3 (Binary Colloidal Alloy Test 3): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System):
The Cell Wall/Resist Wall Experiment Containers are located in EMCS. Water hydration troubleshooting is ongoing. B3 and B4 hydration succeeded.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): In progress.

EarthKAM (Earth Knowledge Acquired by Middle School Students): EarthKAM captured 1033 images for the data-gathering session from 4/22 to 4/26. Sixty schools participated (approximately 2800 students) from schools in Argentina, Canada, Columbia, Germany, Japan, Mexico, Spain, South Korea and the United States. 681 images were taken with the 50mm lens and 352 were captured with the 180mm lens. The camera was setup in the Node-2 nadir hatch window.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Inc16 science data were returned on 15S.

EuTEF (European Technology Exposure Facility): On 4/20, EuTEF platform encountered a MIL Bus error. Ground operators performed a graceful shutdown, power cycled and fully recovered the platform and its instruments. - DEBIE-2: Link error still under investigation; - DOSTEL: On-going science acquisition; - EuTEMP: Currently inactive as planned; - EVC: Further troubleshooting is on-going; - EXPOSE: On-going science acquisition; - FIPEX: Long-duration measurements with sensors RAM1, RAM4 and ZENITH8 have started on 4/23; - MEDET: On-going science acquisition, running nominal, except sample wheel of the Spectrometer is blocked on "park" position; - PLEGPAY: Langmuir Probe run was successfully

performed during the 15S undocking on 4/19 via direct commanding; - TRIBOLAB: On 4/15, the Pin On Disk (POD1) run was suddenly stopped after we encountered much higher than anticipated friction coefficients measurements. After analysis, it was decided to resume this POD1 run on 4/21. But TRIBOLAB went again immediately to a stop mode again, meaning that POD1 run is considered completed.

FSL (Fluid Science Laboratory): The mechanical troubleshooting of the FSL Drawers was successful on 4/23, as FSL activation from ground on 4/24 confirmed that all the FSL laser switches are properly engaged and fully functional.

GEOFLOW: Start of GEOFLOW is pending further FSL commissioning activities (check of FSL optical modes) currently planned for next week.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Inc16 Blood and urine samples have been returned with 15S and handed over to science team.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION/REPOSITORY: In progress.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems):

Ongoing.

SAMPLE: Inc16 samples have been downloaded with 15S and handed over to science team.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): In progress.

SOLAR (Solar Monitoring Observatory): The Sun observation is now closed (Beta angles higher than 24 deg), and will resume on 4/30. On 4/18, the instruments were put in safe mode for the 15S undocking. - SOVIM: Waiting for the Sun; - SOLSPEC: Waiting for the Sun; - SOLACES: Waiting for the Sun.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): The 4 ECs (Experiment Containers) of Rotor B are yet to be retrieved by the crew from the blocked Rotor B.

CEO (Crew Earth Observations): "Greetings to the Increment 17 crew from the staff of Crew Earth Observations! We look forward continuing to work with you in support of our payload. We have already started to receive your imagery; through 4/20 we have received 73 frames including an excellent, unsolicited sequence for one of our science targets: Santorini Volcanic Complex, Greece. We will evaluate this to decide whether any additional imagery of this target is required. By way of continuity we have received a total 18,678 frames through 4/18 for Increment 16. This included excellent 400mm views of the Slate Island Impact Crater site in Lake Superior. Only 800mm views are needed to complete this site. Nice going! Also your striking view of the Cerro Culiacan volcano in west-central Mexico will be published on NASA/GSFC's Earth Observatory website this weekend. It is a fine example of a radial drainage pattern and the integration of agriculture in rich volcanic soils. Good shot!"

CEO photo targets uplinked for today were **Chongqing, China** (*nadir pass over this famous city situated on the Yellow River in the Red Basin. The population of*

*Chongqing proper is 4 million, but 31 million cluster in the county of Chongqing. Images looking obliquely at the mountain walls around the basin in which Chongqing lies can also reveal the density and altitude of the persistent smog blanket), **Dhaka, Bangladesh** (the metro area population is almost 12 million. The crew was to shoot margins of the city. Looking left, two famous rivers were the visual cue: Dhaka lies on the far side of the Ganges River, between the very wide Brahmaputra River and the much smaller Meghna River), and **Harvard Forest, Vermont** (looking left and shooting the forest which lies approximately half way between the ground track and Boston. The 1200-hectare site includes a variety of forests and wetlands. Research at the Forest focuses on effects of natural and human disturbances on forest ecosystems).*

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 8:02am EDT [= epoch]):*

Mean altitude -- 342.5 km

Apogee height -- 347.3 km

Perigee height -- 337.8 km

Period -- 91.39 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007076

Solar Beta Angle -- -34.5 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 206 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54037

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

05/07/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/31/08 -- STS-124/Discovery/1J launch -- JEM PM "Kibo", racks, RMS (5:01pm EDT)

06/02/08 -- STS-124/Discovery/1J docking

07/10/08 -- Russian EVA-20 (7/10-11)

08/07/08 -- ATV1 undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)

10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 04/25/08

All ISS systems continue to function nominally, except those noted previously or below.

FE-2 Reisman continued his support of the experiment CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) in the MSG (Microgravity Science Glovebox), today concluding the processing of SPU-8 (Sample Processing Unit 8), transferring the data from the ECU (Electronics Control Unit) to the MSG laptop, then removing SPU-8 from the WV (Work Volume) and installing SPU-7 for the next run. MSG was later powered down from its A31p laptop (~8:30am EDT). *[CSLM-2 examines the kinetics (e.g., growth rate) of "competing" particles within a liquid matrix. During this process, small particles shrink by giving up atoms to larger particles, causing the larger particles of tin, suspended in a liquid comprised of molten lead/tin alloy ("matrix"), to grow in size ("coarsen"). This study defines the mechanisms and rates of coarsening that govern the manufacture with metals from turbine blades to dental amalgam fillings.]*

As is standard for new Expeditions, the two Russian crewmembers, Volkov & Kononenko, performed the periodic 3-hr. routine health checkout on the RS (Russian segment)'s STTS telephone/telegraph subsystem, including inspection and audio function checks of all comm panels (PA) in and between the Service Module (SM), FGB and Docking Compartment (DC1), VHF receiver tests, and an audit of headsets. *[The "Voskhod-M" STTS enables telephone communications between the SM, FGB, DC1 and U.S. segment (USOS), and also with users on the ground over VHF channels selected by an operator at an SM comm panel, via STTS antennas on the SM's outside. There are six comm panels in the SM with pushbuttons for accessing any of three audio channels (LINE-1,-2,-3), plus an intercom channel (VPU). Other modes of the STTS include telegraphy (teletype), EVA voice, emergency alarms, Packet/Email, and TORU docking support. Last time done 11/30/07 by Malenchenko & Tani.]*

The three crewmembers performed the mandatory CHeCS (Crew Health Care Systems) emergency/contingency medical OBT (on-board training) drill, a one-hour U.S. exercise designed to refresh crewmembers' acuity in applying HMS (Health Maintenance System) equipment like ACLS (Advanced Cardio Life Support) in an emergency. *[The drill gives crewmembers the opportunity to work as a team in resolving a simulated medical emergency onboard ISS and to refresh their memory of on-orbit stowage and deployment locations, equipment use, and procedures. Setting up (but not actually operating/manipulating) onboard equipment such as the RSP (Respiratory Support Pack), ALSP (Advanced Life Support Pack), intubation kit, HMS defibrillator, all stowed in the Lab CHeCS rack, and the CMRS (Crew Medical Restraint System), Garrett, Sergey and Oleg stepped through the ACLS algorithm manual to resolve a simulated medical emergency onboard ISS. Objectives of the exercise include practicing communication and coordination necessary to perform medical emergency procedures, locating appropriate emergency medical components, and determining each crewmember's individual method of delivering CPR (cardio-pulmonary resuscitation) in zero-G.]*

FE-2 Reisman conducted the periodic (monthly) CSA-CP (Compound Specific Analyzer-Combustion Products) maintenance/checkout, today on all four units. *[The CSA-CP is a passive cabin atmosphere monitor that provides quick response capability during a combustion event (fire). Its collected data are stored on a logger. Garrett changed out the battery on the prime unit, then zero-calibrated all instruments (to eliminate drift in the combustion sensors). Following zero calibration, the backup units were stowed in the Node, along with the sampling pump, while the prime unit was deployed at the SM Central Post.]*

Reisman also gathered measurements for the regular atmospheric status check for ppCO₂ (Partial Pressure Carbon Dioxide) in the Lab, SM (at panel 449) and COL (Columbus Orbital Laboratory), using the hand-held CDMK (CO₂ Monitoring Kit, #1002) and recording CO₂ readings and battery "ticks". Batteries were to be replaced if necessary.

Later, the FE-2 completed a run with the MedOps experiment WinSCAT (Windows Spaceflight Cognitive Assessment Tool) by logging in on the MEC (Medical Equipment Computer) and performing the psychological evaluation exercise on the laptop-based WinSCAT experiment. It was Garrett's second onboard session. *[WinSCAT is a time-constrained questionnaire test of cognitive abilities, routinely performed by astronauts aboard the ISS every 30 days before or after the PHS (periodic health status) test or on special CDR's, crewmembers or flight surgeons request.]*

Reisman also filled out the regular FFQ (Food Frequency Questionnaire), his sixth,

on the MEC (Medical Equipment Computer). *[On the FFQs, NASA/ESA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily. Latest food count (as of 4/20): 287 containers with 903.5 rations (456 US/447.5 Russian). Rate of food consumption by Exp-16 was 396 rations used in 190 days by three persons = 69% of one ration/person/day.]*

As standard procedure for newly arrived station residents, Volkov & Kononenko filled out the questionnaire for the standard Russian biomedical Braslet-M/Anketa ("bracelet/questionnaire") test procedure. *[If desired, the crewmembers may evaluate a number of "bracelet" cuffs for their usefulness in suppressing the adverse effects of micro-G for the "newcomer" aboard the station during the acute phase of adaptation to weightlessness, if there are such indications. The "bracelets" are compression cuffs attached to a belt and worn on the upper thighs over the coveralls, intended as countermeasures against the initial micro-G effects of blood filling (vascularity) in the upper torso (heaviness and blood pulsation in the head), facial puffiness, nasal stuffiness, painful eye movement, and vestibular disorders (dizziness, nausea, vomiting). They create artificial blood accumulation in the upper thirds of the thighs, causing some of the circulating blood volume to relocate from the upper body to the lower extremities, thereby (hopefully) correcting the adverse hemodynamic effect of micro-G and thus improving the crewmember's working capability. The actual compression cuff in the Braslet units is a combination of alternating multi-layer tensile and non-tensile elements, whose distension by body movements creates elastic forces that produce the necessary pressure on the body surface. The questionnaire lists bracelet types, days worn, cuff tension used, wearing method (on body or over clothing), thigh cuff positioning, etc.]*

Garrett supported a new ground-commanded upgrading of the PCS (Portable Computer System) laptops with a patch required for the upcoming JEM/1J mission, including such data as C&W (Caution & Warning) messages, emergency texts for NH₃ leak events, etc. *[The FE-2 powered up all PCS machines and deployed a stowed laptop in Node-2, after which each machine was patched by the ground and then reconnected to the C&C MDM (Command & Control Multiplexer/Demultiplexer computer) after automatic reboot. Afterwards, Garrett configured the COL, LAB & SM PCS laptops and called down their battery charge levels.]*

Later, Reisman also performed the regular bi-weekly reboots of the SSC (Station Support Computer) File Server and OCA Comm Router laptops.

Earlier, the FE-2 downloaded the structural dynamics data collected last night during the ATV reboost by the IWIS (Internal Wireless Integrated System) from the RSUs (Remote Sensor Units) and NCU (Network Control Unit) to the SSC (Station Support Computer) laptop for subsequent downlink to the ground. The IWIS gear was then disassembled and removed.

Additionally, Garrett completed the periodic checkup on active U.S. payloads, i.e., cleaning the ANITA (Analyzing Interferometer for Ambient Air) inlet plus inspecting and filter cleaning of the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. *[The CGBA incubator is controlled from the ground, with automatic video downlinked to Earth. ANITA is now back up again and running, collecting data every six seconds and downlinking the data daily to the ground team. ANITA monitors low levels of potential gaseous contaminants in the ISS cabin atmosphere with a capability of simultaneously monitoring 32 gaseous contaminants. The experiment is testing the accuracy and reliability of this technology as a potential next-generation atmosphere trace-gas monitoring system for ISS and future spacecraft. This is a cooperative investigation with ESA.]*

In preparation for the following PAO TV event, Reisman set up and activated the VDS MPC (Video Distribution System/Multi-Purpose Converter) with its four downlinks for transmitting SONY PD-100 camcorder imagery. Later (~12:00pm), the MPC was powered off again.

At ~11:35am, Garrett engaged in two PAO TV interviews with US clients,- WCBS-TV, New York (Dana Tyler, Jim Rosenfeld), and WOFL-TV, Orlando, FL (Mike Dunston, Holly Bristow).

Kononenko completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC (Contingency Water Container) from the Lab humidifier. Weekly SOZh reports (on Sundays) to TsUP/Moscow deal with number & dates of water and urine containers, counter readings of water consumption (SPK-U, SVO) & urine collection, plus data and total operating time of the Russian POTOK-150MK (150 micron) air filter unit of the SOGS air revitalization subsystem.]*

Volkov took on the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The camcorder setup in the SM for filming the workout of all crewmembers on the RED resistive exerciser in Node-1 during the last two days was today focused on the TVIS (Treadmill with Vibration Isolation & Stabilization) for similar documentation of their treadmill workout (with the TVIS skirt removed for visibility). Later, Reisman removed and stowed the video equipment. *[The periodic videos are required for biomechanical assessment of hardware status by ground engineers.]*

The crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exercise device (FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1).

Afterwards, Garrett downloaded the crew’s exercise data file to the MEC for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~4:00am, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU, [Glavnaya operativnaya gruppa upravleniya = “Main Operative Control Group”]), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~8:45am, Sergey & Oleg linked up with TsUP-Moscow stowage specialists via S-band to conduct the weekly IMS tagup, discussing transfer details and stowage locations. *[Discussions today concerned the current whereabouts of the 800A storage battery removed in the SM on 4/23 and of the BNP Portable Repress Tank transferred from Soyuz TMA-11 on 4/19.]*

At ~3:10pm, the crewmembers are scheduled for their regular weekly tagup with the Lead Flight Director at JSC/MCC-H.

Listed on the crew’s “job jar” task list for today was a battery check & reboot on the PWS (Portable Workstation) laptop in the COL.

ATV Reboost Update: The overnight ISS reboost with the ATV1 “Jules Verne” main engines was started at 12:22am EDT for 12m 15s and completed successfully. Planned Delta-V was 2.64 m/s vs. 2.66 m/s actual, resulting in a

mean altitude increase of 4.64 km (2.51 nmi). Purpose of the reboost maneuver was to set up the proper phasing (central orbit sweep angle) for the upcoming launches of 29P and STS-124/1J. ISS attitude control authority was handed over to RS MCS (Motion Control System) at 11:15pm for the subsequent maneuver to reboost attitude at 11:20pm. After the burn, the station was turned back to TEA (Torque Equilibrium Attitude) and returned to US Momentum Management at ~1:25am.

CDRA Update: The Carbon Dioxide Removal Assembly (CDRA) was activated yesterday when the CO₂ level peaked at 5.4 mmHg. After running for ~24 hrs, it was turned off again today starting at ~9:00am. *[The RS Vozdukh CO2 scrubber is more effective when the CO₂ levels are higher, so normally the ppCO₂ will slowly rise over about a week and stabilize between 5 & 6 mmHg, which is within Flight Rule limits but has been known to cause symptoms in some more susceptible crewmembers. Therefore, Flight Control activated the CDRA yesterday temporarily as a pre-emptive measure.]*

COL Condensate Issue Update: Since activation of the Columbus condensate system, ground specialists have suspected a partial blockage of the condensate line from COL through Node-2 into the Lab. Ground-commanded troubleshooting has had inconclusive results. The ISS crew will now be required to temporarily disconnect the condensate (waste water) jumper in the Node-2/COL vestibule in order to obtain flow rate data as a step towards possibly locating the site of the blockage. *[Starting next Monday, there will be a two-day sequence of steps to be performed by the crew: On 4/28, safing the waste water bus and initial setup of the sample bag for collecting condensate; on 4/29, final setup for the troubleshooting with periodic checks of the condensate collected within the sample bag, followed by the tear-down.]*

MCAS Checkout: For today's ground-commanded checkout of the Robotics MCAS (Mobile Base System [MBS] Common Attachment System) at ~2:00pm, requiring UMA (Umbilical Mechanism Assembly) mating, later demating, the RS thrusters were disabled at 1:10pm until ~3:15pm and physical exercise restricted, both due to loads constraints.

CEO (Crew Earth Observation) photo targets uplinked for today were **Tigris-Euphrates Delta** (*nadir views of the coastline were requested*), **Mt. Etna, Sicily** (*nadir views were requested*), **Tin Bider Impact Crater, Algeria** (*this 6-km-diameter crater is a dark circular feature off track left. The crater lies between a dry inland delta under track, and a major dune field [erg], the Grand Erg Oriental*), and **Virginia Coast Reserve, Virginia** (*this environmental site is the barrier island-lagoon-mainland landscape of the Eastern Shore of Virginia. Looking left on the*

seaward side of the Delmarva Peninsula, close to the southern tip).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 9:26am EDT [= epoch]):*

Mean altitude -- 342.7 km

Apogee height -- 347.6 km

Perigee height -- 337.8 km

Period -- 91.39 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0007277

Solar Beta Angle -- -36.5 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude gain in the last 24 hours -- 4600 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54022

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

05/07/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/31/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS (5:01pm EDT)

06/02/08 -- STS-124/Discovery/1J docking

07/10/08 -- Russian EVA-20 (7/10-11)

08/07/08 -- ATV1 undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC

10/18/08 -- STS-126/Discovery/ULF2 docking

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-67/32P launch

11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 03/28/08

All ISS systems continue to function nominally, except those noted previously or below.

As per his voluntary "job jar" task list, after wakeup and before breakfast FE-2 Garrett Reisman completed his first session with the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop. *[To monitor the crewmember's sleep/wake patterns and light exposure, Garrett wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

FE-1 Yuri Malenchenko serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out" cycle to vacuum on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process was terminated before sleeptime, at ~4:30pm EDT. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. Filter bed 1 was regenerated yesterday.]*

After reviewing the ATV rendezvous & docking timeline plus uplinked RODF (Russian Operations Data File) crew procedures, CDR Whitson & FE-1 Malenchenko used the onboard ATV Rendezvous, Docking & Undocking simulator software to conduct training runs.

Later, Whitson set up the video gear for Ku-band analog & digital video downlink, in support of engineers testing the ATV docking video transmission to the ground. Afterwards, the CDR deactivated the A31p laptop used for the downlink.

Peggy & Garrett had about half an hour reserved to work on the CMRS (Crew

Medical Restraint System), stowed in the CHeCS (Crew Health Care Systems) rack, performing the periodic checkout and inspection of the system for upcoming standard CMO (Crew Medical Officer) proficiency training. *[The crew inspected the CMRS for cracks in the board and/or metal fastener exposed on top of CMRS (found on the ground units), either of which could provide a high-voltage defibrillation ground path from the patient to ISS structure. The board-like CMRS allows strapping down a patient on the board with a harness for medical attention by the CMO who is also provided with restraints around the device. The device can be secured to the ISS structure within two minutes to provide a patient restraint surface for performing emergency medical procedures, such as during ACLS (Advanced Cardiac Life Support). It can also be used to transport a patient between the station and the Orbiter middeck. It isolates the crew and equipment electrically during defibrillations and pacing electrical discharges, accommodates the patient in the supine zero-G positions, provides cervical spine stabilization and, for a three-person crew, can also restrain two CMOs during their delivery of medical care.]*

Reisman also performed the regular inspection and checkout of the HMS RSP (Health Maintenance System/Respiratory Support Pack).

After setting up the Rodnik “plumbing” gear on 3/22 and testing the Progress 28P’s BV1 tank bladder for leak tightness, Malenchenko today transferred accumulated urine from two EDV containers (#381, #360) to the BV1 water tank. *[Each of the two spherical Rodnik tanks consists of a hard shell with a soft membrane (bladder) composed of elastic fluoroplastic. The bladder is used to expel water from the tank by compressed air pumped into the tank volume surrounding the membrane.]*

With the US ER3 (EXPRESS Rack 3) now located in the COL (Columbus Orbital Laboratory) as of 3/22, Garrett Reisman installed the cables for the rack’s EMCS (European Modular Cultivation System) facility, then configured the EMCS power switch to On and opened the gas valves, preparatory to the EMCS checkout scheduled tomorrow. *[The EMCS rack contains a rotating centrifuge that can support a wide range of small plant and animal experiments under partial gravity conditions. The EMCS gas valves must be opened manually within 24 hours prior to EMCS facility powerup if the power up is performed via ground commanding.]*

In the Lab, Whitson connected the regular ITCS LTL (Internal Thermal Control System/Low Temperature Loop) coolant jumper at the LAB1D6 rack in support of ground-commanded activation of the U.S. CDRA (Carbon Dioxide Removal Assembly) at 12:10pm-12:40pm EDT for troubleshooting the unit. Peggy supported the blower on/off activity by removing (later reinstalling) ducting between ASV (Air Supply Valve) 102 and absorbent bed 2.

Malenchenko conducted the periodic (monthly) functional closure test of the Vozdukh CO2 removal system's spare emergency vacuum valves (AVK), in the spare parts kit. *[The AVKs are critical because they close the Vozdukh's vacuum access lines in the event of a malfunction in the regular vacuum valves (BVK) or a depressurization in the Vozdukh valve panel (BOA). Access to vacuum is required to vent CO2 during the regeneration of the absorbent cartridges (PP). During nominal operation, the AVK valves remain open.]*

After preparing the auditory test equipment, Peggy, Yuri & Garrett each took the periodic (monthly) O-OHA (On-Orbit Hearing Assessment) test, a 30-min. NASA environmental health systems examination to assess the efficacy of acoustic countermeasures, using a special MEC (Medical Equipment Computer) laptop application. It was the fourth session for the CDR & FE-1, the first for the FE-2. *[The O-OHA audiography test involves minimum audibility measurements for each ear over a wide range of frequencies (0.25-10 kHz) and sound pressure levels, with the crewmembers using individual-specific Prophonics earphones, Bose ANC headsets and the SLM (sound level meter). To conduct the testing, the experimenter is supported by special EarQ software on the MEC, featuring an up/down-arrow-operated slider for each test frequency that the crewmember moves to the lowest sound pressure level at which the tone can still be heard. The baseline test is required not later than about Flight Day 14 for each new Expedition and is then generally performed once per month. Note: There have been temporary hearing deficits documented on some U.S. and Russian crewmembers, all of which recovered to pre-mission levels.]*

For the Russian flight engineer, it was time today for his first orthostatic hemodynamic endurance test session with the Russian Chibis suit in preparation for his return to gravity on 4/19, conducting the MedOps MO-4 exercise protocol in the below-the-waist reduced-pressure device (ODNT, US: LBNP/Lower Body Negative Pressure). With Peggy assisting her crewmate as CMO (Crew Medical Officer), the one-hour session was supported by ground specialist tagup via VHF at ~12:01pm EDT on DO1. *[The Chibis provides gravity-simulating stress to the body's cardiovascular/circulatory system for evaluation of Malenchenko's orthostatic tolerance (e.g., the Gauer-Henry reflex) after 200 days in zero-G. Data output include blood pressure readings.]*

In the US Lab, FE-2 Reisman set up the hardware associated with urine and blood collections for his first session of NASA's NUTRITION w/Repository experiment, scheduled on his timeline tomorrow, requiring Garrett to start his mandatory 8-hr fasting tonight for the blood draw. *[The 24-hr urine sampling begins with the first void tomorrow morning and continues through the first void on Sunday morning. The NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes*

measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]

CDR Whitson removed closeout panels in the Lab for IFM (Inflight Maintenance) of the port IMV (Intermodular Ventilation) valve of the THC (Temperature & Humidity Control) system, working with the ground to adjust the valve RMO (Remote Manual Override).

Yuri Malenchenko had another hour set aside for his end-of-increment cleanup and departure preparations. *[Instructions on packing of return items and a keep vs. trash list were uplinked for assisting Yuri and Peggy in their preparing for their return in the severely downmass-limited Soyuz Descent Module. Trashed items will be stowed in the Orbital Module, to be separated along with the Instrumentation/ Propulsion Module prior to atmospheric entry.]*

Garrett Reisman spent ~60 minutes for general orientation (station familiarization & acclimatization), as is standard daily rule for the first two weeks after starting station residency

Afterwards, the FE-2 performed the regular monthly & quarterly maintenance of the TVIS (Treadmill with Vibration Isolation & Stabilization), inspecting the condition of harnesses, belt slats, corner bracket ropes, IRBAs (Isolation Restorative Bungee Assemblies) and gyroscope wire ropes for any damage or defects, lubricating as required plus recording time & date values.

Malenchenko completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Later, Yuri conducted the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Working off his “available time” discretionary task list, the FE-1 performed the

regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).

Also from the voluntary task list, Yuri supported the BIO-5 Rasteniya-2 ("Plants-2") experiment, which researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}), by checking status and taking photographs. The crewmembers performed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, the CDR transferred the crew's exercise data file to the MEC laptop for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

After setting up and activating the VDS MPC (Video Distribution System/Multi-Purpose Converter) with its four downlinks to allow the ground to receive HDTV (high-definition TV) downlink, the crew at 11:00am sent down two PAO TV messages for recording and later playback, one for Yuri's Night at NASA ARC (Ames Research Center), the other for the annual "VEISHEA" celebration at Iowa State University (ISU). Later (~11:35am), the MPC was powered off again. *[The annual Yuri's Night Celebration, held around the world on 4/12, commemorates the anniversary of Yuri Gagarin's launch on April 12, 1961 to become the first human in space, and the maiden flight of the Space Shuttle "Columbia" with John Young & Bob Crippen twenty years later – on April 12, 1981. ISU's "VEISHEA" event is an annual celebration held each spring and one of ISU's oldest traditions. The name VEISHEA combines the first letters of the colleges at the origin of VEISHEA in 1922: Veterinary Medicine, Engineering, Industrial Science, Home Economics, Agriculture. ISU also recognized Clay Anderson as a distinguished alumnus.]*

At ~4:20am EDT, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~5:05am, the FE-1 linked up with TsUP-Moscow stowage specialists via S-band to conduct the weekly IMS tagup, discussing stowage issues and equipment locations.

At ~9:00 am, Whitson and Reisman had their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which

displays the uplinked ground video on the SSC-10 laptop).

At ~9:50am, the ISS crew held its weekly teleconference with ISS Program Management at JSC/Houston via Private S/G2, S-band/audio.

At ~4:20pm, the crewmembers will convene for their standard bi-weekly teleconference with the JSC Astronaut Office (Steve Lindsey), via S-band S/G-2 audio & phone patch.

WDS Update: An updated Water Delivery System “cue card” was uplinked for the crew’s reference, which includes the five CWCs that were transferred from Endeavour during 1J/A. *[The new card (16-0018Z) lists 39 CWCs (~1551.8 L total) for the four types of water identified on board: technical water (871.5 L, for Elektron, flushing, hygiene), potable water (647.2 L), condensate water (27.3 L), waste/EMU dump and other (5.8 L). Of the 39 containers, 15 CWCs with technical water (640.5 L) cannot be used until cleared for Wautersia bacteria, and 4 CWCs with potable water (176.3 L) are not cleared for use pending analysis of samples returned on 1J/A.]*

ATV Update (Flight Day 18): Early yesterday morning, ATV “Jules Verne” departed its parking orbit 2000 km in front of ISS, beginning to phase back to the Rendezvous Initiation point in preparation for ATV Demo Day 1 tomorrow (3/29). The ATV performed the following three maneuvers, all of which were reported to be nominal:

- TA1: start 1:59:37am EDT, delta-V: 1.50 m/s
- TA2: start 2:44:45am, delta-V: 3.24 m/s
- TA3: start 3:28:25am, delta-V: 1.55 m/s.

In addition, the ISS crew completed two of the ATV rendezvous on-board training sessions yesterday and another one today.

The ATV-CC continues to see higher than expected power consumption from the pressurized module shell heaters and is working to identify the reason. The spacecraft is being controlled by ESA’s ATV-CC/Toulouse in France, working with TsUP-Moscow and MCC-Houston. On Demo Day 2 (3/31), the ATV begins approaching the ISS from two miles away, maneuvering with a series of engine firings to about 10 m (36 ft) from the station before the ISS crew sends an abort command to move the ATV away from the complex. These maneuvers will test all ATV systems that are required for a safe automated linkup to the ISS three days later (4/3) by means of the ASN PCE (Proximity Communications Equipment) in the SM, or manually as backup.

CEO photo target uplinked for today was Tropical Cyclone Pancho, NW Australia (*DYNAMIC EVENT: Maximum sustained winds predicted to be 65kt, storm tracking*

almost due south. Looking right of track for the eye. Shooting obliques to acquire the very long cloud feeder bands, especially right of track. Short lens settings probably allowed most of the storm to be captured in single views), Patagonian Glaciers (there was a reasonable chance for clear weather on the dry side [east side] of the Southern Andes Mts. Looking left of track to shoot smaller glacier tongues), and Pilcomayo River dynamics, N Argentina (a mapping swath of 400-mm images was requested, looking left of track [for 30–60 secs]—to show the highly complex modern and past stream channel patterns on this largest “river fan” on Earth. These patterns have interesting similarities to “channel” patterns on Mars, for which they are being used as analogs in ongoing research).

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 7:38am EDT [= epoch]):*

Mean altitude -- 340.1 km

Apogee height -- 340.8 km

Perigee height -- 339.4 km

Period -- 91.34 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0001054

Solar Beta Angle -- 43.7 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 102 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53579

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking) ~10:39am EDT

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch - ~7:16am (CDR Sergei Volkov, FE Oleg Kononenko, SFP Yi So-yeon)

04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~8:43am

04/12/08 -- **Cosmonautics Day**, with **Yuri's Night** (check out <http://www.yurisnight.net/2008/>)

04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)

05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/25/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS

05/27/08 -- STS-124/Discovery/1J docking
06/05/08 -- STS-124/Discovery/1J undocking
08/07/08 -- ATV1 undocking
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
4QTR CY09 -- STS-130/19A - MPLM
1QTR CY10 -- STS-131/ULF4
2QTR CY10 -- STS-132/20A – Node-3 + Cupola
3QTR CY10 -- STS-133/ULF5.

ISS On-Orbit Status 04/24/08

All ISS systems continue to function nominally, except those noted previously or below.

Before breakfast and exercise, CDR Volkov & FE-1 Kononenko completed their first session with the periodic Russian MedOps test "Hematokrit" (MO-10), which measures the red cell count of the blood, with FE-2 Reisman acting as CMO (Crew Medical Officer, Russian: Examiner). *[The blood samples were drawn from a finger with a perforator lancet, then centrifuged in two microcapillary tubes in the M-1100 kit's minicentrifuge, and its hematocrit value was read off the tubes with a magnifying glass. It is a well-known phenomenon of space flight that red blood cell count (normal range: 30-45%) tends to go down over time. After the exam, the data were saved in the IFEP software (In-Flight Examination Program) on the MEC (Medical Equipment Computer), and Kononenko stowed the equipment.]*

The new E-17 crew (Sergey, Oleg, Garrett) performed the mandatory two-hour OBT (onboard training) emergency egress drill for the case of rapid cabin depressurization, with Russian & US specialists standing by at both control centers for crew questions or comments. The rule is that the emergency egress exercise should be performed by every new station crew once within seven days after departure of the previous crew. *[Background: Purpose of the drill is to (a) familiarize the station residents with the location of hardware and the positions of valves used in emergency situations, (b) work through the Russian Segment (RS) hardware deactivation procedures, (c) review ATV emergency response material, (d) practice crew emergency joint activities, and (e) identify crew comments and suggestions that arise during training regarding crew procedures and equipment. In the RS, the crew translated along the emergency egress path to the DC1 Docking Compartment (where Soyuz TMA-12 is currently docked), checking hardware such as the Sokol suits, cable cutters, fire extinguisher (OKR), gas masks (IPK), emergency procedures books, valve settings, hatch rubber seal & restraint integrity, etc. In the US Segment (USOS) the inspection focused on fireports being*

unblocked in the Lab {21}, with other US modules to be checked by future crews), readiness of CSA-CP (Compound Specific Analyzer-Combustion Products), ISS leak kit, PBA (portable breathing assembly) and PFE (portable fire extinguisher), emergency procedures books, valve settings, integrity of hatch rubber seals, presence of hatch handrails, etc. The checks also included Node-2, COL (Columbus Orbital Laboratory), and JLP (Japanese Experiment Module Experiment Logistics Module Pressurized Section). The exercise was topped off by a thorough debrief with the ground via S-band. During the session, the crew simulated executing the planned emergency procedures while moving about the station. For the case of an onboard fire and for emergency descent, there are other mandatory emergency drill OBTs.]

CDR Volkov performed the routine task of taking close-up photos of a scuff mark left by the probe of the last Progress' active docking mechanism on the internal part of the FGB passive docking cone mechanism. The pictures were then transferred to OCA for subsequent downlinking. These images are used to refine current understanding of docking conditions. *[The passive drogue (docking cone) ring of the SSVP-StM docking mechanism is rotated out of the passageway and thus accessible for inspection. As other crewmembers before him, the CDR used the Nikon D1X digital still camera to take several pictures with the hatch closed down.]*

FE-1 Kononenko completed another routine radiation data monitoring & logging session for flow & dose power data with the MATRYOSHKA-R radiation payload and its LULIN-5 electronics box. *[Data were downloaded, accumulated readings were recorded on a log sheet for subsequent downlink to TsUP/Moscow via the BSR-TM payload data channel, and the memory storage card was replaced.]*

The FE-1 also broke out the LULIN-ISS radiation complex kit, set up its ICU (Interface Control Unit, Russian: BUI) and connected it to a power outlet plus four PILLE radiation dosimeters to allow its battery to recharge for the next 24 hrs.

In the US Lab, FE-2 Reisman continued his servicing of the CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) experiment, terminating the final vacuum draw on the sample chamber and initiating the sample run for SPU-8 (Sample Processing Unit 8). Activities will resume tomorrow after the sample has undergone ground-commanded processing for four hours overnight, following several hours of untended delay for tracking power consumption. *[CSLM-2 examines the kinetics of competitive particle growth within a liquid matrix. During this process, small particles shrink by losing atoms to larger particles, causing the larger particles to grow (coarsen) within a liquid lead/tin matrix. This study defined the mechanisms and rates of coarsening that govern the manufacture with metals from turbine blades to dental amalgam fillings.]*

Reisman also had ~3h reserved to prepare two SSC (Station Support Computer) laptops for use in the JEM (Japanese Experiment Module), including configuring their settings with uplinked JEM IP addresses.

In response to elevated onboard CO₂ readings, Garrett connected the regular ITCS LTL (Internal Thermal Control System/Low Temperature Loop) coolant jumper to the LAB1D6 rack in support of the ground-commanded activation of the U.S. CDRA (Carbon Dioxide Removal Assembly), and Houston lowered the temperature setpoint to the regular 9.4 degC. *[CDRA activation took place at 7:00am-8:00am.]*

The FE-2 performed the scheduled lens change on the EarthKAM system at the Node-2 hatch window, going from 50mm to 180mm focal length. The lens change had to be performed on the night side while EarthKAM was not taking pictures. *[EarthKAM was activated on 4/19 for a new session, for the first time in Node-2, the 28th time aboard the ISS and the first time on Increment 17. The reason for moving EK to the Node-2 nadir hatch window is that the Lab science window still needs to be shuttered to protect it against outgassing from the SPDM (Special Purpose Dexterous Manipulator) Dextre. The payload runs without crew intervention. EK is using a Kodak ESC 460C electronic still camera with 50mm and 180mm lenses, powered by 16Vdc from a 28 Vdc adapter, taking pictures by remote operation from the ground, without crew interaction. It is available for students who submit image requests and conduct geographic research (student participants include over 84 teachers who are being trained to use EK). The requests are uplinked in a camera control file to the ThinkPad A31p laptop which then activates the camera at specified times and receives the digital images from the camera's storage card on its hard drive, for subsequent downlink via OpsLAN.]*

Continuing the current round of preventive maintenance on the Russian Segment (RS) ventilation system, Oleg replaced the two dust filters (PS1, PS2) in the *Funktsionalnyi-Grusovoi Blok* (FGB), while Sergey worked in the SM on Group A,B, C ventilation subsystems, performing inspection and photography of equipment & structural elements for residue & condensate while cleaning the fan screens.

In the SM, Oleg took the periodic readings of potentially harmful atmospheric contaminants with the CMS (Countermeasure System) part of the GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, which uses preprogrammed microchips to measure H₂CO (Formaldehyde, methanal), CO (Carbon Monoxide) and NH₃ (Ammonia), taking one measurement per microchip. *[CO was not to be measured today.]*

Garrett Reisman prepared for tonight's ATV1 reboost burn by setting up & re-programming the IWIS (Internal Wireless Instrumentation System) with its NCU

(Network Control Unit) and RSUs (Remote Sensor Units) for acquiring structural dynamics data during the reboost ops. Also activated during the thruster test will be the externally mounted SDMS (Structural Dynamics Measuring System).

Volkov completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC (Contingency Water Container) from the Lab humidifier. Weekly SOZh reports (on Sundays) to TsUP/Moscow deal with number & dates of water and urine containers, counter readings of water consumption (SPK-U, SVO) & urine collection, plus data and total operating time of the Russian POTOK-150MK (150 micron) air filter unit of the SOGS air revitalization subsystem.]*

The CDR also performed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The video equipment in the SM remains in place for filming all crewmembers' subsequent workout on the RED resistive exerciser in Node-1, for biomechanical assessment of hardware status by ground engineers. *[The camcorder equipment will be torn down when the RED sessions of all crewmembers have been captured.]*

The crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1).

Afterwards, Garrett downloaded the crew's exercise data file to the MEC for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Volkov & Kononenko again had the regular full hour for themselves for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residency.

At ~9:00am EDT, the three crewmembers convened for their standard bi-weekly teleconference with the JSC Astronaut Office (Steve Lindsey), via S-band S/G-2 audio & phone patch.

At ~2:15pm, FE-2 Reisman conducted a 30-min. telecon to debrief the STS-123 (1J/A) crew on their EVAs in preparation for upcoming extravehicular activities.

ATV1 Performance Update: A planned refueling leak check on the ATV “Jules Verne” was completed nominally. Data from an erratic helium sensor in the oxidizer refueling system have been discarded without further impact. The pre-reboost firing test used 91 kg of fuel to achieve 0.98 m/s delta-V, exactly as predicted. However, 145 kg of attitude control prop was used by the RCS (reaction control system); it is under scrutiny.

ATV1 Reboost Update: Tonight’s ISS reboost by the ATV is scheduled for a TIG (Time of Ignition) of 12:22am EDT, to yield an expected delta-V of 2.65 m/s. ISS attitude control authority will be handed over to RS MCS (Motion Control System) at 11:15pm for the subsequent maneuver to reboost attitude at 11:20pm. After the burn, the station is slewed back to TEA (Torque Equilibrium Attitude) and returned to US Momentum Management at ~1:25am.

FE-1 Email Update: Efforts are underway at MCC-H/Astronaut Office to enable emails from Kononenko’s spouse Tatiana to get to Oleg.

CWC Update: A new updated CWC (Contingency Water Container) “cue card” was uplinked for the crew’s reference. *[The new card (17-0002A) lists 38 CWCs (~1595.6 L total) for the four types of water identified on board: technical water (853.8 L, for Elektron, flushing, hygiene), potable water (647.2 L), condensate water (88.8 L), waste/EMU dump and other (5.8 L). Of the 38 containers, 15 CWCs with technical water (672.6 L) and 4 CWCs with potable water (176.3 L) must be cleared for Wautersia bacteria by MCC-H before use.]*

COL Update: The first part of the paced troubleshooting sequence on the FSL (Fluid Science Laboratory) by Reisman yesterday was successful. The laser switch in FSL was recovered, and all three drawers are operating fine; additional troubleshooting is scheduled next week (4/29 & 4/30).

SRVK-2M Update: After the RS SRVK condensate water processor twice shut down with indications of membrane overfill after yesterday’s BKO multifiltration unit R&R, the crew demated and remated the connector. The systems are now operating nominally.

CEO photo targets uplinked for today were **Tianjin, China** (*the city of Tianjin with a population of more than 10 million, is Beijing’s port on the Bohai Gulf. Looking just left of track*), **Yellow River Delta, China** (*the delta changes rapidly and should be undergoing heavy sedimentation during the present spring thaw. Looking nadir and*

*left to map the margins), **Urumqi, China** (this city is the focus of China's hydrocarbon exploration effort in its far west. Looking left at the foot of the mountains), **Dunde Ice Cap, China** (ice caps in central Asia are of increasing interest to climate change scientists. The Dunde has been cored in three places [cores about 140 m long] to the bedrock base. The cores go back to the last glacial ~20,000 years ago, and show an enormous increase in dust concentrations from that windier, drier period. Researchers also record a strong warming trend in the last ten years on Tibetan glaciers. Requested were general views of the ice cap looking left of track), and **Ganges River Delta** (a mapping swath of overlapping images is requested at nadir or just left of track, to document change in the waterways and coastline of the delta).*

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 7:29am EDT [= epoch]):*

Mean altitude -- 338.2 km

Apogee height -- 341.0 km

Perigee height -- 335.4 km

Period -- 91.30 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0004114

Solar Beta Angle -- -38.0 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 116 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 54005

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

05/07/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/31/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS (5:01pm EDT)

06/02/08 -- STS-124/Discovery/1J docking

07/10/08 -- Russian EVA-20 (7/10-11)

08/07/08 -- ATV1 undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)

10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 04/23/08

All ISS systems continue to function nominally, except those noted previously or below.

Before breakfast, CDR Volkov, FE-1 Kononenko and FE-2 Reisman began their workday with the periodic session of the Russian biomedical routine assessments PZeh-MO-7/Calf Volume Measurement and PZeh-MO-8/Body Mass Measurement (first for CDR & FE-1, second for FE-2), using the IM mass measurement device which Oleg Kononenko afterwards broke down for stowage. *[Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference pints, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures. For determining body mass in zero-G, where things are weightless but not massless, the Russian IM "scales" measure the inertial forces that arise during the oscillatory motion of a mass driven by two helical metering springs with known spring constants. By measuring the time period of each oscillation of the unknown mass (the crewmember) and comparing it to the period of a known mass, the crewmember's mass is calculated by the computer and displayed.]*

Sergei Volkov set up the hardware for the Russian MBI-21 PNEVMOKARD experiment and conducted the session, his first (which forbids moving or talking during data recording). The experiment is controlled from the RSE-Med A31p laptop, equipped with new software, and uses the TENZOPLUS sphygmomanometer to measure arterial blood pressure. *[PNEVMOKARD (Pneumocard) is an attempt to obtain new scientific information to refine the understanding about the mechanisms used by the cardiorespiratory system and the whole body organism to spaceflight conditions. By recording (on PCMCIA cards) the crewmember's electrocardiogram, impedance cardiogram, low-frequency phonocardiogram (seismocardiogram), pneumotachogram (using nose temperature sensors), and finger photoplethysmogram, the experiment supports integrated studies of (1) the cardiovascular system and its adaptation mechanisms in various phases of a long-duration mission, (2) the synchronization of heart activity and*

breathing factors, as well as the cardiorespiratory system control processes based on the variability rate of physiological parameters, and (3) the interconnection between the cardiorespiratory system during a long-duration mission and the tolerance of orthostatic & physical activities at the beginning of readaptation for predicting possible reactions of the crewmembers organism during the their return to ground.]

In the US Lab, FE-2 Reisman continued the evacuation sequence of the CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) experiment in preparation for its ops tomorrow, which involved a series of vacuum draws on the sample chamber. *[After configuring the MSG (Microgravity Science Glovebox) facility, Garrett closed vacuum vent valves, checked for acceptable humidity levels in the sample chamber, and opened the SPU (Sample Processing Unit) water valve to initiate unattended vacuum prep. Later, he opened the vent & vacuum valves to initiate a vacuum draw on the sample chamber. CSLM-2 examines the kinetics of competitive particle growth within a liquid matrix. During this process, small particles shrink by losing atoms to larger particles, causing the larger particles to grow (coarsen) within a liquid lead/tin matrix. This study defined the mechanisms and rates of coarsening that govern the manufacture with metals from turbine blades to dental amalgam fillings.]*

The CDR performed a major 1.5-hour IFM (in-flight maintenance) in the Service Module (SM) by removing one of the module's eight 800A storage batteries (#2) and replacing it with a spare Blok 800A. The removed unit was prepared for disposal on the next Progress, M-64/29P. *[The ZRU charge/discharge unit #2 was deactivated by TsUP/Moscow beforehand and later reactivated. The new battery #2 is currently being conditioned in Cycle mode. This restores the full set of eight SM batteries to operation.]*

Meanwhile, the FE-1 also conducted routine IFM (in-flight maintenance) on the SRVK-2M condensate water processor, removing its multifiltration unit (BKO), which has reached its service life limit. The old BKO was replaced with a new unit and stowed for deorbiting on Progress 29P. *[BKO contains five purification columns to rid the condensate of dissolved mineral and organic impurities. It has a service lifetime of ~450 liters throughput. The water needs to be purified for proper electrolysis in the Elektron O₂ generator.]*

In the COL (Columbus Orbital Laboratory), FE-2 Reisman began the first part of the paced troubleshooting sequence on the FSL (Fluid Science Laboratory). Today's tasks consisted of removal (later re-install) of the gap protector cover, followed by checkout of the FCE (Facility Core Element) drawers for correct seating to verify proper functioning of the laser safety switches in the rear part, and closure of a front

panel switch. *[Tomorrow, troubleshooting will focus on ODM (Optical Diagnostic Module) Laser Switch Verification and ODM/CEM (Central Experiment Module) functions, including telemetry, to verify the ODM laser switches integrity ODM & CEM functionalities. On 4/29, Reisman will support a software upgrading of the RIC (Rack Interface Controller) and VMU (Video Management Unit). followed on 4/30 by the long-overdue LAN (Local Area Network) cable repair with an uploaded repair kit and a temporary repair of the MIL BUS A connector, followed by a ground-only repair checkout and minimum system/subsystem checkout. If these activities are successful, Reisman will support the ground, after 5/5, in conducting Optical Checkout #1, Optical Target exchange, Procedure walkthrough, Optical Checkout #2, GEOFLOW EC (Experiment Container) insertion, another Procedure walkthrough, GEOFLOW check-out, and GEOFLOW science start.]*

Garrett also conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. *[Updated "cue cards" based on the crew's water calldowns are sent up every other week. The current cue card (17-0002) lists 38 CWCs (~1519.7 L total) for the four types of water identified on board: technical water (801.7 L, for Elektron, flushing, hygiene), potable water (647.2 L), condensate water (65 L), waste/EMU dump and other (5.8 L). Of the 38 containers, 15 CWCs with technical water (620.5 L) cannot be used until cleared for Wautersia bacteria, and 4 CWCs with potable water (176.3 L) are not cleared for use pending analysis of samples returned on 1J/A.]*

Volkov & Kononenko completed a 2-hr outfitting job by removing the old curtain in front of the ASU toilet facility in the SM and replacing it with a new curtain, delivered on Progress M-63/28P. The activity was supported by ground specialist tagup from TsUP-Korolev.

The FE-1 completed the periodic (about twice a month) replenishing of the Elektron oxygen generator's water supply for electrolysis, filling the KOV EDV container with water collected in CWC (Contingency Water Container) #1035 from the Lab CCAA (Common Cabin Air Assembly) dehumidifier. *[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]*

Kononenko conducted the daily routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

As part of the ECLSS servicing, Oleg also performed the periodic check of the function of the IP-1 airflow sensors in the various Russian segment (RS) hatchways. *[The inspection includes the passageways PrK (SM Transfer*

Compartment)–ATV, PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1.]

Volkov completed the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The FE-2 configured the video equipment in the SM for filming all crewmembers’ subsequent workout on the RED resistive exerciser in Node-1, for biomechanical assessment of the hardware status by ground engineers. *[The camcorder equipment is being left in place until all crewmember’s RED sessions are captured. The first video was recorded via VTR (Video Tape Recorder) from the ground.]*

Afterwards, the crew completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDRFE-2) and VELO bike with bungee cord load trainer (CDR, FE-1).

Later, Sergei downloaded the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Oleg unstowed and installed the equipment for the periodic Russian PZE-MO-10 “Hematokrit” testing that is scheduled for him tomorrow. *[MO-10 measures the hematocrit (red blood cell mass) value of the blood (it is a well-known phenomenon of space flight that red blood cell mass {normal range: 30-45%} tends to go down over time).]*

Volkov & Kononenko again had the regular 60 minutes for themselves for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residency.

At ~5:20am EDT, Oleg & Sergei powered up the SM’s amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply) and at 5:25am conducted a ham radio exchange with students at the P.I. Klimuk School No. 4 in Shchelkovo, Russia, with Cosmonaut Yurchikhin in attendance. *[Questions were uplinked beforehand. “Did you dream to become a cosmonaut?”; “What is your attitude to female-cosmonauts?”; “Do you perform space walks? What are your sensations?”; “How do you spend your leisure time in space?”; “What does it take now to become a cosmonaut?”; “How does a cosmonaut feel after landing?”; “Who do you want to be like in your life?”; “Are you*

a happy person?"; "Would you like for your child also to be a cosmonaut?"; "We are aware that Sergei is a graduate of V. M. Komarov School in Star City. What kind of school memories to you have? Do you remember your teachers?"

At ~2:40pm EDT, Garrett Reisman is scheduled for his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on an SSC laptop).

As a voluntary item on the "job jar" task list, Reisman was to retrieve an ITCS (Internal Thermal Control System) sample return Ziplock bag containing two ITCS coolant samples from the Lab1S5 Rack front and restow it in a CTB (Cargo Transfer Bag) with trashed items.

ATV Closet Ops: An updated unpacking list was uplinked yesterday to support future unloading of ATV-1 "Jules Verne". An ATV is not unpacked the same way as a Progress. Serving more like a storage shed, items are removed as they are needed for activities. This is referred to as "closet ops". An item will be unloaded at the time when it is needed, and there is no specific unpack time scheduled on the crew's timeline as for Progress or MPLM (Multi-Purpose Logistics Module). This alleviates storage requirements, always a critical issue on ISS.

CEO photo targets uplinked for today were **Eastern Tien Shan Mountains, China** (*ice caps on this central Asian mountain range are the object of interest. Requested were general views right of track as ISS passed parallel to the range*), **Lake Nasser, Toshka Lakes, Egypt** (*views just left of track captured the new Toshka lakes and then the shoreline of Lake Nasser. Shoreline views to show water levels were requested. Water levels have been declining for the last three years after many years of rising*), and **Barringer Impact Crater, Arizona** (*this small crater [1 km diameter], better known as Arizona's Meteorite Impact crater, is pristine, being only ~50,000 years old. As ISS flew over the Grand Canyon, the crew was to look right of track on the edge of the great forested area known as the Mogollon Rim, with nearby lava-capped hills being a local visual cue*).

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 8:35am EDT [= epoch]*):

Mean altitude -- 338.3 km

Apogee height -- 340.9 km

Perigee height -- 335.8 km

Period -- 91.30 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0003817

Solar Beta Angle -- -38.8 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 111 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53990

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

05/07/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/31/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS (5:01pm EDT)

06/02/08 -- STS-124/Discovery/1J docking

07/10/08 -- Russian EVA-20 (7/10-11)

08/07/08 -- ATV1 undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC

10/18/08 -- STS-126/Discovery/ULF2 docking

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-67/32P launch

11/28/08 -- Progress M-67/32P docking (SM aft port)

12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment

12/06/08 -- STS-119/Discovery/15A docking

12/15/08 -- STS-119/Discovery/15A undocking

2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD

3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation

05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**

3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2

4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola

1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)

1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)

2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 04/22/08

All ISS systems continue to function nominally, except those noted previously or below.

FE-1 Kononenko performed major periodic replacements on the SM(Service Module)'s ASU toilet facility, changing out replaceable parts with new components, such as a sensor unit (A8A-9060), two receptacles (PR & MP), four hoses, a T-connector, an elbow fitting, an indicator, a filter insert (F-V), and the pretreat container (E-K) with its hose. All old parts were discarded as trash. The KTO waste container is being kept for ~7 days. The activity was supported by ground specialist tagup. *[E-K contains five liters of pre-treat solution, i.e., a mix of H₂SO₄ (sulfuric acid), CrO₃ (chromium oxide, for oxidation and purple color), and H₂O (water). The pre-treat liquid is mixed with water in a dispenser (DKiV) and used for toilet flushing.]*

In the US Lab, after inspecting, activating & configuring the MSG (Microgravity Science Glovebox) facility, FE-2 Reisman initiated a new series of vacuum draws on the sample chamber by opening the vent and vacuum valves in preparation for CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) experiment ops on 4/24. After configuring the EMCS for water reservoir replacement, Reisman then replaced the water reservoirs on both rotors and set EMCS switches to allow ground commanding of the facility. The setup was photo documented. *[CSLM-2 examines the kinetics of competitive particle growth within a liquid matrix. During this process, small particles shrink by losing atoms to larger particles, causing the larger particles to grow (coarsen) within a liquid lead/tin matrix. This study defined the mechanisms and rates of coarsening that govern the manufacture with metals from turbine blades to dental amalgam fillings.]*

Starting a new round of preventive ventilation system maintenance in the Russian Segment (RS), CDR Volkov cleaned Group A, B & C fan screens in the SM and

inspected equipment & structural elements in the maintenance areas to check for residue & condensate, taking photographs of the latter if found, for subsequent downlink.

Garrett Reisman performed the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling a CWC (Contingency Water Container, #1062) with the collected water slated for processing. No samples were required this time. *[Estimated offload time before reaching the tank's neutral point (leaving ~6 kg in the tank): ~25 min.]*

Garrett also deactivated and safed the US OGS (Oxygen Generation System). Next activation is tentatively planned after the 1J flight, sometime in mid-June. *[Activities included deactivation of the WDS (Water Delivery System), accessing the OGS rack front and demating the O₂ outlet QD (Quick Disconnect) at the LAB1PD1 panel, then performing an O₂ purge of the H₂ (hydrogen) sensor, retrieving the WW (Waste Water) plug for disconnecting the WW jumper and reinstalling the WDS on the OGS rack front.]*

Sergei Volkov unstowed the RSK2 A31p laptop used by So-Yeon Yi and installed it (with Velcro) in the SM (panel 418) for use with the Kenwood amateur/ham radio station, which he connected and later tested with the laptop in a health check.

Kononenko conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems (see also above for replacement maintenance). *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV at the SKV-2 air conditioner for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Working off the Russian discretionary "time permitting" task list, the CDR & FE-1 updated/edited the IMS (Inventory Management System)'s standard "delta file", including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

In continued support of the Japanese CW/RW (Cell Wall/Resist Wall) experiment in the MSG EMCS (Microgravity Science Glovebox/European Modular Cultivation System), which has been having problems with insufficient hydration, Garrett Reisman's attention today focused on the Water Reservoirs, which he replaced with new ones on both rotors. *[CW/RW operates in the EMCS facility in eight special ECs (Experiment Containers) which Garrett recently (3/30) installed on the*

centrifuges of the facility. The EMCS rack contains two rotating centrifuges, Rotor A & Rotor B that can support a wide range of small plant & animal experiments under partial gravity conditions.]

Later, the FE-2 spent ~30 min reviewing an uplinked forward plan for troubleshooting the failed science experiments in the COL (Columbus Orbital Laboratory). *[Starting tomorrow (4/23), Garrett will check the FCE (Facility Core Element) drawers for correct seating to verify proper functioning of the laser safety switches in the rear part and closure of a front panel switch. On 4/24, troubleshooting will focus on ODM (Optical Diagnostic Module) Laser Switch Verification and ODM/CEM (Central Experiment Module) functions, including telemetry, to verify the ODM laser switches integrity ODM & CEM functionalities. On 4/29, Reisman will support a software upgrading of the RIC (Rack Interface Controller) and VMU (Video Management Unit). followed on 4/30 by the long-overdue LAN (Local Area Network) cable repair with an uploaded repair kit and a temporary repair of the MIL BUS A connector, followed by a ground-only repair checkout and minimum system/subsystem checkout. If these activities are successful, Reisman will support the ground, after 5/5, in conducting Optical Checkout #1, Optical Target exchange, Procedure walkthrough, Optical Checkout #2, GEOFLOW EC (Experiment Container) insertion, another Procedure walkthrough, GEOFLOW check-out, and GEOFLOW science start.]*

Oleg used the Russian BAR-RM Thermohygrometer instrument (Iva-6A) to take air temperature measurements at the VPrK inlet fan of the SM Transfer Compartment.

The FE-2 performed a tape exchange on both VDS VTRs (Video Distribution System/Video Tape Recorders), VTR1 & VTR2. The old tapes were stowed for later return to Houston.

Garrett also downloaded the IWIS (Internal Wireless Instrumentation System) structural dynamics data taken during Soyuz 15S departure and ATV1 reboost to an SSC (Station Support Computer) for subsequent downlink to the ground.

At ~10:40am EDT, Garrett Reisman downlinked two televised PAO messages of greetings, one for use at NASA Visitors Centers around the US, the other for replay at the Academy of Arts & Sciences 40th anniversary screening of the Stanley Kubrick/Arthur C. Clarke film "2001: A Space Odyssey" on 4/25, at a second screening of this film at the Smithsonian Folklife Festival at the mall in Washington, D.C., and possibly also at its screening at the Tribeca Film Festival.

The three crewmembers had their standard PMC (Private Medical Conference) today.

The crew also completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1).

Afterwards, Garrett downloaded the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Sergei & Oleg had the regular 60 minutes for themselves for general orientation (station familiarization & acclimatization) as is standard daily rule for fresh crewmembers for the first two weeks after starting station residency.

VolSci Program Update: For the Voluntary Science program on 4/26 (Saturday) or 4/27 (Sunday), Garrett Reisman was offered two options for his choice: (1) SLAMMD (Space Linear Acceleration Mass Measurement - Body Mass Measurement), or (2) EPO(Education Payload Operations) Careers Demo (Identify all the different steps crewmembers have taken to get to where they are today; identify all the different NASA careers that work together to prepare an astronaut for spaceflight. Objective: to motivate students to strive for a career in science, technology, engineering, and mathematics and to someday work for NASA).]

CEO photo targets uplinked for today were **Central Asia dust event** (*Dynamic event. A major dust event is taking place in the Takla Makan Desert of western China. This desert basin is often much hazier than surrounding areas due to blowing dust. The crew was to include the mountainous margins of the basin so that we can gauge the altitude of the top of dusty airmass. The Takla Makan is one of the dustiest places on Earth, with its dust frequently falling on Beijing and Japan. Looking right of track, for three minutes*) and **Nile River delta, Egypt** (*looking right of track for general views of the delta region. These images will be used to pinpoint future targets*).

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 8:04am EDT [= epoch]*):

Mean altitude -- 338.4 km

Apogee height -- 341.2 km

Perigee height -- 335.7 km

Period -- 91.30 min.

Inclination (to Equator) -- 51.63 deg
Eccentricity -- 0.0004093
Solar Beta Angle -- -39.0 deg (magnitude increasing)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 76 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 53974

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

05/07/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
05/31/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS (5:01pm EDT)
06/02/08 -- STS-124/Discovery/1J docking
07/10/08 -- Russian EVA-20 (7/10-11)
08/07/08 -- ATV1 undocking
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
2QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
3QTR CY09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3/Discovery - ELC1, ELC2
4QTR CY09 -- STS-130/20A/Endeavour – Node-3 + Cupola
1QTR CY10 -- STS-131/19A/Atlantis - MPLM(P)
1QTR CY10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)

2QTR CY10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 04/21/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 1 of Increment 17 (with CDR Sergei Volkov, FE-1 Oleg Kononenko, FE-2 Garrett Reisman).*

The crew enjoyed a full rest day.

Having passed Day 30 of his flight, FE-2 Reisman ended his latest session with the NASA/JSC experiment NUTRITION w/Repository by collecting a final urine sample upon wakeup for storage in the MELFI (Minus-Eighty Laboratory Freezer for ISS). The sampling kit was then stowed away. *[The current NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R +30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

In the JLP (Japanese Experiment Module Experiment Logistics Module Pressurized Section), Garrett Reisman performed the periodic checkup on JLP status and shell temperatures by using the MKAM (Minimum Keep Alive Monitor), then called down the results of the temperature check via S-band.

CDR Volkov conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including ASU toilet facilities systems/replaceables.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS

treadmill (CDR, FE-1, FE-2), RED resistive exercise device (FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1).

Afterwards, Garrett downloaded the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~1:45pm EDT, FE-2 Reisman powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply) and at 1:50pm conducted a ham radio exchange with children at the Arnold Palmer Hospital for Children in Orlando, Florida. *[Arnold Palmer Hospital for Children in Orlando, Florida, is one of 8 hospitals under the Orlando Regional Healthcare umbrella and addresses the unique medical needs of children in the Central Florida area, including a level one trauma center. The children who participated in this contact are patients at the hospital. It was an exciting surprise and enriching experience that made their hospital stay a memorable event. Questions to Garrett were uplinked beforehand. "What kind of food do you eat, and is it good?"; "How long can you stay out on a spacewalk?"; "What experiments are you doing in space?"; "What duties are yours on the Space Station?"; "How do you communicate with your family?"; "What do you do if you get sick in space?"; "What can you see on Earth from Space?"; "How long will the Space Station last?"; "What skills do I need to be an astronaut?"; "What is your favorite thing to do on the Space Station?"]*

ATV Reboost Test: The single-burn reboost firing test of the ATV "Jules Verne" overnight at 12:10am-1:52am was conducted successfully. Burn duration was 4m 33s, with a delta-V of 1.04 m/s (3.41 ft/sec). Mean altitude gain was ~1.49 km. The purpose of the reboost was to test the ATV main engines prior to the scheduled reboost on 4/25 (Friday). ISS attitude control authority was handed over to the Russian MCS (Motion Control System) thrusters at ~12:00am and returned to US momentum management at ~2:47am.

CEO photo target uplinked for today was **Central Asia dust event** (*Dynamic event. A major dust event is taking place in the Takla Mayan Desert of western China. This desert basin is often much hazier than surrounding areas due to blowing dust. Images were to include the mountainous margins of the basin so that researchers can gauge the altitude of the top of dusty air mass. The Takla Mayan is one of the dustiest places on Earth, with its dust frequently falling on Beijing and Japan*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the

Earth from space, with 314,000 from the ISS alone).

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

04/25/08 -- ATV-1 "Jules Verne" reboost
05/07/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
05/31/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS (5:01pm EDT)
06/02/08 -- STS-124/Discovery/1J docking
07/10/08 -- Russian EVA-20 (7/10-11)
08/07/08 -- ATV1 undocking
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
10/01/08 -- NASA 50 Years
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- ISS 10 Years
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
04/23/09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
07/16/09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- Six-person crew on ISS (following Soyuz 18S-2 docking)
09/03/09 -- STS-129/ULF3/Discovery - ELC1, ELC2
10/22/09 -- STS-130/20A/Endeavour – Node-3 + Cupola
01/21/10 -- STS-131/19A/Atlantis - MPLM(P)
03/18/10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
04/29/10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 04/20/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday. Week 1 of Increment 17 (with CDR Sergei Volkov, FE-1 Oleg Kononenko, FE-2 Garrett Reisman).*

Crew wake/sleep cycle has "normalized", Today's wakeup - 2:00am, sleeptime – 5:30pm EDT.

First activity this morning for FE-2 Reisman was to start on his FD30 (Flight Day 30) session with the NASA/JSC experiment NUTRITION w/Repository. Reisman completed the all-day session, collecting urine samples for 24 hrs (to continue through tomorrow morning) and blood samples (for Serum & Heparin). *[Garrett performed self-phlebotomy, i.e., drew his blood samples (from an arm vein) which were first allowed to coagulate in the Repository, then spun in the HRF2 RC (Human Research Facility 2/Refrigerated Centrifuge) and finally placed in MELFI (Minus-Eighty Laboratory Freezer for ISS). The RC was later powered off after a temperature reset to limit wear on the compressor, and cleaned. Background: NUTRITION is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight; this includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes. The Clinical Nutritional Assessment profile currently required on all U.S. Astronauts collects blood and urine samples preflight and postflight. NUTRITION expands this protocol by also capturing in-flight samples and an additional postflight sample. Furthermore, additional measurements are included for samples from all sessions, including additional markers of bone metabolism, vitamin status, and hormone and oxidative stressor tests. The results will be used to better understand the impact of countermeasures (exercise and pharmaceuticals) on nutritional status and nutrient requirements. The Clinical Nutritional Assessment profile (MR016L), first started on two Mir crewmembers and then on all ISS US crews, nominally consists of two pre-flight and one post-flight analysis of nutritional status, as well as an in-flight assessment of dietary intake using the FFQ (Food*

Frequency Questionnaire). The current NUTRITION project has expanded MR016L testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]

Later, the FE-2 worked in the JLP (Japanese Experiment Module Experiment Logistics Module Pressurized Section), performing the periodical status and shell temperature check from the MKAM (Minimum Keep-Alive Monitor) and calling down the temperatures via S-band.

CDR Volkov conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the Service Module (SM), including ASU toilet facilities systems/replaceables and the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV at the SKV-2 air conditioner for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Sergei also gathered weekly data on total operating time & "On" durations of the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem for reporting to TsUP.

At ~8:05am EDT, the crewmembers held their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP/Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (FE-2) and VELO bike with bungee cord load trainer (CDR, FE-1).

Afterwards, Garrett downloaded the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

All three crewmembers had their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked

ground video on an SSC laptop), Sergei at 7:00am, Oleg at 8:30am, Garrett at 11:35am.

ATV Reboost Test: A single-burn reboost test of the ATV “Jules Verne” is scheduled for tonight at 12:10am-1:52am. ISS attitude control authority will be handed over to the Russian MCS (Motion Control System) thrusters at ~12:00am and returns to US momentum management at ~2:47am.

Weekly Science Update (*Expedition Sixteen -- Week 26*)

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): Completed. Instrument was relocated to FGB for Inc17 measurements (as Russian experiment) and ALTCRISS was re-activated on 4/8. Increment 16 passive dosimeters and memory cards were returned on 15S.

ANITA: Completed.

BCAT-3 (Binary Colloidal Alloy Test 3): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System): In progress.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): The CSLM-2 SPU #4 completed the vacuum vent cycles, and started the sample 10-hour heat soak, at the end of 10 hours the quench was successfully completed. The SPU #4 temperature data was reviewed and preliminary results show a nominal run.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Experiment data were returned on 15S.

EuTEF (European Technology Exposure Facility): EuTEF platform is nominal. DEBIE-2: Link error still under investigation; DOSTEL: On-going science acquisition; EuTEMP: Currently inactive as planned; EVC: So far further troubleshooting is required, as the high-resolution downlinked images are very difficult to interpret. The impact of MISSE-6 on the EVC field of view is apparently much bigger than anticipated; EXPOSE: On-going science acquisition; FIPEX: Short-duration measurements with sensors RAM1, RAM4 and ZENITH8 continue. Long-term measurements can not be started due to RS422 Link Error – Troubleshooting on-going; MEDET: On-going science acquisition, running nominal, except sample wheel of the Spectrometer is blocked on "park" position; PLEGPAY: During the SOLACES instrument operation, some countermeasure Xenon gas release was implemented (nominal procedure). Analysis on-going to assess if we can relax this countermeasure procedure. Next test (Langmuir Probe acquisitions) via direct commanding will take place during the 15S undocking; TRIBOLAB: on 4/10 the instrument was commanded in Thermal Stabilisation mode in preparation of the first experiment run. On 4/11, the first TRIBOLAB Pin On Disk (POD1) was started and ran until 15S undock. The experiment was paused during the 15S thruster firing on 4/14, and resumed successfully. On 4/15, the Pin On Disk (POD1) run was suddenly stopped after we encountered much higher than anticipated friction coefficients measurements. Analysis on-going.

Fluid Science Laboratory (FSL): The FSL Facility awaits further troubleshooting after 1J/A departure.

GEOFLOW: Deferred. Start of GEOFLOW is pending further FSL troubleshooting/commissioning activities.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Second session for Yuri Malenchenko has been nominally performed between 4/12 and 4/15. Blood and urine samples were returned on 15S.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: In progress.

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION/REPOSITORY: In progress.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SAMPLE: Last crew sampling session for Inc16 FE-1 Malenchenko was successfully performed on 4/7. Samples were downloaded on 15S.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): In progress.

SOLAR (Solar Monitoring Observatory): On 4/12, the tracking mode software was successfully patched. First results are promising, but require further assessment. SOLAR platform went to stand-by mode during Sun tracking measurements. The Sun observation is now closed (Beta angles higher than 22deg), and will resume on 4/30. SOVIM: Science data acquisition has been performed nominally until closing of Sun observation window (4/15); SOLSPEC: One spectrum measurement has been successfully performed on 4/13 and will help to cross-compare the results gathered with Sun instrument on NASA Sounding Rocket launched on 4/14/16:58GMT; SOLACES: Two spectrum measurements have been successfully performed on 4/13 and will help to cross-compare the results gathered with Sun instrument on NASA Sounding Rocket launched on 4/14/16:58GMT.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels):
Planned.

CEO (Crew Earth Observation): Through 4/15 the ground has received a total of 18,267 ISS CEO images for review and cataloging. Late this week imagery received included sessions with camera times corresponding to the following daily target requests: Pilcomayo River dynamics, N. Argentina; Lima, Peru; East Venezuelan land use; Irrawaddy River Delta, Burma; Chongqing, China; Luquillo Forest, Puerto Rico; Santa Barbara Coast, California; Eastern Tien Shan Mountains, China; and Slate Islands Impact Crater, Lake Superior. We will be providing feedback on these acquisitions as we work through them in the coming week. Feedback on last week's acquisitions includes: Teide Volcano, Canary Islands – first review indicates more clouds present than we had hoped; Volcán Colima, Mexico – again clouds prevented a good acquisition; imagery for other acquisitions are still under review. "Your recent striking image of the Cananea Copper Mine, Sonora-Mexico will be published on NASA/GSFC's Earth Observatory site this weekend. Your photo beautifully illustrates the land use and ecological impacts one of the world's largest open-pit copper mines. Thanks for spotting this one. We are very pleased with the quality of your imagery and your high level of response to our target requests. Please don't hesitate to ask if we can provide additional products or assistance in acquiring our science targets."

No CEO photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with

ISS Orbit (as of this morning, 8:52am EDT [= epoch]):

Mean altitude -- 336.9 km

Apogee height -- 337.9 km

Perigee height -- 336.0 km

Period -- 91.28 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0001405

Solar Beta Angle -- -37.6 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 146 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53943

Significant Events Ahead *(all dates Eastern Time, some changes possible):*

05/07/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port) *[pending 15S landing anomaly analysis]*
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
05/31/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS (5:01pm EDT)
06/02/08 -- STS-124/Discovery/1J docking
07/10/08 -- Russian EVA-20 (7/10-11)
08/07/08 -- ATV1 undocking
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
10/01/08 -- NASA 50 Years
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- ISS 10 Years
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
04/23/09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
07/16/09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- Six-person crew on ISS (following Soyuz 18S-2 docking)
09/03/09 -- STS-129/ULF3/Discovery - ELC1, ELC2
10/22/09 -- STS-130/20A/Endeavour – Node-3 + Cupola
01/21/10 -- STS-131/19A/Atlantis - MPLM(P)
03/18/10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
04/29/10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 04/19/08

All ISS systems continue to function nominally, except those noted previously or below. *Day 192 in space for Peggy & Yuri (190 days onboard ISS). Expedition 17 Crew: CDR Sergei Volkov, FE-1 Oleg Kononenko, FE-2 Garrett Reisman.*

Yest posadka! *(We have Landing!)* Welcome back home, Yuri Malenchenko, Peggy Whitson and So-Yeon Yi! After 192 days in space (190 docked to ISS), Soyuz TMA-11/15S, carrying two-thirds of the Expedition 16 crew plus the South-Korean SFP, **landed successfully** this morning at ~4:30am EDT in the steppes of Kazakhstan, with the crew in excellent condition. The landing in Kazakhstan was approximately 450 km west of the prime landing area in the “ballistic mode” zone. *[The 15S undocking sequence was initiated on 4/19 with the command to open the Soyuz hooks at 1:03 am EDT. 15S separated from ISS at 1:06 am using the docking system springs. Three minutes after initial separation an automatic separation burn was performed by the Soyuz vehicle. A 4 min 18 sec de-orbit burn was initiated at 3:40 am EDT. During descent, the 15S vehicle guidance system down-moded to a ballistic entry mode. The satisfactory condition of the crew was confirmed by 15S CDR Yuri Malenchenko when he made contact with TsUP-Moscow via the 15S Iridium satellite phone. Russian SAR (Search & Rescue) helicopters from the ballistic staging area, including a NASA crew surgeon, reached the crew approximately 30 minutes after landing, and reported the crew to be in good health. The crew was transported to Kustenai, Kazakhstan via helicopter and departed for Star City, arriving at approximately 1:00pm EDT, where they were received by a welcoming NASA delegation headed by Christopher Scolese, Michael*

Ryschkewitsch, and William Gerstenmaier. Post-flight analysis of data from the descent module systems will be conducted after the module is returned to Moscow.]

After the long undock workday (12:30pm yesterday – 4:45am this morning), the remaining ISS crew is enjoying a really long (21-hr) sleep period, from 4:45am – 2:00am tomorrow morning. Beginning on Sunday, 4/20, the station sleep/wake cycle is then back on the standard 2:00am-5:30pm EDT.

Preparations for the early undocking began late last night, with the returning crew ingressing the Soyuz Descent Module and FE-1 Malenchenko performing the regular communications check from the TMA-11 at ~6:30pm EDT.

Yuri & Peggy then activated the spacecraft (~10:00pm), followed by Sergei Volkov & Oleg Kononenko closing the Soyuz and FGB hatches, and the departing Soyuz crew started the standard one-hour leak check on the Soyuz-to-FGB vestibule.

The video recording of the earlier Change of Command ceremony was downlinked by FE-2 Reisman at 10:20pm.

Garrett also deactivated the onboard amateur radio stations in the Service Module (SM) and FGB to prevent radio interference with the departing spacecraft.

At 11:30-11:45pm, the ISS went in free drift for FGB hooks opening.

During that time (~11:30pm), Reisman assembled, configured and activated the U. S. EarthKAM (EK) hardware for a new session, for the first time in Node-2, the 28th time aboard the ISS and the first time on Increment 17). The reason for moving EK to the Node-2 nadir hatch window is that the Lab science window still needs to be shuttered to protect it against outgassing from the SPDM (Special Purpose Dexterous Manipulator) Dextre. *[For focusing the camera, Garrett had to see the ground. EK is using a DCS 760 electronic still camera with 50mm (f/1.4) lens at the Node-2 window, powered by 16Vdc from a 28 Vdc adapter, taking pictures by remote operation from the ground, without crew interaction. Numerous schools are participating in this EarthKAM session. EarthKAM is an education program that enables thousands of students to photograph and examine Earth from the unique perspective of space, integrating the excitement of ISS with middle-school education. The student requests are uplinked in a camera control file to an A31p SSC (Station Support Computer) laptop which then activates the camera at specified times and receives the digital images from the camera's storage card on its hard drive, for subsequent downlink via OPS LAN.]*

ISS attitude control was again switched to free drift at 1:01am this morning, followed

shortly by the Soyuz undocking.

Prior to starting their sleep period at 4:45am, the remaining ISS crew completed a number of post-undocking tasks:

With the U.S. CDRA (Carbon Dioxide Removal Assembly) deactivated by the ground early this morning (~3:00am-8:00am) and its cooling no longer required, FE-2 Reisman demated and took down the ITCS LTL (Internal Thermal Control System/ Low Temperature Loop) jumper at the CDRA-supporting LAB1D6 rack.

Garrett also set up the hardware associated with urine and blood collections for his second session of NASA's NUTRITION w/Repository experiment in the Lab, scheduled on his timeline tomorrow and requiring Garrett to start his mandatory 8-hr fasting tonight for the blood draw (since he has a 21-hr sleep cycle on Sunday). The 24-hour urine sample collection starts with the first void Sunday morning and continues through the first void on Monday morning.

On the US voluntary "job jar" task list, activities for CDR Volkov and FE-2 Reisman included taking measurements for the regular atmospheric status check for ppCO₂ (pp Carbon Dioxide) in the Lab, SM (at panel 449) and COL (Columbus Orbital Laboratory), using the hand-held CDMK (CO₂ Monitoring Kit, #1002 & #1009), with the CDRA now turned off. Batteries were to be replaced if necessary.

Also added to the discretionary task list for Sergei & Garrett was the periodic torquing (tightening) of the male QDs (Quick Disconnects) gfound on the FSS (Fluid System Servicer) jumpers.

A third job in the "job jar" task lit, at the crew's convenience, is the periodic audit of rack locations, using the IMS (Inventory Management System). *[The audit function, introduced with the implementation of IMS software version 2.0, allows the crewmember to set up audits of bags, kits, containers and stowage locations on the laptop.]*

In a fourth suggested job item, the IMS audit feature is also to be used by the crew for an inventory of CTBs (Cargo Transfer Bags) shown as containing spare A31p laptop hardware (#1131), IWIS components (#1188), BP/ECG (Blood Pressure/ Electrocardiogram) equipment (#1003), water microbiology kit (#1001), and a jettison bag with EMCS hardware.

Kononenko conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Volkov completed the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The crewmembers completed their regular physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), and RED resistive exercise device (FE-2).

Afterwards, Garrett downloaded the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

CEO photo targets uplinked for today (optional) were **Taal Volcano, Philippines** (*Taal volcano, one of the most active volcanoes in the Philippines, is easily recognized as an island in the 20-km long Taal caldera lake. The island is a complex volcano that has grown about 25% in area during historical time. Powerful pyroclastic flows and surges from historical eruptions from Taal have caused much destruction. The growth of satellite cities around Manila brings increasing numbers of people closer to the volcano*), **Manila, Philippines** (*looking right, between the ISS track and Taal Volcano. Crew was to shoot urban margins of greater Manila, home to more than 14 million people*), and **Chaing Mai, Thailand** (*looking left for this university city, the largest in northern Thailand. Asian cities tend to be earth-colored and thus harder to identify from orbit. Chang Mai lies in a light-toned valley. Valleys are intensively farmed so that little forest remains—allowing the north-south valleys to be more easily detected from orbit*).

CEO photography can be studied at this “Gateway” website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Significant Events Ahead (*all dates Eastern Time, some changes possible*):

- 05/07/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port) [*pending 15S landing anomaly analysis*]
- 05/14/08 -- Progress M-64/29P launch
- 05/16/08 -- Progress M-64/29P docking (DC1)
- 05/31/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS (5:01pm EDT)
- 06/02/08 -- STS-124/Discovery/1J docking
- 07/10/08 -- Russian EVA-20 (7/10-11)

08/07/08 -- ATV1 undocking
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
04/23/09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
07/16/09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
09/03/09 -- STS-129/ULF3/Discovery - ELC1, ELC2
10/22/09 -- STS-130/20A/Endeavour – Node-3 + Cupola
01/21/10 -- STS-131/19A/Atlantis - MPLM(P)
03/18/10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
04/29/10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 04/18/08

All ISS systems continue to function nominally, except those noted previously or below. *Day 9 of joint E16/E17 operations by CDR-16 Peggy Whitson, FE-1-16 Yuri Malenchenko, FE-2-17 Garrett Reisman, CDR-17 Sergei Volkov, FE-1-17 Oleg Kononenko and SFP/VC14 So-Yeon Yi. Day 191 in space for Peggy & Yuri.* Last day before Soyuz 15S undocking, with the ISS crew on an irregular wake/sleep cycle:

- Sleep: 1:00am – 12:30pm EDT;
- Wake-up: 12:30pm – 4:45am (4/19); E16 departs @ 1:06am
- Sleep time for E17: 4:45am – 2:00am (4/20)

The E16/E17 crew rotation/handover period is running down. Whitson, Volkov, Malenchenko and Kononenko are completing their joined crewtime for dedicated (“functional”) CDR/CDR & FE/FE handover activities plus “generic” handovers where crewmembers are scheduled together to complete various designated standard tasks.

From the US voluntary “job jar” task list, after wakeup and before breakfast, FE-2 Reisman & SFP (Space Flight Participant) So-Yeon Yi again downloaded the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data from their Actiwatches to the HRF-1 (Human Research Facility 1) laptop. Yi has been participating in SLEEP for NASA under a Space Act agreement with South Korea. Later tonight, CDR Whitson will work with her own, Garrett’s and So-Yeon’s Actiwatch, downloading their accumulated data to the HRF-1 laptop, initializing her unit for FE-2 Reisman, then stowing the SLEEP hardware and powering down the HRF1 laptop. *[To monitor the crewmember’s sleep/wake patterns and light exposure, crewmembers wear a special Actiwatch device which measures the light levels encountered by them as well as their patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

For Peggy & Garrett, the second session with the biomed experiment INTEGRATED IMMUNE (Validating Procedures for Monitoring Crew member Immune Function) ended today with the CDR & FE-2 performing their final INTEGRATED IMMUNE blood and liquid saliva collection, assisting each other with the blood draw, photo-documented by Kononenko. The subjects' saliva return pouches and blood sleeves as well as the saliva collection kit were then stowed in the MELFI (Minus-Eighty Laboratory Freezer for ISS), which Reisman had prepared with ICEPACs before. *[IMMUNE assessment, integrated with the Russian IMMUNO, is a 24-hr. test of human immune system changes, with the objective to investigate immune neuro-endocrine reactions in the space environment by studying samples of saliva, blood and urine before, during and after flight for changes related to functions like bone metabolism, oxidative damage and immune function, using collection kits and the biomedical (MBI) protection kit, to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects. The saliva is collected in two forms, dry and liquid. The dry samples are collected at intervals during the collection day using a specialized book that contains filter paper. The liquid saliva collections require that the crewmember soak a piece of cotton inside their mouth and place it in a salivette bag; there are four of the liquid collections during docked operations. For cold storage, samples are secured in the MELFI. Also included are entries in a fluid/medications intact log, and a stress-test questionnaire to be filled out by the subject at begin and end. Urine is collected during a 24-hour period, conventionally divided into two twelve-hour phases: morning-evening and evening-morning.]*

FE-1 Malenchenko, with assistance by CDR-17 Volkov, prepared for his return to Earth by spending about two hours in the Soyuz with packing and stowing of equipment, after transferring BTKh-1, -2, & -4 (Glycoproteid, MIMETIK-K & VAKTsINA-K) sample hardware in the "Luch-2" kit, the "Konyugatsiya" (BTKh-10, Conjugation) experiment in the Recomb-T kit from CRYOGEM-03M, and INTERLEUKIN-K (BTKh-20) to TMA-11.

Also transferred for return were the Russian payload TkN-9 SVS (Self-Propagating High-Temperature Synthesis) equipment, the Japanese GCF-JAXA Crystallization Facility, the Russian SAMPLE experiment, and other payload items, with transfers logged in the IMS (Inventory Management System).

SFP So-Yeon Yi meanwhile closed out and transferred her experiments KAP01 (Growth & mutation of plant seeds) and KAP03 (Development of Bioreactor for use on the ISS).

FE-2 Reisman set up, programmed and verified the IWIS (Internal Wireless Instrumentation System) with its RSUs (Remote Sensor Units) and NCU (Network

Control Unit) to record structural dynamics/vibrational data during the ISS free drift and Soyuz undocking periods. The departure will also be recorded by the external SDMS (Structural Dynamics Measurement System).

Garrett conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Oleg Kononenko completed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The remaining crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR-17, FE-17), and RED resistive exercise device (FE-2).

Afterwards, Garrett & Oleg downloaded the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

As Whitson, Malenchenko and Yi prepare to ingress Soyuz TMA-11, CDR Volkov is scheduled (at ~8:55pm) to configure the onboard communications system (STTS) for the undocking, both working to set up, check and maintain the VHF comm link from the TMA-11 SA to TsUP/Moscow via RGS (Russian Ground Site) and the comm system for Soyuz undocking and descent.

Work hours for the crew continued into the next day (4/19) in support of the Soyuz undocking and post-undocking activities, with sleep time beginning at 4:45am EDT.

If everything is nominal, the return to Earth of the TMA-11 spacecraft tomorrow morning will proceed along the following approximate event sequence (all times EDT):

- ISS attitude control handover to RS --- 9:40pm (4/18);
- ISS in free drift for FGB hooks open --- 11:30pm (4/18);
- ISS in free drift for undocking --- 1:02:30am (4/19)
- Hooks Open command --- 1:03:30am; automatic undocking from SM on DO15;
- Separation springs action (delta-V ~0.12 m/sec) --- 1:06:30pm;

- Manual separation burn (15 sec, ~ 0.65 m/sec) --- 1:09:30am;
- ISS attitude control handover to US --- 2:00am;
- Deorbit Burn start (delta-V 115.2 m/sec) --- 3:40:42am;
- Deorbit Burn complete --- 3:45:06am
- Tri-Module separation (140.1 km) --- 4:04:37am;
- Atmospheric entry (102.5 km, with ~ 170 m/sec) --- 4:07:30am;
- Max G-load (32.7 km alt) --- 4:14:10am;
- Parachute deploy command (10.6 km alt) --- 4:16:07am;
- 15S Landing (DO2) --- 4:31am EDT; 11:31am Moscow DMT; 2:31pm local Kazakhstan;
- Local Sunset --- 9:36am (8:36pm local).

[Note: Kazakhstan time = GMT+6h; EDT+10h. Moscow DMT = EDT+7h.]

What the Soyuz TMA-11 crew will experience during their reentry/descent:

For the reentry, Malenchenko, Whitson and Yi will be wearing the Russian Kentavr anti-G suit. *[The Kentavr garment is a protective anti-g suit ensemble to facilitate the return of a long-duration crewmember into the Earth gravity. Consisting of shorts, gaiters, underpants, jersey and socks, it acts as countermeasure for circulatory disturbance, prevents crewmember from overloading during descent and increases orthostatic tolerance during post-flight adaptation. Russian crewmembers are also advised to ingest fluid-electrolyte additives, viz., three sodium chloride tablets during breakfast and after the midday meal, each time with 300 ml of fluid, and two pills during the meal aboard Soyuz before deorbit.]*

Before descent:

Special attention will be paid to the need for careful donning of the medical belt with sensors and securing tight contact between sensors and body.

During preparation for descent, before atmosphere reentry, crewmembers settle down comfortably in the Kazbek couches, fasten the belts, securing tight contact between body and the seat liner in the couch.

During de-orbit:

Dust particles starting to sink in the Descent Module (SA) cabin is the first indication of atmosphere reentry and beginning of G-load effect. From that time on, special attention is required as the loads increase rapidly.

Under G-load effect during atmosphere reentry the crew expects the following experience:

Sensation of G-load pressure on the body, burden in the body, labored breathing and speech. These are normal sensations, and the advice is to "take them coolly". In case of the feeling of a lump in the throat, this is no cause to "be nervous". This is frequent and should not be fought. Best is to "try not to swallow and talk at this moment". Crew should check vision and, if any disturbances occur, create additional tension of abdominal pressure and leg muscles (strain abdomen by pulling in), in addition to the Kentavr anti-G suit.

During deployment of pilot parachute (0.62 & 4.5 square meters), drogue chute (16 sq.m.) and main (518 sq.m.) chutes the impact accelerations will be perceived as a "strong snatch". No reason to become concerned about this but one should be prepared that during the parachutes deployment and change ("rehook") of prime parachute to symmetrical suspension, swinging and spinning motion of the SA occurs, which involves vestibular (middle ear) irritations.

It is important to tighten restrain system to fasten pelvis and pectoral arch. Vestibular irritation can occur in the form of different referred sensations such as vertigo, hyperhidrosis, postural illusions, general discomfort and nausea. To prevent vestibular irritation the crew should "limit head movement and eyes movement", as well as fix their sight on motionless objects.

Just before the landing (softened by six small rocket engines behind the heat shield):

Crew will be prepared for the vehicle impact with the ground, with their bodies fixed along the surface of the seat liner in advance. "Special attention should be paid to arm fixation to avoid the elbow and hand squat" (instruction). Landing speed: ~9.9 m/sec.

After landing:

Crew should not get up quickly from their seats to leave the SA. They were advised to stay in the couch for several minutes and only then stand up. In doing that, they should limit head and eyes movement and avoid excessive motions, proceeding slowly. They and their body should not take up earth gravity in the upright position too quickly.

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port, 1:03:30am EDT)

04/19/08 -- Soyuz TMA-11/15S landing (4:30am EDT, 11:30am Moscow/DMT, 2:30pm Kazakhstan)

05/07/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/31/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS (5:01pm EDT)

06/02/08 -- STS-124/Discovery/1J docking
 07/10/08 -- Russian EVA-20 (7/10-11)
 08/07/08 -- ATV1 undocking
 08/12/08 -- Progress M-65/30P launch
 08/14/08 -- Progress M-65/30P docking (SM aft port)
 08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
 09/09/08 -- Progress M-64/29P undocking (from DC1)
 09/10/08 -- Progress M-66/31P launch

ISS On-Orbit Status 04/17/08

All ISS systems continue to function nominally, except those noted previously or below. *Day 8 of joint E16/E17 operations by CDR-16 Peggy Whitson, FE-1-16 Yuri Malenchenko, FE-2-17 Garrett Reisman, CDR-17 Sergei Volkov, FE-1-17 Oleg Kononenko and SFP/VC14 So-Yeon Yi. Day 190 in space for Peggy & Yuri.*

Yesterday, Peggy Whitson set a new US endurance record of 374 days for the longest cumulative time spent in space, held before by Mike Foale (heading the list: Sergei Krikalev with 803 days).

(See Peggy's picture at bottom, uplinked overnight by a grateful Flight Control Team).

With undocking time on 4/19 approaching, the ISS crew went on an irregular sleep/wake cycle:

- Wake #1 this morning: 2:00am – 10:00am EDT;
- "Nap": 10:00am – 2:00pm
- Wake #2: 2:00pm – 1:00am (4/18)

Tomorrow:

- Sleep: 1:00am – 12:30pm
- Wake for E16/E17: 12:30pm - 4:45am (4/19) – *E16 departs @ 1:06am*

Saturday:

- Sleep for E17: 4:45am – 2:00am (4/20).

Aboard ISS, the E16/E17 crew rotation/handover activities continue. Whitson, Volkov, Malenchenko and Kononenko have several hours crewtime between them for dedicated ("functional") CDR/CDR & FE/FE handover activities. In addition, there are "generic" handovers where crewmembers are scheduled together to complete various designated standard tasks.

Upon wake-up, CDR-17 Sergei Volkov terminated his MBI-12 SONOKARD experiment session (his first), started last night, by taking the recording device from his SONOKARD sports shirt pocket and later copying the

measurements to the RSE-MED laptop for subsequent downlink to the ground. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

From the US voluntary "job jar" task list, after wake-up and before breakfast, FE-2 Garrett Reisman & SFP (Space Flight Participant) So-Yeon Yi again downloaded the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data from their Actiwatches to the HRF-1 (Human Research Facility 1) laptop. Yi is participating for NASA under a Space Act agreement with South Korea. *[To monitor the crewmember's sleep/wake patterns and light exposure, crewmembers wear a special Actiwatch device which measures the light levels encountered by them as well as their patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

Floating in the Soyuz TMA-11/15S Orbital Module (BO), FE-1 Malenchenko dismantled and removed the LKT local temperature sensor commutator (TA251MB) of the BITS2-12 onboard telemetry system, along with its PZU-1M ROM (read-only memory) unit, now no longer required since the BO is to be jettisoned before 15S reentry. *[The electronics was to be stowed on ISS for reuse in a future Progress vehicle.]*

CDR Whitson cleared out some stowed equipment in Node-2 to make room for the setup and activation of the EarthKAM system by Reisman on 4/19 (first time in Node 2).

Dr. Whitson also conducted flow tests on the CDRA (Carbon Dioxide Removal Assembly) as part of the ongoing troubleshooting of the assembly's delta pressure anomaly. *[The first two attempts at CDRA troubleshooting have been inconclusive as to the cause of the delta-P increase but point to problems likely stemming from a blockage in the no.2 Desiccant/Absorbent Bed (DAB 202). Today's task was to evaluate flow conditions at three ports of DAB 202 to confirm where the blockage is. This task must be performed before Mission 1J to allow launch of a spare DAB if needed and its R&R during the docked period.]*

Oleg Kononenko and Sergei Volkov, with Malenchenko's handover assist, completed the periodic checkout of the HMS CMRS (Health Maintenance System/ Crew Medical Restraint System), followed by a health check of the HMS RSP

(Respiratory Support Pack).

The FE-1-17 gathered measurements for the regular atmospheric status check for ppCO₂ (pp Carbon Dioxide) in the Lab, SM (at panel 449) and COL (Columbus Orbital Laboratory), using the hand-held CDMK (CO₂ Monitoring Kit, #1002).

Batteries were to be replaced if necessary.

The CDR-17 conducted the periodic time synchronization between the RSS1 and the BSPN payload server, after testing functionality by checking data comm between the two computers and synching RSS1 to station time, in support of payload data transfers from the BSPN for subsequent downlink on OCA comm (via the Russian RSS1 laptop to a PCMCIA flash card). The transfer pertained to a parameter table that was copied from BSPN into the RBO-3-3 Matryoshka radiation hardware. *[Before RSS1/BSPN synchronization, the RSS1 is updated with the exact time as per the station clock (which in turn is synchronized daily from RGS/ Russian Ground Site). Experiment control application is a payload file transfer program called ShellForKE.];*

Peggy & Garrett performed the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. *[Updated “cue cards” based on the crew’s water calldowns are sent up every other week.]*

FE-1 Malenchenko used the standard ECOSFERA equipment, set up yesterday, to conduct microbial air sampling runs for the MedOps SZM-MO-21 experiment, with the POTOK Air Purification System temporarily powered down, taking samples from cabin surfaces along with samples from crewmembers for sanitation and disease studies. The sample tubes were then stowed in the Kriogem-03 refrigerator for return on TMA-11. *[The equipment, consisting of an air sampler set, a charger and power supply unit, provides samples to help determine microbial contamination of the ISS atmosphere, specifically the total bacterial and fungal microflora counts and microflora composition according to morphologic criteria of microorganism colonies.]*

Yuri, with Sergei, also performed the MO-22 Sanitary-Epidemiological Status check, part of the Russian MedOps program. *[To monitor for microflora, Yuri collected samples from surface areas of interior panels and hardware at various places in the Service Module (SM), the FGB, and the ATV “Jules Verne”, using cotton swabs and special test tubes which were then stowed in 15S for return to the ground.]*

Later, the FE-1 used the Russian IPD-NH₃ Draeger tubes, on a cartridge belt with a pump, to check the cabin air for NH₃ (ammonia, from possible urine spillage),

followed by the periodic air sampling with the AK-1M adsorber around the SM work table. The samplers were also stowed in the Soyuz 15S Descent Module for analysis on the ground.

In preparation for his return to gravity, Yuri Malenchenko undertook the second session of his fifth and final training session of the Russian MO-5 MedOps protocol of cardiovascular evaluation in the below-the-waist reduced-pressure device (ODNT, US: LBNP) on the Russian VELO ergometer, assisted by CDR Whitson as CMO (Crew Medical Officer). The activity was then closed out. *[The one-hour assessment, supported by ground specialist tagup (VHF) and telemetry monitoring from Russian ground sites (at 6:11am EDT), uses the Gamma-1 ECG equipment with biomed harness, skin electrodes and a blood pressure and rheoplethysmograph cuff wired to the cycle ergometer's instrumentation panels. The Chibis ODNT provides gravity-simulating stress to the body's cardiovascular/circulatory system for evaluation of Malenchenko's orthostatic tolerance (e.g., the Gauer-Henry reflex) after several months in zero-G. The preparatory training generally consists of first imbibing 150-200 milliliters of water or juice, followed by two cycles of a sequence of progressive regimes of reduced ("negative") pressure, set at -20, -25, -30, and -35 mmHg for five min. each, then -25, -30, and -35 mmHg (Torr) for 10 min. each plus 30mmHg for 5 min. while shifting from foot to foot at 10-12 steps per minute, while wearing a sphygmomanometer to measure blood pressure. The body's circulatory system interprets the pressure differential between upper and lower body as a gravity-like force pulling the blood (and other liquids) down. Chibis data and biomed cardiovascular readings are recorded. The Chibis suit (not to be confused with the Russian "Penguin" suit for spring-loaded body compression, or the "Kentavr" anti-g suit worn during reentry) is similar to the U.S. LBNP facility (not a suit) used for the first time on Skylab in 1973/74, although it appears to accomplish its purpose more quickly.]*

FE-1-17 Kononenko serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out" cycle to vacuum on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process will be terminated tonight at ~6:35pm EDT. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. Filter bed 1 was regenerated yesterday.]*

FE-2 Reisman continued his support of the CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) experiment in the MSG (Microgravity Science Glovebox), today transferring the data for SPU-4 (Sample Processing Unit 4) from the ECU (Electronics Control Unit) to the MSG laptop, then removing SPU-4 from the WV (Work Volume) and installing SPU-8 for the next run. MSG was later powered down from its A31p laptop (~8:55am).

Afterwards, Garrett performed the periodic inspection & cleaning of the FDS (Fire Detection & Suppression) system's bacteria filters and SDs (smoke detectors) in the US Airlock (A/L), Node-1, Lab, and Node-2.

The FE-2 also worked in the ATV "Jules Verne", rearranging temporarily stowed equipment to adjust the location of the vehicle's CG (center-of-gravity) for stable flight control, should its separation become necessary in a contingency. The stowage configuration was to be photographed for ground evaluation.

Both Whitson & Malenchenko are scheduled for another standard pre-descent PMC (Private Medical Conference) today.

After the rest period ("nap"), built in from 10:00am to 2:00pm to support synchronization of the crew's wake/sleep cycle for the Soyuz departure early on 4/19, today's second work period extends from 2:00pm to 1:00am tomorrow (4/18) morning.

First thing after their "nap", Peggy & Garrett will be closing out their second session of the biomed experiment INTEGRATED IMMUNE (Validating Procedures for Monitoring Crew member Immune Function) by collecting one final dry saliva sample. A final saliva & blood collection is planned for tomorrow. *[IMMUNE protocol requires the collection to occur first thing post-sleep, before eating, drinking and brushing teeth, and all samples are stored at ambient temperature. Along with NUTRITION (Nutritional Status Assessment), INTEGRATED IMMUNE samples & analyzes participant's blood, urine, and saliva before, during and after flight for changes related to functions like bone metabolism, oxidative damage and immune function to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects. The saliva is collected in two forms, dry and liquid. The liquid saliva collections require that the crewmembers soak a piece of cotton inside their mouth and place it in a salivette bag; there are four of the liquid collections during docked operations.]*

Whitson & Reisman will then work on EVA equipment in the A/L, resizing EMU (Extravehicular Mobility Unit) #3018 for Robert Kimbrough for use on STS-126/ULF2 and EMU #3004 for Ronald Garan for contingency use on STS-124/1J.

Yuri Malenchenko will wrap up Russian biotech payloads for return on TMA-11 *[specifically BTKh-12 (BIOEKOLOGIYA), BTKh-8 (BIOTREK), BTKh-31 (ANTIGEN) and BTKh-29 (GINSENG).]*

Garrett Reisman is scheduled to fill out the regular FFQ (Food Frequency Questionnaire), his fifth, on the MEC (Medical Equipment Computer). *[On the*

FFQs, NASA/ESA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]

Yuri again has several hours reserved for packing & stowing of equipment on TMA-11, focusing mainly on a long list of discarded equipment which he secures in the Orbital Module, to be jettisoned along with the Instrumentation Compartment before the Descent Module's atmospheric entry.

SFP So-Yeon Yi, with Sergei & Oleg taking photo/video imagery of her VC14 activities as required, finishes up her KAP (Korean Astronaut Program) science experiments, which includes work on –

- *KAP01/Growth & mutation of plant seeds (monitoring, photography, filling out questionnaire),*
- *KAP02/Identification of fruit fly genes responsive to gravity and responsible for aging (monitoring, video recording, later stowing),*
- *KAP06/Study of the possibility of using traditional Korean food in onboard food rations (testing during crew Breakfast, Lunch & Dinner, with video coverage),*
- *KAP10/Earth observations; and*
- *KAP11/Noise level reduction onboard the ISS RS (prep & setup, taking noise measurements and imagery at various locations, tearing down hardware & preparing kit for return).*

So-Yeon also has two regular daily tagups with her consultant team at TsUP-Moscow via VHF-1 (~3:30am EDT; ~8:10pm), her fourth PAO TV interview, today with three children from Yangyang as well as with her mother (~6:25am), and a commemorative (“symbolic”) activity on the air, performing a “Show & Tell” with a “Cheonsangyoulchaboonya (Space) Map”, discussion of various flags from Korea, a Ten-Thousand Won paper money bill, and reading some poetry.

At ~9:35pm, So-Yeon is scheduled for an ARISS (Amateur Radio on ISS) ham radio session with students and teachers at Dae Jeon Science Hall in Korea.

Working off the voluntary Russian task list, So-Yeon also will transfer imagery and other data before sleeptime tonight from flash card to her RSK2 laptop HDD (Hard Disk Drive) for return to the ground.

Later, at 3:10pm, CDR Whitson will set up the video camera system for covering and recording the traditional Change-of-Command Ceremony at 3:20pm at which the Sergei Volkov will formally replace Peggy Whitson as the new ISS Commander for Expedition 17.

Reisman is to conduct the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Malenchenko will complete the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Working off the Russian discretionary "time permitting" task list, Yuri is to perform the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder). *[GCF-JAXA will be moved to TMA-11 tomorrow for return.]*

At ~8:00pm, Reisman will set up and activate the VDS MPC (Video Distribution System/Multi-Purpose Converter) with its four downlinks to allow the ground to "pull down" accumulated HDTV (high-definition TV) footage of onboard activities. Later (~9:05pm), the MPC will be powered off again.

The crewmembers are scheduled for their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), RED resistive exercise device (CDR, FE-1-17, FE-2) and VELO bike with bungee cord load trainer (FE-1, CDR-17).

Afterwards, Sergei downloads the crew's exercise data file to the MEC for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

VolSci Program: For the Voluntary Science program on 4/21 (Monday), Garrett Reisman was offered two choices for his selection: (1) a session with the SLAMMD (Space Linear Acceleration Mass Measurement - Body Mass Measurement) experiment; (2) an EPO (Education Payload Operations) Demo on space careers, creating a video discussing different careers found at NASA, to be used to produce an educational product to enhance existing education resources for students in grades 9-12. Selection is required ASAP.

CEO photo target uplinked for today was **Lake Nasser, Toshka Lakes, Egypt** (*looking left of track for Lake Nasser in the foreground and the string of Toshka lakes beyond, in Egypt's southern desert. Images of shorelines to show the present status of declining water levels are of greatest interest*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

Significant Events Ahead (*all dates Eastern Time, some changes possible*):

04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port, 1:06:30am EDT)
04/19/08 -- Soyuz TMA-11/15S landing (4:31am EDT, 11:31am Moscow/DMT, 2:31pm Kazakhstan)
05/07/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
05/31/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS (5:01pm EDT)
06/02/08 -- STS-124/Discovery/1J docking
07/10/08 -- Russian EVA-20 (7/10-11)
08/07/08 -- ATV1 undocking
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
04/23/09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
07/16/09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation

05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
09/03/09 -- STS-129/ULF3/Discovery - ELC1, ELC2
10/22/09 -- STS-130/20A/Endeavour – Node-3 + Cupola
01/21/10 -- STS-131/19A/Atlantis - MPLM(P)
03/18/10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
04/29/10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 04/16/08

All ISS systems continue to function nominally, except those noted previously or below. *Day 7 of joint E16/E17 operations by CDR-16 Peggy Whitson, FE-1-16 Yuri Malenchenko, FE-2-17 Garrett Reisman, CDR-17 Sergei Volkov, FE-1-17 Oleg Kononenko and SFP/VC14 So-Yeon Yi. Day 189 in space for Peggy & Yuri.*

The crew's work/sleep cycle again was adjusted slightly, from yesterday's wakeup at 2:20am to 2:15am EDT (sleep time tonight at 5:45pm). Tomorrow, work period will be adjusted again (to 2:00am–12:00pm).

Aboard ISS, crew rotation/handover activities continued for all six residents involved. Whitson, Volkov, Malenchenko and Kononenko had several hours scheduled between them for dedicated ("functional") CDR/CDR & FE/FE handover activities; in addition, there are "generic" handovers where crewmembers are scheduled together to complete various designated standard tasks.

From the US voluntary "job jar" task list, after wakeup and before breakfast, FE-2 Garrett Reisman & SFP (Space Flight Participant) So-Yeon Yi again downloaded the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data from their Actiwatchs to the HRF-1 (Human Research Facility 1) laptop. Yi is participating for NASA under a Space Act agreement with South Korea. *[To monitor the crewmember's sleep/wake patterns and light exposure, crewmembers wear a special Actiwatch device which measures the light levels encountered by them as well as their patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

After wake-up, FE-1-17 Kononenko terminated his MBI-12 SONOKARD experiment session (his first), started last night, by taking the recording device from his SONOKARD sports shirt pocket and later copying the measurements to the RSE-MED laptop for subsequent downlink to the ground. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through*

computer processing of records obtained overnight, (2) systematically record the crewmember's physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]

CDR Whitson & FE-2 Reisman finished up their second session of the biomed experiment INTEGRATED IMMUNE (Validating Procedures for Monitoring Crew member Immune Function) by collecting one final wet saliva sample first thing after wake-up. *[IMMUNE protocol requires the collection to occur first thing post-sleep, before eating, drinking and brushing teeth, and all samples are stored at ambient temperature. Along with NUTRITION (Nutritional Status Assessment), INTEGRATED IMMUNE samples & analyzes participant's blood, urine, and saliva before, during and after flight for changes related to functions like bone metabolism, oxidative damage and immune function to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects. The saliva is collected in two forms, dry and liquid. The liquid saliva collections require that the crewmembers soak a piece of cotton inside their mouth and place it in a salivette bag; there are four of the liquid collections during docked operations.]*

FE-1 Malenchenko, with Kononenko observing, performed the periodic servicing of the Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The regen process will be terminated before sleeptime, at ~3:30pm EDT. Regeneration of bed #2 follows tomorrow. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods.]*

FE-2 Reisman set up the ROBoT trainer, including the Node-1 camcorder for recording, and used it with CDR-17 Volkov as handover for a proficiency drill for the upcoming SSRMS/Robotics ops. Later, Garrett tore down the setup and stowed it. *[ROBoT uses DOUG (Dynamic Operations Ubiquitous Graphics) software, a hand controller and two laptops (one for graphics, one for the simulation) for on-orbit training of MSS (Mobile Service System) and SSRMS (Space Station Remote Manipulator System) operations. The training should be performed once every four weeks (unless crewmember actually performs arm ops). This OBT (Onboard Training) lesson is designed to refresh cognitive skills related to SSRMS operations. Degradation of these skills could affect mission success and safety of the crew.]*

Malenchenko & Kononenko completed the periodic (about twice a month) replenishing of the Elektron oxygen generator's water supply for electrolysis, filling

the KOV EDV container with water collected in CWC (Contingency Water Container) #1065 from the Lab CCAA (Common Cabin Air Assembly) dehumidifier. *[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]*

Oleg completed his first radiation data monitoring & logging session for flow & dose power data with the MATRYOSHKA-R radiation payload and its LULIN-5 electronics box. *[Data were downloaded, accumulated readings were recorded on a log sheet for subsequent downlink to TsUP/Moscow via the BSR-TM payload data channel, and the memory storage card was replaced].*

In preparation for their return to gravity, Yuri Malenchenko undertook his fifth and final training session of the Russian MO-5 MedOps protocol of cardiovascular evaluation in the below-the-waist reduced-pressure device (ODNT, US: LBNP) on the Russian VELO ergometer, assisted by CDR Whitson as CMO (Crew Medical Officer). A second session is scheduled tomorrow. *[The one-hour assessment, supported by ground specialist tagup (VHF) and telemetry monitoring from Russian ground sites (at 6:11am EDT), uses the Gamma-1 ECG equipment with biomed harness, skin electrodes and a blood pressure and rheoplethysmograph cuff wired to the cycle ergometer's instrumentation panels. The Chibis ODNТ provides gravity-simulating stress to the body's cardiovascular/circulatory system for evaluation of Malenchenko's orthostatic tolerance (e.g., the Gauer-Henry reflex) after several months in zero-G. The preparatory training generally consists of first imbibing 150-200 milliliters of water or juice, followed by two cycles of a sequence of progressive regimes of reduced ("negative") pressure, set at -20, -25, -30, and -35 mmHg for five min. each, then -25, -30, and -35 mmHg (Torr) for 10 min. each plus 30mmHg for 5 min. while shifting from foot to foot at 10-12 steps per minute, while wearing a sphygmomanometer to measure blood pressure. The body's circulatory system interprets the pressure differential between upper and lower body as a gravity-like force pulling the blood (and other liquids) down. Chibis data and biomed cardiovascular readings are recorded. The Chibis suit (not to be confused with the Russian "Penguin" suit for spring-loaded body compression, or the "Kentavr" anti-g suit worn during reentry) is similar to the U.S. LBNP facility (not a suit) used for the first time on Skylab in 1973/74, although it appears to accomplish its purpose more quickly.]*

Peggy Whitson collected ITCS (Internal Thermal Control System) fluid samples in the Lab and in COL (Columbus Orbital Facility) for return to the ground for analysis. *[The ammonia coolant samples were collected in special bags, which were then packed in a Ziplock bag (#1009).]*

FE-1-17 Kononenko gathered water samples in the Russian Segment from the

Service Module (SM) SVO-ZV Water Supply System, BRP-M Water Distribution & Heating Unit (Hot tap) and SM Rodnik BV1 water storage tank. All samples were prepared for return on TMA-11.

The FE-1 took the periodic sensor readings of the Russian “Pille-MKS” (MKS = ISS) radiation dosimetry experiment which has ten sensors placed at various locations in the Russian segment (DC1, SM starboard & port cabin windows, ASU toilet facility, control panel, etc.). The flash card with the stored data was removed for return on TMA-11 and replaced with another memory card. *[Nine of the ten dosimeters are read manually.]*

In the SM, Yuri & Oleg took the periodic readings of potentially harmful atmospheric contaminants with the CMS (Countermeasure System) part of the GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, which uses preprogrammed microchips to measure H₂CO (Formaldehyde, methanal), CO (Carbon Monoxide) and NH₃ (Ammonia), taking one measurement per microchip.

The Russian flight engineers printed out two copies of the formal Russian handover protocol document certifying RS handover/acceptance as part of the standard Change-of-Command procedures scheduled tomorrow. *[Two copies of the ISS RS Handover Protocol were printed out for signature by Malenchenko, Kononenko and Volkov. The first copy remains on ISS, the second copy will be returned to the ground on Soyuz TMA-11.]*

Using the vacuum cleaner and other tools, Garrett performed the periodic US segment (USOS) hatch seal inspection (Node-1 forward, aft & starboard, Lab aft & forward, Node-2 aft, and Joint Airlock, Node-2 aft & starboard) in support of ACS (Atmospheric Control System) maintenance (last time done: 2/6).

Reisman also conducted the hatch seal inspection in the JLP (Japanese Experiment Module Experiment Logistics Module Pressurized Section) module for the first time.

In the Lab, the FE-2 later continued his support of the CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) experiment in the MSG (Microgravity Science Glovebox) facility, terminating the final vacuum draw started yesterday and initiating the first sample run, for SPU-4 (Sample Processing Unit 4). *[SPU-4 will process for 10h 30min, to be followed by the next activity tomorrow. CSLM-2 examines the kinetics of competitive particle growth within a liquid matrix. During this process, small particles shrink by losing atoms to larger particles, causing the larger particles to grow (coarsen) within a liquid lead/tin matrix. This study defined the mechanisms and rates of coarsening that govern the manufacture with metals from turbine*

blades to dental amalgam fillings.]

In preparation for a microbial air sampling session scheduled tomorrow, tonight before sleep time Malenchenko will unstow and set up the MedOps SZM-MO-21 ECOSFERA equipment, initiating charging on the Ecosphere power pack (BP). *[The equipment, consisting of an air sampler set, a charger, power supply unit, and incubation tray for Petri dishes, determines microbial contamination of the ISS atmosphere, specifically the total bacterial and fungal microflora counts and microflora composition according to morphologic criteria of microorganism colonies.]*

Peggy Whitson performed a battery check on the PDA (Personal Digital Assistant) set up for charging yesterday, then undertook a series of tests of its new RFID (Radio Frequency ID) software by using it with a scanner to test RFID tags on various items for evaluation as an auditing tool. *[Tests of the SDTO (Station Development Test Objective) included scans of RFID-tagged items delivered on 28P, to be compared by the ground with as-packed 28P data, also scans of RFID-tagged items after a period of crew usage, followed by a manual audit, for subsequent comparison with these manual audit data. The use of the system for locating RFID-tagged items was also tried out.]*

With the temporary increase in crew size from three to six placing more emphasis on ventilation, Whitson is also scheduled to conduct the currently daily check of the function of the important IP-1 airflow sensors in the various Russian segment (RS) hatchways. *[The inspection includes the passageways PrK (SM Transfer Compartment)–ATV, PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1.]*

Garrett meanwhile conducted the periodic checkup on active U.S. payloads, i.e., cleaning the ANITA (Analyzing Interferometer for Ambient Air) inlet plus inspecting and filter cleaning of the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. *[The CGBA incubator is controlled from the ground, with automatic video downlinked to Earth. ANITA continues to collect data every six seconds and downlinks the data daily to the ground team. ANITA monitors low levels of potential gaseous contaminants in the ISS cabin atmosphere with a capability of simultaneously monitoring 32 gaseous contaminants. The experiment is testing the accuracy and reliability of this technology as a potential next-generation atmosphere trace-gas monitoring system for ISS and future spacecraft. This is a cooperative investigation with ESA.]*

Yuri had three hours reserved for packing and stowing of equipment on TMA-11, focusing mainly on a long list of discarded equipment which he stowed in the Orbital Module, to be jettisoned along with the Instrumentation Compartment before atmospheric entry of the Descent Module.

SFP So-Yeon Yi, with Sergei & Oleg taking photo/video imagery of her VC14 activities as required, conducted her KAP (Korean Astronaut Program) science experiments, which included work on –

- *KAP01/Growth & mutation of plant seeds (monitoring, photography, filling out questionnaire),*
- *KAP02/Identification of fruit fly genes responsive to gravity and responsible for aging (monitoring, video recording, later stowing),*
- *KAP04/SFP medical monitoring (taking six measurements of ocular [eye] pressure during the day);*
- *KAP06/Study of the possibility of using traditional Korean food in onboard food rations (testing during crew Breakfast, Lunch & Dinner, with video coverage),*
- *KAP08/Synthesis of metal-organic porous materials in microgravity (retrieval & closeout),*
- *KAP09/High-resolution telescope (ELT) and study of micro-electro-mechanical system (MEMS) for next generation telescopes (equipment deactivation, filling out questionnaire, deinstalling the gear), and*
- *KAP11/Noise level reduction onboard the ISS RS (prep & setup, taking noise measurements and imagery at various locations, tearing down hardware & preparing kit for return).*

So-Yeon also had one regular daily tagup with her consultant team at TsUP-Moscow via VHF-1 (~10:55am EDT), her third PAO TV interview, today with Figure Skater Kim Yu-na (~7:35am), and a standard PMC (Private Medical Conference).

Working off the voluntary Russian task list, So-Yeon was to transfer imagery and other data before sleeptime tonight from flash card to her RSK2 laptop HDD (Hard Disk Drive) for return to the ground.

Later tonight, Peggy Whitson will have another standard pre-descent PMC via S- & Ku-band audio/video.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), RED resistive exercise device (CDR, FE-1-17, FE-2) and VELO bike with bungee cord load trainer (FE-1, CDR-17).

Afterwards, Peggy downloaded the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Kononenko conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Oleg also did the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Working off the Russian discretionary "time permitting" task list, Malenchenko performed the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).

At ~1:15pm, Peggy Whitson & Garrett Reisman engaged in two PAO TV interviews with US clients,- CBS News (Bill Harwood, Peter King), and ABC News (Gina Sunseri).

CEO photo targets uplinked for today were **Mt. Etna, Sicily** (*nadir pass over Etna, which is usually smoking. Detailed images were requested*), **Mississippi Delta Region** (*CEO researchers requested images of this site again for more nadir views than have been acquired thus far*), **Plum Island Ecosystem, Maine** (*looking left from ISS track over Cape Cod Bay, for an estuary on the bay next north of Boston. Changing nutrient flows in the estuary, where urban pressures have increased greatly, are the object of the research. Data for many aspects of the research [water color, new housing, loss of natural landscapes, etc.] can be gleaned from ISS/CEO imagery*), and **Johnston Island reef, central Pacific** (*looking a touch right of nadir for this atoll [only 4 km long] with its surrounding, much longer coral reef. The atoll lies about 1400 km west of Hawaii and has been enlarged to accommodate a large runway. Crew was to shoot detail of the reef, for the reef-mapping project*).

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 5:54am EDT [= epoch]*):

Mean altitude -- 337.4 km

Apogee height -- 338.3 km

Perigee height -- 336.5 km

Period -- 91.28 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.000135

Solar Beta Angle -- -28.2 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 98 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53877

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port, 1:06:30am EDT)

04/19/08 -- Soyuz TMA-11/15S landing (4:31am EDT, 11:31am Moscow/DMT, 2:31pm Kazakhstan)

05/07/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/31/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS (5:01pm EDT)

06/02/08 -- STS-124/Discovery/1J docking

07/10/08 -- Russian EVA-20 (7/10-11)

08/07/08 -- ATV1 undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC

10/18/08 -- STS-126/Discovery/ULF2 docking

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-67/32P launch

11/28/08 -- Progress M-67/32P docking (SM aft port)

12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment

12/06/08 -- STS-119/Discovery/15A docking

12/15/08 -- STS-119/Discovery/15A undocking

04/23/09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD

07/16/09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation

05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**

09/03/09 -- STS-129/ULF3/Discovery - ELC1, ELC2

10/22/09 -- STS-130/20A/Endeavour – Node-3 + Cupola

01/21/10 -- STS-131/19A/Atlantis - MPLM(P)
03/18/10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
04/29/10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 04/15/08

All ISS systems continue to function nominally, except those noted previously or below. *Day 6 of joint E16/E17 operations by CDR-16 Peggy Whitson, FE-1-16 Yuri Malenchenko, FE-2-17 Garrett Reisman, CDR-17 Sergei Volkov, FE-1-17 Oleg Kononenko and SFP/VC14 So-Yeon Yi. Day 188 in space for Peggy & Yuri.*

The crew's work/sleep cycle again was adjusted slightly, from yesterday's wakeup at 2:15am to 2:20am EDT (sleep time tonight at 5:50pm). Tomorrow, work period will again be adjusted by 5 min (to 2:15am–5:45pm).

Aboard ISS, crew rotation/handover activities continued for all six residents involved. Whitson, Volkov, Malenchenko and Kononenko had several hours scheduled between them for dedicated ("functional") CDR/CDR & FE/FE handover activities; in addition, there are "generic" handovers where crewmembers are scheduled together to complete various designated standard tasks.

From the US voluntary "job jar" task list, after wakeup and before breakfast, FE-2 Garrett Reisman & SFP (Space Flight Participant) So-Yeon Yi again downloaded the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data from their Actiwatchs to the HRF-1 (Human Research Facility 1) laptop. Yi is participating for NASA under a Space Act agreement with South Korea. *[To monitor the crewmember's sleep/wake patterns and light exposure, crewmembers wear a special Actiwatch device which measures the light levels encountered by them as well as their patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

Yuri Malenchenko finished Part 2 of his second stress test plus saliva and blood sampling of the ESA/Russian biomed experiment "IMMUNO", today completing remaining urine sample collections and conducting close-out ops. Specimens were stowed in a special urine containment bag in the KRIOGEM-3M refrigerator (blood

samples were secured yesterday in the MELFI {Minus Eighty Degree Celsius Laboratory Freezer for ISS} in cold packs). *[IMMUNO is a 24-hr. test of human immune system changes, with the objective to investigate immune neuro-endocrine reactions in the space environment by studying samples of saliva, blood and urine using collection kits and the biomedical (MBI) protection kit. Also included are entries in a fluid/medications intact log, and a stress-test questionnaire to be filled out by the subject at begin and end of the first day, based on the accompanying MO-3 stress test, performed during the subject's physical exercise regimen.]*

Following his concluding "IMMUNO" session, Malenchenko took air samples with the IPD-NH₃ Draeger tubes sampler, testing for ammonia (NH₃) in the SM (Service Module), i.e., checking for spilled urine.

After FE-2 Reisman prepared the auditory test equipment, he, CDR-17 Volkov & FE-17 Kononenko took the periodic O-OHA (on-orbit hearing assessment) test, a 30-min. NASA environmental health systems examination to assess the efficacy of acoustic countermeasures, using a special MEC laptop application. It was the first session for the three crewmembers. *[The O-OHA audiography test involves minimum audibility measurements for each ear over a wide range of frequencies (0.25-10 kHz) and sound pressure levels, with the crewmembers using individual-specific Prophonics earphones, Bose ANC headsets and the SLM (sound level meter). To conduct the testing, the experimenter is supported by special EarQ software on the MEC, featuring an up/down-arrow-operated slider for each test frequency that the crewmember moves to the lowest sound pressure level at which the tone can still be heard. The baseline test is required not later than about Flight Day 14 for each new Expedition and is then generally performed once per month. Note: There have been temporary hearing deficits documented on some U.S. and Russian crewmembers, all of which recovered to pre-mission levels.]*

Malenchenko, Whitson & Yi spent three hours in the TMA-11 Descent Module (SA) to conduct the Soyuz descent drill, a standard training exercise for every crew returning on a Soyuz. The exercise, which strictly forbids any command activation (except for switching the InPU display), was supported by a tagup and discussions with ground instructor at TsUP/Moscow via S-band. *[The session includes a review of the pertinent ODFs (operational data files), specifically the books on Soyuz Ascent & Descent Procedures, Emergency Descents, and Off-Nominal Situations, crew responsibilities when executing the flight program, visual crew recognition of SUS (Entry Control System) failures, spacesuit procedures, etc., with special emphasis on operations with the Neptune-ME cockpit console. The training uses a Descent Simulator application on the RSK1 laptop. During the actual descent, Malenchenko, as Soyuz CDR, will occupy the middle couch, with Yi in the right seat and Whitson in the Descent Module's left Kazbek couch. Pending the*

final State Commission decision at about 3.5h before undocking, 15S return is expected for 4/19 (next Saturday), with undocking at 1:03:30am EDT and landing about 82 km from Arkalyk/Kazakhstan at ~4:30am (2:30pm Kazakhstan time). See below for details.]

In preparation for an upcoming software reload, the CDR plugged a PDA (Personal Digital Assistant) into an A31p SSC (Station Support Computer) laptop for recharging its battery.

CDR-17 Volkov set up for his first biweekly NOA/Nitric Oxide Analyzer (MBI-21) session and undertook the procedure, later filling in the electronic log book on the RSE1 laptop, downlinking images to TsUP via OCA, copying photos to the RSK1 laptop hard drive for return, and restowed the hardware. *[Purpose of the ESA experiment ESANO1, last performed by Oleg Kotov, consisting of the "Platon" analyzer and its power supply, is to monitor expired nitric oxide (NO) in the subject's exhaled air to detect signs of airway inflammation and indications of venous gas emboli (bubbles) that may be caused by inhalation of pollutants in the closed environment of the ISS cabin and increased risk of decompression sickness.]*

Volkov also continued his work with the Russian KPT-2 science payload BAR-RM, Kelvin, Ira and TTM-2, begun yesterday, today terminating Kelvin charging and initiating TTM-2 charging, later terminating it. *[BAR-RM is designed to develop a procedure for detection of air leakage from ISS modules based on environmental data anomalies (temperature, humidity, ultrasound emissions). The payload uses a remote infrared thermometer (Kelvin-Video), a thermohygrometer (Iva-6A), a heat-loss anemometer/thermometer (TTM-2), an ultrasound analyzer (AU-01), and a leak detector (UT2-03) to determine physical background signs of loss of ISS pressure integrity which could be indicative of leaks in the working compartments of the station. Measurements are taken in specific zones (13 in SM PkhO and 4 in DC1), both with lights & fans turned on and off. The BAR instruments' batteries need to be recharged every two months to keep them at their peak performance.]*

Garrett Reisman completed a 30-min. Robotics OBT (Onboard Training) session to "brush up" on a number of basic maneuvers for the SSRMS (Space Station Remote Manipulator System) required during his tenure on Increment 17. *[The review included such tasks as unloading the arm, grappling & ungrapppling an MPLM (Multi-Purpose Logistics Module), single-joint maneuvering to EVA pickup, maneuvering to an S0 truss location, and performing an emergency EVA dropoff at the Airlock.]*

Malenchenko, with Volkov observing, spent some time on the GANK-4M real-time Harmful Contaminant Gas Analyzer of the Service Module (SM) pressure control & atmospheric monitoring system (SOGS), adjusting a measurement coefficient ("Coefficient B") and taking atmospheric readings.

Yuri & Sergei also performed a health check on a the FPP ST-64 electronic interference filter, designed to protect the ATV from electromagnetic interference (EMI), by connecting it to the MMTs-01 Multimeter and testing for resistance, i.e., electric continuity.

In the Lab, Garrett Reisman continued his support of the CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) experiment in the MSG (Microgravity Science Glovebox) facility in preparation for experiment operations scheduled tomorrow. *[Evacuation activities consisted in closing vacuum vent valves, checking for acceptable humidity levels, and opening the SPU (Sample Processing Unit) water valve to initiate unattended vacuum prep, followed later by closing the SPU water valve, checking again for humidity levels in the sample chamber, and opening the vent valve and vacuum valve to initiate a vacuum draw on the sample chamber. The steps were later repeated for another SPU. CSLM-2 examines the kinetics of competitive particle growth within a liquid matrix. During this process, small particles shrink by losing atoms to larger particles, causing the larger particles to grow (coarsen) within a liquid lead/tin matrix. This study defined the mechanisms and rates of coarsening that govern the manufacture with metals from turbine blades to dental amalgam fillings.]*

Peggy Whitson completed the T+2 in-flight microbiology analysis of water samples collected in the ATV "Jules Verne" in MCDs (Microbial Capture Devices) on 4/13, while Garrett Reisman (as functional handover) performed the T+2 analysis on the samples collected by him in the SM. The analysis, which also uses coliform detection bags, involves visual inspection for colony growth and data recording. *[The water samples were taken from the ATV water tank and the SM SRV-K (Condensate Water Processor) Hot and Warm water taps. Some of the samples taken on 4/13 will return on Flight 1J for ground analysis.]*

Reisman also conducted the periodic (every two weeks) inspection of the RED (Resistive Exercise Device) canister bolts for re-tightening if required, followed by the monthly inspection of canister cords and RED accessories.

The two new Inc17 crewmembers, Sergei & Oleg, continued their familiarization overview of the onboard exercise equipment, today focusing on the anaerobic RED device.

Besides their extensive handover activities with Peggy and Yuri, the two "newcomers" Sergei & Oleg assisted SFP Yi in conducting her KAP (Korean Astronaut Program) science experiments, particularly in taking photo/video imagery of the VC14 activities where required.

So-Yeon Yi's busy schedule today included work on –

- *KAP01/Growth & mutation of plant seeds (monitoring, photography, filling out questionnaire),*
- *KAP02/Identification of fruit fly genes responsive to gravity and responsible for aging (monitoring, video recording, later stowing),*
- *KAP04/SFP medical monitoring (Holter cardiac recording equipment, experiment termination & closeout);*
- *KAP06/Study of the possibility of using traditional Korean food in onboard food rations (testing during crew Breakfast, Lunch & Dinner, with video coverage),*
- *KAP07/Growth of Zeolite crystals, super crystals, and crystal layers in microgravity (equipment transfer, assembly, setup in SM, removing samples G.H.I, from oven & conducting closeout ops),*
- *KAP08/Synthesis of metal-organic porous materials in microgravity (oven temperature check),*
- *KAP09/High-resolution telescope (ELT) and study of micro-electro-mechanical system (MEMS) for next generation telescopes (equipment deactivation, video recording, filling out questionnaire, remounting and activating equipment at window, questionnaire),*
- *KAP14/Educational experiment; demo of Surface Tension in zero-G),*
- *KAP15/Recording scenes of daily life & activities of the SFP, using Samsung Gx-10 and Samsung NV11 cameras. (Footage to be downlinked on 4/17).*

So-Yeon also had one regular daily tagup with her consultant team at TsUP-Moscow via VHF-1 (~10:35am EDT) and her third telephone interview with a Korean radio station (~4:20am).

Working off the voluntary Russian task list, So-Yeon was to transfer imagery and other data before sleeptime tonight from flash card to her RSK2 laptop HDD (Hard Disk Drive) for return to the ground.

With the temporary increase in crew size from three to six placing more emphasis on ventilation, CDR-17 Volkov conducted the currently daily check of the function of the important IP-1 airflow sensors in the various Russian segment (RS) hatchways.

[The inspection includes the passageways PrK (SM Transfer Compartment)–ATV, PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1.]

Kononenko conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Volkov completed the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

At ~5:30pm, shortly before sleep time, Oleg is scheduled to set up the Russian MBI-12 SONOKARD (Sonocard) payload and started his first experiment session, using a sports shirt from the SONOKARD kit with a special device in the pocket for testing a new method for acquiring physiological data without using direct contact on the skin. Measurements are recorded on a data card for return to Earth. *[SONOKARD objectives are stated to (1) study the feasibility of obtaining the maximum of data through computer processing of records obtained overnight, (2) systematically record the crewmember’s physiological functions during sleep, (3) study the feasibility of obtaining real-time crew health data. Investigators believe that contactless acquisition of cardiorespiratory data over the night period could serve as a basis for developing efficient criteria for evaluating and predicting adaptive capability of human body in long-duration space flight.]*

Working off the Russian discretionary “time permitting” task list, Malenchenko performed the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).

At 11:00am EDT, all crewmembers, including SFP So-Yeon Yi, gathered in the US segment for the “traditional” live televised SFP/Joint Crew News conference, with US media at NASA Centers (~15 min.) and Russian/Korean media at TsUP-Moscow (~15 min.).

At ~1:25pm, Peggy Whitson & Garrett Reisman engaged in two PAO TV interviews with US clients,- SPACE.COM (Tariq Malik) and Houston Chronicle (Mark Carreau).

Whitson & Malenchenko underwent another standard pre-descent PMC (Private Medical Conference) via S- & Ku-band audio/video.

At ~2:15pm, Reisman set up and activated the VDS MPC (Video Distribution System/Multi-Purpose Converter) with its four downlinks to allow the ground to “pull down” accumulated HDTV (high-definition TV) footage of onboard activities. Later (~3:20pm), the MPC will be powered off again.

The periodic US segment hatch seal inspection was added to the discretionary “job jar” task list for the FE-2.

The crewmembers completed their regular 2.5-hr. physical workout program (about

half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (CDR, FE-1/fulltime), and RED resistive exercise device (FE-2). Volkov & Kononenko also performed their first physical exercise session on ISS, Sergei on the Russian VELO bike with bungee cord load trainer, Oleg on the RED.

Afterwards, Peggy & Sergei downloaded the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Handover Background: Handover activities between E16 & E17 crewmembers are designed to cover a large variety of onboard systems & operations, including Safety, Communications, Video & Audio, Life Support (SOZh), US Segment, TORU/ Teleoperator Control, EVA Tools, ATV Status, Science Hardware, Medical Equipment, Iridium-9505A phone, CISN (Crew Informational Support System), BVS/ Onboard Computer System, etc. FE-1 Malenchenko has 13:15 hrs scheduled for equipment preparation for return & disposal stowage on Soyuz 15S, with 3 hrs of assistance by Sergei Volkov.

What will the Soyuz TMA-11 crew experience during their reentry/descent?

For the reentry, Malenchenko, Whitson and Yi will be wearing the Russian Kentavr anti-G suit. *[The Kentavr garment is a protective anti-g suit ensemble to facilitate the return of a long-duration crewmember into the Earth gravity. Consisting of shorts, gaiters, underpants, jersey and socks, it acts as countermeasure for circulatory disturbance, prevents crewmember from overloading during descent and increases orthostatic tolerance during post-flight adaptation. Russian crewmembers are also advised to ingest fluid-electrolyte additives, viz., three sodium chloride tablets during breakfast and after the midday meal, each time with 300 ml of fluid, and two pills during the meal aboard Soyuz before deorbit.]*

Before descent:

Special attention will be paid to the need for careful donning of the medical belt with sensors and securing tight contact between sensors and body.

During preparation for descent, before atmosphere reentry, crewmembers settle down comfortably in the Kazbek couches, fasten the belts, securing tight contact between body and the seat liner in the couch.

During de-orbit:

Dust particles starting to sink in the Descent Module (SA) cabin is the first indication of atmosphere reentry and beginning of G-load effect. From that time on, special attention is required as the loads increase rapidly.

Under G-load effect during atmosphere reentry the crew expects the following experience:

Sensation of G-load pressure on the body, burden in the body, labored breathing and speech. These are normal sensations, and the advice is to "take them coolly". In case of the feeling of a lump in the throat, this is no cause to "be nervous". This is frequent and should not be fought. Best is to "try not to swallow and talk at this moment". Crew should check vision and, if any disturbances occur, create additional tension of abdominal pressure and leg muscles (strain abdomen by pulling in), in addition to the Kentavr anti-G suit.

During deployment of pilot parachute (0.62 & 4.5 square meters), drogue chute (16 sq.m.) and main (518 sq.m.) chutes the impact accelerations will be perceived as a "strong snatch". No reason to become concerned about this but one should be prepared that during the parachutes deployment and change ("rehook") of prime parachute to symmetrical suspension, swinging and spinning motion of the SA occurs, which involves vestibular (middle ear) irritations.

It is important to tighten restrain system to fasten pelvis and pectoral arch. Vestibular irritation can occur in the form of different referred sensations such as vertigo, hyperhidrosis, postural illusions, general discomfort and nausea. To prevent vestibular irritation the crew should "limit head movement and eyes movement", as well as fix their sight on motionless objects.

Just before the landing (softened by six small rocket engines behind the heat shield):

Crew will be prepared for the vehicle impact with the ground, with their bodies fixed along the surface of the seat liner in advance. "Special attention should be paid to arm fixation to avoid the elbow and hand squat" (instruction). Landing speed: ~9.9 m/sec.

After landing:

Crew should not get up quickly from their seats to leave the SA. They were advised to stay in the couch for several minutes and only then stand up. In doing that, they should limit head and eyes movement and avoid excessive motions, proceeding slowly. They and their body should not take up earth gravity in the upright position too quickly.

CEO photo targets uplinked for today were **Lake Nasser, Toshka Lakes, Egypt** (*images of shoreline change along Lake Nasser as well as around the Toshka Lakes were requested. Dark lake water stands out well against the light desert background. Lake levels have been dropping for two years after rising for several years. The Toshka lakes in southern Egypt were developed in order to draw farming populations from the overpopulated Nile Delta in the north. Falling water*

levels are thus a worrying sign for the project), **Charlevoix Impact Crater, Quebec** (this ancient crater [345 million years old] has been heavily affected by the evolution of the St. Lawrence Gulf, and then by repeated glaciations in the last 3 million years, so that only half the crater appears. With a diameter of 54 km, it is a comparatively large feature and easy to locate on the north bank of the Gulf. [The crater is heavily built up and farmed so that the ring itself is less easy to detect although the topographic image shows the morphology well.]), and **Slate Islands Impact Crater, Lake Superior** (this 30-km-diameter crater is 450 million years old. It is one of the easiest to detect from low earth orbit, because it makes up a circular set of islands near the north shore of Lake Superior).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (as of this morning, 1:29am EDT [= epoch]):

Mean altitude -- 337.5 km

Apogee height -- 338.4 km

Perigee height -- 336.7 km

Period -- 91.28 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0001259

Solar Beta Angle -- -24.8 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 180 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53859

Significant Events Ahead (all dates Eastern Time, some changes possible.):

04/19/08 -- Soyuz TMA-11/15S undocking (FGB nadir port, 1:03:30am EDT)

04/19/08 -- Soyuz TMA-11/15S landing (4:30am EDT, 11:30am Moscow/DMT, 2:30pm Kazakhstan)

05/07/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/31/08 -- STS-124/Discovery/1J launch -- JEM PM "Kibo", racks, RMS (5:01pm EDT)

06/02/08 -- STS-124/Discovery/1J docking

07/10/08 -- Russian EVA-20 (7/10-11)

08/07/08 -- ATV1 undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
04/23/09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
07/16/09 -- STS-128/17A/Atlantis – MPLM(P), last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
09/03/09 -- STS-129/ULF3/Discovery - ELC1, ELC2
10/22/09 -- STS-130/20A/Endeavour – Node-3 + Cupola
01/21/10 -- STS-131/19A/Atlantis - MPLM(P)
03/18/10 -- STS-132/ULF4/Discovery – ICC-VLD, MRM1 (contingency)
04/29/10 -- STS-133/ULF5/Endeavour – ELC3, ELC4 (contingency).

ISS On-Orbit Status 04/14/08

All ISS systems continue to function nominally, except those noted previously or below. *Day 5 of joint E16/E17 operations by CDR-16 Peggy Whitson, FE-1-16 Yuri Malenchenko, FE-2-17 Garrett Reisman, CDR-17 Sergei Volkov, FE-1-17 Oleg Kononenko and SFP/VC14 So-Yeon Yi. Underway: Week 26 of Increment 16.*

The crew's work/sleep cycle again was adjusted slightly, from yesterday's wakeup at 2:10am to 2:15am EDT (sleep time tonight at 5:45pm). Tomorrow, work period will again be adjusted by 5 min (to 2:20am–5:50pm).

Aboard ISS, the E16/E17 crew rotation/handover period went underway with full activity schedules for all six residents involved. Whitson, Volkov, Malenchenko and Kononenko had several hours crew time between them for dedicated CDR/CDR & FE/FE handover activities. In addition, there are "generic" handovers where crewmembers are scheduled together to complete various designated standard tasks.

From the US voluntary "job jar" task list, after wakeup and before breakfast, FE-2 Garrett Reisman & SFP (Space Flight Participant) So-Yeon Yi again downloaded the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data from their Actiwatchs to the HRF-1 (Human Research Facility 1) laptop. Yi is participating for NASA under a Space Act agreement with South Korea. *[To monitor the crewmember's sleep/wake patterns and light exposure, crewmembers wear a special Actiwatch device which measures the light levels encountered by them as well as their patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

CDR Whitson & FE-2 Reisman wrapped up their second session of the biomed experiment INTEGRATED IMMUNE (Validating Procedures for Monitoring Crew member Immune Function) by collecting one final wet saliva sample first thing after

wake-up. *[IMMUNE protocol requires the collection to occur first thing post-sleep, before eating, drinking and brushing teeth, and all samples are stored at ambient temperature. Along with NUTRITION (Nutritional Status Assessment), INTEGRATED IMMUNE samples & analyzes participant's blood, urine, and saliva before, during and after flight for changes related to functions like bone metabolism, oxidative damage and immune function to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects. The saliva is collected in two forms, dry and liquid. The liquid saliva collections require that the crewmembers soak a piece of cotton inside their mouth and place it in a salivette bag; there are four of the liquid collections during docked operations.]*

After yesterday's unstowing and setting up of the necessary hardware for the ESA/Russian biomed experiment "IMMUNO", including the KRIOGEM-03M refrigerator, Plasma-03 accessories, CARDIOSCIENCE and SALIVA-IMMUNO kits and wipes, FE-1 Malenchenko today undertook the scheduled session (his last), starting with the first stress test (of two) plus saliva and blood sampling, assisted by CDR-17 Volkov where required for venous blood collection and blood sample processing (smear & in the Plasma-03 centrifuge). Samples were then secured in the MELFI (Minus Eighty Degree Celsius Laboratory Freezer for ISS) in cold packs in their KB-03 container. *[IMMUNO is a 24-hr. test of human immune system changes, with the objective to investigate immune neuro-endocrine reactions in the space environment by studying samples of saliva, blood and urine using collection kits and the biomedical (MBI) protection kit. Also included is a stress-test questionnaire to be filled out by the subject at begin and end of IMMUNO and based on the accompanying MO-3 stress test, performed during the subject's physical exercise regimen.]*

CDR Whitson worked in the JLP (Japanese Experiment Module Experiment Logistics Module Pressurized Section), performing the periodical status and shell temperature check from the MKAM (Minimum Keep-Alive Monitor).

After briefly activating the JLP MKAM fan and moving the JLP's PBA (Portable Breathing Apparatus) from its location COL1PF in the COL (Columbus Orbital Laboratory) to the JLP endcone (JLP1F3), Whitson performed further troubleshooting on the wiring and fixture of the failed JLP GLA (General Luminaire Assembly) P2A, then deactivated the JLP MKAM fan again and returned the PBA to the COL1PF location.

In the COL, Garrett Reisman performed a similar activity, troubleshooting two failed MLU lighting fixtures, MLU1 & MLU7 (which correspond to the USOS GLAs), to determine the possible cause of their failure.

FE-2 Reisman also conducted the periodic inspection of the ELPS (Emergency Lighting & Power Supply) subsystems in Node-2, A/L (US Airlock), COL (Columbus Orbital Laboratory), and Node-1, shown yesterday still as a discretionary activity on the US "job jar" task list.

For their departure on 4/18, Yuri Malenchenko & Peggy Whitson spent an hour in the Soyuz TMA-11/15S Descent Module (SA) supporting a ground-commanded checkout of the Soyuz motion control system (SUD, Mode 2/"Docked") which included pressurization of the Combined Propulsion System (KDU) Section 2 and Tank 2, a test of the pilot's translational hand controller (RUD), and a hot firing of the DPO braking thrusters. KDU maneuver thrusters and DPO lateral thrusters were not fired. The thruster test was nominal, using 15 kg of propellant. *[For the test, station attitude was handed over to Russian thruster control at 8:30am EDT, commanded to free drift at 8:38am, then back to LVLH XVV (Local Vertical Local Horizontal/x-axis in velocity vector) attitude. The one-minute firing started on Daily Orbit 3 at ~8:40am. Attitude control was returned to the U.S. segment (USOS) at 9:27am.]*

Peggy also had another hour set aside for equipment prepacking and transfer to 15S.

Malenchenko, with Kononenko & Volkov observing, conducted his sixth recharging of the Motorola Iridium-9505A satellite phone brought up on Soyuz 15S, a monthly routine job. *[After retrieving it from its location in the TMA-11/15S descent module (BO) at ~6:25am EDT, Yuri initiated the recharging of its lithium-ion battery, monitoring the process every 10-15 minutes as it took place. Upon completion at ~7:45am, the phone was returned inside its SSSP Iridium kit and stowed back in the BO's operational data files (ODF) container. The satphone accompanies returning ISS crews on Soyuz reentry & landing for contingency communications with SAR (Search-and-Rescue) personnel after touchdown (e.g., after an "undershoot" ballistic reentry). The Russian-developed procedure for the monthly recharging has been approved jointly by safety officials. During the procedure, the phone is left in its fire-protective fluoroplastic bag with open flap. The Iridium 9505A satphone uses the Iridium constellation of low-Earth orbit satellites to relay the landed Soyuz capsule's GPS (Global Positioning System) coordinates to helicopter-borne recovery crews. The older Iridium-9505 phones were first put onboard Soyuz in August 2003. The newer 9505A phone, currently in use, delivers 30 hours of standby time and three hours of talk, up from 20 and two hours, respectively, on the older units.]*

In the Lab, after inspecting, activating & configuring the MSG (Microgravity Science Glovebox) facility, Garrett Reisman initiated a new series of vacuum draws on the sample chamber containing an SPU (Sample Processing Unit), by opening the vent

and vacuum valves, for subsequent CSLM-2 (Coarsening in Solid-Liquid Mixtures 2) experiment ops. A second vacuum venting was initiated later in the day. *[CSLM-2 examines the kinetics of competitive particle growth within a liquid matrix. During this process, small particles shrink by losing atoms to larger particles, causing the larger particles to grow (coarsen) within a liquid lead/tin matrix. This study defined the mechanisms and rates of coarsening that govern the manufacture with metals from turbine blades to dental amalgam fillings.]*

Reisman performed maintenance on the MCA (Major Constituents Analyzer), modifying/replacing Mass Spectrometer Assembly ORU connections.

CDR-17 Volkov and FE-1-17Kononenko supported the successful activation of the Elektron oxygen (O₂) generator using the new procedure without the EMI filter on the Elektron's current stabilizer (FPP ST-64) but with ATV "Jules Verne" disconnected from the Service Module (SM) power system. *[Sergei & Oleg first pressurized the BZh Liquid Unit with N₂ (nitrogen) via laptop and later monitored the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating.]*

Kononenko also conducted an ISS repressurization test with ATV oxygen by introducing 4.43 mmHg of O₂ in the cabin today from ATV tankage. This was the first use of the ATV-1 GDS (Gas Delivery System).

In addition, the US OGS (Oxygen Generation System) production was increased to 100 % earlier this morning. *[OGS deactivation will occur upon consumption of remaining water in the PWR reservoir, expected later today.]*

The two new Inc17 crewmembers, Sergei & Oleg, prepared for their physical exercise activities by going through an "orientation course" on procedures using the onboard exercise facilities.

Besides his extensive handover activities with Peggy Whitson and the two flight engineers, Volkov assisted SFP Yi in conducting her KAP (Korean Astronaut Program) science experiments, particularly in taking photo/video imagery of the VC14 activities where required.

So-Yeon Yi's busy schedule today included work on –

- *KAP01/Growth & mutation of plant seeds (monitoring, photography, filling out questionnaire),*
- *KAP02/Identification of fruit fly genes responsive to gravity and responsible for aging (monitoring, video recording, later stowing),*

- KAP03/Development of Bioreactor for use on the ISS,
- KAP04/SFP medical monitoring (Holter cardiac recording equipment, experiment setup & start);
- KAP05/Study of SFP facial changes using a Moiré screen (preparation, experiment ops session),
- KAP06/Study of the possibility of using traditional Korean food in onboard food rations (testing during crew Breakfast, Lunch & Dinner, with video coverage),
- KAP07/Growth of Zeolite crystals, super crystals, and crystal layers in microgravity (equipment transfer, assembly, setup in SM, removing samples D,E,F from oven & replacing with G,H; five temperature checks during the day),
- KAP08/Synthesis of metal-organic porous materials in microgravity (oven temperature check),
- KAP09/High-resolution telescope (ELT) and study of micro-electro-mechanical system (MEMS) for next generation telescopes (equipment deactivation, video recording, filling out questionnaire),
- KAP12/Study of molecular memory device characteristics in space habitation environment (preparation, first test);
- KAP13/Measurements using the South-Korean developed SMMS (Small Mass Measurement System, calibration, measurements, later termination & cleanup),
- KAP15/Recording scenes of daily life & activities of the SFP, using Samsung Gx-10 and Samsung NV11 cameras.

So-Yeon also had two regular daily tagup with her consultant team at TsUP-Moscow via VHF-1 (~4:05am EDT; ~10:15am) and her second live PAO TV broadcast interview with South Korean 8 O'clock News (~6:55am). [Anchor: "Korea's first astronaut Yi So-yeon is also an honorary special correspondent from space. Today we will connect with Yi So-yeon, who is in the International Space Station, to hear from her what is going on in the station. Ms. Yi?" Yi: "Yes, I'm here in the International Space Station. Right now, we are orbiting just outside of (name of a place)." Anchor: "I see. Today is your fifth day in the ISS. How are you adapting?" Yi: "(After demonstrating another zero-gravity somersault, which she demonstrated during the first broadcast, she continues with the interview while upside down for about 2 minutes.) "Did I turn better than I did during the first broadcast? My body is gradually adjusting to zero gravity. In space, you quickly learn to move around using your fingers. If you just softly push away from a wall inside the cabin, your body will fly across to the other side. Outside the station, we move around by holding onto a handrail along the cargo bay. There's really no need to use your legs except when you need to support your body." Anchor: "Do astronauts gain weight in zero gravity?" Yi: "Astronauts do not gain a single gram

of weight even if they eat all they want. Isn't that hard to believe? It's true, though. But it's not necessarily a good thing. Even if your body weight does not increase, body mass does. Mass is unrelated to gravity. So, if you weigh yourself after coming back to Earth, you might find you weigh more than you did before you left. However, most astronauts lose about a kilogram after one week aboard a space flight..."]

Working off the voluntary Russian task list, So-Yeon was to transfer imagery and other data before sleeptime tonight from flash card to her RSK2 laptop HDD (Hard Disk Drive) for return to the ground.

With the temporary increase in crew size from three to six placing more emphasis on ventilation, CDR Whitson conducted the currently daily check of the function of the important IP-1 airflow sensors in the various Russian segment (RS) hatchways.

[The inspection includes the passageways PrK (SM Transfer Compartment)–ATV, PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1.]

Major science activities in the Russian segment (RS) by Kononenko, with Volkov taking photo/video imagery, today focused on the biotechnological experiments BIOEMULSION (BTKh-14). *[Completing bioreactor thermostatic shell ops & setting up bioreactor in thermostatic chamber, later unplugging thermostat shell (KT) from power outlet, disassembling and stowing.]*

CDR Whitson conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Oleg completed the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Sergei set up the Russian KPT-2 "BAR-RM" science payload and prepared it for subsequent operation by initiating battery charging. *[BAR-RM is designed to develop a procedure for detection of air leakage from ISS modules based on environmental data anomalies (temperature, humidity, ultrasound emissions). The payload uses a remote infrared thermometer (Kelvin-Video), a thermohygrometer (Iva-6A), a heat-loss anemometer/thermometer (TTM-2), an ultrasound analyzer (AU-01), and a leak detector (UT2-03) to determine physical background signs of loss of ISS pressure integrity which could be indicative of leaks in the working compartments of the station. Measurements are taken in specific zones of ISS modules, both with lights & fans turned on and off.]*

Volkov also conducted his first observation and aerial KPT-3 photography session of environmental conditions for Russia's Environmental Safety Agency (ECON) using the Nikon D2X digital camera with SIGMA 300-800mm telephoto lens, focusing on Dnepr and Volga River contamination.

So-Yeon Yi and the three Russian crewmembers had about two hours set aside for scheduled commemorative (Russian: "symbolic") activities, a standard tradition for visiting guests and departing expedition crewmembers, today signing and stamping several dozen ISS-16, ISS-17 & VC14 envelopes for Roskosmos, preparing an ISS-16 & ISS-17 flag for Y.A. Gagarin High School No. 66, preparing UN flags and signing ISS-16, ISS-17 & VC14 Certificates, and making a photo/video record of everything.

Volkov, Kononenko and Yi had their standard periodic PMC (Private Medical Conference) via S- & Ku-band audio/video.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (CDR, FE-1/fulltime), and RED resistive exercise device (FE-2).

Afterwards, Garrett and Oleg downloaded the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working off the Russian discretionary "time permitting" task list, Malenchenko performed the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder), and

At ~10:40am EDT, Whitson & Reisman participated in a live PAO TV interview with two clients,- FOX News Radio and WOI-TV, Iowa.

Handover Update: Handover activities between E16 & E17 crewmembers are designed to cover a large variety of onboard systems & operations, including Safety, Communications, Video & Audio, Life Support (SOZh), US Segment, TORU/ Teleoperator Control, EVA Tools, ATV Status, Science Hardware, Medical Equipment, Iridium-9505A phone, CISN (Crew Informational Support System), BVS/ Onboard Computer System, etc. FE-1 Malenchenko has 13:15 hrs scheduled for equipment preparation for return & disposal stowage on Soyuz 15S, with 3 hrs of

assistance by Sergei Volkov.

Return Procedures Preps: After the Soyuz TMA-11 descent review on 4/7 and today's test of the Soyuz MCS (Motion Control System (SUD), the standard descent OBT/drill will be conducted tomorrow (4/15).

IMV Update: Peggy's work on the Intermodule Ventilation (IMV) system over the weekend has increased airflow significantly.

Acoustic Dosimetry Update: The acoustic dosimeter worn by FE-1 Malenchenko overnight for 16 hrs with a microphone on the shirt collar has failed, despite a battery change by the crew. No data were acquired for calldown last night.

No CEO photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 6:49am EDT [= epoch]*):

ISS On-Orbit Status 04/13/08

All ISS systems continue to function nominally, except those noted previously or below. *Day 4 of joint E16/E17 operations by CDR-16 Peggy Whitson, FE-1-16 Yuri Malenchenko, FE-2-17 Garrett Reisman, CDR-17 Sergei Volkov, FE-1-17 Oleg Kononenko and SFP/VC14 So-Yeon Yi. Sunday. Ahead: Week 26 of Increment 16.*

The crew's work/sleep cycle again was adjusted slightly, from yesterday's wakeup at 2:20am to 2:10am EDT (sleep time tonight at 5:40pm). Tomorrow, work period will be adjusted by 5 min (to 2:15am–5:45pm).

Aboard ISS, the E16/E17 crew rotation/handover period went underway with full activity schedules for all six residents involved. Whitson, Volkov, Malenchenko and Kononenko had several hours crewtime between them for dedicated CDR/CDR & FE/FE handover activities. In addition, there are "generic" handovers where crewmembers are scheduled together to complete various designated standard tasks.

From the US voluntary "job jar" task list, after wakeup and before breakfast, FE-2 Reisman & SFP (Space Flight Participant) So-Yeon Yi again downloaded the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data from their Actiwatch to the HRF-1 (Human Research Facility 1) laptop. Yi is participating for NASA under a Space Act agreement with South Korea. *[To monitor the crewmember's sleep/wake patterns and light exposure, crewmembers wear a special Actiwatch device which measures the light levels encountered by them as well as their patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

With the CDRA (Carbon Dioxide Removal Assembly) operating, Whitson terminated

the regeneration of METOX (Metal Oxide) CO₂ absorption canisters #0012 & #0013 in the US Airlock (A/L) oven. *[Next on schedule for CDRA: a fan speed test tomorrow.]*

Peggy also unstowed and deployed an acoustic dosimeter, to be worn by FE-1 Malenchenko for the next 16 hrs with a microphone on the shirt collar. Tonight (~5:20pm) the CDR will call down the data from Yuri's dosimeter and restow the instrument.

Today was the periodical water sample collection & processing day for the crew. CDR Whitson started with a procedures review after unstowing two newly arrived sampling kits. With the first kit, Whitson then collected water samples from the ATV (Automated Transfer Vehicle) "Jules Verne" (which took longer than expected due to initially confusing water tank labeling), the other was used by FE-2 Reisman for the nominal sampling in the SM (Service Module). *[Garrett took potable water samples for microbial in-flight analysis at the SRV-K Hot port, SRV-K Warm port & SVO-ZV taps, plus two chemical/archival post-flight samples from SRV-K Warm & SVO-ZV, using jointly approved Russian sampling procedures with the U.S. WS&A (Water Sampler & Archiver) kit for collection.]*

Later, Reisman performed the in-flight analysis using the WMK (Water Microbiology Kit) and its MCDs (Microbial Capture Devices) with Coliform Detection Bags. *[Four samples (one ATV, three SM) were processed. Two chemical post-flight samples from SRV-K Warm & SVO-ZV will be returned on the STS-124/1J flight. Note: Flush water is being reclaimed by mopping it up with towels which are then hung up in the Russian segment (RS) for evaporation, collection & condensation in the SKV2 air conditioner, thus reducing the amount of water to be transferred from the Lab CCAA (Common Cabin Air Assembly) condensate tank to the RS for "Elektron" processing (demineralizing). Also: there is no cold water tap on ISS, but water can be cooled by placing it at certain naturally cold locations.]*

In preparation for his return to gravity, Yuri also undertook his fourth preliminary session of the Russian MO-5 MedOps protocol of cardiovascular evaluation in the "Chibis" below-the-waist reduced-pressure suit (ODNT, US: LBNP) on the VELO ergometer, assisted by Whitson as CMO (Crew Medical Officer). *[The 60-min assessment, supported by ground specialist tagup (VHF) and telemetry monitoring from Russian ground sites (at 8:16am EDT), uses the Gamma-1 ECG equipment with biomed harness, skin electrodes and a blood pressure and rheoplethysmograph cuff wired to the cycle ergometer's instrumentation panels. The Chibis ODNT provides gravity-simulating stress to the body's cardiovascular/circulatory system for evaluation of Malenchenko's orthostatic tolerance (e.g., the Gauer-Henry reflex) after several weeks in zero-G. The preparatory training*

generally consists of first imbibing 150-200 milliliters of water or juice, followed by a sequence of progressive regimes of reduced ("negative") pressure, set at -25, -30, -35 and -40 mmHg (Torr) for five minutes each while shifting from foot to foot at 10-12 steps per minute, while wearing a sphygmomanometer to measure blood pressure. The body's circulatory system interprets the pressure differential between upper and lower body as a gravity-like force pulling the blood (and other liquids) down. Chibis data and biomed cardiovascular readings are recorded. The Chibis suit (not to be confused with the Russian "Penguin" suit for spring-loaded body compression, or the "Kentavr" anti-g suit worn during reentry) is similar to the U.S. LBNP facility (not a suit) used for the first time on Skylab in 1973/74, although it appears to accomplish its purpose more quickly.]

Continuing the extended leak checking of the spare BZh Liquid Unit (#056) for the Elektron O₂ generator, Malenchenko, with Volkov & Kononenko observing, charged the unit once again with pressurized N₂ from the BPA Nitrogen Purge Unit (#23) to 1 atm (1 kg/cm²). The last test pressurization was on 3/14. *[During Elektron operation, the inert gas locked up in the BZh has the purpose to prevent dangerous O₂/H₂ mixing. A leaking BZh cannot be used.]*

Working on the TVIS (Treadmill with Vibration Isolation & Stabilization), Peggy Whitson prepared the new PCMCIA memory/storage cards for CDR-17 Sergei Volkov and FE-1-17 Oleg Kononenko with their physical exercise protocol.

Peggy also unstowed a spare A31p laptop (#1096) plus 60GB HDD (Hard Disk Drive, #1188) and prepared the computer with BIOS settings updated for use as a Russian C&C SSC (Command & Control/Station Support Computer) anywhere in the SSC power chain.

In preparation for his final session of the ESA/Russian biomed experiment "IMMUNO", Yuri Malenchenko set up the IMMUNO urine collection hardware and took air samples with the IPD-NH₃ Draeger tubes sampler (Tube #6), testing for ammonia (NH₃) in the SM. *[IMMUNO is a 24-hr. test of human immune system changes, with the objective to investigate immune neuro-endocrine reactions in the space environment by studying samples of saliva, blood and urine using collection kits and the biomedical (MBI) protection kit. Samples are secured in the MELFI (Minus-Eighty Laboratory Freezer for ISS). Also included are entries in a fluid/medications intact log, and a stress-test questionnaire to be filled out by the subject at begin and end. Urine is collected during a 24-hour period, conventionally divided into two twelve-hour phases: morning-evening and evening-morning.]*

The FE-1 also closed out the BIO-5 Rasteniya-2 ("Plants-2") experiment, securing

the grown beans from the plants in a bag, retrieving the dry plants and pre-packing the payload equipment for return on Soyuz TMA-12. *[Rasteniya-2 researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}).]*

Besides his extensive handover activities with Oleg Kononenko, FE-1 Malenchenko assisted SFP Yi in conducting her KAP (Korean Astronaut Program) science experiments, switching the KRIOGEM-03 refrigerator to -22 degC and installing Yi's cold packs from -03, also taking photo/video imagery of the VC14 activities where required, particularly for KAP15.

So-Yeon Yi's busy schedule today included work on –

- *KAP01/Growth & mutation of plant seeds (monitoring, photography, filling out questionnaire),*
- *KAP02/Identification of fruit fly genes responsive to gravity and responsible for aging (monitoring, video recording, later stowing),*
- *KAP06/Study of the possibility of using traditional Korean food in onboard food rations (testing during crew Breakfast, Lunch & Dinner, with video coverage),*
- *KAP07/Growth of Zeolite crystals, super crystals, and crystal layers in microgravity (equipment transfer, assembly, setup in SM, removing samples A,B,C from oven & replacing with D,E,F; five temperature checks),*
- *KAP08/Synthesis of metal-organic porous materials in microgravity (hardware transfer, assembly and setup, installation of first sample, oven activation, and temperature check, sample retrieval & new setup in oven),*
- *KAP09/High-resolution telescope (ELT) and study of micro-electro-mechanical system (MEMS) for next generation telescopes (re-mounting equipment at SM window 9, activation, video recording, filling out questionnaire),*
- *KAP12/Study of molecular memory device characteristics in space habitation environment (preparation, first test);*
- *KAP14/Educational experiment (three demos: "Space Pen", "Newton's Laws", Momentum, Acceleration & Gravitation"),*
- *KAP15/Recording scenes of daily life & activities of the SFP, using Samsung Gx-10 and Samsung NV11 cameras.*

So-Yeon also had a regular daily tagup with her consultant team at TsUP-Moscow via VHF-1 (~11:25am), a telephone conversation via VHF-1 with a Korean radio station (~5:15am), and a VC14 ham radio session (~6:50am).

With the temporary increase in crew size from three to six placing more emphasis on ventilation, CDR Whitson was scheduled to check on the function of the

important IP-1 airflow sensors in the various Russian segment (RS) hatchways. *[The inspection includes the passageways PrK (SM Transfer Compartment)–ATV, PrK–RO (SM Working Compartment), PkhO (SM Transfer Tunnel)–RO, PkhO–DC1, PkhO–FGB PGO, FGB PGO–FGB GA, FGB GA–Node-1.]*

Major science activities in the Russian segment (RS) by Kononenko, with Volkov taking photo/video imagery, today focused on the biotechnological experiments KONYUGATSIYA (BTKh-10) and BIOEMULSION (BTKh-14). *[KONYUGATSIYA and BIOEMULSION (#02): transfer samples from KRIOGEM-03 to KRIOGEM-03M and setting -03 to -22 degC. For BTKh-14, placing ICEPACs in -03 and activating mixing mode for other samples.]*

CDR-17 Volkov dismantled the ATV control panel in the SM and stowed it for future use.

Oleg Kononenko deinstalled the BUAP Antenna Switch Controller for the ATV approach & docking procedures, photographed the equipment and also put it away in stowage, supported by ground specialist tagup.

Sergei Volkov then worked in the Soyuz TMA-12/16S Descent Module, dismantling the two "Klest" (KL-152) TV cameras and their light units for return to the ground on 15S, temporarily stowing them in the SM.

CDR Whitson conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables and the weekly collection of the toilet flush (SP) counter and water supply (SVO) readings for calldown to TsUP. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV at the SKV-2 air conditioner for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Peggy also gathered weekly data on total operating time & "On" durations of the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem for reporting to TsUP.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (CDR, FE-1/fulltime), and RED resistive exercise device (FE-2).

Working off the Russian discretionary "time permitting" task list, Malenchenko

performed the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder), and

Suggested on the US "job jar" task list for Garrett Reisman's discretionary performance was the periodic inspection of the ELPS (Emergency Lighting & Power Supply) subsystems in Node-2, A/L (US Airlock), COL (Columbus Orbital Laboratory), and Node-1.

Handover Update: Handover activities between E16 & E17 crewmembers are designed to cover a large variety of onboard systems & operations, including Safety, Communications, Video & Audio, Life Support (SOZh), US Segment, TORU/ Teleoperator Control, EVA Tools, ATV Status, Science Hardware, Medical Equipment, Iridium-9505A phone, CISN (Crew Informational Support System), BVS/ Onboard Computer System, etc. FE-1 Malenchenko has 13:15 hrs scheduled for equipment preparation for return & disposal stowage on Soyuz 15S, with 3 hrs of assistance by Sergei Volkov.

Return Procedures Preps: After the Soyuz TMA-11 descent review on 4/7, a test of the Soyuz MCS (Motion Control System (SUD) is scheduled for 4/14, followed on 4/15 by the standard descent OBT/drill.

No CEO photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 6:31am EDT [= epoch]*):

Mean altitude -- 337.6 km

Apogee height -- 338.3 km

Perigee height -- 337.0 km

Period -- 91.29 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0000975

Solar Beta Angle -- -17.3 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 115 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53831

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

04/18/08 -- Soyuz TMA-11/15S undocking (FGB nadir port, 11:34pm EDT)

04/19/08 -- Soyuz TMA-11/15S landing (2:52am EDT, 9:52am Moscow/DMT, 12:52pm Kazakhstan)
 05/07/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
 05/14/08 -- Progress M-64/29P launch
 05/16/08 -- Progress M-64/29P docking (DC1)
 05/31/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS (5:01pm EDT)
 06/02/08 -- STS-124/Discovery/1J docking
 07/10/08 -- Russian EVA-20 (7/10-11)
 08/07/08 -- ATV1 undocking
 08/12/08 -- Progress M-65/30P launch
 08/14/08 -- Progress M-65/30P docking (SM aft port)
 08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
 09/09/08 -- Progress M-64/29P undocking (from DC1)
 09/10/08 -- Progress M-66/31P launch
 09/12/08 -- Progress M-66/31P docking (DC1)
 10/01/08 -- **NASA 50 Years**
 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
 10/12/08 -- Soyuz TMA-13/17S launch
 10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
 10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
 10/18/08 -- STS-126/Discovery/ULF2 docking
 10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
 11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
 11/20/08 -- **ISS 10 Years**
 11/26/08 -- Progress M-67/32P launch
 11/28/08 -- Progress M-67/32P docking (SM aft port)
 12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
 12/06/08 -- STS-119/Discovery/15A docking
 12/15/08 -- STS-119/Discovery/15A undocking
 1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
 05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
 3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
 4QTR CY09 -- STS-130/19A - MPLM
 1QTR CY10 – STS-131/ULF4
 2QTR CY10 -- STS-132/20A – Node-3 + Cupola
 3QTR CY10 – STS-133/ULF5.

ISS On-Orbit Status 04/12/08

All ISS systems continue to function nominally, except those noted previously or below. *Day 3 of joint E16/E17 operations by CDR-16 Peggy Whitson, FE-1-16 Yuri Malenchenko, FE-2-17 Garrett Reisman, CDR-17 Sergei Volkov, FE-1-17 Oleg Kononenko and SFP/VC14 So-Yeon Yi.*

Today Russia observes **Denj Kosmonavtov** (Cosmonauts Day) and the world Yuri's Night -- celebrating Yuri Alexeyevich Gagarin's pioneering flight into space 47 years ago. And NASA is observing the 27th anniversary of STS-1, the first Space Shuttle mission to orbit. *[Yuri was accepted into the cosmonaut unit in 1960, at age 26. After his historic 108-min. flight around the Earth in "Vostok 1", which ended with a parachute ejection at 7 km altitude over a farm field near the city of Engels in Saratov Oblast (province), he was promoted to unit leader. Seven years later, on March 27, 1968, Yuri died with a flight instructor in a fighter jet crash. Chief Designer of the thusly inaugurated Soviet human space program was Sergey Pavlovich Korolev. Exactly 20 years later, John Young and Bob Crippen took the Columbia into space for a test mission lasting 2 days 6 hours 20 minutes 52 seconds.]*

The crew's work/sleep cycle shifted again, from yesterday's wakeup at 6:20am to 2:20am EDT (sleeptime tonight at 5:50pm). Tomorrow, work period will shift by 10 min (to 2:10am–5:40pm).

Aboard ISS, the E16/E17 crew rotation/handover period went underway with full activity schedules for all six residents involved. Whitson, Volkov, Malenchenko and Kononenko had several hours crewtime between them for dedicated CDR/CDR & FE/FE handover activities. In addition, there are "generic" handovers where crewmembers are scheduled together to complete various designated standard tasks.

From the US voluntary “job jar” task list, after wakeup and before breakfast, FE-2 Reisman & SFP (Space Flight Participant) So-Yeon Yi downloaded the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data from their Actiwatches to the HRF-1 (Human Research Facility 1) laptop. Yi is participating for NASA under a Space Act agreement with South Korea. *[To monitor the crewmember’s sleep/wake patterns and light exposure, crewmembers wear a special Actiwatch device which measures the light levels encountered by them as well as their patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

Today was the second session for CDR Whitson & FE-2 Reisman with the biomed experiment INTEGRATED IMMUNE (Validating Procedures for Monitoring Crew member Immune Function) for collecting wet saliva samples first thing in post-sleep. *[IMMUNE protocol requires the collection to occur first thing post-sleep, before eating, drinking and brushing teeth, and all samples are stored at ambient temperature. Along with NUTRITION (Nutritional Status Assessment), INTEGRATED IMMUNE samples & analyzes participant’s blood, urine, and saliva before, during and after flight for changes related to functions like bone metabolism, oxidative damage and immune function to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects. The saliva is collected in two forms, dry and liquid. The liquid saliva collections require that the crewmembers soak a piece of cotton inside their mouth and place it in a salivette bag; there are four of the liquid collections during docked operations.]*

Later, Whitson & Reisman conducted the BRASLET SDTO (Station Development Test Objective) protocol for Garrett’s first scan session. *[For the SDTO session, the FE-2 had to abstain from caffeine 12 hrs prior to the scan session, heavy meals 4 hrs before and any food at all 2 hrs prior to the scan, plus no exercise 2 hours before and no liquids 30 mins before. SDTO-17011 “Validation of On-Orbit Methodology for the Assessment of Cardiac Function and Changes in the Circulating Volume Using Ultrasound and Braslet-M Occlusion Cuffs (Braslet)” is a collaborative effort between NASA and the Russian FSA (Federal Space Agency), with the goal to establish a valid ultrasound methodology for assessing a number of aspects of central and peripheral hemodynamics and cardiovascular function, specifically in rapid changes in intravascular circulating volume. BRASLET uses Braslet-M occlusion cuffs, i.e., the Russian-made operational countermeasure already pre-calibrated and available onboard for each ISS crewmember. BRASLET employs multiple modes of ultrasound imaging and measurements, in combination with short-term application of Braslet-M occlusive cuffs and cardiopulmonary maneuvers (Valsalva, Mueller) to demonstrate and to evaluate the degree of changes in the circulating volume on orbit. This will be accomplished by*

performing echocardiographic examinations in multiple modes (including Tissue Doppler mode), ultrasound measurements of lower extremity venous and arterial vascular responses to Braslet-M device under nominal conditions and also during cardiopulmonary Mueller and Valsalva maneuvers. Identical measurements will be repeated without Braslet-M, with Braslet-M applied, and immediately after releasing the occlusion device.]

With the CDRA (Carbon Dioxide Removal Assembly) operating, Whitson terminated the regeneration of METOX (Metal Oxide) CO₂ absorption canisters #0017 & #0019 in the US Airlock (A/L) oven, then started the bake-out process on canisters #0012 & #0013.

Peggy also performed the periodic service of the prime CSA-CP (Compound Specific Analyzer-Combustion Products) instrument, replacing its battery with a fresh one (#1182).

Garrett continued his support of the Japanese CW/RW (Cell Wall/Resist Wall) experiment in the MSG EMCS (Microgravity Science Glovebox/European Modular Cultivation System), swapping the ECs (Experiment Containers) on rotor A in order to save as much science as possible for CW/RW - which has been having problems with the hydration. *[CW/RW operates in the EMCS facility in eight special ECs (Experiment Containers) which Garrett recently (3/30) installed on the centrifuges of the facility. The EMCS rack contains two rotating centrifuges, Rotor A & Rotor B, that can support a wide range of small plant & animal experiments under partial gravity conditions.]*

The FE-2 also serviced the U.S. OGS (Oxygen Generation System) which has been producing O₂ in the last few days, removing the PWR (Payload Water Reservoir) after verifying that it was empty and replacing it with a full PWR, then reactivating the OPS WDS (Water Delivery System). *[The ground monitored the activity via S-band and returned the unit to "Process" after R&R completion. Like the Elektron, OGS produces O₂ from water by electrolysis, dumping the also generated H₂ (hydrogen) through venting.]*

As standard documentation for each Increment, Garrett took POSSUM (Payload On-orbit Still Shots for Utilization and Maintenance) digital photography of all payload racks that have undergone recent changes, including ER3 (EXPRESS Rack 3) & MSG in COL (Columbus Orbital Laboratory) and ER2, ER5 & HRF1 (Human Research Facility 1) in the Lab. *[POSSUM is a regular payload photo activity that obtains formal electronic situational still shots of any subrack & locker payload that has been moved or reconfigured.]*

Besides his extensive handover activities with Oleg Kononenko, FE-1 Malenchenko assisted SFP Yi in conducting her KAP (Korean Astronaut Program) science experiments, taking photo/video imagery of the VC14 activities where required, particularly for KAP15.

So-Yeon Yi's busy schedule today included work on -

- *KAP02/Identification of fruit fly genes responsive to gravity and responsible for aging (monitoring, video recording, later stowing),*
- *KAP04/SFP medical monitoring (taking four measurements of ocular pressure during the day);*
- *KAP06/Study of the possibility of using traditional Korean food in onboard food rations (testing during crew Breakfast & Dinner),*
- *KAP07/Growth of Zeolite crystals, super crystals, and crystal layers in microgravity (equipment transfer, assembly, setup in SM, activating oven with samples A,B,C, several temperature checks),*
- *KAP08/Synthesis of metal-organic porous materials in microgravity (hardware transfer, assembly and setup, installation of first sample, oven activation, and temperature check),*
- *KAP09/High-resolution telescope (ELT) and study of micro-electro-mechanical system (MEMS) for next generation telescopes (mounting equipment at SM window 9, activation, video recording, filling out questionnaire, deactivation, gear removal from window),*
- *KAP13/Measurements using the South-Korean developed SMMS (Small Mass Measurement System, later termination & cleanup),*
- *KAP15/Recording scenes of daily life & activities of the SFP, using Samsung Gx-10 and Samsung NV11 cameras.*

So-Yeon also had two regular daily tagups with her consultant team at TsUP-Moscow via VHF, and two PAO TV downlinks with VIP personnel at TsUP-Moscow

—

- one (~4:50am EDT) with Anatoly N. Perminov, Head of Roskosmos, on the occasion of today's Cosmonautic Day,
- the other (~6:20am) with President Lee Myung-bak of South Korea.
[President Lee: "I can't believe you are actually in space". Yi: "Yes, Then let me show you something (does a somersault). How's that?"... Lee: "I guess all the people feel my feeling in this nation and my heart is filled with unspeakable joy from living in this beautiful place." Yi: "Though it has only been a few days, I can say that this is a wonderful opportunity for me that I will never forget for the rest of my life. It is regrettable that I am enjoying this wonderful experience alone. I believe it was the strength of science that allowed me to enjoy this opportunity. I hope that the Government has more interest so that more people can enjoy this kind of precious opportunity."

Lee: "Yes, I myself thought more of the space industry while witnessing the process of putting the first Korean in outer space. I realized that the citizens of Korea are interested in space development—more than I thought they were. The space industry is an important factor that determines a nation's competitiveness in the 21st Century. As such, I will provide as much support as possible. I will make efforts so that we will send the second and third Koreans to space in the near future."]

Whitson retrieved a PMIC (Portable Microphone) with bad performance from the Lab forward cone and cleaned its internal relay contacts in an attempt to improve voice transmission.

Peggy also continued troubleshooting IMV (Intermodule Ventilation), cleaning the Node-1 aft IMV fan inlet and taking airflow measurements on the THC (Temperature & Humidity Control) IMV from the A/L to Node-1 at the NOD1O2-35 lower (deck) slots.

With the increase in crew size from three to six placing more emphasis on ventilation, Sergei Volkov was scheduled to check on the function of the important IP-1 airflow sensors in the various Russian segment (RS) hatchways, including the SM-to-DC1 tunnel, and the FGB-to-Node & FGB-to-Soyuz passageways.

Garrett Reisman set up the ARISS (Amateur Radio on ISS) ham radio equipment in the SM and checked out SFP Yi in using the amateur radio equipment. The ham station will remain powered on for the duration of the VC14 mission.

Major science activities in the Russian segment (RS) by Kononenko, with Volkov taking photo/video imagery, today focused on the biotechnological experiments BIOEMULSION and PLAZMIDA. *[BIOEMULSION (BTKh-14): setting up incubator in Bioreactor, activation of mixing mode for culturing. PLAZMIDA (BIO-8): Removing Recomb-K hardware from KRIOGEM-3 at +37degC, activating mobilization and setting up in KRIOGEM-3M thermostat at +4degC, supported by ground specialist tagup.]*

Kononenko transferred a new kit for the "Matryoshka-R" (RBO-3-2) radiation payload suite from Soyuz TMA-12 to the ISS for installation in the RS. *[The complex Matryoshka payload suite is designed for sophisticated radiation studies. Three detectors now in use are positioned in spherical "Phantom" containers in the DC1, four in the stbd crew cabin, under the work table, and behind a panel (#327).]*

Reisman took the CHeCS emergency medical operations OBT (On-Board Training) drill, a 30-min. exercise to refresh his Crew Medical Officer (CMO)'s acuity in applying ACLS (advanced cardio life support) in an emergency. *[The HMS (Health*

Maintenance Systems) hardware, including ACLS equipment, may be used in contingency situations where crew life is at risk. To maintain proficiency, crewmembers spend one hour per month reviewing HMS and ACLS equipment and procedures via the HMS and ACLS CBT (computer-based training). The training drill, each crewmember for him/herself, refreshes their memory of the on-orbit stowage and deployment locations, equipment etc. and procedures.]

Garrett also had another 60 minutes for himself for general orientation (station familiarization & acclimatization) as is standard daily rule for the first two weeks after starting station residency.

At ~4:35am, the crew engaged in a PAO TV exchange with VIP guests at TsUP/ Moscow, headed by Roskosmos Director General Anatoly Perminov, for Cosmonautics Day today, the 47th Anniversary of Yuri Gagarin's launch in Vostok-1.

At ~6:10am, the crew also supported the exchange of greetings and messages between SFP So-Yeon Yi and South-Korean President Myung-bak Lee (see above).

The FE-2 performed the routine daily maintenance of the SOZh (Environment Control & Life Support System, ECLSS) system in the SM, including the ASU toilet facilities systems/replaceables.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (CDR, FE-1/fulltime), and RED resistive exercise device (FE-2).

Afterwards, Yuri was to download the crew's exercise data file to the MEC for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working off the discretionary "time permitting" task list, Malenchenko performed the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder), and

Handover Update: Handover activities between E16 & E17 crewmembers are designed to cover a large variety of onboard systems & operations, including Safety, Communications, Video & Audio, Life Support (SOZh), US Segment, TORU/ Teleoperator Control, EVA Tools, ATV Status, Science Hardware, Medical Equipment, Iridium-9505A phone, CISN (Crew Informational Support System), BVS/ Onboard Computer System, etc. FE-1 Malenchenko has 13:15 hrs scheduled for

equipment preparation for return & disposal stowage on Soyuz 15S, with 3 hrs of assistance by Sergei Volkov.

Return Procedures Preps: After the Soyuz TMA-11 descent review on 4/7, a test of the Soyuz MCS (Motion Control System (SUD) is scheduled for 4/14, followed on 4/15 by the standard descent OBT/drill.

Weekly Science Update (Expedition Sixteen -- Week 25)

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS):
Completed. Instrument was relocated to FGB for Inc17 measurements (as Russian experiment) and ALTCRISS was re-activated on 4/8.

ANITA: Completed.

BCAT-3 (Binary Colloidal Alloy Test 3): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CW/CR (Cell Wall/Resist Wall) in EMCS (European Modular Cultivation System) :
The CW/RW Experiment Containers located in EMCS EC position A1, A2, B1 and B2 could not be hydrated due to EMCS Water Supply Subsystem problems. Troubleshooting is ongoing.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): In progress.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Last session (4th) was successfully performed on 4/6.

EuTEF (European Technology Exposure Facility): EuTEF platform is nominal. **DEBIE-2:** Link error still under investigation; **DOSTEL:** On-going science acquisition; **EuTEMP:** Currently inactive as planned; **EVC:** so far further troubleshooting could not be performed due to too low EVC temperature; **EXPOSE:** On-going science acquisition; **FIPEX:** 6-day measurements period with sensors RAM1, RAM4 and ZENITH8 started on 4/8. On 4/10, the sensors turned off suddenly. Under further investigation; **MEDET:** On-going science acquisition; **PLEGPAY:** on 4/10, experiment 1 run was nominally performed; **TRIBOLAB:** on 4/10 the instrument was commanded in Thermal Stabilisation mode in preparation of the first experiment run. On 4/11, the first TRIBOLAB Pin On Disk (POD1) has been started and will run until Soyuz undock.

Fluid Science Laboratory (FSL): The FSL Facility awaits further troubleshooting after 1J/A departure.

GEOFLOW: Deferred. Start of GEOFLOW is pending further FSL troubleshooting/commissioning activities but is not expected in Inc16 anymore.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Second session has currently started, to run from 4/12 through 4/15.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: “Peggy, thank you for unstowing Garrett’s saliva kit and having it ready for him to begin his collections. Garrett, we appreciate your efforts during your early increment Integrated Immune session.”

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 “Pirs”.

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION/REPOSITORY: “Peggy, the Nutrition/Repository PI teams want to say thank you for your fantastic support throughout all five sessions and for the addition of the extra tube during this last activity!”

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SAMPLE: Last crew sampling session for Inc16 FE-1 Malenchenko was successfully performed on 4/7. Samples were inserted in MELFI Dewar 4.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): “Peggy, thanks for downloading 1 J/A FE2 and your Actiwatches, as well as initializing the KARI SFP Actiwatch. You also completed your last targeted week of sleep logging. Your only remaining scheduled activity is downloading all three Actiwatches and doffing your and KARI SFP Actiwatches. Thanks for all your additional sleep logging. The PI greatly appreciates it.” “Garrett, you have completed your first two Sleep activities (Actiwatch Don and 1st download), and are in-process of completing your first week of sleep logging. Thanks for completing these activities. Any additional sleep logging is above and beyond, and the PI will greatly appreciate it.”

SOLAR (Solar Monitoring Observatory): On 4/4, SOLAR was commanded to SIMUL-PM (Pointing Mode (SIMUL-PM) using Station Ancillary data to find the Sun to allow science data acquisition. Sun tracking precision has been estimated to be sufficient to perform science measurements. Problems with ancillary data were observed on 4/9. The anomaly is under investigation. **SOVIM:** Science data acquisition on-going nominally since 4/4; **SOLSPEC:** To allow for sun tracking precision assessment, sun observations were performed on 4/5 after start of SIMUL-PM mode. Commissioning of instrument has been successfully completed on 4/8 and 4/9. SOLSPEC measurements are planned on 4/14-15 in order to cross-compare with Sun instrument on NASA Sounding Rocket launched on 4/14 (12:58pm EDT); **SOLACES:** Commissioning completion planned for 4/11. SOLACES measurements are planned on 4/13-14 in order to cross-compare with Sun instrument on NASA Sounding Rocket on 4/17 (12:58pm).

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: Planned.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels):
Planned.

CEO (Crew Earth Observation): Through 4/8 the ground has received a total of 17,604 ISS CEO images for review and cataloging. Late this week imagery received included sessions with camera times corresponding to the following daily target requests: Teide Volcano, Canary Islands; Volcan Colima, Mexico; Afar Rift Zone, Ethiopia; Calcutta India; and East Haruj Megafans, Libya. The ground specialists will provide feedback on these acquisitions as they work through them in the coming week. "Feedback on last week's acquisitions includes: Lake Eyre, Australia – excellent coverage, best in many months, suggests moist conditions are returning; Somalia Coast – excellent mapping pass – dry conditions persist as expected – all requirement for this target have been met; Central Arizona-Phoenix – well-focused imagery of much of this target was acquired, but more nadir-looking views will be requested in the future; and the Madrean Sky Islands, northern Mexico – we will continue to work with you to help recognize and acquire imagery of these features. Your recent image of the bizarre landscape of the western Saudi Arabian lava field known as the Harrat Khaybar will be published on NASA/GSFC's Earth Observatory site this weekend. Your photo highlights the spectacular landforms, diverse mineralogy, and climate of this volcanic region. Good eye! Thanks for your good imagery response to our target requests. Any additional feedback you find time to provide on this activity would be most welcome!"

CEO photo targets uplinked for today were **Eastern Tien Shan Mts., China** (*regional contextual images of the eastern half of the range were requested. These will assist in gaining more detailed views of permanent ice caps on this range that are being studied for the effects of climate change*), **South Tibesti Megafans** (*an extensive network of dry, non-functioning stream channels occupies a large area south of the Tibesti Mts [probably dating from the last wet period in the Sahara Desert ~10, 000 years ago]. These channel networks appear to be good analogs for river-like lines on Mars. Overlapping images right of track on the nearer of two megafans were requested*), **Sky Islands, northern Mexico/SW USA** (*the crew was to shoot a mapping swath right of track. "Sky Islands" are the higher elevations of mountains in Mexico's Sierra Madre ranges and the US Southwest which are cool and moist enough for dense forests to flourish. The forested peaks appear as green "islands" in the deserts, mainly of northern Mexico, but also in the US Southwest. The sky islands boast some of the richest biodiversity anywhere in North America. To start this round of change documentation the ground requested*

*broad views looking right of track), and **Sevilleta Wildlife Area, New Mexico** (the Sevilleta LTER [Long Term Ecological Research] Project is located about 80 kilometers south of Albuquerque, New Mexico. The crew was to shoot a mapping swath just right of track, immediately after the Sky Islands target. The Refuge is of great interest because it falls at the geographic intersection of several major biotic zones: Chihuahuan Desert grassland and shrubland to the south, Great Plains grassland to the north, Piñon-Juniper woodland on the neighboring mountains, Colorado Plateau shrub-steppe to the west, and riverbank vegetation along the middle Rio Grande Valley).*

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 7:43am EDT [= epoch]*):

Mean altitude -- 337.7 km

Apogee height -- 338.4 km

Perigee height -- 337.1 km

Period -- 91.29 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0000945

Solar Beta Angle -- -13.3 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 154 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53816

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

04/12/08 -- **Cosmonautics Day**, with **Yuri's Night** (check out <http://www.yurisnight.net/2008/>)

04/18/08 -- Soyuz TMA-11/15S undocking (FGB nadir port, 11:34pm EDT)

04/19/08 -- Soyuz TMA-11/15S landing (2:52am EDT, 9:52am Moscow/DMT, 12:52pm Kazakhstan)

05/07/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/31/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS (5:01pm EDT)

06/02/08 -- STS-124/Discovery/1J docking

07/10/08 -- Russian EVA-20 (7/10-11)

08/07/08 -- ATV1 undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
 09/09/08 -- Progress M-64/29P undocking (from DC1)
 09/10/08 -- Progress M-66/31P launch
 09/12/08 -- Progress M-66/31P docking (DC1)
 10/01/08 -- **NASA 50 Years**
 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
 10/12/08 -- Soyuz TMA-13/17S launch
 10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
 10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
 10/18/08 -- STS-126/Discovery/ULF2 docking
 10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
 11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
 11/20/08 -- **ISS 10 Years**
 11/26/08 -- Progress M-67/32P launch
 11/28/08 -- Progress M-67/32P docking (SM aft port)
 12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
 12/06/08 -- STS-119/Discovery/15A docking
 12/15/08 -- STS-119/Discovery/15A undocking
 1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
 05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
 3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
 4QTR CY09 -- STS-130/19A - MPLM
 1QTR CY10 – STS-131/ULF4
 2QTR CY10 -- STS-132/20A – Node-3 + Cupola
 3QTR CY10 – STS-133/ULF5.

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 04/11/08

All ISS systems continue to function nominally, except those noted previously or below. *Day 2 of joint E16/E17 operations.*

The crew's work/sleep cycle shifted again, from yesterday's wakeup at 5:00am to 6:20am EDT (sleeptime tonight at 5:50pm, from 9:30pm). Work period will shift again tomorrow (to 2:20am–5:50pm).

Aboard ISS, the E16/E17 crew rotation/handover period went underway with full activity schedules for all six residents involved.

CDR-17 Sergei Volkov and FE-1-16 Yuri Malenchenko conducted a communications test between the two docked Soyuz vehicles (15S/16S), checking out comm systems both via hard-line mode (MBS) and S-band, and VHF mode on two channels, including the ground (TsUP-Moscow). *[The test was also intended to provide multi-segment comm procedure training. Systems were reconfigured to nominal mode afterwards.]*

In the Soyuz TMA-12/16S Orbital Module, Volkov installed the LKT local temperature sensor switch (TA251M1B) of the BITS2-12 onboard telemetry system and its ROM/read-only memory unit (PZU TA765B), both kept in storage from an earlier Soyuz.

Additionally, Volkov performed the routine task of taking two photos of the internal part of the DC1 port's docking cone, used for yesterday's 16S linkup. These images are used to refine current understanding of docking conditions. The pictures were then transferred to OCA for subsequent downlinking. *[The objective is to take photo imagery of the scratch or scuff mark left by the head of the active docking probe on the internal surface of the passive drogue (docking cone) ring, now rotated out of the passageway. As other crewmembers before him, the CDR-17 used the Nikon D1X digital still camera to take two pictures each with the hatch*

closed down.]

Later today, as part of crew handovers, FE-1-17 Oleg Kononenko is scheduled for the monthly maintenance on the deactivated Russian IK0501 GA (Gas Analyzer) of the SOGS (Pressure Control & Atmospheric Monitoring System) by replacing its CO₂ filter assembly (BF) with a new unit from FGB stowage (done last: 2/29), then reactivating the unit. With Peggy Whitson, the new crewmembers were also to conduct the periodic IK0501 sensor adjustment for O₂ readings. *[IK0501 is an automated system for measuring CO₂, O₂, and H₂O in the air as well as the flow rate of the gas being analyzed].*

After his second session with the ELITE-S2 (Elaboratore Immagini Televisive - Space 2) experiment yesterday, FE-2 Garrett Reisman powered up the payload's IMU (Interface Management Unit) to allow the ground to downlink the data from the session by remote command. Afterwards, Garrett turned the unit off. *[The Italian (ASI) experiment ELITE-S2 is a human motion analysis facility for technological characterization and potential application for multifactorial movement analysis, to study the connection between brain, visualization and motion in micro-G.]*

Major science activities in the Russian segment (RS) by Kononenko today focused on the biotechnological experiment CONJUGATION (Pairing), BIOEMULSION, and PLAZMIDA. *[CONJUGATION: removal of the Recomb-K hybridization experiment from the KRIOGEM-03M thermostat/cooler, process activation at ambient temperature, photography of Recomb-K hardware, completing activation and returning to KRIOGEM at +4 degC. BIOEMULSION (BTKh-14): setting up incubator in Bioreactor, activation of mixing mode for culturing. PLAZMIDA (BIO-8): Removing Recomb-K hardware from KRIOGEM-03M, activating mobilization and setting up in KRIOGEM thermostat at +37degC.]*

SFP So-Yeon Yi worked on her KAP (Korean Astronaut Program) science experiments. *[Today's VC-14 schedule included activities on –*

- KAP01/Growth & mutation of plant seeds (monitoring, photography, filling out questionnaire),*
- KAP02/Identification of fruit fly genes responsive to gravity and responsible for aging (monitoring, video recording, later stowing),*
- KAP05/Study of SFP facial changes using a Moiré screen (preparation, experiment ops session 1),*
- KAP06/Study of the possibility of using traditional Korean food in onboard food rations (testing during crew Dinner time at ~3:50pm EDT),*
- KAP07/Growth of Zeolite crystals, super crystals, and crystal layers in microgravity (equipment transfer, assembly, setup in SM),*

- *KAP08/Synthesis of metal-organic porous materials in microgravity (hardware transfer, assembly and setup, installation of first sample, oven activation, and temperature check), and*
- *KAP09/High-resolution telescope (ELT) and study of micro-electro-mechanical system (MEMS) for next generation telescopes (mounting equipment at SM window 9, activation, video recording, filling out questionnaire).]*

The SFP also had a routine PMC (Private Medical Conference) via VHF, the regular daily tagup with her consultant team at TsUP-Moscow via VHF, and a telephone conversation at ~10:50am EDT (23:50 Korean Standard Time) with two listeners (one teen, one adult) from a Korean radio station, chosen from among listeners submitting “Reasons why I want to talk to an astronaut”.

Working off a voluntary Russian task list, So-Yeon was to transfer imagery and other data from flash card to her RSK2 laptop HDD (Hard Disk Drive) for return to the ground.

As is standard procedure for newly arrived station residents, Sergei Volkov and Oleg Kononenko had their PMCs (Private Medical Conferences) via S-band.

FE-1 Malenchenko closed out the ESA/RSC-Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS) with its AST Spectrometer and ALC equipment on FGB panel 420. *[Yuri removed PCMCIA card #941 from the AST slot, checked it out on the RSK1 laptop for data quantity and total size of files, and stowed it with nine other memory cards for return to Earth on TMA-11.]*

FE-2 Reisman filled out the regular FFQ (Food Frequency Questionnaire), his fourth, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA/ESA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

In the US Airlock (A/L), CDR Peggy Whitson terminated the regeneration of METOX (Metal Oxide) CO₂ absorption canisters #0020 & #0021 in the A/L’s oven, then started the bake-out process on canisters #0017 & #0019.

Whitson & Reisman conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. *[Updated "cue cards" based on the crew's water calldowns are sent up every other week. The current cue card (16-0018Y), to be updated today, lists 37 CWCs (~1483.4 L total) for the four types of water identified on board: technical water (800.4 L, for Elektron, flushing, hygiene), potable water (647.2 L), condensate water (32.3 L), waste/EMU dump and other (3.7 L). Of the 37 containers, 13 CWCs with technical water (569.4 L) cannot be used until cleared for Wautersia bacteria, and 4 CWCs with potable water (176.3 L) are not cleared for use pending analysis of samples returned on 1J/A.]*

The CDR also deactivated and tore down the IWIS (Internal Wireless Instrumentation System) setup used yesterday for measuring structural dynamics data during Soyuz docking.

Yuri Malenchenko performed the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various station hatchways, including the FGB-to-Soyuz tunnel, DC1-to-Soyuz vestibule and FGB-to-Node1 passageway.

For Reisman's first session with the BRASLET experiment, scheduled tomorrow, Peggy and Garrett gathered the necessary equipment, particularly Garrett's cuffs.

[For the SDTO (Station Development Test Objective) scan session, the FE-2 has to abstain from caffeine 12 hrs prior to the scan session, heavy meals 4 hrs before and any food at all 2 hrs prior to the scan, plus no exercise 2 hours before and no liquids 30 mins before. SDTO-17011 "Validation of On-Orbit Methodology for the Assessment of Cardiac Function and Changes in the Circulating Volume Using Ultrasound and Braslet-M Occlusion Cuffs (Braslet)" is a collaborative effort between NASA and the Russian FSA (Federal Space Agency), with the goal to establish a valid ultrasound methodology for assessing a number of aspects of central and peripheral hemodynamics and cardiovascular function, specifically in rapid changes in intravascular circulating volume. Braslet uses Braslet-M occlusion cuffs, i.e., the Russian-made operational countermeasure already pre-calibrated and available onboard for each ISS crewmember. Braslet employs multiple modes of ultrasound imaging and measurements, in combination with short-term application of Braslet-M occlusive cuffs and cardiopulmonary maneuvers (Valsalva, Mueller) to demonstrate and to evaluate the degree of changes in the circulating volume on orbit. This will be accomplished by performing echocardiographic examinations in multiple modes (including Tissue Doppler mode), ultrasound measurements of lower extremity venous and arterial vascular responses to Braslet-M device under nominal conditions and also during cardiopulmonary Mueller and Valsalva maneuvers. Identical measurements will be repeated without Braslet-M, with Braslet-M applied, and immediately after releasing the occlusion device.]

Sergei gathered measurements for the regular atmospheric status check for ppCO₂ (pp Carbon Dioxide) in the Lab, SM (at panel 449) and COL (Columbus Orbital Laboratory), using the hand-held CDMK (CO₂ Monitoring Kit, #1002). Batteries were to be replaced if necessary.

At ~4:05pm, Reisman is to set up and activate the VDS MPC (Video Distribution System/Multi-Purpose Converter) with its four downlinks to allow the ground to “pull down” accumulated HDTV (high-definition TV) footage of yesterday’s arrival of Soyuz 16S. Later (~5:15pm), the MPC will be powered off again.

Malenchenko and Kononenko relocated the three Emergency SODF (Station Operations Data Files) books from Soyuz 16S into the 15S vehicle and updated the ISS EMER-1 SODF with new pages delivered on 16S. *[TMA-12 delivered two new ODF books (VC-14, RPS ISS16/17 Handover) and nine packages of updates to existing books (Med Ops, Med Equipment, Tech Exps, PHOTO, Science Exps, ODF ROMs, Laptop Connectivity Recovery).]*

Volkov performed the routine daily maintenance of the SOZh (Environment Control & Life Support System, ECLSS) system in the SM, including the ASU toilet facilities systems/replaceables.

Later today, Sergei will work on the IMS (Inventory Management System), updating/editing its standard “delta file”, including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Reisman had another 60 minutes for himself for general orientation (station familiarization & acclimatization) as is standard daily rule for the first two weeks after starting station residency.

The crewmembers completed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (CDR, FE-1/fulltime, FE-2), and RED resistive exercise device (FE-2).

Afterwards, Garrett was to download the crew’s exercise data file to the MEC for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working off the discretionary “time permitting” task list, Yuri Malenchenko –

- performed the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator,

maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder), and

- serviced the BIO-5 Rasteniya-2 ("Plants-2") experiment, which researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}), by monitoring the greenhouse, taking pictures and downloading them to the ground.

At ~1:00pm EDT, Peggy Whitson & Garrett Reisman engaged in three interactive PAO TV interviews with U.S. media clients, - WCBS News (Steve Scott), CBS Newspath (Gerry Mazza) and WHO-TV (Patrick Dix).

Handover Update: Handover activities between E16 & E17 crewmembers are designed to cover a large variety of onboard systems & operations, including Safety, Communications, Video & Audio, Life Support (SOZh), US Segment, TORU/ Teleoperator Control, EVA Tools, ATV Status, Science Hardware, Medical Equipment, Iridium-9505A phone, CISN (Crew Informational Support System), BVS/ Onboard Computer System, etc. FE-1 Malenchenko has 13:15 hrs scheduled for equipment preparation for return & disposal stowage on Soyuz 15S, with 3 hrs of assistance by Sergei Volkov.

Return Procedures Preps: After the Soyuz TMA-11 descent review on 4/7, a test of the Soyuz MCS (Motion Control System (SUD) is scheduled for 4/14, followed on 4/15 by the standard descent OBT/drill.

CEO photo targets uplinked for today were **Luquillo Forest, Puerto Rico** (*good near-nadir pass. A swath of overlapping images was requested*), **Santa Maria Volcano, Guatemala** (*looking right, between ISS track and the prominent Lake Atitlan. Santa María volcano had been inactive for at least 500 to several thousand years. But on October 25, 1902 it erupted violently following a series of earthquakes--as one of the largest eruptions of the twentieth century. Skies were darkened over Guatemala for days, with ash detected as far away as northern California. The eruption tore a gaping hole in the south flank of the cone—which is still visible as a vegetationless zone [due to intense rainfall erosion]. A massive new lava dome known as Santiaguito has been growing within the crater since the eruption. Dome growth has been accompanied by almost continuous minor explosions, with periodic lava extrusion, larger explosions, pyroclastic flows, and mud flows*), and **Santa Barbara Coast, California** (*the main objective is to document land cover and the rapid land use change on a seasonal basis. Shooting a mapping swath left and right of track along the coastline, noting any features in the near offshore*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 7:19am EDT [= epoch]*):

Mean altitude -- 337.9 km

Apogee height -- 338.6 km

Perigee height -- 337.2 km

Period -- 91.29 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0001073

Solar Beta Angle -- -9.1 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 112 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53799

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

04/12/08 -- **Cosmonautics Day**, with **Yuri's Night** (check out <http://www.yurisnight.net/2008/>)

04/18/08 -- Soyuz TMA-11/15S undocking (FGB nadir port, 11:34pm EDT)

04/19/08 -- Soyuz TMA-11/15S landing (2:52am EDT, 9:52am Moscow/DMT, 12:52pm Kazakhstan)

05/07/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/31/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS (5:01pm EDT)

06/02/08 -- STS-124/Discovery/1J docking

07/10/08 -- Russian EVA-20 (7/10-11)

08/07/08 -- ATV1 undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC

10/18/08 -- STS-126/Discovery/ULF2 docking

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
4QTR CY09 -- STS-130/19A - MPLM
1QTR CY10 – STS-131/ULF4
2QTR CY10 -- STS-132/20A – Node-3 + Cupola
3QTR CY10 – STS-133/ULF5.

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osp/iss_reports/index.htm

ISS On-Orbit Status 04/10/08

All ISS systems continue to function nominally, except those noted previously or below.

The ISS crew's work/sleep cycle shifted this morning, from wakeup at 2:00am to 5:00am EDT (sleeptime tonight at 9:30pm, from 5:30pm). Work period will shift again tomorrow (6:20am–5:50pm) and on 4/12 (2:10am–5:40pm).

Yest *kasaniya!* Soyuz TMA-12/16S docked smoothly at the DC1 port at 8:57am EDT, five minutes ahead of time, with Expedition 17 crewmembers CDR Sergei Volkov and FE-1 Oleg Kononenko, plus Korean SFP (Spaceflight Participant) So-Yeon Yi, 14th Visiting Crewmember (VC). After about 1.5 hrs spent in Soyuz on pre-transfer activities, the crew opened hatches, followed by crew transfer, the traditional joyful welcome event and the installation of the BZV QD (quick disconnect) clamps by Volkov and Kononenko at ~12:10pm. *[After successful "kasaniya" (contact), automatic "sborka" (closing of Soyuz & DC1 port hooks & latches) took place shortly thereafter (~9:07am) while ISS was in free drift. Attitude control authority had been handed over to the Russian MCS (Motion Control System) at ~5:25am and was returned to US CMG control at ~10:05am. For the 16S docking, Russian thrusters were disabled during Soyuz volume pressurization and clamp installation; they were afterwards returned to active attitude control (~12:30pm). Before hatch opening, the crew performed leak checks of the Soyuz modules and the Soyuz/ISS interface vestibule. They then doffed their Sokol suits and set them up for drying (~1:05pm), deactivated the Atmosphere Purification Unit (BOA) in the Descent Module (SA), replaced the Soyuz ECLSS LiOH cartridges, equalized Soyuz/ISS pressures, and put the spacecraft into conservation mode on ISS integrated power.]*

Before the docking, CDR Whitson prepared for the arrival by activating the video system with the Japanese SONY HDV camera (backed up by the U.S. SONY PD100 camcorder) in the RS (Russian Segment) for transmitting over the MPEG-2

(Moving Pictures Expert Group 2) encoder from DC1 & SM to downlink via U.S. OpsLAN and Ku-band in “streaming video” packets. *[Later in the day, Peggy deactivated the equipment again and disassembled it, including the hook-up of the UOP DCP (utility outlet panel/display & control panel) power bypass cable at the CUP RWS (Cupola Robotic Work Station).]*

FE-2 Reisman set up the IWIS (Internal Wireless Instrumentation System), verifying proper function of the RSUs (Remote Sensor Units) and NCU (Network Control Unit) for recording structural dynamics (vibrational) data during the docking. Later in the day, Peggy Whitson downloaded the accumulated data to an SSC (Station Support Computer) for subsequent dump to the ground.

FE-1 Malenchenko activated the KRIOGEM-03M refrigerator in the SM to +4 degC for time-critical payload hardware arriving on Soyuz (e.g., BIOEMULSIYA bioreactor, KONYUGATSIYA, BIO-8 PLAZMIDA/Recomb-K).

The FE-1 also configured station comm (STTS) for the docking and later reconfigured it for post-docking nominal hardline mode (MBS).

The CDR also prepared for the arrival by connecting the regular ITCS LTL (Internal Thermal Control System/Low Temperature Loop) coolant jumper connection to the LAB1D6 rack in support of the ground-commanded activation of the U.S. CDRA (Carbon Dioxide Removal Assembly), and Houston lowered the temperature setpoint to the regular 9.4 degC. *[CDRA activation took place at 10:01am-11:01am.]*

Later tonight, with the CDRA running, Whitson is scheduled to start the regeneration of two METOX (Metal Oxide) CO₂ absorption canisters in the Airlock’s bake-out oven (#0020, #0021).

Upon docking, on TsUP Go, Malenchenko switched hatch KVDs (Pressure Equalization Valves) between DC1 and Soyuz to electric control mode.

After the arrival, hatch opening, and crew welcome, CDR-17 Sergei Volkov immediately began with payload transfers (e.g., Recomb-K) from Soyuz to ISS and setups.

As part of Soyuz deactivation after the docking, Volkov installed the intermodular air exchange ducting between the Soyuz (through both Orbital & Descent Modules) and the DC1 Docking Compartment. *[The two optional modes for the ducting configuration are with & without air heating.]*

Later, Volkov and FE-1-17 Oleg Kononenko went through the procedures of setting

up and drying out the Sokol spacesuits and gloves worn by the Soyuz travelers.

High-priority payload transfers to the Service Module (SM) for the E-16/E-17 crew rotation period involve

- BIOEMULSIYA bioreactor (set up in the KRIOGEM-03M cooler, with photography); *[BTKh-14 investigates the design and improvement of a closed-type autonomous (thermostat-controlled) bioreactor for obtaining biomass of organisms and bioactive substances (BAV) without additional ingredients input or removal of metabolism products, for bacterial, enzymatic, and pharmaceutical preparations;]*
- KONYUGATSIYA (BTKh-10) in its Biokont-T container (also in KRIOGEM); *[BTKh-10 deals with the processes of genetic material transmission using bacterial conjugation, in the Biokont-T container and Rekomb-K hardware in the KRIOGEM-03M;]*
- ASTROVACCINE (BTKh-27);
- ANTIGEN (set up in Bioecology container #13);
- LAKTOLEN & ARIL (in Bioecology containers #6-1 & #18); *[BTKh-5, ARIL studies the effects of space flight on cultures of Lactolen- and Interleukin ARIL producing cells.]*

The three new arrivals received the obligatory standard Safety Briefing by CDR Whitson to familiarize them with procedures and escape routes in case of an emergency. *[The Briefing included pointing out the location of the “Emergency Response/Visiting Crew” books, showed how to move about the station without getting hurt or accidentally disturbing air flow meters/sensors (PP IP-1) and familiarized the Korean with her switch to a different Soyuz for return.]*

Yuri Malenchenko also took So-Yeon Yi on a one-hour guided tour of the ISS.

[The tour was to acquaint the SFP with both station segments, her living quarters in the RS, her work station in the DC1 Docking Compartment, other work locations, the sites for her scheduled twice-a-day VHF conferences with her Korean advisory group and her ham radio sessions, location of her RSK2 laptop (delivered on TMA-12), stowage of her KAP (Korean Astronaut Program) experiments, uplink printouts and camera equipment for her use, email ops, and PFC (Private Family Conference) using the IP (Internet Protocol) phone.]

Assisted by Yuri, SFP Yi later transferred and photographed her experiments KAP01 (Growth and mutation of plant seeds), KAP02 (Identification of Drosophila genes responsive to gravity and responsible for aging); and KAP03 (Development of Bioreactor for use on the ISS), checked out the installed removable HDD (Hard Disk Drive) on her RSK2 A31p laptop in the DC1, and donned the Actiwatch for the U.S. SLEEP experiment (in which she participates pursuant to a Space Act agreement with NASA).

FE-2 Garrett Reisman conducted his second session with the ELITE-S2 (Elaboratore Immagini Televisive - Space 2) payload, assisted by Whitson, first detaching the CEVIS (Cycle Ergometer with Vibration Isolation) from the ER3 (EXPRESS Rack 3) and moving it out of the field of view of the cameras crucial to of the experiment, which he set up for capturing his movement protocol. After powering up the IMU (Interface Management Unit) and calibrating the work area for the cameras (half of the work area facing one way, the other half facing the other way), the FE-2 had ~1.5 hrs to perform the test operations, with Whitson taking documentary photographs. Peggy later stowed the test camera and re-installed the CEVIS, while Garrett turned off the IMU. *[The Italian (ASI) experiment ELITE-S2 is a human motion analysis facility for technological characterization and potential application for multifactorial movement analysis, to study the connection between brain, visualization and motion in micro-G. By recording and analyzing the three-dimensional motion of astronauts, this study should help engineers apply ergonomics into future spacecraft designs and determine the effects of weightlessness on breathing mechanisms for long-duration missions. For each of three protocols (e.g., MOVE, IMAGINE), a set of body landmarks are identified and reflective markers are applied on the subject who then performs prescheduled movements with the index finger tips then returns to the initial position (for example, the subject has to reach and brush, without exerting forces). The video cameras trace the trajectories of the body parts of the astronaut catching the light reflected by the markers, thus recording the kinetic and trajectory data of the movement.]*

Peggy Whitson worked on the IMV (Intermodule Ventilation) system between Lab and Node-2, cleaning the duct and diffuser grille and troubleshooting the airflow by checking out the downstream side of the silencer for possible caked FOD (Foreign Object/Debris).

Later today, the CDR will take airflow measurements on the THC (Temperature & Humidity Control) IMV from the Airlock to Node-1 at the IMV fan location, using the Velocicalc instrument.

With the increase in crew size from three to six placing more emphasis on ventilation, Peggy is also scheduled to check on the function of the important IP-1 airflow sensors in the various Russian segment hatchways, including the SM-to-DC1 tunnel, and the FGB-to-Node & FGB-to-Soyuz passageways.

At ~4:40pm EDT, Volkov and Malenchenko will swap out Yi's and Reisman's IELK (Individual Equipment & Liner Kit, Russian: USIL) between the two Soyuz vehicles, TMA-11/15S & TMA-12/16S, including their tailored Sokol spacesuits. The IELKs of Volkov & Kononenko are already in the 16S spacecraft that has now become the

Expedition 17 CRV (Crew Return Vehicle), good for a maximum of 200 days in space, while Whitson's and Malenchenko's IELKs remain in 15S for the return on 4/19. *[A crewmember is not considered transferred until her/his IELK, AMP (Ambulatory Medical Pack) and ALSP (Advanced Life Support Pack) drug kit are transferred. After today's installation of the VC14 IELK, Yi is now considered a 15S crewmember, and **Expedition 17 has technically begun its residence** aboard ISS, with Peggy Whitson passing her CDR-baton to Sergei Volkov. TMA-11 has been docked at ISS since 10/12/07. By the time of its return on 4/19, the spacecraft will have spent 192 days in space, 8 days short of its "warranty" life.]*

The CDR is scheduled to conduct the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV at the SKV-2 air conditioner for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

On the IMS (Inventory Management System), Yuri will update/edit its standard "delta file", including locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Working off the discretionary "time permitting" task list, Malenchenko performed the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).

The crewmembers are scheduled for their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Peggy is to download the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

CEO photo targets uplinked for today were **South Tibesti Megafans, Chad** *(relict channels of an extensive megafan river system occupy a large area, probably dating from the last wet period in the Sahara Desert [~10,000 years ago]. These channel networks appear to be good analogs for river-like lines on Mars. Overlapping images immediately right of track were requested: the relict stream beds are located on the light-toned flats below the dark volcano slopes of the*

Tibesti Mts. [the black volcano slopes are visual cue for the ISS crew], Lima, Peru (Nadir pass), London, England, Great Britain (looking left of track. The River Thames is the visual cue for the ISS crew), and Moorea Coral Reef, Tahiti (looking right of track for this coral reef. The Moorea Coral Reef LTER is located 15 km northwest of the main island of Tahiti. Moorea is a high, 1.2 million-year-old volcanic island surrounded by a well developed coral reef and lagoon system).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 7:44am EDT [= epoch]):*

Mean altitude -- 338.0 km

Apogee height -- 338.7 km

Perigee height -- 337.3 km

Period -- 91.29 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0001071

Solar Beta Angle -- -4.7 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 151 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53784

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

04/12/08 -- **Cosmonautics Day**, with **Yuri's Night** (check out <http://www.yurisnight.net/2008/>)

04/18/08 -- Soyuz TMA-11/15S undocking (FGB nadir port, 11:34pm EDT)

04/19/08 -- Soyuz TMA-11/15S landing (2:52am EDT, 9:52am Moscow/DMT, 12:52pm Kazakhstan)

05/06/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/31/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS (5:01pm EDT)

06/02/08 -- STS-124/Discovery/1J docking

07/10/08 -- Russian EVA-20 (7/10-11)

08/07/08 -- ATV1 undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
4QTR CY09 -- STS-130/19A - MPLM
1QTR CY10 – STS-131/ULF4
2QTR CY10 -- STS-132/20A – Node-3 + Cupola
3QTR CY10 – STS-133/ULF5.

ISS On-Orbit Status 04/09/08

All ISS systems continue to function nominally, except those noted previously or below.

Soyuz TMA-12/16S, with Expedition 17 crewmembers CDR Sergei Alexandrovich Volkov (CDR) and Oleg Dmitrievich Kononenko (FE-1), plus Korean SFP (Spaceflight Participant) So-Yeon Yi, 14th Visiting Crewmember (VC) to spend time on the station, continues to catch up with the ISS for the **docking tomorrow morning at ~9:02am EDT**. *(See launch picture below).* *[FD1 activities yesterday included the first two maneuver burns, DV1 (10:57am) & DV2 (11:50am), both with the SKD main engine. FD2 activities, started yesterday afternoon with Soyuz crew wakeup at ~4:05pm on Orbit 12, include systems & crew health status reports to TsUP, preparation of the Soyuz Habitation Module (SA) workspace, building attitude for and executing the DV3 burn, placing Soyuz back in its sun-spinning "barbecue" mode (ISK), and swapping CO₂ absorption cartridges (LiOH) in the BO. Afterwards, the crewmembers will put on their Sokol suits and PKO biomed harnesses, transfer to the SA, activate its air purification system (SOA) and close the hatch to the Descent Module (BO). After activation of the active Kurs-A system on Soyuz and of the passive Kurs-P on the Service Module (SM), with a short Kurs-A/P test and several additional adjustment burns during automated rendezvous, station fly-around to align with the DC1 Docking Compartment will begin tomorrow at ~8:37am at ~400m range, followed by station keeping at ~160m (~8:46am) and docking at the DC1 port at ~9:02am. Volkov & Kononenko will replace Expedition 16 CDR Whitson & FE-1 Malenchenko. FE-2 Dr. Garrett Reisman remains on the station, joining Expedition 17 until early June when he is replaced by U.S. Astronaut Gregory E. Chamitoff on STS-124/1J. So-Yeon Yi, the 30-year old biotechnologist student from KAIST (Korea Advanced Institute of Science & Technology) and South Korea's first astronaut, will return with Peggy & Yuri on 4/19 in Soyuz TMA-11/15S.]*

In preparation for his return to gravity, Yuri also undertook his third preliminary

session of the Russian MO-5 MedOps protocol of cardiovascular evaluation in the "Chibis" below-the-waist reduced-pressure suit (ODNT, US: LBNP) on the VELO ergometer, assisted by Whitson as CMO (Crew Medical Officer). *[The 60-min assessment, supported by ground specialist tagup (VHF) and telemetry monitoring from Russian ground sites (at 5:20am EDT), uses the Gamma-1 ECG equipment with biomed harness, skin electrodes and a blood pressure and rheoplethysmograph cuff wired to the cycle ergometer's instrumentation panels. The Chibis ODNT provides gravity-simulating stress to the body's cardiovascular/circulatory system for evaluation of Malenchenko's orthostatic tolerance (e.g., the Gauer-Henry reflex) after several weeks in zero-G. The preparatory training generally consists of first imbibing 150-200 milliliters of water or juice, followed by a sequence of progressive regimes of reduced ("negative") pressure, set at -25, -30, -35 and -40 mmHg (Torr) for five minutes each while shifting from foot to foot at 10-12 steps per minute, while wearing a sphygmomanometer to measure blood pressure. The body's circulatory system interprets the pressure differential between upper and lower body as a gravity-like force pulling the blood (and other liquids) down. Chibis data and biomed cardiovascular readings are recorded. The Chibis suit (not to be confused with the Russian "Penguin" suit for spring-loaded body compression, or the "Kentavr" anti-g suit worn during reentry) is similar to the U.S. LBNP facility (not a suit) used for the first time on Skylab in 1973/74, although it appears to accomplish its purpose more quickly.]*

FE-2 Reisman continued his preparations of the MELFI (Minus Eighty Degree Laboratory Freezer for the ISS) for upcoming sample stowage by swapping trays between Dewars 1 & 3 and retrieving more -32deg ICEPAC belts from stowage for insertion in Dewar 1.

After temporarily deactivating the Russian SKV-2 air conditioner, the FE-1 collected another set of condensate water (KAV) samples from the Condensate Water Recovery System (SRV-K2M), upstream of its Gas-Liquid Mixture Filter (FGS), in empty drink bags for return to Earth on Soyuz 15S.

Malenchenko conducted the periodic time synchronization between the RSS1 and the BSPN payload server, after testing functionality by checking data comm between the two computers and synching RSS1 to station time, in support of payload data transfers from the BSPN for subsequent downlink on OCA comm (via the Russian RSS1 laptop to a PCMCIA flash card). *[Before RSS1/BSPN synchronization, the RSS1 is updated with the exact time as per the station clock (which in turn is synchronized daily from RGS/Russian Ground Site). Experiment control application is a payload file transfer program called ShellForKE.];*

In the DC1 Docking Compartment, the FE-1 reconnected a cable to the comm panel to enable "air-to-air" communications from the approaching Soyuz TMA-12.

As a test of the ground-controlled Russian onboard command sequencer (SPP) for the Korean VC14, Malenchenko conducted a PAO TV broadcast, downlinking messages of greetings for Cosmonautics Day (4/12) to the residents & municipal area of the city of Engels as well as to the students & faculty of the MAI (Moscow Aviation Institute) Aerospace Department. *[At Engels, Yuri Gagarin learned to fly and, with other cosmonauts, practiced parachute jumping. It is also the location where he landed after his historic space flight on April 12, 1961.]*

Later, after Reisman configured the designated A31p laptop in the FGB for converting analog-to-digital video, he and Malenchenko set up the system for a video transmission test from the RS (Russian Segment) over the MPEG-2 (Moving Pictures Expert Group 2) encoder to downlink via U.S. OpsLAN and Ku-band in “streaming video” packets. Afterwards, Garrett deactivated the A31p again.

Garrett performed the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier’s condensate tank, filling a CWC (Contingency Water Container, #1062) with the collected water slated for processing. No samples were required this time. *[Estimated offload time before reaching the tank’s neutral point (leaving ~6 kg in the tank): ~30 min.]*

The FE-1 completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV at the SKV-2 air conditioner for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Working off the discretionary “time permitting” task list, Malenchenko performed the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).

A second suggested task for Yuri was the daily monitoring, picture-taking and downloading on the BIO-5 Rasteniya-2 (“Plants-2”) experiment. *[Rasteniya-2 researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. During the duration of the BIO-5 experiment, students of the Moscow City Palace for Youth Creativity of the Meshchansky inter-regional center #15 in Moscow and the Prince*

of Oldenburg Lyceum in St. Petersburg are cultivating plants in parallel on the ground and conducting comparative observation of plant growth and development under gravity and zero-gravity conditions. They are receiving the photo images taken by Yuri.]

The crewmembers performed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Peggy downloaded the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~4:10pm, Garrett is scheduled for his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop).

OGS Update: In line with the Program decision to keep the Elektron oxygen generator deactivated for power reasons while the ATV vehicle is docked to the ISS, the US OGS (Oxygen Generation System) continues to operate. This morning the OGS production rate has been increased from 25% to 50% (with day/night cycling enabled). This equates to ~6 lbm/day of O₂ produced. Currently, the corrected ppO₂ (Oxygen partial pressure) is 165.6 mmHg (21.7% max).

Columbus Update: Ground-controlled thermal checkout continues on the COL Air Loop, with air loop temperature control disabled for the duration of the ground commanding. The testing will continue through tomorrow. The crew was informed to minimize their time in Columbus during the testing since the module could have higher than expected temperatures.

CEO photo targets uplinked for today were **Irrawaddy River Delta, Burma** (*continued mapping of the mouths of the Irrawaddy was requested. Many changes in vegetation and stream locations have been noted in this densely farmed zone*), **Chongqing, China** (*this is the biggest city in the western parts of China, with 4.1 million people. Looking a touch right. The city lies on the Chang [Yangtze] River, which is the visual cue from ISS*), **Toshka Lakes, Egypt** (*after many years of rising water levels, the Toshka lakes appear to be experiencing an extended decline. The last imagery was taken six months ago, so new detailed documentation is needed. Looking at nadir and a touch right. Dry lake floors are beginning to appear as water levels decline*), and **Luquillo Forest, Puerto Rico** (*the Luquillo Experimental*

Forest [LEF] on the northeast tip of Puerto Rico, has been a center of tropical forestry research for nearly a century. In addition, the LEF is a recreation site for over half a million people per year, a water supply for approximately 20% of Puerto Rico's population, and a refuge of Caribbean biodiversity. Good 400mm imagery was recently acquired, and 800-mm images are now requested. Looking right on the tip of the island).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 8:10am EDT [= epoch]):*

Mean altitude -- 338.2 km

Apogee height -- 338.6 km

Perigee height -- 337.7 km

Period -- 91.30 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0000704

Solar Beta Angle -- -0.3 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 186 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53768

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~9:02am

04/12/08 -- **Cosmonautics Day**, with **Yuri's Night** (check out <http://www.yurisnight.net/2008/>)

04/18/08 -- Soyuz TMA-11/15S undocking (FGB nadir port, 11:34pm EDT)

04/19/08 -- Soyuz TMA-11/15S landing (2:52am EDT, 9:52am Moscow/DMT, 12:52pm Kazakhstan)

05/06/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/31/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS (5:01pm EDT)

06/02/08 -- STS-124/Discovery/1J docking

07/10/08 -- Russian EVA-20 (7/10-11)

08/07/08 -- ATV1 undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
4QTR CY09 -- STS-130/19A - MPLM
1QTR CY10 – STS-131/ULF4
2QTR CY10 -- STS-132/20A – Node-3 + Cupola
3QTR CY10 – STS-133/ULF5.

ISS On-Orbit Status 04/08/08

All ISS systems continue to function nominally, except those noted previously or below.

Our good partners did it again: **Soyuz TMA-12 (16S) launched flawlessly** this morning on time at 7:16:39am EDT (see *Flight Plan at bottom*). Separations from second & third stage were nominal. Orbit was attained at L+ 8:45 min at an altitude of ~202 km (perigee ~189.6 km/apogee ~230.1 km, downrange ~520 km, velocity ~7.50 km/s). Antennas and solar arrays deployed nominally at orbit insertion. 16S has a planned two-day rendezvous profile, to aim for docking on Thursday, 4/10. *[At orbit insertion, Soyuz unfolded two solar arrays, four Kurs antennas, one TORU/Rassvet-M antenna and one telemetry antenna. Later, the crew activated antenna heaters, set the maneuver mode, turned on the RKO orbit radio tracking system, started leak checks, etc. Two orbit adjustment burns of ~5 min duration each were executed this morning, DV1 (~25.55 m/s) at ~10:57am, DV2 (~14.27 m/s) at ~11:50am, both with the SKD main engine. After the two-day "chase", supported by several more midcourse burns, 16S will dock at the DC1 Docking Compartment on 4/10 at ~9:02am EDT.]*

The ISS crew had 90 min. reserved for an in-depth review of the on-board VC14 (Visiting Cosmonaut 14) program/timeline, to be executed by SFP (Spaceflight Participant) So-yeon Yi from South Korea during the Soyuz ascent flight and after her arrival in 16S. Duration of the VC14 program is 11 days (from 4/8 to 4/19), with nine days (4/10-4/19) aboard the ISS Russian Segment (RS). *[VC14 comprises 15 experiments plus some additional events, viz.: **P01**- Growth and mutation of plant seeds; **KAP02** - Identification of *Drosophila* genes responsive to gravity and responsible for aging; **KAP03** - Development of Bioreactor for use on the ISS; **KAP04** - SFP medical monitoring project; **KAP05** - Study of SFP facial changes on the ISS using a Moiré screen; **KAP06** - Study of the possibility of using traditional Korean food in onboard food rations; **KAP07** - Growth of Zeolite crystals, super*

crystals, and crystal layers in microgravity; **KAP08** - Synthesis of metal-organic porous materials in microgravity; **KAP09** - High-resolution telescope (ELT) and study of micro-electro-mechanical system (MEMS) for next generation telescopes; **KAP10** - Earth observations; **KAP11** - Noise level reduction onboard the ISS RS; **KAP12** - Study of molecular memory device characteristics in space habitation environment; **KAP13** - Experiment involving measurements using small mass measurement system (SMMS); **KAP14** - Educational experiment; **KAP15** - Daily life and activities of SFP, using Samsung Gx-10 and Samsung NV11 cameras. Also: Four video conferences between ISS RS & TsUP-Moscow in real-time; two ham radio sessions; internal photo & video imagery on the ISS RS; activity with commemorative items; tagups with Korean cosmonaut advisory group (via Russian comm assets) – twice daily in the mornings and evenings; and Experiment ops with the US SLEEP/Actiwatch program.]

Afterwards, at ~6:50am EDT, the crew tagged up with ground specialists to discuss the VC14 program.

FE-1 Malenchenko later set up the RS work area for the SFP. [Preparations for So-yeon Yi included transferring the KUBIK-3 cooler/container from the Soyuz BO (Orbital Module) to the FGB, relocating the ALTCRISS ATS spectrometer from the DC1 to the FGB & photographing the setup, configuring BIOEMULSION experiment hardware in the SM, transferring the KRIOGEM-03 refrigerator to the SM & conducting a temperature test, monitoring MATRYOSHKA LIULIN-5 hardware readings & turning it off (except for its electronics), and preparing a location in the SM for a second KRIOGEM-03 thermostat to be delivered on Soyuz 16S.]

Malenchenko also collected samples of condensate water (KAV) upstream of the FGS (Gas-Liquid Mixture Filter) of the SRV-K2M (Condensate Water Recovery System) in empty drink bags for return to Earth in 15S.

Afterwards, Yuri conducted a continuity and functions test of the SRV-K2M control panel (PU) of the condensate transfer pump (BPK) and then an activation test of the BPK itself, supported by ground specialist tagup.

FE-2 Reisman conducted the periodic checkup on active U.S. payloads, i.e., cleaning the ANITA (Analyzing Interferometer for Ambient Air) inlet plus inspecting and filter cleaning of the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. [The CGBA incubator is controlled from the ground, with automatic video downlinked to Earth. ANITA continues to collect data every six seconds and downlinks the data daily to the ground team. ANITA monitors low levels of potential gaseous contaminants in the ISS cabin atmosphere with a capability of simultaneously monitoring 32 gaseous contaminants. The experiment is testing the accuracy and reliability of this technology as a potential next-

generation atmosphere trace-gas monitoring system for ISS and future spacecraft. This is a cooperative investigation with ESA.]

The FE-2 also prepared the MELFI (Minus Eighty Degree Laboratory Freezer for the ISS) for upcoming sample stowage by retrieving two -32deg ICEPAC belts from stowage and inserting them in Sections 2 & 3 of Tray C in Dewar 1.

CDR Whitson retrieved and stowed the four passive FMK (Formaldehyde Monitoring Kit) sampling assemblies deployed by her on 4/6 in the Lab (at P3, below CEVIS) and SM (at the most forward handrail, on panel 307), to catch any atmospheric formaldehyde on a collector substrate for subsequent analysis on the ground. *[Two monitors each are usually attached side by side, preferably in an orientation with their faces perpendicular to the direction of air flow.]*

Later, the CDR performed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV at the SKV-2 air conditioner for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Peggy & Yuri spent another hour each on end-of-increment cleanup and departure preparations. *[Instructions on packing of return items and a keep vs. trash list were uplinked for assisting Yuri and Peggy in their preparing for their return in the severely downmass-limited Soyuz Descent Module. Trashed items were stowed in the Orbital Module (BO), to be separated along with the Instrumentation/Propulsion Module prior to atmospheric entry.]*

In the US Airlock, Garrett Reisman, as per ground instruction, opened the PBA (Portable Breathing Apparatus) bottle #1014 to discharge any remaining oxygen. *[Earlier (3/31), during the periodic PEP (Portable Emergency Provisions) inspection, the bottle was reported to show its pressure gauge in the red zone, i.e., low on pressure and unusable. A replacement is being manifested on the ground.]*

The crewmembers performed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1/fulltime), and RED resistive exercise device (CDR, FE-2).

Afterwards, Garrett downloaded the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM

storage medium (done six times a week).

Whitson & Malenchenko held their standard periodic PMC (Private Medical Conference) via S- & Ku-band audio/video.

Reisman had another 60 minutes for himself for general orientation (station familiarization & acclimatization) as is standard daily rule for the first two weeks after starting station residency.

Working off the discretionary “time permitting” task list, Yuri –

- conducted the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur), and
- performed the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).

At ~4:40am EDT, the crew joined in downlinking two PAO TV messages of greetings on the occasion of the upcoming Cosmonautics Day (4/12), one to the winners of a Children’s Art Contest, the other to the Moscow Aviation Institute (MAI) Aerospace Department. *[The “Space and I” Child Art Contest prize award ceremony will take place in Novosibirsk on April 13, while on April 18 prizes will be awarded to the winners of the Space Race Child Art Contest in Star City: “....Dear young friends! We congratulate you on the conclusion of this art contest for kids. We wish you to be full of new bold ideas, bright fantasies, and creative energy, but – most important – to be good people! For this, study well, try to be a bit like the first planet’s cosmonaut Yuri Alexeyevich Gagarin, space rocket chief designer Sergey Pavlovich Korolev, and many others.)” MAI Aerospace Dept. students & faculty will gather on Cosmonautics Day in the MAI Cultural Center “to sing, to dance, and to just have fun”: “....We wish we were there and we wish you success in your studies and hope you have a good time! To steal a line from a song – We see it all from high above! And we clearly see from here the best students of the 6th Department – Freshman Igor Avdeyenko, Sophomore Sergey Shadsky, Junior Elvira Meipariani, Senior Sergey Chulkov, and Graduate Year student Nina Botvina! Guys, please accept our admiration and thanks from distant space!”]*

At ~1:15pm, Peggy & Garrett held a crew discretionary teleconference via Ku- & S-band.

Soyuz 16S (Expedition 17+1) flight plan for CDR Sergei Alexandrovich Volkov, FE-1 Oleg Dmitrievich Kononenko, and SFP So-Yeon Yi (South Korea):

Flight Day 1 (all times EDT):

- 4/8: 7:16am: Launch (L), when ISS was at 164 deg phase angle
- L+1min52sec: Escape rocket jettison (~46 km altitude)
- L+1:53: First stage (four strap-on boosters) separation (~49 km altitude)
- L+2:38: Launch shroud jettison (~84 km)
- L+4:45: Second stage (core) separation (~167 km altitude)
- L+4:57: Third stage lower skirt jettison
- L+8:45: Third stage shutdown (orbital insertion, ~202 km altitude, 7.5 km/s velocity)
- L+8:48: Third stage separation (~202 km) = S
- 7:33:27 At S+8 sec: deployment of 2 solar arrays, 4 Kurs-A antennas, 1 radio antenna (Rassvet-M VHF-2), 1 telemetry antenna (onboard measurement syst.)
- 8:33am: Orbit 2 began (ascending node)
- 9:24am: TsUP issues Soyuz flight vector (position, velocity data)
- 10:02am: Orbit 3 began
- 10:57am: First maneuver burn (DV1) by main propulsion engine
- 11:42am: Orbit 4 began
- 11:50am: Second maneuver burn (DV2) by main propulsion engine
- 1:01pm: Orbit 5 began
- 2:00pm: Crew doffed/stowed Sokol suits
- 2:31am: Orbit 6 began
- 2:31pm: Crew sleep began
- 4:05pm: Crew sleep ends.

Ahead:

- Start ISS Flyaround -- 4/10 (Thu), 8:37am; range ~405m;
- Start Stationkeeping -- 8:46am; range ~160m, below;
- Final Approach -- 8:53am;
- Docking -- 9:02am.

OGS Update: In line with a Program decision to keep the Elektron oxygen generator deactivated for power reasons while the ATV vehicle is docked to the ISS, the US OGS (Oxygen Generation System) was activated yesterday and subsequently started operating in 25% production mode with day/night cycling enabled (i.e., producing about 3 lb/day of O₂). The mode will be increased when more power becomes available.

Columbus Update: This morning ground engineers performed Run 1 of a planned COL Air Loop Thermal Checkout. During the checkout, the Columbus temperature was expected to increase somewhat, and the crew was advised to minimize their time in the module.

ATV Update: The scheduled ATV1 thruster test was successfully conducted on 4/5 (Saturday). After the handover to USOS CMG momentum management at the completion of the test, the vehicle momentum peaked at approximately 97% (of full capability) during SARJ (Solar Alpha Rotary Joint) and BGA (Beta Gimbal Angle) rotations. This is an expected occurrence due to the increased mass and inertia of the vehicle. Mitigating procedures have been instituted to minimize the momentum during these operations. Following yesterday's undocking of Progress 28P, and after the ATV transitioned to Standard Mode 2, the ATV solar arrays went prematurely into Autotrack. TsUP confirmed that neither they nor the crew had sent commands to "Jules Verne" that would have caused the arrays to switch to Autotrack. Ground teams are analyzing.

CEO photo targets uplinked for today were **Calcutta, India** (*looking right on the Hooghly River, one of the distributaries of the Ganges Delta, for this urban area of ~14 million people, focusing on city margins*), **East Haruj Megafans, Libya** (*a detailed swath of overlapping images looking just right of track was requested: remote sensing is a powerful way to collect data on these remote features. Understanding the way recently recognized extensive networks of desert streams are functioning [where there are no hillsides to channel them] is a new branch of research. This research has special application to ongoing research on Mars [e.g. for understanding the enigmatic flat plains in the Meridian region where the rover Opportunity still functions]*), **Pilcomayo River dynamics, N Argentina** (*the Pilcomayo River has built the largest inland delta [megafan] on Earth. It is also unusual because at present it stops flowing not far from the Andes Mt front—i.e. water and sediment fail to reach the sea, even though this is a major regional river. The cause may be tectonic subsidence. The crew was asked to shoot detailed images as far out onto the plains as the river stretches*), **Lima, Peru** (*looking a touch right for the capital city Lima [a short distance inland] and its port Callao, with a combined population of 7.5 million. Images of the margins of the cities were requested*), **East Venezuela land use** (*a swath of overlapping images close to nadir was to document new farming expansions in a part of the world which has been untouched until recently*), **Mississippi Delta Region** (*a mapping swath along track was to document ecological changes since Hurricane Katrina's passage in August 2005*), and **Sky Island Forests, Sierra Madre, Mexico/SW USA** (*the higher elevations of mountains in Mexico's Sierra Madre ranges and the US Southwest are cool and moist enough for thick pine-oak forest to flourish. The forested peaks appear as green "islands" in the deserts mainly of northern Mexico, but also in the US Southwest. The sky islands boast some of the richest biodiversity anywhere in North America. To start this round of change documentation researchers requested broad views looking right of track*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the

Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 7:51am EDT [= epoch]):*

Mean altitude -- 338.4 km

Apogee height -- 338.8 km

Perigee height -- 337.9 km

Period -- 91.30 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0000609

Solar Beta Angle -- 4.2 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 263 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53752

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~9:02am

04/12/08 -- **Cosmonautics Day**, with **Yuri's Night** (check out <http://www.yurisnight.net/2008/>)

ISS On-Orbit Status 04/07/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 25 of Increment 16.*

This morning at 4:49am EDT, Progress M-63/28P successfully undocked from the ISS. All separation burns went off nominally, and the deorbit burn followed at 7:50am for destructive reentry over the Pacific Ocean. This freed the DC1 Docking Compartment port for Soyuz TMA-12/16S docking on 4/10 at ~9:02am. *[For the undocking, ISS attitude control was handed over to Russian MCS (Motion Control System) at ~2:55am and returned to U.S. momentum management at ~5:45am, still in earth-fixed LVLH (local vertical/local horizontal). During the undocking, the station was in free drift for ~9 min. Structural response data were taken by MAMS (Microgravity Acceleration Measuring System) and the external truss-mounted SDMS (Structural Dynamic Measurement System). The undocking was preceded at ~4:15am by a temporary shutdown of the amateur radio equipment in the FGB (Ericsson) & SM (Kenwood) to prevent radiofrequency interference with the departing Progress vehicle.]*

After the separation, FE-1 Malenchenko took the usual NIKON D2X w/80-400mm lens photographs of the receding cargo ship's docking assembly (from ~8-40 m distance) to verify that no rubber seals are missing on the DC1 docking interface and to assess seal integrity.

Malenchenko and CDR Whitson worked their way through the Soyuz descent drill, a standard preparatory training for every crew returning on a Soyuz. For the exercise, Yuri and Peggy spent two hours in the SM, tagging up with an instructor at TsUP-Moscow to discuss procedures. *[The session included a review of the pertinent RODFs (Russian Ops Data Files), specifically the books on Soyuz Ascent & Descent Procedures, Emergency Descents, and Off-Nominal Situations, crew responsibilities when executing the flight program, visual crew recognition of SUS (Entry Control System) failures, contingency transition to manual entry control*

(RUS), etc. The training uses a Descent Simulator application on the RSK1 laptop. During the actual descent, Malenchenko as Soyuz CDR will occupy the middle couch, with So-yeon Yi in the right seat and Whitson in the Descent Module's left Kazbek couch. Pending the final State Commission decision at about 3.5h before undocking, 16S return is expected for 4/19, with undocking at 11:34pm EDT on 4/18 and landing near Arkalyk/Kazakhstan at ~2:52am EDT (12:52pm Kazakhstan time) on 4/19.]

Afterwards, the CDR and FE-1 tried on their KENTAVR suits for a fit check, supported by tagup with specialists (S-band). *[The Kentavr ("Centaur") garment is a protective anti-g suit ensemble to facilitate the return of a long-duration crewmember into the Earth gravity. Consisting of shorts, gaiters, underpants, jersey and socks, it acts as countermeasure for circulatory disturbance, prevents crewmember from overloading during descent and increases orthostatic tolerance during post-flight adaptation. Russian crewmembers are also advised to ingest fluid-electrolyte additives, viz., three sodium chloride tablets during breakfast and after the midday meal, each time with 300 ml of fluid, and two pills during the meal aboard Soyuz before deorbit.]*

Whitson & Malenchenko also took their pre-descent PMC (Private Medical Conference) via S- & Ku-band audio/video.

As Yuri conferred via S-band with ground specialists regarding Soyuz TMA-11/15S loading with return cargo, Reisman & Whitson made preparations for upcoming cargo transfer operations from the newly arrived ATV1 "Jules Verne".

[Preparations inside the ATV included installation of a TSR (Temporary Stowage Rack) at loc. ATV1D1, building a "bungee jail" holding place for cargo, relocating stowage bags and adapter plates from rack fronts to the "jail", and installing handrails.]

Later, Malenchenko closed the DC1-to-Soyuz PEV (Pressure Equalization Valve; Russian: KVD) and uninstalled good lighting fixtures from the Soyuz Orbital Module (BO) to be kept as spares for the SM. *[The BO will be separated and discarded along with the Instrumentation/Propulsion Module prior to atmospheric entry.]*

The FE-1 also transferred a second set of Russian hand controllers, one for rotation (RUO), the other for translation (RUD), from the Soyuz to the FGB for stowage in the PILOT experiment container.

In the JLP (Japanese Experiment Module Experiment Logistics Module Pressurized Section), Garrett Reisman performed the periodic checkup on JLP status and shell temperatures by using the MKAM (Minimum Keep Alive Monitor).

After activating the MSG (Microgravity Science Glovebox) facility, the FE-2 continued troubleshooting the EMCS (European Modular Cultivation System) and succeeded in clearing up the problem by determining that the EMCS main door was obstructed by an EMCS laptop cable. Garrett also straightened out a crimped water line. EMCS was activated, and hydration of the Japanese CW/RW (Cell Wall/Resist Wall) experiment began. *[CW/RW operates in the EMCS facility in eight special ECs (Experiment Containers) which Garrett recently (3/30) installed on the centrifuges of the facility. The EMCS rack contains two rotating centrifuges that can support a wide range of small plant & animal experiments under partial gravity conditions. On Rotor A, the new ECs for CW/RW are EC92 in position A1, EC95 at A2, EC94 at A3, EC96 at A4, on Rotor B - EC97 in position B1, EC99 at B2, EC98 at B3, and EC100 at B4.]*

In the Lab, Reisman performed IFM (Inflight Maintenance) on the OGS (Oxygen Generation System). *[Garrett accessed it in its rack, replaced its H₂ (hydrogen) sensor with a new sensor, mated its electrical connections and hooked up the QD (Quick Disconnect) between the O₂ outlet hose and the N₂ (nitrogen) purge unit. Then, after the OGS was powered for 20 min, the FE-2 reconnected the H₂ sensor hose QDs, closed the rack door afterwards and turned on the WDS (Water Delivery System). Like the Russian Elektron, OGS produces O₂ from water by electrolysis, dumping the also generated H₂ through venting.]*

Whitson conducted the periodic atmospheric sampling in the center of the Lab, SM and JLP with the GSC (Grab Sample Container), while Malenchenko used the AK-1M adsorber to collect cabin air samples in the SM and FGB.

Later, Yuri prepared the IPD Draeger tube kits with their accumulated air samples for stowage on Soyuz 15S and return to Earth.

Malenchenko also conducted the periodic (monthly) functional closure test of the Vozdukh CO₂ removal system's spare emergency vacuum valves (AVK), in the spare parts kit. *[The AVKs are critical because they close the Vozdukh's vacuum access lines in the event of a malfunction in the regular vacuum valves (BVK) or a depressurization in the Vozdukh valve panel (BOA). Access to vacuum is required to vent CO₂ during the regeneration of the absorbent cartridges (PP). During nominal operation, the AVK valves remain open.]*

Reisman downloaded the structural dynamics data collected this morning during Progress undocking by the IWIS (Internal Wireless Integrated System) from the

RSUs (Remote Sensor Units) and NCU (Network Control Unit) to the SSC (Station Support Computer) laptop for subsequent downlink to the ground.

Yuri collected microbial samples of himself for the ESA/Russian experiment SAMPLE (Study of Microbial Communities Exposed to Weightlessness) with objectives similar to the US SWAB experiment. The samples were inserted in the MELFI (Minus-Eighty Laboratory Freezer for ISS), Dewar 4, Tray B/Section 3.

[Sampling will also include key areas of the ISS (switches, keyboards, personal hygiene equipment, etc) which will help determine what types of microbial species are present on ISS and how they adapt or mutate in space.]

Peggy & Yuri spent about an hour each on end-of-increment cleanup and departure preparations. *[Instructions on packing of return items and a keep vs. trash list were uplinked for assisting Yuri and Peggy in their preparing for their return in the severely downmass-limited Soyuz Descent Module. Trashed items are being stowed in the Orbital Module (BO), to be separated along with the Instrumentation/ Propulsion Module prior to atmospheric entry.]*

Garrett Reisman had another 60 minutes for himself for general orientation (station familiarization & acclimatization) as is standard daily rule for the first two weeks after starting station residency.

The FE-2 performed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV at the SKV-2 air conditioner for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Working off the discretionary “time permitting” task list, Yuri –

- conducted the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur),
- performed the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder), and
- serviced the BIO-5 Rasteniya-2 ("Plants-2") experiment, which researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}), by monitoring the greenhouse, taking pictures and downloading them to

the ground.

The crewmembers performed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1/fulltime), and RED resistive exercise device (CDR, FE-2).

Afterwards, Whitson downloaded the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~10:45am EDT, FE-2 Reisman powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply) and at 10:50am conducted a ham radio exchange with students at Osnovna škola (Elementary School) in Pazin, Croatia. *[Elementary school Vladimir Nazor of Pazin is a school with more than hundred year's tradition, founded in 1890. It is one of the highest rated schools in this part of the country, with more than 1500 pupils.*

Robotics, electronics and ham radio activities are more popular every day, with pupils achieving awards in national competitions. Astronomy is one of the latest after-school activities, which combined with existing ham radio activities resulted in applying for the ISS school contact. Questions to Garrett were uplinked beforehand. "When you were in space for the first time, how old were you?"; "How long does it take from Earth to ISS?"; "Were you afraid of going to ISS?"; "What is the most frightening in space?"; "Is it boring in space sometimes?"; "How do you shower?"]

Elektron Update: RSC-Energia has completed the final procedures for activating the Elektron without the ATV power/noise (EMI) filter and has delivered it to ESA for review.

Columbus Update: A replacement delta-P sensor for redundancy in the COL water loops will be manifested soon. Troubleshooting of the COL condensate water separator blockage is in work with NASA. An open loop command was sent to the SOLAR payload which is a major step in recovering the payload; the system can now operate on a fixed position to track the sun. BLB (Biolab) troubleshooting will require removal & replacement of the locking pin; the pin is requested to be manifested on Flight 1J. ESA is completing procedures for the FSL (Fluid Science Laboratory) laser switch checkout; planners will work on when to schedule the activity.

No CEO (Crew Earth Observation) photo targets uplinked for today..

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this noon, 12:23pm EDT [= epoch]*):

Mean altitude -- 338.6 km

Apogee height -- 339.1 km

Perigee height -- 338.0 km

Period -- 91.31 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0000831

Solar Beta Angle -- 8.7 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 115 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53740

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

04/08/08 -- Soyuz TMA-12/16S launch - 7:16am EDT (CDR Sergei Volkov, FE Oleg Kononenko, SFP Yi So-yeon)

04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~9:02am

04/12/08 -- **Cosmonautics Day**, with **Yuri's Night** (check out <http://www.yurisnight.net/2008/>)

04/18/08 -- Soyuz TMA-11/15S undocking (FGB nadir port, 11:34pm EDT)

04/19/08 -- Soyuz TMA-11/15S landing (2:52am EDT, 9:52am Moscow/DMT, 12:52pm Kazakhstan)

05/06/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/31/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS (5:01pm EDT)

06/02/08 -- STS-124/Discovery/1J docking

07/10/08 -- Russian EVA-20 (7/10-11)

08/07/08 -- ATV1 undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
4QTR CY09 -- STS-130/19A - MPLM
1QTR CY10 – STS-131/ULF4
2QTR CY10 -- STS-132/20A – Node-3 + Cupola
3QTR CY10 – STS-133/ULF5.

ISS On-Orbit Status 04/06/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday -- off-duty day for CDR Whitson, FE-1 Malenchenko & FE-2 Reisman except for housekeeping and voluntary work. Ahead: Week 25 of Increment 16.*

Having passed Day 180 of her flight, Dr. Peggy Whitson ended her fourth session with the NASA/JSC experiment NUTRITION w/Repository by collecting a final urine sample upon wakeup for storage in the MELFI (Minus-Eighty Laboratory Freezer for ISS). The sampling kit was then stowed away. *[The current NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R +30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

Today FE-1 Malenchenko was the subject for the BRASLET experiment (SDTO/ Station Development Test Objective), holding still for his first ultrasound scanning session by Peggy as operator (for which Yuri had to abstain from caffeine 12 hrs prior to the scan session, heavy meals 4 hrs before and any food at all 2 hrs prior to the scan, plus no exercise 2 hours before and no liquids 30 mins before). Afterwards, Peggy powered down the HRF USN (Human Research Facility) Ultrasound, closed the Image Collector Software on the HRF PC, stowed the hardware and transferred still images from the still camera to the OpsLAN. *[The SDTO-17011 "Validation of On-Orbit Methodology for the Assessment of Cardiac Function and Changes in the Circulating Volume Using Ultrasound and Braslet-M Occlusion Cuffs (Braslet)" is a collaborative effort between NASA and the Russian FSA (Federal Space Agency), with the goal to establish a valid ultrasound*

methodology for assessing a number of aspects of central and peripheral hemodynamics and cardiovascular function, specifically in rapid changes in intravascular circulating volume. Braslet uses Braslet-M occlusion cuffs, i.e., the Russian-made operational countermeasure already pre-calibrated and available onboard for each ISS crewmember. Braslet employs multiple modes of ultrasound imaging and measurements, in combination with short-term application of Braslet-M occlusive cuffs and cardiopulmonary maneuvers (Valsalva, Mueller) to demonstrate and to evaluate the degree of changes in the circulating volume on orbit. This will be accomplished by performing echocardiographic examinations in multiple modes (including Tissue Doppler mode), ultrasound measurements of lower extremity venous and arterial vascular responses to Braslet-M device under nominal conditions and also during cardiopulmonary Mueller and Valsalva maneuvers. Identical measurements will be repeated without Braslet-M, with Braslet-M applied, and immediately after releasing the occlusion device.]

Afterwards, CDR Whitson retrieved USN error logs off the laptop, winding up troubleshooting of her earlier VolSci Ultrasound activities. The USN now is back in commission.

The crew conducted the regular weekly three-hour task of thorough house cleaning. *["Uborka", normally done on Saturdays, includes removal of food waste products, cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab. Additionally, as part of the weekly cleaning, Malenchenko performs an inspection of structural elements, cables and instruments behind SM panels for moisture.]*

As part of today's *uborka*, the crew replaced the four dust filters (PF1-4) in the SM, two dust filters (PS1, PS2) in the *Funktsionalnyi-Grusovoi Blok* (FGB) and cleaned the mesh screens of the FGB's central ventilation fans (TsV1 & TsV2), with the fans running.

Malenchenko performed the monthly 20-min. maintenance/servicing of the toilet facility (ASU), changing out replaceable ASU parts with new components, i.e., the urine receptacle (MP) and a filter insert (F-V). The old parts were discarded as trash.

The FE-1 conducted the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables and the weekly collection of the toilet flush (SP) counter and

water supply (SVO) readings for calldown to TsUP. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV at the SKV-2 air conditioner for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Yuri also gathered weekly data on total operating time & "On" durations of the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem for reporting to TsUP.

CDR Whitson completed the periodic deployment of four passive FMK (Formaldehyde Monitoring Kit) sampling assemblies in the Lab (at P3, below CEVIS) and SM (at the most forward handrail, on panel 307) for two days, to catch any atmospheric formaldehyde on a collector substrate for subsequent analysis on the ground. *[Two monitors each are usually attached side by side, preferably in an orientation with their faces perpendicular to the direction of air flow.]*

At ~8:25am EDT, the crewmembers held their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP/Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

Whitson & Reisman had their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop), Peggy at 10:45am, Garrett at 12:25pm.

Working off the discretionary "time permitting" task list, Yuri conducted his second session of the ETD (Eye Tracking Device) experiment, which studies the coordination of eye and head movements in zero-G, i.e. the adaptation of the human vestibular (balance) system, and takes place in the DC-1's central sphere. *[After its initial calibration with the calibrating unit, the experiment investigates horizontal eye and head movement coordination, measures Listing's plane, and determines the orientation of the vestibulo-ocular coordinate system, using five target marks on a visual target board on the EV-2 hatch on the horizontal plane. For the experiment, Yuri first had to check the setup of the left and right video cameras, then establish his most comfortable and stable body position relative to the visual target (60 cm for the first part of the experiment, 100 to 150 cm in parts two & three). Each step requires another prior calibration run, using visual target cues or the calibration unit.]*

Also from the task list, the FE-1 performed the regular daily checkup on the

Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).

A third task list item for Malenchenko today was to service the BIO-5 Rasteniya-2 ("Plants-2") experiment, which researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}), by monitoring the greenhouse, taking pictures and downloading them to the ground.

The crewmembers performed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Before sleeptime, the CDR closed the protective shutters of the Lab science window in preparation for tomorrow morning's **undocking of Progress M-63/28P**. Separation of the cargo drone-turned-trash can from DC1 nadir port will take place at 4:50am EDT.

No CEO photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 8:42am EDT [= epoch]*):

Mean altitude -- 338.7 km

Apogee height -- 339.5 km

Perigee height -- 337.8 km

Period -- 91.31 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0001252

Solar Beta Angle -- 13.2 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.77

ISS On-Orbit Status 04/05/08

All ISS systems continue to function nominally, except those noted previously or below. *Saturday – half-day off for CDR Whitson, FE-1 Malenchenko & FE-2 Reisman.*

Having passed Day 180 of her flight, Dr. Peggy Whitson began her fourth session with the NASA/JSC experiment NUTRITION w/Repository, for which she had to forego exercising and food intake for eight hours. Today's protocol consisted of two blood draws (for Serum & Heparin). Later, the CDR set up the equipment for the 24-hour urine collections which start with the first void early tomorrow morning and continue through Sunday morning. *[Acting as operator, CMO (Crew Medical Officer) Garrett Reisman performed phlebotomy on Peggy Whitson, i.e., drawing blood samples (from an arm vein) which was first allowed to coagulate in the Repository for 20-30 minutes, then spun in the HRF RC (Human Research Facility/Refrigerated Centrifuge) and finally placed in MELFI (Minus-Eighty Laboratory Freezer for ISS). The RC was later powered off after a temperature reset to limit wear on the compressor, and cleaned. Background: NUTRITION is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight; this includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes. The Clinical Nutritional Assessment profile currently required on all U.S. Astronauts collects blood and urine samples preflight and postflight. NUTRITION expands this protocol by also capturing in-flight samples and an additional postflight sample. Furthermore, additional measurements are included for samples from all sessions, including additional markers of bone metabolism, vitamin status, and hormone and oxidative stressor tests. The results will be used to better understand the impact of countermeasures (exercise and pharmaceuticals) on nutritional status and nutrient requirements. The Clinical Nutritional Assessment profile (MR016L), first started on two Mir crewmembers and then on all ISS US crews, nominally consists of two pre-flight and one post-flight analysis of nutritional status, as well as an in-flight assessment of dietary intake using the FFQ (Food Frequency Questionnaire). The*

current NUTRITION project expands MR016L testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]

To cover their subsequent ingress in the ATV1 “Jules Verne”, CDR Whitson activated the VDS MPC (Video Distribution System/Multi-Purpose Converter) with its four downlinks to allow the ground to conduct HDTV (high-definition TV) playback and downlink operations. After the ATV activities the MPC was powered off again.

After opening the SM PrK (Service Module Transfer Compartment)-to-ATV vestibule hatches, Malenchenko and Whitson performed first “real” ingress in the European cargo module, which had its atmosphere “scrubbed” overnight since yesterday’s partial ingress. *[Message from Flight Control: “ESA congratulates Peggy and Yuri for the ATV hatch opening today and thanks you for the very good news from your first ingress in ATV.”]*

FE-2 Reisman prepared for the subsequent ATV1 thruster test by verifying that the protective shutters of the Lab science window were closed and setting up/programming the IWIS (Internal Wireless Instrumentation System) with its NCUs (Network Control Units) and RSUs (Remote Sensor Units) for acquiring structural dynamics data during the thruster firing. Also activated during the thruster test was the externally mounted SDMS (Structural Dynamics Measuring System).

For the ATV thruster test, ISS attitude control authority was handed over to the Russian MCS (Motion Control System) at ~9:30am EDT. After the firing (~9:40am), attitude control was returned to US momentum management at ~10:20am.

FE-1 Malenchenko performed a final repress of the ISS cabin atmosphere with air from Progress 28P to adjust total pressure.

Russian thrusters were again disabled at ~10:55am for the removal & inspection of quick-disconnect screw clamps in the DC1-to-Progress 28P docking vestibule and closing of hatches in preparation for 28P undocking on 4/7 (4:49am).

These activities were performed by Yuri and Garrett in the usual sequence:

- Transferring remaining trash and discarded equipment for stowage in Progress,
- Reporting completion of trash loading to the ground for the final Go from TsUP/Moscow,
- Activating the cargo ship,
- Tearing down the ventilation air duct,

- Removing the threaded BZV QDs (quick disconnect screw clamps) of the SSVP docking & internal transfer system,
- Closing hatches between 28P and the transfer tunnel (PrK) to the DC1 after taking video of the mating surfaces/seals
- Conducting the one-hour vestibule leak check and
- Downlinking the video imagery of the SM/Progress hatch interface.

FE-2 Reisman worked on the EMCS (European Modular Cultivation System) to check out the various connections associated with the facility's water flow system. The Japanese CW/RW (Cell Wall/Resist Wall) experiment is not working as planned, and troubleshooting will hopefully find the root cause of this problem and get the plants watered and growing. *[CW/RW operates in the EMCS facility in eight special ECs (Experiment Containers) which Garrett recently (3/30) installed on the centrifuges of the facility. The EMCS rack contains two rotating centrifuges that can support a wide range of small plant & animal experiments under partial gravity conditions. On Rotor A, the new ECs for CW/RW are EC92 in position A1, EC95 at A2, EC94 at A3, EC96 at A4, on Rotor B - EC97 in position B1, EC99 at B2, EC98 at B3, and EC100 at B4. The removed ECs were stowed.]*

In preparation for his return to gravity, Yuri also undertook his second preliminary session of the Russian MO-5 MedOps protocol of cardiovascular evaluation in the "Chibis" below-the-waist reduced-pressure suit (ODNT, US: LBNP) on the VELO ergometer, assisted by Whitson as CMO (Crew Medical Officer). *[The 45-min assessment, supported by ground specialist tagup (VHF) and telemetry monitoring from Russian ground sites (at 7:03am EDT), uses the Gamma-1 ECG equipment with biomed harness, skin electrodes and a blood pressure and rheoplethysmograph cuff wired to the cycle ergometer's instrumentation panels. The Chibis ODNT provides gravity-simulating stress to the body's cardiovascular/circulatory system for evaluation of Malenchenko's orthostatic tolerance (e.g., the Gauer-Henry reflex) after several weeks in zero-G. The preparatory training generally consists of first imbibing 150-200 milliliters of water or juice, followed by a sequence of progressive regimes of reduced ("negative") pressure, set at -20, -25, -30, and -35 mmHg (Torr) for five minutes each while shifting from foot to foot at 10-12 steps per minute, while wearing a sphygmomanometer to measure blood pressure. The body's circulatory system interprets the pressure differential between upper and lower body as a gravity-like force pulling the blood (and other liquids) down. Chibis data and biomed cardiovascular readings are recorded. The Chibis suit (not to be confused with the Russian "Penguin" suit for spring-loaded body compression, or the "Kentavr" anti-g suit worn during reentry) is similar to the U.S. LBNP facility (not a suit) used for the first time on Skylab in 1973/74, although it appears to accomplish its purpose more quickly.]*

At ~7:35am, Yuri Malenchenko had his weekly PFC (Private Family Conference) via

S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop).

The FE-1 also performed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV at the SKV-2 air conditioner for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

The crewmembers performed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-2, FE-1), RED resistive exercise device (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Peggy downloaded the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Columbus Update: All Columbus systems are running nominally. The WPA1 (Water Pump Assembly 1) to WPA2 switch-over conducted yesterday afternoon was successful. Columbus TCS (Thermal Control System) is now running on WPA2.

SLEEP Update: Peggy and Garrett were thanked for finishing off all the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment downloads for both. The Actiwatch was not stowed, leaving it for the upcoming South Korean (KARI) SFP.

Weekly Science Update (Expedition Sixteen -- Week 24)

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): Radiation measurements continue to be performed in the DC1/PIRS module. Card replacement performed on 3/31. Photos were taken by the crew of potential ALTCRISS FGB location for Inc17.

ANITA: Completed.

BCAT-3 (Binary Colloidal Alloy Test 3): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): In progress.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaborate Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Last session (4th) is currently planned just before Soyuz docked Ops.

EuTEF (European Technology Exposure Facility): In progress.

Fluid Science Laboratory (FSL): The FSL Facility is awaiting further troubleshooting after 1J/A departure.

GEOFLOW: Planned.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Second session is currently planned for 4/12 through 4/15.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: "Peggy, thank you for unstowing Garrett's saliva kit and having it ready for him to begin his collections. Garrett, we appreciate your efforts during your early increment Integrated Immune session."

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION/REPOSITORY: "Garrett, thank you for your attention to detail in completing your FD15 Nutrition/Repository session within timeline constraints! We appreciate your efforts and participation."

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SAMPLE: Last crew sampling session is currently planned for 4/7.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): "Peggy, thanks for downloading 1 J/A FE2 and your Actiwatches, as well as initializing the KARI SFP Actiwatch. You also completed your last targeted week of sleep logging. Your only remaining scheduled activity is downloading all three Actiwatches and doffing your and KARI SFP Actiwatches. Thanks for all your additional sleep logging. The PI greatly appreciates it." "Garrett, you have completed your first two Sleep activities (Actiwatch Don and 1st download), and are in-process of completing your first week of sleep logging. Thanks for completing these activities. Any additional sleep logging is above and beyond, and the PI will greatly appreciate it."

SOLAR (Solar Monitoring Observatory): Planned.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: "Peggy, thank you for moving and checking out the Ultrasound –

we were VERY excited to see if functioning nominally!"

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels):
Planned.

CEO (Crew Earth Observation): Through 4/1, the ground has received a total of 17,049 ISS CEO images for review and cataloging. Late this week imagery received included sessions with camera times corresponding to the following daily target requests: Lake Eyre, Australia; Patagonian Glaciers; Somalia Coast; Florida Coastal Everglades; Central Arizona-Phoenix; and Madrean Sky Islands, North America. We will be providing feedback on these acquisitions as we work through them in the coming week. This weekend your striking, oblique view of the rugged escarpments, ravines, and peaks of the Semien Mountains of northern Ethiopia will be published on NASA/GSFC's Earth Observatory site. Your perspective and illumination provides an excellent contextual view of this World Heritage Site."

No CEO photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 11:43am EDT [= epoch]*):

Mean altitude -- 338.8 km

Apogee height -- 339.5 km

Perigee height -- 338.1 km

Period -- 91.31 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0000977

Solar Beta Angle -- 17.7 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 141 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53708

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

04/07/08 -- Progress M-63/28P undocking (DC1), 4:49am

04/08/08 -- Soyuz TMA-12/16S launch - 7:16am EDT (*CDR Sergei Volkov, FE Oleg Kononenko, SFP Yi So-yeon*)

04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~9:02am

04/12/08 -- **Cosmonautics Day**, with **Yuri's Night** (check out <http://www.yurisnight.net/2008/>)

04/18/08 -- Soyuz TMA-11/15S undocking (FGB nadir port, 11:34pm EDT)

04/19/08 -- Soyuz TMA-11/15S landing (2:52am EDT, 9:52am Moscow/DMT, 12:52pm Kazakhstan)
 05/06/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
 05/14/08 -- Progress M-64/29P launch
 05/16/08 -- Progress M-64/29P docking (DC1)
 05/31/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS (5:01pm EDT)
 06/02/08 -- STS-124/Discovery/1J docking
 07/10/08 -- Russian EVA-20 (7/10-11)
 08/07/08 -- ATV1 undocking
 08/12/08 -- Progress M-65/30P launch
 08/14/08 -- Progress M-65/30P docking (SM aft port)
 08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
 09/09/08 -- Progress M-64/29P undocking (from DC1)
 09/10/08 -- Progress M-66/31P launch
 09/12/08 -- Progress M-66/31P docking (DC1)
 10/01/08 -- **NASA 50 Years**
 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
 10/12/08 -- Soyuz TMA-13/17S launch
 10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
 10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
 10/18/08 -- STS-126/Discovery/ULF2 docking
 10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
 11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
 11/20/08 -- **ISS 10 Years**
 11/26/08 -- Progress M-67/32P launch
 11/28/08 -- Progress M-67/32P docking (SM aft port)
 12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
 12/06/08 -- STS-119/Discovery/15A docking
 12/15/08 -- STS-119/Discovery/15A undocking
 1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
 05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
 3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
 4QTR CY09 -- STS-130/19A - MPLM
 1QTR CY10 -- STS-131/ULF4
 2QTR CY10 -- STS-132/20A – Node-3 + Cupola
 3QTR CY10 -- STS-133/ULF5.

ISS On-Orbit Status 04/04/08

All ISS systems continue to function nominally, except those noted previously or below.

After yesterday's successful ATV1 docking, CDR Whitson and FE-1 Malenchenko today performed first ingress of the European cargo carrier by executing a number of prescribed steps, viz.:

- Conducting a 30-min OBT (Onboard Training) procedures review for Docked ATV Operations,
- Completing a one-hour leak check of the SM PrK (Service Module Transfer Compartment)/ATV vestibule interface,
- Preparing the necessary equipment for the first ingress *[including GSC (Grab Sample Container), IPD-CO air sampler for CO (Carbon Monoxide), AK-1M air sampler, a manual sampling pump, goggles, a dusk mask, an A-2 air scrubber filter, etc.]*
- Donning the PPE (Personal Protective Equipment) i.e., safety goggles, dust mask *[keeping PPE on until after ATV closeout operations and egress]*,
- Opening the hatches for partial ingress (~6:20am EDT),
- Installing the QD BZV (quick disconnect screw clamps) of the SSVP docking & internal transfer mechanism to rigidize the coupling,
- Taking copious air samples from the ATV interior, and
- Starting the air scrubber, equipped with an FPP electronic/EMI interference filter, to run for about 8h 20m with hatches closed.

For the second ingress, scheduled tomorrow (Saturday, 4/5, at ~4:00am EDT), the air scrubbing in the ATV will make the PPE unnecessary. ATV1 will then be readily accessible to the crew for nominal operations. Also scheduled for tomorrow is an ATV thruster test.

FE-2 Reisman meanwhile set up the CSLM-2 (Coarsening in Solid-Liquid Mixtures-2) experiment in the MSG (Microgravity Science Glovebox), installing the ECU (Electronics Control Unit), first SPU (Sample Processing Unit) and SAMS RSU

(Space Acceleration Measurement System/Remote Sensor Unit) hardware in the MSG WV (work volume) and connecting CSLM-2 power & data cables to the MSG A31p laptop. The MSG Facility and the A31p were then powered down again. *[The CSLM-2 experiment will begin in approximately ten days.]*

In the US Lab, Peggy Whitson set up the hardware associated with urine and blood collections for her fourth & final session of NASA's NUTRITION w/Repository experiment, scheduled on his timeline tomorrow, requiring Peggy to start her mandatory 8-hr fasting tonight for the blood draw. *[The 24-hr urine sampling begins with the first void tomorrow morning and continues through the first void on Sunday morning. The NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

In the COL (Columbus Orbital Laboratory), Garrett worked on the two VCAs (Video Camera Assemblies) to perform an adjustment on the VCA lens flange back. *[To verify the quality of the video image, the FE-2 used the VMN video monitors.]*

Reisman also performed troubleshooting on the COL delta-pressure sensor/Block 2 Columbus Delta Pressure Sensor Block 2, coordinate with COL-CC.

The FE-2 filled out the regular FFQ (Food Frequency Questionnaire), his third, on the MEC (Medical Equipment Computer). *[On the FFQs, NASA/ESA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

To prepare for next week's (4/7) undocking of Progress M-63/28P, FE-1 Malenchenko dismantled and removed electronic equipment from the cargo ship, to be recycled. Removed were the US-21 matching unit, the cargo ship's LKT local temperature sensor commutator (TA251MB) of the BITS2-12 and its PZU-1M ROM (read-only memory) unit. *[When a Progress is undocked and jettisoned, the valuable electronics are retained, to be recycled on a future vehicle.]*

Completing preparations for Progress 28P undocking, FE-2 Reisman & CDR Whitson installed the StM Docking Mechanism between Progress and the DC1. *[StM is the "classic" probe-and-cone type, consisting of an active docking assembly (ASA) with a probe (SSh), which fits into the cone (SK) on the passive docking assembly (PSA) for initial soft dock and subsequent retraction to hard dock. The ASA is mounted on the Progress' cargo module (GrO), while the PSA sits on the docking ports of the SM, FGB and DC1.]*

Peggy Whitson conducted another CO₂ survey, using the CDMK (Carbon Dioxide Monitor Kit) to take CO₂ data. *[ppCO₂ measurements were 0.47 in COL, 0.47 in*

the Lab, and 0.47 in the SM. Purpose of the 15-min activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the hand-held readings with MCA measurements.]

Garrett worked in the Airlock, terminating the EMU battery discharge process on the second batch of two EMU batteries, #2066 & #2071. *[Discharging the second batch of 16V-batteries took about 27-30 hours. The full maintenance discharge, done manually in the early days of ISS ops, is handled automatically by an SSC laptop equipped with a special DOS application.]*

The FE-2 had another 60 minutes for himself for general orientation (station familiarization & acclimatization), as is standard daily rule for the first two weeks after starting station residency.

Peggy Whitson spent about an hour on end-of-increment cleanup and departure preparations. *[Instructions on packing of return items and a keep vs. trash list were uplinked for assisting Yuri and Peggy in their preparing for their return in the severely downmass-limited Soyuz Descent Module. Trashed items will be stowed in the Orbital Module, to be separated along with the Instrumentation/Propulsion Module prior to atmospheric entry.]*

Yuri performed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV at the SKV-2 air conditioner for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

The crewmembers performed their regular 2.5-hr. physical workout program (about

half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), and TVIS treadmill (CDR, FE-1/full time), RED resistive exercise device (CDR, FE-2).

Afterwards, Reisman downloaded the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~7:00am EDT, the FE-1 linked up with TsUP-Moscow stowage specialists via S-band to conduct the weekly IMS tagup, discussing stowage issues and equipment locations.

At ~7:15am, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~7:45am, the crewmembers will convene for their standard bi-weekly teleconference with the JSC Astronaut Office (Steve Lindsey), via S-band S/G-2 audio & phone patch.

SPDM Update: Robotics ground controllers powered up the RWS (Robotics Workstation) and SPDM (Special Purpose Dexterous Manipulator) to check out the body roll polarity software patch uplinked earlier this week. All operations were nominal and the patch successfully corrected the SPDM body roll polarity (+/-) issues raised during Flight 1J/A.

COL Update: Today COL ground teams performed a standard maintenance activity including a switchover from WPA1 (Water Pump Assembly 1) to WPA2.

Since this was the first WPA switchover on orbit, there was a slight possibility for the water transfer to affect COL accumulator quantities and trigger a false ammonia (NH₃) leak alarm. For this reason, COL NH₃ leak monitoring was disabled during

the switchover and the crew was prepared for NH₃ leak detection in the COL. All

switchover operations were nominal.

CEO photo targets (for discretionary picture taking) uplinked for today were **Tigris-Euphrates Delta** (*a broad image was requested to show the context of the numerous, detailed images already acquired of offshore sand bars and islands*), **Galapagos Islands, E. Pacific** (*Dynamic event. Looking right of track for this archipelago of desertic islands. In the present weak La Niña phase, rainfall is*

*depressed even below that of the normally dry climate. The crew was to document the islands for vegetation status [generalized color of the volcano flanks]), and **Volcán Colima, Mexico** (although CEO researchers have good 400-mm images, no 800-mm shots of Colima's summit exist. The Colima volcanic complex consists of two volcanoes, the 3850-m-high historically active Volcán de Colima at the south, the volcano of interest; and Nevado de Colima, the 4320-m high point of the complex, in the north. Volcán de Colima is a youthful stratovolcano constructed within a 5-km-wide caldera. Occasional major explosive eruptions [most recently in 1913] have destroyed the summit and left a deep, steep-sided crater—subsequently slowly refilled and then overtopped by the growth of a lava dome).*

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 11:08am EDT [= epoch]*):

Mean altitude -- 338.9 km

Apogee height -- 339.4 km

Perigee height -- 338.4 km

Period -- 91.31 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0000782

Solar Beta Angle -- 22.2 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 121 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53692

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

04/05/08 -- ATV1 Jules Verne – full ingress

04/07/08 -- Progress M-63/28P undocking (DC1), 4:49am

04/08/08 -- Soyuz TMA-12/16S launch - 7:16am EDT (CDR Sergei Volkov, FE Oleg Kononenko, SFP Yi So-yeon)

04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~9:02am

04/12/08 -- **Cosmonautics Day**, with **Yuri's Night** (check out <http://www.yurisnight.net/2008/>)

ISS On-Orbit Status 04/03/08

All ISS systems continue to function nominally, except those noted previously or below.

ATV1 “Jules Verne” docked successfully at the SM (Service Module) aft port at 10:45am EDT. SM hooks were closed at 10:56am. The docking was essentially a repeat of Demo Day 2 except for the final approach from S41 (~12m) to Contact and Hooks Closed. *[The 19-ton unmanned ATV maneuvered from a holding position 39 km behind the ISS and conducted a 4-hour staged approach with several stops at reference points for checks. It autonomously computed its own position through relative GPS (Global Positioning System) data, comparing with GPS data received from ISS, and in close range it used VDM (Videometer) lasers pointed at LRRs (Laser Retroreflektors) on the SM for distance & orientation determination relative to its target. Final approach was at a relative velocity of 7 cm/s and with an accuracy of better than 10 cm. The cargo transport, which remains docked for the next four months, is delivering 1,150 kg of dry cargo, including food, clothes and equipment as well as two original manuscripts handwritten by Jules Verne and a 19th Century illustrated edition of his novel “From the Earth to the Moon”. The cargo also includes 856 kg of propellant, 270 kg of drinking water and 21 kg of oxygen, to be transferred to the SM.]*

From the US voluntary “job jar” task list, after wakeup and before breakfast, CDR Whitson & FE-2 Reisman downloaded the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data from their Actiwatchs to the HRF-1 (Human Research Facility 1) laptop. Yi So-yeon, the South Korean SFP (Space Flight Participant), will participate in the experiment. *[To monitor the crewmember’s sleep/wake patterns and light exposure, crewmembers wear a special Actiwatch device which measures the light levels encountered by them as well as their patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

In preparation for the automatic ATV docking the crew went about repeating the steps executed for Demo Day 2, plus standing by for the final linkup, controlled from TsUP-Moscow:

- Verification of the powerdown of onboard ham radio equipment (Kenwood in SM & Ericsson in FGB) to prevent RF interference with the ATV,
- Closing of the protective Lab science window shutter (to be reopened at or about 3:15pm),
- Setting up the KL-154 "Klest" television equipment in the SM with the ATV TV control console (BRTK-PU),
- configuring the designated A31p laptop in the FGB for transmitting analog & digital video of the activities from the RS (Russian Segment) from the MPEG-2 (Moving Pictures Expert Group 2) encoder, downlinked via U.S. OpsLAN and Ku-band in "streaming video" packets,
- Activating and testing the SM's MBRL/PCE (Proximity Communications Equipment) Space-to-Space Radio hardware of the ASN-M satellite navigation system, then
- Monitoring the approach, station-keeping and subsequent closing-in maneuver of the automated ATV1 to hard dock.

Structural dynamics data of the docking event were taken with the external SMDS (Structural Dynamics Measurement System) and the IWIS (Internal Wireless Instrumentation System), with RSUs (Remote Sensing Units) deployed in SM (#1027), FGB (#1035), Lab, Node-1, and Node-2.

Later, the IWIS data were downloaded to SSC (Station Support Computer), to be downlinked to the ground.

Whitson also deactivated the A31p and the MPEG-2 streaming video setup via OpsLAN.

The CDR & FE-1 had half an hour each for their end-of-increment cleanup and departure preparations. *[Instructions on packing of return items and a keep vs. trash list were uplinked for assisting Yuri and Peggy in their preparing for their return in the severely downmass-limited Soyuz Descent Module. Trashed items will be stowed in the Orbital Module, to be separated along with the Instrumentation/Propulsion Module prior to atmospheric entry.]*

FE-2 Reisman conducted the periodic (every two weeks) inspection of the RED (Resistive Exercise Device) canister bolts for re-tightening if required. Garrett then performed major IFM (In-flight Maintenance) on the RED, by replacing canister pulley cables (done after every 53,515 cycles, based on life cycle testing results & safety controls), afterwards concluding with the standard Flexpac canister load calibration as required after cable replacements. (Last time done: 12/26/07).

[Cables are replaced periodically after ground analysis shows cable life has expired. Garrett's on-orbit calibration of the Schwinn RED cans re-established the relationship of specific load settings with a specific number of pulls per setting, followed by recording of the load values measured with a calibration tool and steel handles from the on-orbit calibration kit.]

The CDR conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. *[Updated "cue cards" based on the crew's water calldowns are sent up every other week.]*

To familiarize himself with upcoming CSLM (Coarsening in Solid-Liquid Mixtures), Reisman reviewed crew procedures and training materials for the CSLM-2 experiment.

The FE-2 also continued EMU battery maintenance in the US Airlock, terminating the discharge process on the first batch of two EMU batteries, #2070 & #2065, and initiating it on the second set, #2066 & #2071. *[Discharging the second batch of 16V-batteries takes about 27-30 hours. The full maintenance discharge, done manually in the early days of ISS ops, is handled automatically by an SSC laptop equipped with a special DOS application.]*

Yuri Malenchenko worked with the ground on activating of the Elektron oxygen generator at 32 amps, first pressurizing the BZh Liquid Unit with N₂ (nitrogen) via laptop and later monitoring the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating. The Elektron had been turned off by the ground for the ATV docking (for onboard power balance). *[During nominal operations a gas analyzer is utilized to detect hydrogen (H₂) in the O₂ line (which could cause overheating) but is not included in the control algorithm until 10 minutes after Elektron startup. A new EMI filter, installed on 2/9 on the Elektron's current stabilizer (FPP ST-64), was to prevent RFI (radio frequency interference) with the ATV, but when Yuri reported it to be unusually hot to the touch after yesterday's Elektron activation, he was asked to remove it and turn Elektron back on. It worked nominally. Since there are no spare FPP filters on orbit, the ground opted for turning Elektron off for the docking.]*

The FE-2 had another 60 minutes for himself for general orientation (station familiarization & acclimatization), as is standard daily rule for the first two weeks after starting station residency.

The crewmembers performed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS

cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Reisman downloaded the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Yuri performed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV at the SKV-2 air conditioner for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

ATV Update (Flight Day 26): For today's successful rendezvous & docking, the ATV performed the following 13 maneuvers, all of which were reported to be nominal:

- TV1: 10:47:27pm EDT on 4/2; delta-V: 2.56 m/s
- TV2: 11:32:36pm on 4/2; delta-V: 2.64 m/s
- IF1: 4:52:57am on 4/3; delta-V: 0.39 m/s
- IF2: 5:38:49am; delta-V: 0.03 m/s
- IF3: 6:22:57am; delta-V: 1.54 m/s
- HM1: 7:18:25am; delta-V: 1.61 m/s
- HM2: 7:33:54am; delta-V: 0.32 m/s
- HM3: 7:49:24am; delta-V: 0.41 m/s
- HM4: 7:54:54am; delta-V: 2.135 m/s
- CM1: 8:36:05am; delta-V: 1.46 m/s
- CM2: 8:49:05am; delta-V: 0.36 m/s
- CM3: 9:02:05am; delta-V: 0.32 m/s
- CM4: 9:09:25am;

The ATV performed a nominal automated rendezvous and docking. Contact and capture to the SM aft port occurred at 10:45:21am and 10:45:22am, respectively. ATV hooks were closed at 10:52:41am. SM hooks were reported to be closed at 10:56.

CEO photo targets (for discretionary picture taking) uplinked for today were **Betsiboka River delta, Madagascar** *(Dynamic event. This long term monitoring site is usually cloud covered. As ISS tracked along the coast of Madagascar, the crew was to look right for one of the largest estuaries. Thirty-five of the 55-km length of the estuary has been filled with sediment since World War II--due to very widespread deforestation and consequent soil erosion inland. New islands*

*continue to form in the estuary. Handheld imagery has shown that all downstream islands have grown seaward since the first Space Shuttle flight), **Teide Volcano, Canary Islands** (looking left of track for detailed images of this complex volcano, which makes the island of Tenerife, the largest island looking left of track [the track passed over two other islands in the chain]. Detailed images from different angles allow scientists to collect new data on the morphology of the crater and its lava flows. Looking for dust in the area. Two minutes later the crew had a nadir view of the Strait of Gibraltar, where internal waves could have been visible), and **Panama Canal** (Dynamic Event. Clear weather in one of the cloudiest parts of the world may have allowed views of the Canal Zone, notable as a swath of country which retains some original stands of natural rain forest. The decrease in the size of the forest is the main point of interest in this long term monitoring site).*

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 11:33am EDT [= epoch]):*

Mean altitude -- 339.1 km

Apogee height -- 339.7 km

Perigee height -- 338.4 km

Period -- 91.32 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0000917

Solar Beta Angle -- 26.6 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 135 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53676

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

04/07/08 -- Progress M-63/28P undocking (DC1), 4:49am

04/08/08 -- Soyuz TMA-12/16S launch - 7:16am EDT (CDR Sergei Volkov, FE Oleg Kononenko, SFP Yi So-yeon)

04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~9:02am

04/12/08 -- **Cosmonautics Day**, with **Yuri's Night** (check out <http://www.yurisnight.net/2008/>)

04/18/08 -- Soyuz TMA-11/15S undocking (FGB nadir port, 11:34pm EDT)

04/19/08 -- Soyuz TMA-11/15S landing (2:52am EDT, 9:52am Moscow/DMT, 12:52pm Kazakhstan)

05/06/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/31/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS (5:01pm EDT)
 06/02/08 -- STS-124/Discovery/1J docking
 07/10/08 -- Russian EVA-20 (7/10-11)
 08/07/08 -- ATV1 undocking
 08/12/08 -- Progress M-65/30P launch
 08/14/08 -- Progress M-65/30P docking (SM aft port)
 08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
 09/09/08 -- Progress M-64/29P undocking (from DC1)
 09/10/08 -- Progress M-66/31P launch
 09/12/08 -- Progress M-66/31P docking (DC1)
 10/01/08 -- **NASA 50 Years**
 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
 10/12/08 -- Soyuz TMA-13/17S launch
 10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
 10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
 10/18/08 -- STS-126/Discovery/ULF2 docking
 10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
 11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
 11/20/08 -- **ISS 10 Years**
 11/26/08 -- Progress M-67/32P launch
 11/28/08 -- Progress M-67/32P docking (SM aft port)
 12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
 12/06/08 -- STS-119/Discovery/15A docking
 12/15/08 -- STS-119/Discovery/15A undocking
 1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
 05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
 3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
 4QTR CY09 -- STS-130/19A - MPLM
 1QTR CY10 – STS-131/ULF4
 2QTR CY10 -- STS-132/20A – Node-3 + Cupola
 3QTR CY10 – STS-133/ULF5.

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osp/iss_reports/index.htm

ISS On-Orbit Status 04/02/08

All ISS systems continue to function nominally, except those noted previously or below.

From the US voluntary "job jar" task list, after wakeup and before breakfast, CDR Whitson & FE-2 Reisman downloaded the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data from their Actiwatches to the HRF-1 (Human Research Facility 1) laptop. Yi So-yeon, the South Korean SFP (Space Flight Participant), will participate in the experiment. *[To monitor the crewmember's sleep/wake patterns and light exposure, crewmembers wear a special Actiwatch device which measures the light levels encountered by them as well as their patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

Also upon wake-up, CDR Whitson started Part 2 (of 5) of the periodic acoustic measurement protocol by recording post-sleep data of the crew-worn acoustic dosimeters, later deploying the dosimeters statically in Node-2, COL (Columbus Orbital Laboratory), and SM (Service Module) near the Central Post for the duration of the day. *[Acoustic data must be taken twice per Increment, each time for the duration of the 16-hour crew workday.]*

FE-1 Malenchenko collected surface samples for microbial analysis from numerous locations in the FGB module. The test tubes were then stowed in Kit #297 for return on Soyuz TMA-11/15S. *[The FGB hygiene station is currently suspected as the source of water contamination with Wautersia bacteria.]*

Yuri also broke out the Biosamples Kit A2 of the Russian BTKh-11 Biodegradation ("Biodegradatsiya") experiment and conducted the periodic collecting of surface samples from specific equipment and structures in the station, for subsequent stowage in the Soyuz 15S Descent Module for microbial analysis on Earth. The activity was documented with the Nikon D1X digital camera with SB 28DX flash attachment.

FE-2 Reisman checked out the U.S. SLM (Sound Level Meter) instrument and then used it to conduct the periodic noise level measurements program in the station interior for a 2-hr acoustic survey, including transfer of the recorded data to the MEC (Medical Equipment Computer). *[A total of 39 acoustic measurements were obtained at 13 locations in the Lab, six locations in Node-2, 11 locations in the SM, and seven locations in the COL (Columbus Orbital Laboratory). The survey also includes two crew preference locations taken at their perceived loudest locations in the station. The SLM gives instantaneous noise levels and their frequency spectra, which are transferred to the MEC laptop via an RS232 cable and later downlinked with regular CHeCS (Crew Health Care Systems) data dump or via OCA.]*

In the SM, Malenchenko took the periodic readings of potentially harmful atmospheric contaminants with the CMS (Countermeasure System) part of the GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, which uses preprogrammed microchips to measure H₂CO (Formaldehyde, methanal), CO (Carbon Monoxide) and NH₃ (Ammonia), taking one measurement per microchip.

Afterwards, Yuri Ivanovich also completed the 2.5-hr Part 2 of his second onboard "Profilaktika" (MBI-8, "Countermeasures") series of preventive health maintenance fitness testing, including ECG (Electrocardiogram), blood test and subjective rating. *[Today's fitness test was performed on the TVIS treadmill in unmotorized (idle) mode, with free choice of speeds within the range permitted. The test investigates the action mechanism and efficiency of various countermeasures (currently VELO and TVIS) aimed at preventing locomotor system disorders in weightlessness. The test differs from the normal TVIS session by the use of the TEEM-100 gas analyzer (via a mask equipped with a pneumotachometer sensor), measurement of blood lactate level and subjective evaluation of physical exertion levels during the test. The lactate blood samples were taken twice at the end of the session, using the ACCUSPORT analyzer and REFLOTRON-4 accessories. Results were entered on a log sheet. TEEM and ECG (electrocardiograph) data were transferred to the RSE-Med laptop, also on a tape cassette (Cardiocassette-2000), and prepared for later downlink via Regul-Packet comm. The TEEM-100M kit was packed for stowage for use by Expedition 17, and the Profilaktika data kit was stowed in Soyuz 15S for return.]*

At ~7:00am EDT, CDR Whitson closed the Lab science window shutter as protection from thruster effluents, before TsUP/Moscow commanded the propellant line purge of Progress M-63/28P at the DC1 in preparation for its undocking next Monday (4/7; 4:49am). The shutter was reopened after ~12:55pm, i.e., several orbits later to let the vent cloud disperse in the space vacuum. *[ISS attitude control authority was handed over to Russian MCS (Motion Control System) thrusters at*

7:25am to keep the attitude stable during the venting, and was returned to US momentum management at ~9:50am.]

The CDR worked in the COL, completing the checkout of the MSG (Microgravity Science Glovebox) which was relocated from the US Lab to COL (loc. COL1F2) on 3/22, followed on 3/23 by having its power, data & fluid connectors mated and the rack activated. *[Later, the MSG ground team afterwards started sending extensive commanding during a period of two to three hours in order to verify video & data connections. Afterwards, Peggy was to power down the MSG facility.]*

In the Lab, Whitson cleared stowed equipment from the front of portside racks to allow rotation of the LAB1S6 rack for a subsequent IFM (Inflight Maintenance) on the MTL (Moderate Temperature Loop) RFCA (Rack Flow Control Assembly) of Node-1, which is located in the Lab. After the RFCAs were swapped, both were powered nominally with no RPC (Remote Power Controller) trips. Subsequently, the racks were to be rotated back and the equipment restowed in front of them.

[Peggy replaced the RFCA with the LTL (Low Temperature Loop) RFCA from Node-2, a two-hour activity. Swapping the RFCAs should help determine whether there is a problem with the MTL RFCA itself, which had suffered an RPC overcurrent trip on 2/24.]

FE-1 Malenchenko unstowed a Progress M-61 (26P)-delivered (EDV-OR container with disinfectant, set up the pumping equipment and initiated (later closed out) the transfer of all of the disinfectant solution to the SM's Rodnik BV1 tank.

The FE-1 and CDR again had an hour each for their end-of-increment cleanup and departure preparations. *[Instructions on packing of return items and a keep vs. trash list were uplinked for assisting Yuri and Peggy in their preparing for their return in the severely downmass-limited Soyuz Descent Module. Trashed items will be stowed in the Orbital Module, to be separated along with the Instrumentation/ Propulsion Module prior to atmospheric entry.]*

For the benefit of the new US flight engineer, CDR Whitson & FE-2 Reisman, with Malenchenko assisting part-time, went through the mandatory 60-min Emergency Event OBT (Onboard Training) drill for new crewmembers, for the case of rapid cabin depressurization or fire. Russian and US experts stood by at both control centers for consultation. The rule is that the Russian-led emergency exercise should be performed by every new station crewmember once within seven days after departure of the previous crew. *[Background: Purpose of the drill for new station residents is to (a) familiarize them with the location of hardware and the positions of valves used in emergency situations, (b) familiarize them with the translation routes to the Soyuz vehicle, (c) work through the Russian Segment (RS) hardware deactivation procedures, (d) familiarize them with the particulars of the*

scenario and the results of the previous US Segment (USOS) fire drill, and (d) practice crew interactions in emergency situations. Referring to EMER book crew procedures, first Peggy and Garrett translated along the emergency egress path to the FGB nadir port (where Soyuz TMA-11 is currently docked), checking hardware such as the Sokol suits, cable cutters, fire extinguisher (OKR), gas masks (IPK), emergency procedures books, valve settings, hatch rubber seal & restraint integrity, etc. In the USOS the inspection focused on fireports in the Lab, Node and Airlock, readiness of CSA-CP (Compound Specific Analyzer-Combustion Products), ISS leak kit, PBAs (portable breathing assemblies) and PFEs (portable fire extinguishers), emergency procedures books, valve settings, integrity of hatch rubber seals, presence of hatch handrails, etc. The exercise was topped off by a thorough debrief with the ground via S-band. During the session, the crew simulated executing the planned emergency procedures while moving about the station. For the case of an onboard fire and for emergency descent, there are other mandatory emergency drill OBTs.]

The FE-2 performed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV at the SKV-2 air conditioner for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Afterwards, Reisman performed the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various station hatchways, including the FGB-to-Soyuz tunnel, and the FGB-to-Node1 passageway.

The FE-2 also continued EMU battery maintenance in the US Airlock, starting the discharge process on two EMU batteries, #2070 & #2065. *[Discharging the 16V-batteries takes about 12-15 hours. The full maintenance discharge, done manually in the early days of ISS ops, is handled automatically by an SSC laptop equipped with a special DOS application.]*

Peggy conducted the periodic checkup on active U.S. payloads, i.e., cleaning the ANITA (Analyzing Interferometer for Ambient Air) inlet plus inspecting and filter cleaning of the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. *[The CGBA incubator is controlled from the ground, with automatic video downlinked to Earth. ANITA continues to collect data every six seconds and downlinks the data daily to the ground team. ANITA monitors low levels of potential gaseous contaminants in the ISS cabin atmosphere with a capability of simultaneously monitoring 32 gaseous contaminants. The experiment is testing the accuracy and reliability of this technology as a potential next-*

generation atmosphere trace-gas monitoring system for ISS and future spacecraft. This is a cooperative investigation with ESA.]

Working off the discretionary “time permitting” task list, Yuri –

- conducted the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur),
- performed the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder), and
- serviced the BIO-5 Rasteniya-2 (“Plants-2”) experiment, which researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}), by monitoring the greenhouse, taking pictures and downloading them to the ground.

The crewmembers performed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (CDR, FE-1, FE-2), RED resistive exercise device (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Garrett downloaded the crew’s exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

The FE-2 had another 60 minutes for himself for general orientation (station familiarization & acclimatization), as is standard daily rule for the first two weeks after starting station residency.

At ~10:30am EDT, Yuri Malenchenko supported a PAO TV “Telebridge” event, during which he participated in the taping of a TV show called “I Trust, I Love, I Hope” for Cosmonautics Day (4/12) at the House of Officers in Moscow (Suvorov Square). *[This is a new monthly show being broadcast on the Zvezda TV Channel, dedicated this year to the family: Year 2008 was declared Family Year in Russia, and show attendance were officers and their families, military “dynasties”, and Yuri Malenchenko’s spouse, Ekaterina. Some subjects for discussion between “Showmaster” Yulia Menshova, Ekaterina and Yuri: “How is your daughter growing?”, “Yuri’s Welcome Back party”, “Where does Yuri want to go with his family after his return?”, “How is work structured on the station? Do you have days off, holidays?”]*

PEP Update: As a result of Reisman's PEP (Portable Emergency Provisions) inspection on 3/31, the crew reported one of the PBA (Portable Breathing Apparatus) bottles (#1014, in the Airlock) showing its pressure gauge in the red zone, i.e., the bottle has become unusable. A replacement is being manifested on the ground.

CDRA Update: The troubleshooting of the Carbon Dioxide Removal Assembly on 3/28 yielded no blockage on the Return duct which could have caused the dP anomaly. More troubleshooting plans are under development.

SSRMS Update: The uploading of the software patch for two SPDM (Special Purpose Dexterous Manipulator) configuration files (to correct the body roll polarity [+/-] reversal issue observed during 1J/A) originally planned for yesterday, was postponed until after the upcoming SSRMS ops.

ATV1 Update (Flight Day 24): Yesterday (4/1), the ATV1 began phasing back (by going higher, i.e., slowing down) to the rendezvous initiation point in preparation for docking. Jules Verne performed the following three maneuvers, all of which were reported to be nominal:

- TA1: 6:20am EDT; delta-V: 1.90 m/s
- TA2: 7:06am; delta-V: 6.82 m/s
- TA3: 7:50am; delta-V: 1.00 m/s.

Prior to the maneuvers, at approx. 12:30am, ATV1 repressurized its propulsion system in preparation for docking. By 8:30am yesterday, ATV1 was 10 km above and 700 km in front of ISS, phasing back at approx. 100 km per rev, crossed directly above ISS at approx. 7:15pm last evening and continued on to about 1200 km behind where it will begin a series of 3 TB maneuvers today at ~2:00pm EDT to set up the rendezvous activities.

CEO photo targets uplinked for today were **Somalia Coast** (*in the past Coastal Somalia has exhibited dramatic changes in vegetation greenness in response to ENSO [El Niño-Southern Oscillation] cycles. The ISS pass in mid-afternoon offered nadir viewing conditions as it paralleled the coast. Using the 180mm lens setting for a mapping strip northeastward from Mogadishu during this La Niña phase of the ENSO*), **East Haruj Megafans, Libya** (*this mid-afternoon pass was just left center of this remote target in the Libyan Desert. A mapping swath taken near nadir was requested. The almost featureless landforms of these "desert flats" have been recently recognized as vast spreads of river sediment [megafans]. The sediment has been transported hundreds of km from mountains far to the south. Now-dry river courses can be traced from the mountains. These rivers undoubtedly flowed during wet climate phases in the past*), and **Tenoumer Impact Crater, Mauritania**

(this young impact site is situated in northern Mauritania north of the large, well-known circular landmark feature known as the Richat Structure. It is small, only 1.9-km in diameter and just 10 thousand years old. The ISS pass approached from the SW in mid-afternoon sun. After noting Richat, the crew was to look left of track, trying to get an 800mm view of this feature).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 7:52am EDT [= epoch]):*

Mean altitude -- 339.2 km

Apogee height -- 340.0 km

Perigee height -- 338.5 km

Period -- 91.32 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0001132

Solar Beta Angle -- 30.8 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 133 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53658

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

04/03/08 -- ATV1 Docking Day 3; ~10:41am EDT

04/07/08 -- Progress M-63/28P undocking (DC1), 4:49am

04/08/08 -- Soyuz TMA-12/16S launch - 7:16am EDT (CDR Sergei Volkov, FE Oleg Kononenko, SFP Yi So-yeon)

04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~9:02am

04/12/08 -- **Cosmonautics Day**, with **Yuri's Night** (check out <http://www.yurisnight.net/2008/>)

04/18/08 -- Soyuz TMA-11/15S undocking (FGB nadir port, 11:34pm EDT)

04/19/08 -- Soyuz TMA-11/15S landing (2:52am EDT, 9:52am Moscow/DMT, 12:52pm Kazakhstan)

05/06/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/31/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS (5:01pm EDT)

06/02/08 -- STS-124/Discovery/1J docking

07/10/08 -- Russian EVA-20 (7/10-11)

08/07/08 -- ATV1 undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)
 08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
 09/09/08 -- Progress M-64/29P undocking (from DC1)
 09/10/08 -- Progress M-66/31P launch
 09/12/08 -- Progress M-66/31P docking (DC1)
 10/01/08 -- **NASA 50 Years**
 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
 10/12/08 -- Soyuz TMA-13/17S launch
 10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
 10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
 10/18/08 -- STS-126/Discovery/ULF2 docking
 10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
 11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
 11/20/08 -- **ISS 10 Years**
 11/26/08 -- Progress M-67/32P launch
 11/28/08 -- Progress M-67/32P docking (SM aft port)
 12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
 12/06/08 -- STS-119/Discovery/15A docking
 12/15/08 -- STS-119/Discovery/15A undocking
 1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
 05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
 3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
 4QTR CY09 -- STS-130/19A - MPLM
 1QTR CY10 – STS-131/ULF4
 2QTR CY10 -- STS-132/20A – Node-3 + Cupola
 3QTR CY10 – STS-133/ULF5.

ISS On-Orbit Status 04/01/08

All ISS systems continue to function nominally, except those noted previously or below.

From the US voluntary "job jar" task list, after wakeup and before breakfast CDR Whitson & FE-2 Reisman downloaded the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment data from their Actiwatches to the HRF-1 (Human Research Facility 1) laptop, changed the lithium battery in Peggy's Actiwatch and initialized both their watches. They also changed the battery of SFP (Space Flight Participant) Yi So-yeon's Actiwatch and initialized the unit for her.

[To monitor the crewmember's sleep/wake patterns and light exposure, crewmembers wear a special Actiwatch device which measures the light levels encountered by them as well as their patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days.]

FE-1 Malenchenko began his activities with the routine checkup of DC1 (Docking Compartment) circuit breakers and fuses. *[The monthly checkup in the "Pirs" DC1 looks at AZS circuit breakers on the BVP Amp Switch Panel (they should all be On) and the LEDs (light-emitting diodes) of 14 fuses in Fuse Panels BPP-30 & BPP-36.]*

Malenchenko also completed his first session of the 24-hour of ECG (electrocardiogram) recording under the Russian MedOps MO-2 protocol. *[For the ECG recording, the Russian flight engineer yesterday donned the five-electrode Holter harness which read his dynamic (in motion) heart function from two leads over 24 hours and recorded data on the Kardioregistrator 90205 unit.]*

Afterwards, the FE-1 went on to conduct the first part of the onboard "Profilaktika" (MBI-8, "Countermeasures") preventive health maintenance fitness test on the VELO bicycle ergometer. Part 2, on the TVIS treadmill, is scheduled

tomorrow. *[Test procedure for MBI-8, which requires workouts on the VELO and TVIS, is identical to the Russian MO-5 assessment, but in addition to the nominal procedure it uses the TEEM-100M gas analyzer with breathing mask, a blood lactate test with the ACCUSPORT analyzer and REFLOTRON-4 accessories, and a subjective evaluation of physical exertion levels during the test (using the Borg Perceived Exertion Scale, viz., 10 steps from very light over hard and very hard to maximum). Results are entered on a log sheet. TEEM and ECG (electrocardiograph) data are transferred to the RSE-Med laptop, also on a tape cassette (Cardiocassette-2000), and prepared for later downlink via Regul-Packet comm. Results are also called down to specialists standing by at TsUP. Data from the previous session (1/3) were also to be transferred.]*

In preparation for his return to gravity, Yuri also undertook his first preliminary session of the Russian MO-5 MedOps protocol of cardiovascular evaluation in the "Chibis" below-the-waist reduced-pressure suit (ODNT, US: LBNP) on the VELO ergometer, assisted by Whitson as CMO (Crew Medical Officer). *[The 45-min assessment, supported by ground specialist tagup (VHF) and telemetry monitoring from Russian ground sites (at 8:45am EDT), uses the Gamma-1 ECG equipment with biomed harness, skin electrodes and a blood pressure and rheoplethysmograph cuff wired to the cycle ergometer's instrumentation panels. The Chibis ODNT provides gravity-simulating stress to the body's cardiovascular/circulatory system for evaluation of Malenchenko's orthostatic tolerance (e.g., the Gauer-Henry reflex) after several weeks in zero-G. The preparatory training generally consists of first imbibing 150-200 milliliters of water or juice, followed by a sequence of progressive regimes of reduced ("negative") pressure, set at -20, -25, -30, and -35 mmHg (Torr) for five minutes each while shifting from foot to foot at 10-12 steps per minute, while wearing a sphygmomanometer to measure blood pressure. The body's circulatory system interprets the pressure differential between upper and lower body as a gravity-like force pulling the blood (and other liquids) down. Chibis data and biomed cardiovascular readings are recorded. The Chibis suit (not to be confused with the Russian "Penguin" suit for spring-loaded body compression, or the "Kentavr" anti-g suit worn during reentry) is similar to the U.S. LBNP facility (not a suit) used for the first time on Skylab in 1973/74, although it appears to accomplish its purpose more quickly.]*

The CDR set up the camcorder equipment for taking video of Garrett Reisman's first PFE-OUM (Periodic Fitness Evaluation - Oxygen Uptake Measurement session on the CEVIS (Cycle Ergometer with Vibration Isolation), filmed via VTR (Video Tape Recorder) from the ground. *[The footage was downlinked afterwards for biomechanical evaluation of the exercising crewmember and assessment of the on-orbit setup of equipment during data collection and hardware status.]*

Later, Whitson & Reisman configured the PFE-OUM equipment at the HRF-2

(Human Research Facility 2) rack for Garrett's workout on the CEVIS while wearing an HRM (Heart Rate Monitor), with Peggy as operator, obtaining measurements of the subject. *[The equipment includes the HRF PFM/PAM (Pulmonary Function Module/Photoacoustic Analyzer Module), Mixing Bag System and GDS (Gas Delivery System). After calibration of the DPFM (Differential Pressure Flowmeter), Peggy assisted in changing the loads on the ergometer and recording data. Later, the CDR updated the evaluation protocol, deactivated & stowed the gear, and powered down the PFE-OUM laptop. Purpose of PFE-OUM is to measure aerobic capacity during exercise within 14 days after arrival on ISS, and once monthly during routine PFEs. The data allows exercise physiologists & flight doctors to assess the crew's health & fitness and to provide data for modifying & updating crew-specific exercise regimes. PFE-OUM is a collaborative effort between NASA and ESA (European Space Agency).]*

Afterwards, the FE-2 removed the experiment hardware, while the CDR disassembled the video setup and stowed it, then gave the Go for the ground to downlink the VTR tape.

Peggy Whitson performed the periodic calibration of the two CSA-O₂ (Compound Specific Analyzer-Oxygen sensor) instruments #1041 & #1052, using a calibration tank with accurately known pressure (2100 psi). *[Partial Pressure Oxygen (ppO₂) readings were 21.7% before and 21.8% after calibration on #1041, 21.7%/21.8% on #1052.]*

Reisman worked in the US Airlock, connecting EMUs (Extravehicular Mobility Units) #3003 & #3004 to their SCU (Service & Cooling Umbilical) and initiated the standard 1-hr scrubbing process on the spacesuits' cooling water loops, filtering ionic and particulate matter (via a 3-micron filter). The cooling loops were afterwards reconfigured and the EMU water processing kit disassembled and stowed.

In preparation for ATV1 (Automated Transfer Vehicle 1) docking on 4/3, Yuri checked on the ready availability of the necessary hardware (adapters, T-pieces, hoses) for doing leak checks on the SM PrK (Service Module Transfer Tunnel) and ATV hatch interface in the event of a failure of the ATV depress valve's power unit (KSD BP).

Afterwards, Malenchenko performed regular maintenance on the SRVK-2M condensate water recovery system in the SM, replacing its end-of-life filter reactor (F-R).

FE-2 Reisman prepared the MELFI (Minus Eighty Degree Laboratory Freezer for

the ISS) for the next DCB (Double Cold Bag) sample stow activity, retrieving fourteen -32deg ICEPAC belts from stowage and inserting them in the various trays and sections of Dewar 3.

Yuri collected water samples from downstream of the BKO multifiltration unit in a drinking bag (paket dlya napitkov) for return to Earth, to monitor the quality of the water being fed from the KOV EDV container through the BKO to the Elektron-VM oxygen generator at the BKO's end-of-life.

Afterwards, Malenchenko worked with the ground on activating of the Elektron-VM at 32 amps, first pressurizing the BZh Liquid Unit with N₂ (nitrogen) via laptop and later monitoring the external temperature of its secondary purification unit (BD) for the first 10 minutes of operations to ensure that there was no overheating. *[During nominal operations a gas analyzer is utilized to detect hydrogen (H₂) in the O₂ line (which could cause overheating) but is not included in the control algorithm until 10 minutes after Elektron startup. Earlier this year (2/9), an EMI filter was installed on the Elektron's current stabilizer (FPP ST-64) to prevent RFI (radio frequency interference) with the ATV1.]*

Later, Malenchenko transferred CWCs (Contingency Water Containers) #1053 & #1072 with US condensate to the Russian Segment (RS) for the periodic (about twice a month) replenishing of the Elektron's water supply for electrolysis, filling the designated KOV EDV container. Once filled, the EDV was connected to the BPK transfer pump for processing through the BKO. *[The 40-minute procedure is specially designed to prevent air bubbles larger than ~10 mm from getting into the BZh Liquid Unit where they could cause Elektron shutdown.]*

The FE-1 performed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV at the SKV-2 air conditioner for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Working off the discretionary "time permitting" task list, Yuri conducted the daily IMS (Inventory Management System) maintenance, updating/editing its standard "delta file" including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Also from the task list, the FE-1 performed the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian

TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).

Later today, before sleep time, Peggy will ready the equipment for the periodic acoustic measurement protocol by deploying crew-worn acoustic dosimeters to the crew, to be carried overnight with a microphone on the shirt collar. (Last time done: 2/8). *[Tomorrow, after about 15 hours of measurements, dosimeter data will be downloaded and the hardware power-cycled for another data take. At that point, the crew will deploy the dosimeters statically in the station for the duration of the day, record measurements tomorrow noon and stow the instruments. Acoustic data must be taken twice per Increment, each time for the duration of the 16-hour crew workday.]*

CDR Whitson performed more fine adjustment on the IMV (Intermodular Ventilation) valve's RMO (Remote Manual Override) actuator at the Lab aft port location (LAB1P7), then reinstalled the closeout panels 02, 03, 04 which she had removed on 3/28.

The crewmembers performed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR), RED resistive exercise device (CDR, FE-2), and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Peggy downloaded the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~4:00am EDT, FE-2 Reisman powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset, and power supply) and at 4:05am conducted a ham radio exchange with students at the Shanghai Youth Centre of Science & Technology Education in Xuhui/Shanghai, China. *[Shanghai Youth Centre of Science & Technology (SYCSTE), an institution directly under the Shanghai Education committee, was founded on June 1, 1957, and is one of the earliest afterschool educational centers for teenagers in China. Questions to Garrett were uplinked beforehand but the time did not suffice for answering all of them. "What does the Moon look like in space?"; "Will humans grow taller and taller in the space station without gravity? If a baby is born there, will it grow taller than Yao Ming?"; "Does your hair grow faster in the space station? Could you get a haircut?"; "Does your biologic time change in space? How to set up your sleeping time?"; "Have you ever seen aliens or UFOs in space?"; "In the space station, what kind of method will you use to participate in the 2008 Beijing Olympics?"]*

At ~11:40am, the crew downlinked three PAO TV messages of greetings to TsUP/ Moscow for Cosmonautics Day on April 14, the Anniversary of Yuri Gagarin's launch in Vostok-1 47 years ago. *[The first message was intended for a special event at the Rossiya State Central Concert Hall in Luzhniki on 4/14, the second for the citizens and guests at the 6th Festival "Honorary Citizens" in St. Petersburg (commemorating movie actor Cyril Yurievich Lavrov, People's Artist of the Soviet Union, who portrayed Sergey Pavlovich Korolev in a highly popular movie), and the third for a special Cosmonautics Day event at the Siberian State Aerospace University in Krasnoyarsk. "...Productive cooperation between Russia, USA, Canada, Japan and European countries in the matter of assembly and operation of the International Space Station in the interests of the entire world community promotes and strengthens trust, good neighborly relationship in space and on the Earth..."]*

SSRMS Update: In the period 11:50am-2:50pm EDT today, the Space Station Remote Manipulator System is being "walked off" by ground operators to the Node-2 PDGF (Power & Data Grapple Fixture), to collect FMS (Force/Moment Sensor) characterization data on its LEE A (Latching End Effector A) tomorrow and configure the SSRMS for the planned 1J pre-launch checkout in May. Engineers are also checking out a software patch for two SPDM (Special Purpose Dexterous Manipulator) configuration files to correct the body roll polarity (+/-) reversal issue observed during 1J/A.

ATV Update (Flight Day 23): For yesterday's successfully completed Demo Day 2 rendezvous and demonstration activities, the ATV performed 13 maneuvers, all of which were reported to be nominal:

- TV1: 12:44:13am EDT on 3/31; delta0-V: 2.65 m/s
- TV2: 1:33:27am; delta-V: 2.67 m/s
- IF1: 6:47:09am; delta-V: delta0-V: 0.33 m/s
- IF2: 7:32:59am; delta-V: 0.02 m/s
- IF3: 8:17:07am; delta-V: 1.49 m/s
- HM1: 9:11:44am; delta-V: 1.56 m/s
- HM2: 9:27:13am; delta-V: 0.33 m/s
- HM3: 9:42:43am; delta-V: 0.34 m/s
- HM4: 9:48:13am; delta-V: 2.20 m/s
- CM1: 10:30:14am; delta-V: 1.46 m/s
- CM2: 10:43:14am; delta-V: 0.41 m/s
- CM3: 10:56:14am; delta-V: 0.34 m/s
- CM4: 11:03:34am; delta-V: 1.48 m/s.

The ATV performed a nominal rendezvous scenario and approached to S41 (12

m). Per the plan, ATV-CC/Toulouse commanded a RETREAT/HOLD/RESUME sequence between 11:52:21am and 11:58:18am, and the crew commanded a RETREAT from S41 to S4 at 12:42:02pm. The demonstration activities completed with a successful crew-commanded ESCAPE maneuver that began at 12:52:21pm, with a delta-V of 4.00 m/s. As of last night 7:00pm EDT, Jules Verne was 7 km below and 275 km in front of ISS. ATV1 continued to phase in front of ISS at a rate of approximately 68 km per rev until this morning at 6:21:37am, when it began a series of maneuvers to bring it back to the ISS for Docking Day 3.

Visual confirmation of displaced MLI (Multi-Layer Insulation) aft of the vehicle's forward cone was obtained via the ISS cameras. This is not expected to impact docking operations on 4/3.

The ATV probe was successfully extended on 3/31 at 11:09:56pm EDT.

CEO photo targets (for discretionary picture taking) uplinked for today were **Afar Rift Zone, Ethiopia** (*a swath of detailed images taken along track at nadir was requested for further analysis of volcanoes and fault lines in this unusual part of the planet. The Afar Rift Zone is one of the few places where "sea-floor spreading" can be seen on land. The zone is located where the Red Sea is opening as part of the process of the African, Arabian and the new East African tectonic plates drifting apart*), **Chad basin dust** (*Dynamic event. Change-of-season dust storms have been detected in the Chad basin, east of Lake Chad. Looking left for the margins of any dust clouds. Dust from this basin, one of the most vigorous dust producers on the planet, reaches the Americas several times per year*), **Patagonian Glaciers** (*shooting pictures near nadir for smaller glacier tongues on the west [Pacific] side of the narrow Andes Mts., a region where we have least imagery coverage. There should have been some viewing between scattered clouds*), and **Saharan dust, E. Atlantic Ocean** (*Dynamic event. A major dust event is taking place with dust blowing into the Atlantic Ocean from the Western Sahara Desert. Looking left for the divide between the hazy dust-laden air mass and the clear oceanic air [with some cloud cover]. The short focal-length lens may have permitted the acquisition of islands in any images as landmarks to assist image cataloging*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 7:30am EDT [= epoch]*):

Mean altitude -- 339.3 km

Apogee height -- 339.9 km

Perigee height -- 338.8 km

Period -- 91.32 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0000752

Solar Beta Angle -- 35.0 deg (magnitude decreasing)
Orbits per 24-hr. day -- 15.77
Mean altitude loss in the last 24 hours -- 188 m
Revolutions since FGB/Zarya launch (Nov. 98) -- 53642

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

04/03/08 -- ATV1 Docking Day 3; ~10:41am EDT
04/07/08 -- Progress M-63/28P undocking (DC1), 4:49am
04/08/08 -- Soyuz TMA-12/16S launch - 7:16am EDT (*CDR Sergei Volkov, FE Oleg Kononenko, SFP Yi So-yeon*)
04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~9:02am
04/12/08 -- **Cosmonautics Day**, with **Yuri's Night** (check out <http://www.yurisnight.net/2008/>)
04/18/08 -- Soyuz TMA-11/15S undocking (FGB nadir port, 11:34pm EDT)

ISS On-Orbit Status 03/31/08

All ISS systems continue to function nominally, except those noted previously or below. *Underway: Week 24 of Increment 16.*

As suggested on his voluntary "job jar" task list, after wakeup and before breakfast FE-2 Garrett Reisman completed his fourth session with the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop. *[To monitor the crewmember's sleep/wake patterns and light exposure, Garrett wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

Preparatory to today's ATV1 "Jules Verne" Demo Day 2, CDR Whitson closed the Lab science window shutters as protection against Russian thruster contamination, configured the designated A31p laptop in the FGB for transmitting analog & digital video of the RS (Russian Segment) activities from the MPEG-2 (Moving Pictures Expert Group 2) encoder, downlinked via U.S. OpsLAN and Ku-band in "streaming video" packets, and later deactivated the A31p after the rendezvous activities.

FE-1 Malenchenko meanwhile readied the KL-154 "Klest" television equipment from the SM (Service Module)'s ATV TV control console (BRTK-PU).

ISS attitude control authority was handed over to RS MCS (Motion Control System) thrusters at 7:37am EDT for maneuvering the station to ATV1 rendezvous attitude (8:11am). *[Rendezvous attitude: LVLH (Local Vertical Local Horizontal) +XVV (+x-axis in velocity vector), YPR (Yaw, Pitch, Roll) = 0,0,0. Later, after returning to TEA (Torque Equilibrium Attitude) at ~1:25pm, control was returned to U.S. momentum management at 1:55pm.]*

After preparing for the second ATV1 rendezvous demo, Malenchenko & Whitson activated and tested the MBRL/PCE (Proximity Communications Equipment) Space-to-Space Radio hardware of the ASN-M satellite navigation system in the SM, then monitored the approach, station-keeping and subsequent escape maneuver of the automated ATV1, recording times and performance data. All planned maneuvers were completed entirely nominally. *[Demo Day 2 involved Jules Verne closing in on ISS from the S-1/2 waypoint about 40km behind (at 8:26am EDT), arriving via Hohmann transfer at the S2 station-keeping (holding) point at a distance of ~3500m behind ISS (~9:57am) for subsequent testing of HOLD & RETREAT commands through the PCE. Approach continued to the second holdpoint, S3 at ~249 m (~11:10am), then to S4 at ~19m (by 12:13pm), followed by inching closer to S41 (12m) for more HOLD & RETREAT command tests, next retreating to S4 and finally performing the actual ESCAPE maneuver of 4 m/sec delta-V (~12:38pm) to take the vehicle away from the station, closing out Demo Day 2 ops at ~12:45pm.*

Background: Navigation between S-1/2 and S3 is based on GPS (Global Positioning System) data of the ISS which are received by the ATV and compared with ATV GPS data. From S3 to docking, ATV employs two sophisticated measuring systems for range, line-of-sight angles & relative attitude,- the VDM (Videometer) and Telegoniometer (TGM), which use lasers illuminating RVTs (Rendezvous Targets) on the aft end of the SM, installed previously on Russian spacewalks. The ISS crew is prohibited by Flight Rule to view the ATV through cameras or binoculars when inside a range of 5 m, and also not with the naked eye from SM window 26, until VDM & TGM are powered off, to prevent eye damage from non-visible light.]

Afterwards (~1:30pm), Peggy & Yuri were scheduled for a debriefing teleconference with the ground to review the ground/crew communications and determine if anything needs to be changed before Docking Day next Thursday (4/3).

The FE-1 performed the periodic (generally monthly) service of the ESA/RSC-Energia experiment ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS), removing the PCMCIA memory card #945 and replacing it with #941 on the AST spectrometer on DC1 panel 402 to continue operations, then testing #945 on the RSK1 laptop for data quantity and total size of files, before stowing it for later return to Earth. Yuri also photographed the future new location of the AST in the FGB (beginning on 4/8).

Malenchenko also started his first session of the Russian MedOps MO-2 protocol which calls for 24-hour recording of his ECG (electrocardiogram). *[For the ECG recording, Yuri donned the five-electrode Holter harness that read his dynamic (in motion) heart function from two leads over 24 hours and record data on the Kardioregistrator 90205 unit. CDR Whitson assisted her crewmate in the harness donning (and will also do so in tomorrow's doffing).]*

FE-2 Reisman worked in the JLP (Japanese Experiment Module Experiment Logistics Module Pressurized Section), first performing the periodic status and shell temperature check from the MKAM (Minimum Keep-Alive Monitor), then briefly activating the MKAM fan and relocating the module's PBA (Portable Breathing Apparatus) from its location COL1PF in the COL (Columbus Orbital Laboratory) to the JLP endcone. After troubleshooting the wiring and fixture of the failed JLP GLA (General Luminaire Assembly) P2A, Garrett conducted the periodic inspection of the PEP PFE (Portable Emergency Provisions/Portable Fire Extinguisher), then deactivated the JLP fan again and returned the PBA to the COL1PF location.

Reisman also undertook the monthly FDS (Fire Detection & Suppression) PEP safety inspection/audit in the other ISS modules besides JLP. *[The IMS (Inventory Management System)-supported inspection involves verification that PFEs (portable fire extinguishers), PBAs (portable breathing apparatus), QDMAs (quick-don mask assemblies) and EHTKs (extension hose/tee kits) are free of damage to ensure their functionality, and to track shelf life/life cycles on the hardware (QDMA harness inspection was not required this time).]*

Malenchenko had another hour reserved for transferring more discarded cargo to the Progress 28P and stowing it according to detailed plan in the logistics spacecraft-turned-trash can, to be jettisoned next week (4/7).

FE-2 Reisman was scheduled to initiate, later terminate, a total-pressure adjustment of the cabin atmosphere with air from 28P storage.

Garrett also unstowed and set up the PFE-OUM (PFE-Oxygen Uptake Measurement) equipment on the HRF-2 (Human Research Facility 2) rack, including the HRF PFM/PAM (Pulmonary Function Module/Photoacoustic Analyzer Module), Mixing Bag System and GDS (Gas Delivery System), for his first PFE-OUM protocol session tomorrow. *[The Periodic Fitness Evaluation with Oxygen Uptake Measurement experiment, using the CEVIS ergometer for workout, demonstrates the capability of crewmembers to perform periodic fitness evaluations with continuous oxygen consumption measurements within 14 days after arrival on ISS, and once monthly during routine PFEs. Once the capability of the pulmonary function system (PFS) to perform PFEs is verified, crewmembers will be able to integrate their monthly PFE with oxygen consumption measurements to fulfill the requirement for cardiovascular fitness evaluations during long-duration space flight.]*

The FE-1 performed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities

systems/replaceables plus the weekly collection of the toilet flush counter (SPK-U) and water supply (SVO) readings for calldown to TsUP/Moscow. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV at the SKV-2 air conditioner for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

In the Lab, Peggy Whitson worked on the MELFI (Minus-Eighty Laboratory Freezer for ISS) rack, preparing box modules in Dewar 1, Tray C, for easier Double Coldbag packing, by removing obstructing Velcro straps.

The crewmembers performed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1/full time), and RED resistive exercise device (CDR, FE-2).

Afterwards, Garrett downloaded the crew's exercise data file to the MEC (Medical Equipment Computer) for downlink, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Reisman had another 60 minutes for himself for general orientation (station familiarization & acclimatization), as is standard daily rule for the first two weeks after starting station residency.

Peggy Whitson spent about an hour on end-of-increment cleanup and departure preparations. *[Instructions on packing of return items and a keep vs. trash list were uplinked for assisting Yuri and Peggy in their preparing for their return in the severely downmass-limited Soyuz Descent Module. Trashed items will be stowed in the Orbital Module, to be separated along with the Instrumentation/Propulsion Module prior to atmospheric entry.]*

Working off his suggested "time permitting" task list, Yuri Malenchenko completed a series of regular servicing tasks, viz.: -

- Supporting the BIO-5 Rasteniya-2 ("Plants-2") experiment, which researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}), by monitoring the greenhouse, taking pictures and downloading them to the ground;
- Performing the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART

- (automatic temperature recorder), and
- Conducting the daily IMS maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

ATV Update (Flight Day 22): In preparation for today’s successful Demo Day 2 rendezvous & approach program, the ATV1 yesterday began phasing back to the rendezvous initiation point S1/2 at ~30km behind the ISS, performing the following six maneuvers, all of which were reported to be nominal:

- TA1: 8:22:06pm on 3/29; delta-V: 1.70 m/s
- TA2: 9:08:06pm; delta-V: 7.32 m/s
- TA3: 9:53:54pm; delta-V: 1.23 m/s
- TB1: 4:34:28pm on 3/30; delta-V: 5.18 m/s
- TB2: 5:18:27pm; delta-V: 8.16 m/s
- TB3: 6:08:59pm; delta-V: 2.50 m/s.

The IMMT (ISS Mission Management Team) afterwards gave the GO for Demo Day 2.

No CEO photo targets uplinked for today.

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 8:43am EDT [= epoch]*):

Mean altitude -- 339.5 km

Apogee height -- 340.4 km

Perigee height -- 338.7 km

Period -- 91.32 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0001248

Solar Beta Angle -- 38.9 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 115 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53627

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

04/03/08 -- ATV1 Docking Day 3; ~10:41am EDT

04/07/08 -- Progress M-63/28P undocking (DC1), 4:49am

04/08/08 -- Soyuz TMA-12/16S launch - 7:16am EDT (CDR Sergei Volkov, FE Oleg Kononenko, SFP Yi So-yeon)

04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~9:02am

04/12/08 -- **Cosmonautics Day**, with **Yuri’s Night** (check out <http://www.yurisnight>).

ISS On-Orbit Status 03/30/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday -- off-duty day for CDR Whitson, FE-1 Malenchenko & FE-2 Reisman except for housekeeping and voluntary work. Ahead: Week 24 of Increment 16. Flight Control to Crew: "Everyone at the ATV-CC (as well as MCC-M and MCC-H) could not be more pleased with how Demo Day 1 went!"*

From his voluntary "job jar" task list, after wakeup and before breakfast FE-2 Garrett Reisman completed his third session with the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop.

[To monitor the crewmember's sleep/wake patterns and light exposure, Garrett wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days.]

Also before breakfast, having reached the FD15 (Flight Day 15) mark in his flight, Reisman performed the last sampling of his first session with the NASA/JSC experiment NUTRITION w/Repository, collecting a final urine sample upon wakeup for storage in the MELFI (Minus-Eighty Laboratory Freezer for ISS). The sampling kit was then stowed away. *[The current NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]*

The crew conducted the regular weekly three-hour task of thorough house cleaning. *["Uborka", normally done on Saturdays, includes removal of food waste products,*

cleaning of compartments with vacuum cleaner, damp cleaning of the Service Module (SM) dining table, other frequently touched surfaces and surfaces where trash is collected, as well as the FE's sleep station with a standard cleaning solution; also, fan screens and grilles are cleaned to avoid temperature rises. Special cleaning is also done every 90 days on the HEPA (high-efficiency particulate air) bacteria filters in the Lab. Additionally, as part of the weekly cleaning, Malenchenko performs an inspection of structural elements, cables and instruments behind SM panels for moisture.]

Later, the FE-1 completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables plus the weekly collection of the toilet flush counter (SPK-U) and water supply (SVO) readings for calldown to TsUP/Moscow. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV at the SKV-2 air conditioner for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Yuri also gathered weekly data on total operating time & "On" durations of the Russian POTOK-150MK (150 micron) air filter unit of the SM's SOGS air revitalization subsystem for reporting to TsUP.

Whitson & Malenchenko conducted another OBT (Onboard Training) session, Part 2, for ATV1 Approach & Docking Demo Day 2 tomorrow (3/31), reviewing RODF (Russian Operations Data File) material and running a number of scenarios, including malfunctions, on the ATV simulator application, supported by S-band tagup with ground engineers.

In preparation for the upcoming Japanese CW/RW (Cell Wall/Resist Wall) experiment, FE-2 Garrett Reisman replaced eight ECs (Experiment Containers) on the centrifuges of the EMCS (European Modular Cultivation System) facility with different ECs. *[The EMCS rack contains two rotating centrifuges that can support a wide range of small plant & animal experiments under partial gravity conditions. On Rotor A, the new ECs for CW/RW are EC92 in position A1, EC95 at A2, EC94 at A3, EC96 at A4, on Rotor B - EC97 in position B1, EC99 at B2, EC98 at B3, and EC100 at B4. The removed ECs were stowed.]*

With the U.S. CDRA (Carbon Dioxide Removal Assembly) deactivated by the ground early this morning (~3:15am-8:15am EDT) and its cooling no longer required, Whitson demated and took down the ITCS LTL (Internal Thermal Control System/Low Temperature Loop) jumper at the CDRA-supporting LAB1D6 rack.

[After Peggy's troubleshooting on 3/28, CDRA was operated for a day, but ground engineers could not resolve the elevated Precooler differential pressure (dP) offset between half-cycle 1 & half-cycle 2 operations. The anomalous dP signature has not been explained yet, despite several days of troubleshooting. Ground teams are now discussing further troubleshooting options.]

Working off his suggested "time permitting" task list, Yuri Malenchenko completed a series of regular maintenance tasks for today, by -

- Conducting his tenth and final Increment 16 run of the Russian DZZ-2 "Diatomeya" ocean observations program *[using the NIKON F-5 digital still camera with 80-200 mm lens and the SONY PD-150P camcorder at medium zoom, Yuri focused on color bloom patterns, swirls, wakes of subsurface waves, ocean water level drop, smoothing lanes in wave fields, and sudden cloud pattern anomalies in the Atlantic and Indian oceans];*
- Performing another session of the Russian GFI-8 "Uragan" (hurricane) earth-imaging program *[using the NIKON D2X still camera and the Japanese HDV (High Definition) video camera provided by SFP Charles Simonyi to shoot imagery of icebergs in the southern portion of the Atlantic ocean, Patagonian glaciers, coastal & mountain areas of Columbia, and the cities of Palmira, Bogotá and coastal cities on the Atlantic];*
- Supporting the BIO-5 Rasteniya-2 ("Plants-2") experiment, which researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}), by monitoring the greenhouse, taking pictures and downloading them to the ground;
- Performing the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder), and
- Completing the periodic collection & deletion of readings on the MOSFET (metal oxide semiconductor field-effect transistor) radiation sensor reader/display of the RBO-3-2 Matryoshka-R anthropomorphic (human torso) "phantoms" located inside the station for sophisticated radiation studies, collecting radiation measurements every 15 minutes around the clock.

The crewmembers performed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1/full time, FE-2), and RED resistive exercise device (CDR, FE-2).

ATV Update (Flight Day 21): After a highly successful Demo Day 1 rendezvous & approach program yesterday, the ATV1 last night was 120 km in front of and 6.5 km below the ISS. Jules Verne continued to phase in front of ISS at a rate of ~60 km

per rev until 8:21pm EDT, when it began coming back for Demo Day 2 tomorrow. The rendezvous consisted of the following ten maneuvers, all of which were reported to be nominal:

- TV1: 2:36:30am EDT; delta-V: 2.74 m/s
- TV2: 5:13:36am; delta-V: 2.34 m/s
- TV3: 6:10:08am; delta-V: 1.53 m/s
- IF1: 8:39:20am; delta-V: 0.58 m/s
- IF2: 9:25:23am; delta-V: 0.12 m/s
- IF3: 10:10:31am; delta-V: 0.55 m/s
- HM1: 11:10:15am; delta-V: 1.53 m/s
- HM2: 11:25:44am; delta-V: 0.17 m/s
- HM3: 11:41:14am; delta-V: 0.27 m/s
- HM4: 11:46:44am; delta-V: 2.05 m/s.

At Hold point S2 (~3500 m behind ISS), the ATV performed stationkeeping from 11:56:45am to 1:30:11pm. During this time, the crew successfully performed the HOLD and RETREAT command path test. In addition, the Kurs system was activated and used to collect data for comparison with the ATV's RGPS system. The rendezvous completed with a successful ESCAPE maneuver that began at 1:30:11pm, with a delta-V of 4.03 m/s. *[Between maneuvers TV1 & TV2, PDE-1 (Propulsion Drive Electronics #1) was disabled by the FDIR (Fault Detection, Isolation & Recovery) system due to a thermal delta temperature threshold violation. ATV-CC/Toulouse attempted to reintegrate the PDE, but during the reintegration the FDIR deactivated the PDE a second time for the same temperature threshold violation. Due to an unrelated concern regarding the procedure for reintegrating PDE-1, ATV-CC decided to wait until after the completion of TV2 & TV3 before reintegrating PDE-1. As a result, TV2 & TV3 were performed in a three-PDE configuration. Following TV3, PDE-1 was successfully reintegrated.]*

No CEO photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (as of this morning, 8:21am EDT [= epoch]):

Mean altitude -- 339.6 km

Apogee height -- 340.0 km

Perigee height -- 339.3 km

Period -- 91.33 min.

ISS On-Orbit Status 03/29/08

All ISS systems continue to function nominally, except those noted previously or below.

Per his voluntary "job jar" task list, after wakeup and before breakfast FE-2 Garrett Reisman completed his second session with the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop.

[To monitor the crewmember's sleep/wake patterns and light exposure, Garrett wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days.]

Also before breakfast, having reached the FD15 (Flight Day 15) mark in his flight, Reisman undertook his first session with the NASA/JSC experiment NUTRITION w/ Repository, collecting blood and urine samples. *[Acting as operator and CMO (Crew Medical Officer), CDR Whitson performed phlebotomy on Garrett, i.e., drew blood samples (from an arm vein) which were first allowed to coagulate in the Repository, then spun in the HRF RC (Human Research Facility/Refrigerated Centrifuge) and finally placed in MELFI (Minus-Eighty Laboratory Freezer for ISS). The RC was later powered off after a temperature reset to limit wear on the compressor, and cleaned. Garrett's urine samples were also placed in the MELFI. Background: NUTRITION is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight; this includes measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes. The Clinical Nutritional Assessment profile currently required on all U.S. Astronauts collects blood and urine samples preflight and postflight. NUTRITION expands this protocol by also capturing in-flight samples and an additional postflight sample. Furthermore, additional measurements are included for samples from all sessions, including additional markers of bone metabolism, vitamin status, and hormone and oxidative stressor tests. The results*

will be used to better understand the impact of countermeasures (exercise and pharmaceuticals) on nutritional status and nutrient requirements. The Clinical Nutritional Assessment profile (MR016L), first started on two Mir crewmembers and then on all ISS US crews, nominally consists of two pre-flight and one post-flight analysis of nutritional status, as well as an in-flight assessment of dietary intake using the FFQ (Food Frequency Questionnaire). The current NUTRITION project expands MR016L testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]

In preparation for today's ATV1 "Jules Verne" Demo Day 1, Peggy Whitson & Yuri Malenchenko –

- closed the Lab science window shutters as protection against Russian thruster contamination,
- set up the KL-154 "Klest" television equipment in the SM (Service Module) with the ATV TV control console (BRTK-PU),
- configured the designated A31p laptop in the FGB for transmitting analog & digital video of the activities from the RS (Russian Segment) from the MPEG-2 (Moving Pictures Expert Group 2) encoder, downlinked via U.S. OpsLAN and Ku-band in "streaming video" packets, and
- deactivated the A31p after the rendezvous demo activities.

ISS attitude control authority was handed over to RS MCS (Motion Control System) thrusters at 9:30am EDT for maneuvering the station to ATV1 rendezvous attitude at 10:04am. *[Rendezvous attitude: LVLH (Local Vertical Local Horizontal) +XVV (+x-axis in velocity vector), YPR (Yaw, Pitch, Roll) = 0,0,0. Later, after returning to TEA (Torque Equilibrium Attitude) at ~1:37pm, control was handed back to U.S. momentum management at 2:12pm.]*

After preparing for the ATV1 rendezvous demo in the SM, Malenchenko & Whitson activated and checked out the MBRL/PCE (Proximity Communications Equipment) Space-to-Space Radio hardware of the ASN-M satellite navigation system, then monitored approach, station-keeping and subsequent escape maneuvers of the remote-controlled ATV1, recording times and performance data. *[The Demo Day 1 program involved Jules Verne closing in on ISS from ~39km behind (at 10:18am EDT) to 15.5 km (by 11:02am) and arriving at the S2 holding point at a distance of ~3500m behind ISS at ~11:48am for subsequent testing of HOLD, RETREAT, ESCAPE and other critical commands through PCE without actually executing them. Afterwards, the actual Escape maneuver of 4 m/sec delta-V was to take the vehicle away from and below the station at ~1:29pm.]*

Afterwards, Peggy & Yuri were scheduled (~2:30pm) for a debriefing teleconference

with the ground to review the ground/crew communications and determine if anything needs to be changed before Demo Day 2.

FE-2 Reisman meanwhile performed the periodic offloading of the Lab CCAA (Common Cabin Air Assembly) dehumidifier's condensate tank, filling CWC (Contingency Water Container) #1062 with the collected water slated for processing. No samples required this time. *[Estimated offload time before termination (leaving ~6 kg in the tank): ~35 min.]*

In the COL (Columbus Orbital Laboratory), Garrett also checked out the EMCS (European Modular Cultivation System) applications on the laptop computer (ELC) in the newly relocated US ER3 (EXPRESS Rack 3) which he connected yesterday for ground-commanded power-up. *[The EMCS rack contains a rotating centrifuge that can support a wide range of small plant and animal experiments under partial gravity conditions.]*

Yuri Malenchenko had another hour set aside for his end-of-increment cleanup and departure preparations. *[Instructions on packing of return items and a keep vs. trash list were uplinked for assisting Yuri and Peggy in their preparing for their return in the severely downmass-limited Soyuz Descent Module. Trashed items will be stowed in the Orbital Module, to be separated along with the Instrumentation/ Propulsion Module prior to atmospheric entry.]*

Afterwards, the FE-1 completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Whitson conducted the periodic (monthly) CSA-CP (Compound Specific Analyzer-Combustion Products) maintenance/checkout, today on all four units. *[The CSA-CP is a passive cabin atmosphere monitor that provides quick response capability during a combustion event (fire). Its collected data are stored on a logger. Peggy changed out the battery on the prime unit, then zero-calibrated all instruments (to eliminate drift in the combustion sensors). Following zero calibration, the backup units were stowed in the Node, along with the sampling pump, while the prime unit was deployed at the SM Central Post.]*

Yuri performed another run with the Russian "Uragan" (hurricane) earth-imaging program, using the Nikon D2X digital camera through SM windows 6-9. *[Targets uplinked for today were the country of Columbia (natural environment) and the city*

of Bogotá.]

Working off his “available time” discretionary task list, Malenchenko also performed the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator,

The crewmembers performed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1/full time, FE-2), and RED resistive exercise device (CDR, FE-2).

Afterwards, the CDR transferred the crew’s exercise data file to the MEC (Medical Equipment Computer) laptop for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

At ~8:05am, the crewmembers held their regular WPC (Weekly Planning Conference) with the ground, discussing next week's "Look-Ahead Plan" (prepared jointly by MCC-H and TsUP/Moscow timeline planners) via S-band/audio, reviewing the monthly calendar, upcoming activities, and any concerns about future on-orbit events.

ATV Update (Flight Day 20): Yesterday (3/28), the ATV1 performed the following three maneuvers, all of which were reported to be nominal:

- TB1: start 6:48:53pm EDT, delta-V: 5.976 m/s
- TB2: start 7:38:13pm, delta-V: 6.947 m/s
- TB3: start 8:30:32pm, delta-V: 3.054 m/s.

ATV-CC/Toulouse completed an RDS (Russian Docking System) checkout. The preliminary results were nominal; however a detailed evaluation is being performed by the ATV-CC Engineering Support Team. In addition, the ISS crew completed the third ATV rendezvous on-board training session yesterday. Due to a problem with the simulator software on the crew's laptop, a subset of the session will be repeated on 3/30.

ATV-CC continues to see higher than expected power consumption from the pressurized module shell heaters and preliminary investigations indicate the problem is due to loose or missing thermal blankets. MART (Multi-lateral Anomaly Resolution Team) meetings were held on 3/27 & 3/28 and concluded that there will be no impacts to docking or crew ingress, and no impact to undocking has been identified.

Weekly Science Update (Expedition Sixteen -- Week 23)

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): Radiation

measurements continue to be performed in the PIRS module. Radiation measurements continue to be performed in the PIRS module.

ANITA: Completed.

BCAT-3 (Binary Colloidal Alloy Test 3): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): Two sides of first Silicate Garden complete with students analyzing data in their classrooms currently, and two Petri Dish runs complete but with no results. The Petri Dish installed during 1JA joint ops contains two small tomato plants as seen in the downlinked images with a possible third new one. This Petri Dish will remain in place until 1J when it will be returned for analysis of plant material.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): In progress.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): Last session (4th) is currently planned just before Soyuz docked Ops.

EuTEF (European Technology Exposure Facility): The EuTEF platform power feeders have been successfully de-activated/re-activated in conjunction with the EVA-3 and EVA-5 on 3/18 and 3/23, respectively. On 3/24, a graceful shutdown was performed after off-nominal and incoherent telemetry readings. EuTEF is nominal since then. - DEBIE-2: the instrument showed regular link errors. Currently powered off; - DOSTEL: On-going science acquisition; - EuTEMP: Currently inactive as planned; - EVC: after a successful commissioning, we encountered some difficulty to get nominal images acquisition. Under investigation if the problem comes from EVC itself or from the Columbus High Rate Multiplexer; Currently

powered off; - EXPOSE: On-going science acquisition; - FIPEX: FIPEX showed Link Errors and was further troubleshooted this week; tests are on-going and basic science measurements are collected; - MEDET: On-going science acquisition; - PLEGPAY: The first long-duration (100 hrs) experiment has been started on 3/26; Currently powered on; - TRIBOLAB: in Stand-by mode, awaiting to start science acquisition after ATV docking on 4/3; Currently powered on.

Fluid Science Laboratory (FSL): The FSL Facility is awaiting further troubleshooting after 1J/A departure.

GEOFLOW: On 3/25, the FSL VMU (Video Management Unit) Optical Fibre has been tested and is fully functional. The FSL commissioning will continue in the next coming weeks. FSL LAN and MIL bus repair activities have been postponed until after 1J/A mission. Start of GEOFLOW is pending further FSL troubleshooting/commissioning activities.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): Blood and urine samples of first session have been downloaded on STS-123 (1J/A). Second session is currently planned during Soyuz docked Ops.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: "Peggy, thank you for unstowing Garrett's saliva kit and having it ready for him to begin his collections. Garrett, we appreciate your efforts during your early increment Integrated Immune session."

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION/REPOSITORY: Planned.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems): Ongoing.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): “Peggy, we have placed on your task list next week the next Sleep download activity. During this activity you will be changing the battery in your Actiwatch as well as downloading and initializing 1J/A FE-2 and your Actiwatch. You will also change the battery and initialize an Actiwatch for the South-Korean SFP (KARI Space Flight Participant). Thanks for your participation.”

SOLAR (Solar Monitoring Observatory): Anomaly on platform Sun pointing mode under further investigation: no science acquisition possible so far. However, calibration runs of SOLSPEC spectral lamps have been performed on 3/26 and 3/27. On 3/27, SOLAR went unexpectedly in stand-by mode, but has been fully recovered. The calibration run on 3/27 will have to be repeated.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite): In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: “Peggy, thank you for moving and checking out the Ultrasound – we were VERY excited to see if functioning nominally!”

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): The 4 ECs (Experiment Containers) from Rotor A (0-g condition) transfer from BIOLAB TCU#1 (Temperature Control Unit 1) to MERLIN (Microgravity Experiment Research Locker Incubator II) cooler unit has been successfully performed on 3/24. The MERLIN temperature was monitored on a daily basis and was very stable. These 4 ECs have been downloaded on STS-123 (1J/A) and currently shipped to Germany. The 4 ECs of Rotor B are yet to be retrieved by the crew from the blocked Rotor B. BIOLAB anomalies encountered during WAICO-Run#1 imply major impact on science return.

CEO (Crew Earth Observation): Ongoing.

CEO photo targets (for discretionary picture taking) uplinked for today were **Spider Impact Crater, W Australia** (*this 13-km-wide crater is old [>570 million years]. A comprehensive search of the CEO database shows no handheld images*), **Hyderabad, India** (*looking immediately left for this important city of 6.7 million. Visual cue is the dark line of the river that runs through the city. Trying to shoot the diffuse urban boundary*), **Somalia Coast** (*CEO observers are documenting longer term changes of vegetation in this semi desert. Shooting a swath following the coast. Vegetation seems to green and die off in concert with multi-year El Niños*), and **Kwanza Basin, Angola** (*a mapping swath under track was requested to document new economic development as oil wealth streams into Angola. Looking for linear features such as railroads, highways, and power lines*).

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 8:00am EDT [= epoch]*):

Mean altitude -- 339.9 km

Apogee height -- 340.6 km

Perigee height -- 339.3 km

Period -- 91.33 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0000903

Solar Beta Angle -- 45.8 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.77

Mean altitude loss in the last 24 hours -- 137 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53595

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking) ~10:39am EDT

04/07/08 -- Progress M-63/28P undocking (DC1), 4:49am

04/08/08 -- Soyuz TMA-12/16S launch - 7:16am EDT (*CDR Sergei Volkov, FE Oleg Kononenko, SFP Yi So-yeon*)

04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~9:02am

04/12/08 -- **Cosmonautics Day**, with **Yuri's Night** (check out <http://www.yurisnight.net/2008/>)

04/18/08 -- Soyuz TMA-11/15S undocking (FGB nadir port, 11:34pm EDT)

04/19/08 -- Soyuz TMA-11/15S landing (2:52am EDT, 9:52am Moscow/DMT, 12:52pm Kazakhstan)

05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch
 05/16/08 -- Progress M-64/29P docking (DC1)
 05/25/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS
 05/27/08 -- STS-124/Discovery/1J docking
 06/05/08 -- STS-124/Discovery/1J undocking
 08/07/08 -- ATV1 undocking
 08/12/08 -- Progress M-65/30P launch
 08/14/08 -- Progress M-65/30P docking (SM aft port)
 08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
 09/09/08 -- Progress M-64/29P undocking (from DC1)
 09/10/08 -- Progress M-66/31P launch
 09/12/08 -- Progress M-66/31P docking (DC1)
 10/01/08 -- **NASA 50 Years**
 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
 10/12/08 -- Soyuz TMA-13/17S launch
 10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
 10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
 10/18/08 -- STS-126/Discovery/ULF2 docking
 10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
 11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
 11/20/08 -- **ISS 10 Years**
 11/26/08 -- Progress M-67/32P launch
 11/28/08 -- Progress M-67/32P docking (SM aft port)
 12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
 12/06/08 -- STS-119/Discovery/15A docking
 12/15/08 -- STS-119/Discovery/15A undocking
 1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
 05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
 3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
 4QTR CY09 -- STS-130/19A - MPLM
 1QTR CY10 -- STS-131/ULF4
 2QTR CY10 -- STS-132/20A – Node-3 + Cupola
 3QTR CY10 -- STS-133/ULF5.

Note: The daily ISS On-Orbit Status reports can also be found at
http://www.hq.nasa.gov/osf/iss_reports/index.htm

ISS On-Orbit Status 03/28/08

All ISS systems continue to function nominally, except those noted previously or below.

As per his voluntary "job jar" task list, after wakeup and before breakfast FE-2 Garrett Reisman completed his first session with the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop. *[To monitor the crewmember's sleep/wake patterns and light exposure, Garrett wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days.]*

FE-1 Yuri Malenchenko serviced the Russian BMP (Harmful Impurities Removal System), starting the "bake-out" cycle to vacuum on absorbent bed #2 of the regenerable dual-channel filtration system. The regen process was terminated before sleeptime, at ~4:30pm EDT. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods. Filter bed 1 was regenerated yesterday.]*

After reviewing the ATV rendezvous & docking timeline plus uplinked RODF (Russian Operations Data File) crew procedures, CDR Whitson & FE-1 Malenchenko used the onboard ATV Rendezvous, Docking & Undocking simulator software to conduct training runs.

Later, Whitson set up the video gear for Ku-band analog & digital video downlink, in support of engineers testing the ATV docking video transmission to the ground. Afterwards, the CDR deactivated the A31p laptop used for the downlink.

Peggy & Garrett had about half an hour reserved to work on the CMRS (Crew

Medical Restraint System), stowed in the CHeCS (Crew Health Care Systems) rack, performing the periodic checkout and inspection of the system for upcoming standard CMO (Crew Medical Officer) proficiency training. *[The crew inspected the CMRS for cracks in the board and/or metal fastener exposed on top of CMRS (found on the ground units), either of which could provide a high-voltage defibrillation ground path from the patient to ISS structure. The board-like CMRS allows strapping down a patient on the board with a harness for medical attention by the CMO who is also provided with restraints around the device. The device can be secured to the ISS structure within two minutes to provide a patient restraint surface for performing emergency medical procedures, such as during ACLS (Advanced Cardiac Life Support). It can also be used to transport a patient between the station and the Orbiter middeck. It isolates the crew and equipment electrically during defibrillations and pacing electrical discharges, accommodates the patient in the supine zero-G positions, provides cervical spine stabilization and, for a three-person crew, can also restrain two CMOs during their delivery of medical care.]*

Reisman also performed the regular inspection and checkout of the HMS RSP (Health Maintenance System/Respiratory Support Pack).

After setting up the Rodnik “plumbing” gear on 3/22 and testing the Progress 28P’s BV1 tank bladder for leak tightness, Malenchenko today transferred accumulated urine from two EDV containers (#381, #360) to the BV1 water tank. *[Each of the two spherical Rodnik tanks consists of a hard shell with a soft membrane (bladder) composed of elastic fluoroplastic. The bladder is used to expel water from the tank by compressed air pumped into the tank volume surrounding the membrane.]*

With the US ER3 (EXPRESS Rack 3) now located in the COL (Columbus Orbital Laboratory) as of 3/22, Garrett Reisman installed the cables for the rack’s EMCS (European Modular Cultivation System) facility, then configured the EMCS power switch to On and opened the gas valves, preparatory to the EMCS checkout scheduled tomorrow. *[The EMCS rack contains a rotating centrifuge that can support a wide range of small plant and animal experiments under partial gravity conditions. The EMCS gas valves must be opened manually within 24 hours prior to EMCS facility powerup if the power up is performed via ground commanding.]*

In the Lab, Whitson connected the regular ITCS LTL (Internal Thermal Control System/Low Temperature Loop) coolant jumper at the LAB1D6 rack in support of ground-commanded activation of the U.S. CDRA (Carbon Dioxide Removal Assembly) at 12:10pm-12:40pm EDT for troubleshooting the unit. Peggy supported the blower on/off activity by removing (later reinstalling) ducting between ASV (Air Supply Valve) 102 and absorbent bed 2.

Malenchenko conducted the periodic (monthly) functional closure test of the Vozdukh CO2 removal system's spare emergency vacuum valves (AVK), in the spare parts kit. *[The AVKs are critical because they close the Vozdukh's vacuum access lines in the event of a malfunction in the regular vacuum valves (BVK) or a depressurization in the Vozdukh valve panel (BOA). Access to vacuum is required to vent CO2 during the regeneration of the absorbent cartridges (PP). During nominal operation, the AVK valves remain open.]*

After preparing the auditory test equipment, Peggy, Yuri & Garrett each took the periodic (monthly) O-OHA (On-Orbit Hearing Assessment) test, a 30-min. NASA environmental health systems examination to assess the efficacy of acoustic countermeasures, using a special MEC (Medical Equipment Computer) laptop application. It was the fourth session for the CDR & FE-1, the first for the FE-2. *[The O-OHA audiography test involves minimum audibility measurements for each ear over a wide range of frequencies (0.25-10 kHz) and sound pressure levels, with the crewmembers using individual-specific Prophonics earphones, Bose ANC headsets and the SLM (sound level meter). To conduct the testing, the experimenter is supported by special EarQ software on the MEC, featuring an up/down-arrow-operated slider for each test frequency that the crewmember moves to the lowest sound pressure level at which the tone can still be heard. The baseline test is required not later than about Flight Day 14 for each new Expedition and is then generally performed once per month. Note: There have been temporary hearing deficits documented on some U.S. and Russian crewmembers, all of which recovered to pre-mission levels.]*

For the Russian flight engineer, it was time today for his first orthostatic hemodynamic endurance test session with the Russian Chibis suit in preparation for his return to gravity on 4/19, conducting the MedOps MO-4 exercise protocol in the below-the-waist reduced-pressure device (ODNT, US: LBNP/Lower Body Negative Pressure). With Peggy assisting her crewmate as CMO (Crew Medical Officer), the one-hour session was supported by ground specialist tagup via VHF at ~12:01pm EDT on DO1. *[The Chibis provides gravity-simulating stress to the body's cardiovascular/circulatory system for evaluation of Malenchenko's orthostatic tolerance (e.g., the Gauer-Henry reflex) after 200 days in zero-G. Data output include blood pressure readings.]*

In the US Lab, FE-2 Reisman set up the hardware associated with urine and blood collections for his first session of NASA's NUTRITION w/Repository experiment, scheduled on his timeline tomorrow, requiring Garrett to start his mandatory 8-hr fasting tonight for the blood draw. *[The 24-hr urine sampling begins with the first void tomorrow morning and continues through the first void on Sunday morning. The NUTRITION project is the most comprehensive in-flight study done by NASA to date of human physiologic changes during long-duration space flight. It includes*

measures of bone metabolism, oxidative damage, nutritional assessments, and hormonal changes, expanding the previous Clinical Nutritional Assessment profile (MR016L) testing in three ways: Addition of in-flight blood & urine collection (made possible by MELFI), normative markers of nutritional assessment, and a return session plus 30-day (R+30) session to allow evaluation of post-flight nutrition and implications for rehabilitation.]

CDR Whitson removed closeout panels in the Lab for IFM (Inflight Maintenance) of the port IMV (Intermodular Ventilation) valve of the THC (Temperature & Humidity Control) system, working with the ground to adjust the valve RMO (Remote Manual Override).

Yuri Malenchenko had another hour set aside for his end-of-increment cleanup and departure preparations. *[Instructions on packing of return items and a keep vs. trash list were uplinked for assisting Yuri and Peggy in their preparing for their return in the severely downmass-limited Soyuz Descent Module. Trashed items will be stowed in the Orbital Module, to be separated along with the Instrumentation/ Propulsion Module prior to atmospheric entry.]*

Garrett Reisman spent ~60 minutes for general orientation (station familiarization & acclimatization), as is standard daily rule for the first two weeks after starting station residency

Afterwards, the FE-2 performed the regular monthly & quarterly maintenance of the TVIS (Treadmill with Vibration Isolation & Stabilization), inspecting the condition of harnesses, belt slats, corner bracket ropes, IRBAs (Isolation Restorative Bungee Assemblies) and gyroscope wire ropes for any damage or defects, lubricating as required plus recording time & date values.

Malenchenko completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Later, Yuri conducted the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

Working off his “available time” discretionary task list, the FE-1 performed the

regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).

Also from the voluntary task list, Yuri supported the BIO-5 Rasteniya-2 ("Plants-2") experiment, which researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}), by checking status and taking photographs. The crewmembers performed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, the CDR transferred the crew's exercise data file to the MEC laptop for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

After setting up and activating the VDS MPC (Video Distribution System/Multi-Purpose Converter) with its four downlinks to allow the ground to receive HDTV (high-definition TV) downlink, the crew at 11:00am sent down two PAO TV messages for recording and later playback, one for Yuri's Night at NASA ARC (Ames Research Center), the other for the annual "VEISHEA" celebration at Iowa State University (ISU). Later (~11:35am), the MPC was powered off again. *[The annual Yuri's Night Celebration, held around the world on 4/12, commemorates the anniversary of Yuri Gagarin's launch on April 12, 1961 to become the first human in space, and the maiden flight of the Space Shuttle "Columbia" with John Young & Bob Crippen twenty years later – on April 12, 1981. ISU's "VEISHEA" event is an annual celebration held each spring and one of ISU's oldest traditions. The name VEISHEA combines the first letters of the colleges at the origin of VEISHEA in 1922: Veterinary Medicine, Engineering, Industrial Science, Home Economics, Agriculture. ISU also recognized Clay Anderson as a distinguished alumnus.]*

At ~4:20am EDT, the crew held the regular (nominally weekly) tagup with the Russian Flight Control Team (GOGU), including Shift Flight Director (SRP), at TsUP via S-band/audio, phone-patched from Houston and Moscow.

At ~5:05am, the FE-1 linked up with TsUP-Moscow stowage specialists via S-band to conduct the weekly IMS tagup, discussing stowage issues and equipment locations.

At ~9:00 am, Whitson and Reisman had their weekly PFCs (Private Family Conferences) via S-band/audio and Ku-band/MS-NetMeeting application (which

displays the uplinked ground video on the SSC-10 laptop).

At ~9:50am, the ISS crew held its weekly teleconference with ISS Program Management at JSC/Houston via Private S/G2, S-band/audio.

At ~4:20pm, the crewmembers will convene for their standard bi-weekly teleconference with the JSC Astronaut Office (Steve Lindsey), via S-band S/G-2 audio & phone patch.

WDS Update: An updated Water Delivery System “cue card” was uplinked for the crew’s reference, which includes the five CWCs that were transferred from Endeavour during 1J/A. *[The new card (16-0018Z) lists 39 CWCs (~1551.8 L total) for the four types of water identified on board: technical water (871.5 L, for Elektron, flushing, hygiene), potable water (647.2 L), condensate water (27.3 L), waste/EMU dump and other (5.8 L). Of the 39 containers, 15 CWCs with technical water (640.5 L) cannot be used until cleared for Wautersia bacteria, and 4 CWCs with potable water (176.3 L) are not cleared for use pending analysis of samples returned on 1J/A.]*

ATV Update (Flight Day 18): Early yesterday morning, ATV “Jules Verne” departed its parking orbit 2000 km in front of ISS, beginning to phase back to the Rendezvous Initiation point in preparation for ATV Demo Day 1 tomorrow (3/29). The ATV performed the following three maneuvers, all of which were reported to be nominal:

- TA1: start 1:59:37am EDT, delta-V: 1.50 m/s
- TA2: start 2:44:45am, delta-V: 3.24 m/s
- TA3: start 3:28:25am, delta-V: 1.55 m/s.

In addition, the ISS crew completed two of the ATV rendezvous on-board training sessions yesterday and another one today.

The ATV-CC continues to see higher than expected power consumption from the pressurized module shell heaters and is working to identify the reason. The spacecraft is being controlled by ESA’s ATV-CC/Toulouse in France, working with TsUP-Moscow and MCC-Houston. On Demo Day 2 (3/31), the ATV begins approaching the ISS from two miles away, maneuvering with a series of engine firings to about 10 m (36 ft) from the station before the ISS crew sends an abort command to move the ATV away from the complex. These maneuvers will test all ATV systems that are required for a safe automated linkup to the ISS three days later (4/3) by means of the ASN PCE (Proximity Communications Equipment) in the SM, or manually as backup.

CEO photo target uplinked for today was Tropical Cyclone Pancho, NW Australia (*DYNAMIC EVENT: Maximum sustained winds predicted to be 65kt, storm tracking*

almost due south. Looking right of track for the eye. Shooting obliques to acquire the very long cloud feeder bands, especially right of track. Short lens settings probably allowed most of the storm to be captured in single views), Patagonian Glaciers (there was a reasonable chance for clear weather on the dry side [east side] of the Southern Andes Mts. Looking left of track to shoot smaller glacier tongues), and Pilcomayo River dynamics, N Argentina (a mapping swath of 400-mm images was requested, looking left of track [for 30–60 secs]—to show the highly complex modern and past stream channel patterns on this largest “river fan” on Earth. These patterns have interesting similarities to “channel” patterns on Mars, for which they are being used as analogs in ongoing research).

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 7:38am EDT [= epoch]):*

Mean altitude -- 340.1 km

Apogee height -- 340.8 km

Perigee height -- 339.4 km

Period -- 91.34 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0001054

Solar Beta Angle -- 43.7 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 102 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53579

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking) ~10:39am EDT

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch - ~7:16am (CDR Sergei Volkov, FE Oleg Kononenko, SFP Yi So-yeon)

04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~8:43am

04/12/08 -- **Cosmonautics Day**, with **Yuri's Night** (check out <http://www.yurisnight.net/2008/>)

04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)

05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/25/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS

05/27/08 -- STS-124/Discovery/1J docking
06/05/08 -- STS-124/Discovery/1J undocking
08/07/08 -- ATV1 undocking
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
4QTR CY09 -- STS-130/19A - MPLM
1QTR CY10 -- STS-131/ULF4
2QTR CY10 -- STS-132/20A – Node-3 + Cupola
3QTR CY10 -- STS-133/ULF5.

ISS On-Orbit Status 03/27/08

All ISS systems continue to function nominally, except those noted previously or below. *Welcome back, Endeavour!*

STS-123/Endeavour returned to Earth last night after 15d 18h 11m in space, i.e., the longest Shuttle mission to ISS so far, touching down at KSC on the second opportunity at 8:39pm EDT, after 250 orbits & 6.6 million miles (first opportunity waived off due to cloud layer). *[During the perfectly executed ISS 1J/AE mission, its seven-member crew conducted a record five EVAs, delivered & installed the JAXA JLP (Japanese Experiment Module Experiment Logistics Module Pressurized Section) and the Canadian SPDM Dextre, brought up new Expedition 16 crewmember Garrett Reisman and returned his predecessor Léopold Eyharts who spent 48 days in space (44 aboard the station). It was the 122nd flight of a Space Shuttle, the 25th Shuttle mission to visit the station, the 21st for Endeavour and the second of six Shuttle missions planned for 2008. Next up: STS-124/Discovery/1J on 5/25 with JAXA's JEM Pressurized Module "Kibo", racks & the JEM RMS.]*

Before breakfast, CDR Whitson, FE-1 Malenchenko and FE-2 Reisman began their workday with the periodic session of the Russian biomedical routine assessments PZEh-MO-7/Calf Volume Measurement and PZEh-MO-8/Body Mass Measurement (sixth for CDR & FE-1, first for FE-2), using the IM mass measurement device which Yuri Malenchenko afterwards broke down for stowage. *[Calf measurements (left leg only) are taken with the IZOG device, a custom-sewn fabric cuff that fits over the calf, using the knee and lower foot as fixed reference pints, to provide a rough index of deconditioning in zero-G and effectiveness of countermeasures. For determining body mass in zero-G, where things are weightless but not massless, the Russian IM "scales" measure the inertial forces that arise during the oscillatory motion of a mass driven by two helical metering springs with known spring constants. By measuring the time period of each oscillation of the unknown mass (the crewmember) and comparing it to the period of a known mass, the crewmember's mass is calculated by the computer and displayed.]*

The FE-1 performed the periodic servicing of the Russian BMP (Harmful Impurities Removal System) by starting the "bake-out" cycle to vacuum on absorbent bed #1 of the regenerable dual-channel filtration system. The regen process will be terminated before sleeptime, at ~3:15pm EDT. Regeneration of bed #2 follows tomorrow. *[Regeneration of each of the two cartridges takes about 12 hours and is conducted only during crew awake periods.]*

Whitson & Reisman each completed a run with the MedOps WinSCAT (Spaceflight Cognitive Assessment Tool) experiment by logging in on the MEC (Medical Equipment Computer) and performing the psychological evaluation exercise on the laptop-based WinSCAT experiment. It was Peggy's fifth and Garrett's first session. *[WinSCAT is a time-constrained questionnaire test of cognitive abilities, routinely performed by astronauts aboard the ISS every 30 days before or after the PHS (periodic health status) test or on special CDR's, crewmembers or flight surgeons request.]*

Peggy supported Garret's first session with the ELITE-S2 (Elaboratore Immagini Televisive - Space 2) payload by detaching the CEVIS (Cycle Ergometer with Vibration Isolation) from the ER3 (EXPRESS Rack 3) and moving it out of the field of view of the cameras crucial to of the experiment, which she set up for capturing Garrett's movement protocol. After powering up the IMU (Interface Management Unit) and calibrating the work area for the cameras (half of the work area facing one way, the other half facing the other way), the FE-2 had ~1.5 hrs to perform the test operations, with Whitson taking documentary photographs. Peggy later stowed the test camera and re-installed the CEVIS, while Garrett turned off the IMU. *[The Italian (ASI) experiment ELITE-S2 is a human motion analysis facility for technological characterization and potential application for multifactorial movement analysis, to study the connection between brain, visualization and motion in micro-G. By recording and analyzing the three-dimensional motion of astronauts, this study should help engineers apply ergonomics into future spacecraft designs and determine the effects of weightlessness on breathing mechanisms for long-duration missions. For each of three protocols (e.g., MOVE, IMAGINE), a set of body landmarks are identified and reflective markers are applied on the subject who then performs prescheduled movements with the index finger tips then returns to the initial position (for example, the subject has to reach and brush, without exerting forces). The video cameras trace the trajectories of the body parts of the astronaut catching the light reflected by the markers, thus recording the kinetic and trajectory data of the movement.]*

Whitson & Malenchenko had two hours between them to prepare for the computerized ATV Approach & Docking OBT (Onboard Training) simulation scheduled tomorrow. The detailed review focused on the R&D (Rendezvous &

Docking) timeline and on possible R&D malfunctions. A five-minute joint crew debriefing with the ground concluded the session.

In the Soyuz TMA-11/15S spacecraft, docked at the FGB nadir port, Yuri, Peggy and Garrett conducted the standard 30-min. fit check of the Kazbek couches, the contoured shock absorbing seats in the Descent Module. *[For the fit check, crew members removed their cabin suits and donned Sokol KV-2 suit and comm caps, got into their seats and assessed the degree of comfort & uniform body support provided by the seat liner. Using a ruler, they then measured the gap between the top of the head and the top edge of the structure facing the head crown. The results were reported to TsUP. Kazbek-UM couches are designed to withstand g-loads during launch and orbital insertion as well as during reentry and brake-rocket-assisted landing. Each seat has two positions: cocked (armed) and noncocked. In cocked position, they are raised to allow the shock absorbers to function during touchdown. The fit check assures that the crewmembers, whose bodies gain in length during longer-term stay in zero-G, will still be adequately protected by the seat liners for their touchdown in Kazakhstan, either emergency or regular return. Soyuz 15S will return on 4/19 with Malenchenko, Whitson and SFP Yi So-yeon.]*

Malenchenko unstowed a spare BRPK air/liquid condensate separator unit, flushed it out with clean water into an EDV (to remove any sediments that may have accumulated as a result of lengthy storage) and installed it in the BRPK-2 line of the SRV-K2M Condensate Water Recovery System. The old unit was discarded. *[The BRPK-1's separator was replaced on 3/16.]*

Reisman filled out the regular FFQ (Food Frequency Questionnaire), his second, on the MEC. *[On the FFQs, NASA/ESA astronauts keep a personalized log of their nutritional intake over time on special MEC software. Recorded are the amounts consumed during the past week of such food items as beverages, cereals, grains, eggs, breads, snacks, sweets, fruit, beans, soup, vegetables, dairy, fish, meat, chicken, sauces & spreads, and vitamins. The FFQ is performed once a week to estimate nutrient intake from the previous week and to give recommendations to ground specialists that help maintain optimal crew health. Weekly estimation has been verified to be reliable enough that nutrients do not need to be tracked daily.]*

Whitson performed the post-1J/A seal inspection on the Node-2 topside (zenith) hatch where the JLP module was berthed on 3/14.

Peggy also gathered measurements for another regular atmospheric status check for ppCO₂ (pp Carbon Dioxide), using the hand-held CDMK (CO₂ Monitoring Kit, #1002). Batteries were to be replaced if necessary. *[Purpose of the 15-min activity is to trend with MCA (Major Constituents Analyzer), i.e., to correlate the*

hand-held readings with MCA measurements. CDMK reading in the SM was 0.36; in Lab 0.36, and in COL 0.35.]

Malenchenko completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

Later, Yuri conducted the daily IMS (Inventory Management System) maintenance, updating/editing its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur).

The FE-1 supported the BIO-5 Rasteniya-2 ("Plants-2") experiment, which researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}), today by downlinking the accumulated pictures to the ground. Working off his “available time” task suggestion list, Malenchenko also serviced the experiment by recharging the water tank of the greenhouse.

The CDR conducted the weekly 10-min. CWC (Contingency Water Container) audit as part of on-going WDS (Water Delivery System) assessment of onboard water supplies. *[Updated “cue cards” based on the crew’s water calldowns are sent up every other week. The current cue card (16-0018Y) lists 37 CWCs (~1483.4 L total) for the four types of water identified on board: technical water (800.4 L, for Elektron, flushing, hygiene), potable water (647.2 L), condensate water (32.3 L), waste/EMU dump and other (3.7 L). Of the 37 containers, 13 CWCs with technical water (569.4 L) cannot be used until cleared for Wautersia bacteria, and 4 CWCs with potable water (176.3 L) are not cleared for use pending analysis of samples returned on 1J/A.]*

FE-2 Reisman relocated an “elephant trunk” air duct segment from the A/L CCAA (Airlock Common Cabin Air Assembly) air conditioner outlet to the IMV (Intermodular Ventilation) inlet.

Garrett, as Leo before him, also had 60 minutes for himself for general orientation (station familiarization & acclimatization), as is standard daily rule for the first two weeks after starting station residency.

Yuri Malenchenko had an hour set aside for his end-of-increment cleanup and

departure preparations. *[Instructions on packing of return items and a keep vs. trash list were uplinked for assisting Yuri and Peggy in their preparing for their return in the severely downmass-limited Soyuz Descent Module. Trashed items will be stowed in the Orbital Module, to be separated along with the Instrumentation/ Propulsion Module prior to atmospheric entry.]*

The crewmembers performed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (FE-2), TVIS treadmill (CDR, FE-1), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Peggy transferred the crew's exercise data file to the MEC laptop for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

As suggested on his "available time" discretionary task list, Yuri performed the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).

ATV Update (Flight Day 18): Early this morning, ATV "Jules Verne" departed its parking orbit 2000 km in front of ISS. A three-burn sequence raised the ATV orbit above and behind the station orbit in preparation for Demo Day 1 on 3/29 (Saturday). The spacecraft is being controlled by ESA's ATV-CC/Toulouse in France, working with TsUP-Moscow and MCC-Houston. On Demo Day 2 (3/31), the ATV begins an approach to the station from two miles away, maneuvering with a series of engine firings to about 10 m (36 ft) from the station before the ISS crew sends an abort command to move the ATV away from the station. These maneuvers will test all ATV systems that are required for a safe automated linkup to the ISS three days later (4/3) by means of the ASN PCE (Proximity Communications Equipment) in the SM, or manually as contingency.

Columbus Update: COL-CC/Oberpfaffenhofen continues troubleshooting the COL (Columbus Orbital Laboratory) condensate water removal problem.

Troubleshooting is also underway on the FSL (Fluid Science Laboratory) and BIOLAB payloads. The health check on the FSL fiber optic cable was successful – no damage detected. For BIOLAB, safety paperwork is in work for troubleshooting the locking pin, removing it and bringing it down in Soyuz 15S.

VolSci (Voluntary Science) Update: Corrective assessment by the ground is underway on the SLAMMD (Space Linear Acceleration Mass Measurement Device) equipment on the HRF1 (Human Research Facility 1) rack, for which CDR Whitson

was unable yesterday to establish communications between the payload laptop and the SLAMMD hardware.

SARJ Photography Update: Preliminary analysis of the Solar Alpha Rotary Joint photographs taken by the EVA crew during 1J/A indicate that the suspected “divot” may actually not be a divot; it also may not have increased in size since first seen during the US EVA-14, as first thought. The planned SARJ Autotrack test was not performed.

BGA Latching Issue: During the recent Shuttle undocking, BGA (Beta Gimbal Assembly) 2B latching for feathering in the automatic mode took three attempts until latch #2 locked properly. Later, unlatching for unfeathering was successful only on the second attempt. Latching/unlatching can also be performed manually as backup. Teams are assessing for future operations. Both issues are understood and documented.

CEO photo target uplinked for today was **Lake Eyre, Australia** (*Lake Eyre is a large, usually dry lakebed in south-central Australia and the lowest part of a larger basin that drains nearly a seventh of the continent. It has a complex cycle of filling and drying, not completely linked to the ENSO [El Nino-Southern Oscillation Cycle]. As we have entered a moderate La Nina this winter and have no recent photographs, researchers would like some baseline imagery of conditions in and around the lake. The ISS pass was to the NE of the lake in afternoon sun. As the station crossed south-central Australia from the SW, the crew was to look right of track for context views in mid-afternoon sun*), **Tropical Cyclone Pancho** (*DYNAMIC EVENT: This has been active tropical weather season for the southeastern Indian Ocean. This late-season storm is forecast at the time of the ISS pass to be a Category 2 storm near 19.5S 105.5E and moving southward well off the coast of northwestern Australia. As ISS approached the coast from the SW in late afternoon, the crew was to look for Pancho well to the left of track, using the short lens settings and trying to capture images of the entire storm system*), and **S. Georgia/S. Sandwich** (*the South Georgia Island is an arching, mountainous and glaciated island that lies about 860 miles ESE of the Falkland Islands. The South Sandwich Islands form a separate island group and are to the SE. Weather is marginal, but the crew was asked to try for detailed views of the glaciers on the north coast of South Georgia, also to look for views of the reported numerous ice fragments from the recent breakup of the mega-iceberg A53a to the north and east of the island*).

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 4:30am EDT [= epoch]):*

Mean altitude -- 340.2 km

Apogee height -- 340.6 km

Perigee height -- 339.8 km

Period -- 91.34 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0000589

Solar Beta Angle -- 50.9 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 25 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53561

Significant Events Ahead *(all dates Eastern Time, some changes possible.):*

03/27/08 -- ATV1 end of loiter; left parking point - ~2:00am;

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking) ~10:39am EDT

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch - ~7:16am (CDR Sergei Volkov, FE Oleg Kononenko, SFP Yi So-yeon)

04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~8:43am

04/12/08 -- **Cosmonautics Day**, with Yuri's Night (check out <http://www.yurisnight.net/2008/>)

04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)

05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/25/08 -- STS-124/Discovery/1J launch -- JEM PM "Kibo", racks, RMS

05/27/08 -- STS-124/Discovery/1J docking

06/05/08 -- STS-124/Discovery/1J undocking

08/07/08 -- ATV1 undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)

ISS On-Orbit Status 03/26/08

All ISS systems continue to function nominally, except those noted previously or below. *Off-duty day for the Station crew.*

ISS crew is back on its regular work cycle: 2:00am – 5:30pm EDT.

For her VolSci (Voluntary Science) program today, CDR Peggy Whitson set up the SLAMMD (Space Linear Acceleration Mass Measurement Device) equipment on the HRF1 (Human Research Facility 1) rack, performed the scheduled checkout/control run and took a body mass measurement, documenting the activities with digital still & video imagery for ground evaluation and finally disassembling the equipment again. *[SLAMMD provides an accurate means of determining the on-orbit mass of humans spanning the range from the 5th percentile Japanese female and the 95th percentile American male. The procedure, in accordance with Newton's 2nd Law of Motion, finds the mass by dividing force, generated by two springs inside the SLAMMD drawer, by acceleration measured with a precise optical instrument that detects the position versus time trajectory of the SLAMMD guide arm and a micro controller which collects the raw data and provides the precise timing. The final computation is done via portable laptop computer with SLAMMD unique software. To calculate their mass, crewmembers wrap their legs around a leg support assembly, align the stomach against a belly pad and either rest the head or chin on a head rest. For calibration, an 18-lbs. mass is used at different lengths from the pivot point, to simulate different mass values. Allowable crew mass range is from 90 to 240 lbs.]*

As second VolSci activity on her off-duty day, Whitson powered on the USND (Ultrasound) LITE gear with its TDI (Tissue Doppler Imaging) equipment & the Cooling Stowage Drawer on HRF-1 and performed a functionality checkout, monitored by the ground via Ku- & S-band. The payload was then deactivated again and stowed away.

After setting up the ELITE-S2 (Elaboratore Immagini Televisive - Space 2) payload in the ER2 (EXPRESS Rack 2) yesterday, FE-2 Reisman today reviewed updated crew procedures for the experiment and discussed particulars of the upcoming ops in conference with the PD (Payload Developer & POIC (Payload Operations & Integration Center)). Afterwards, Garrett & Peggy routed the connecting data & power cables, configured the supporting laptop, set up the video cameras for calibrating the work area, and activated the experiment's IMU (Interface Management Unit), later powering it off again. *[The Italian (ASI) experiment ELITE-S2 is a human motion analysis facility for technological characterization and potential application for multifactorial movement analysis, to study the connection between brain, visualization and motion in micro-G. By recording and analyzing the three-dimensional motion of astronauts, this study should help engineers apply ergonomics into future spacecraft designs and determine the effects of weightlessness on breathing mechanisms for long-duration missions.]*

Yuri Malenchenko & Peggy Whitson updated the relevant crew procedures documentation for the upcoming ATV activities, printing out new ATV ODF (Operations Data File) pages for replacing corresponding pages in two procedures books (ATV Rendezvous Docking & Undocking Book & Systems Operations Book).

After Houston flight controllers deactivated the CDRA (Carbon Dioxide Removal Assembly) during last night (10:30pm-3:30am EDT) and cooling is no longer required, Garrett Reisman disconnected the ITCS LTL QD (Internal Thermal Control System/Low Temperature Loop/Quick Disconnect) jumper to the CDRA rack (loc. LAB1D6).

In the Service Module (SM), Malenchenko took readings of potentially harmful atmospheric contaminants with the CMS (Countermeasure System) part of the GANK-4M Real-Time Harmful Contaminant Gas Analyzer suite, which uses preprogrammed microchips to measure H₂CO (Formaldehyde, methanal), CO and NH₃ (Ammonia), taking one measurement per microchip;

Reisman conducted the periodic checkup on active U.S. payloads, i.e., cleaning the ANITA (Analyzing Interferometer for Ambient Air) inlet plus inspecting and filter cleaning of the CGBA-5 (Commercial Generic Bioprocessing Apparatus 5) incubator payload. *[The CGBA incubator is controlled from the ground, with automatic video downlinked to Earth. ANITA continues to collect data every six seconds and downlinks the data daily to the ground team. ANITA monitors low levels of potential gaseous contaminants in the ISS cabin atmosphere with a capability of simultaneously monitoring 32 gaseous contaminants. The experiment is testing the accuracy and reliability of this technology as a potential next-*

generation atmosphere trace-gas monitoring system for ISS and future spacecraft. This is a cooperative investigation with ESA.]

Afterwards, Garrett also completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC from the Lab humidifier.]*

The crewmembers performed their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Peggy transferred the crew's exercise data file to the MEC (Medical Equipment Computer) laptop for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Working off his "available time" task suggestion list, Malenchenko performed the daily monitoring, picture-taking and downloading on the BIO-5 Rasteniya-2 ("Plants-2") experiment. Today's task was extended to include recharging the water tank of the greenhouse. *[Rasteniya-2, researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems, Russian: IMBP). During its operation, the experiment requires regular daily maintenance of the experiment involving monitoring of seedling growth, humidity measurements, moistening of the substrate if necessary, and photo/video recording. During the duration of the BIO-5 experiment, students of the Moscow City Palace for Youth Creativity of the Meshchansky inter-regional center #15 in Moscow) and the Prince of Oldenburg Lyceum in St. Petersburg will be cultivating plants in parallel on the ground and conducting comparative observation of plant growth and development under gravity and zero-gravity conditions. They are receiving the photo images taken by Yuri.]*

Also listed for the FE-1 as a voluntary task was the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).

At ~6:35am EDT, Garrett Reisman powered up the SM's amateur radio equipment (Kenwood VHF transceiver with manual frequency selection, headset & power

supply) and conducted at 6:40am a ham radio exchange with students at the NPO (Non-Profit Organization) "The Child Support Project" in Kyoto, Japan. Questions to Garrett were uplinked by ARISS (Amateur Radio on ISS) beforehand. [*"Is there a temperature in space?"; "Why is it dark in space when the sun is there?"; "What is it like to have many mornings and nights in a day?"; "Is space food delicious?"; "How do you take pictures from space? Can you use an ordinary digital camera?"*]

STS-123/Endeavour Landing Look-ahead (today, EDT):

1:58pm: Deorbit Prep begins
2:13pm: Radiator Stow
3:04pm: Final payload deactivation
3:18pm: Payload bay door closing
4:50pm: IMU (Inertial Measurement Unit) align
3:28pm: Mission Control "Go" for Ops 3 software transition
3:38pm: GPC (General Purpose Computers) transition to Ops 3 for entry
4:33pm: Suit up
4:58pm: Seat Ingress
5:11pm: OMS (Orbital Maneuvering System) engine gimbal checks
5:25pm: APU (Auxiliary Power Unit) prestart
5:38pm: Mission Control "Go-No Go" for the deorbit burn
5:47pm: Maneuver to the Deorbit Burn Attitude
5:53pm: Single APU start
5:58pm: Deorbit burn (duration 2 min 51 sec/delta-V = 306.5 ft/sec)
6:33pm: Entry Interface (400,000 feet – range 4,959 st. mi.)
6:38pm: First Roll Command (to the left)
6:52pm: C-Band radar acquisition
6:54pm: First Roll Reversal (left to right)
7:02pm: HAC (Heading Alignment Circle) intercept (195 degree left overhead to Runway 15)
7:05pm: LANDING (249 orbits)

ATV Update (Flight Day 17): ATV "Jules Verne" continues nominal stationkeeping at the Parking point 2000 km in front of the ISS. Per the plan, the ATV did not perform any maneuvers. ATV is scheduled to leave the Parking point on 3/27 to start its ISS approach for its first Demo Day, with all demo objectives approved trilaterally (Europe, Russia, NASA). ATV-CC/Toulouse continues to see higher than expected power consumption from the pressurized module shell heaters and is working to identify the reason. Tomorrow and Friday, Yuri & Peggy are scheduled for two days of OBT (Onboard Training) to handle the ATV Approach & Docking next week (4/3): (1) tomorrow a thorough 2-hr review of OBT objectives (main rendezvous steps, possible malfunctions, new Rendezvous, Docking & Undocking RODF), including a crew debriefing with the ground, and (2) on 3/28 a series of simulation runs with a sophisticated simulator software on a laptop, covering a

selection of 10 scenarios of the approach & docking, quite similar to the SIMVOL control display used for KURS and TORU training.

Weekend Voluntary Science: For the next VolSci (Voluntary Science) program on Sunday (3/30), one option was proposed to Peggy & Garrett for their choice: to perform five surface sample analyses with the LOCAD-PTS (Lab-on-a-Chip Application Development – Portable Test System).

CEO photo target uplinked for today was **Mozambique** (*this target area is in the coastal plains of far southern Mozambique just north of the capital city of Maputo. Rapid development of this area is now being planned. To better monitor this change CEO researchers are seeking baseline, pre-development imagery. ISS approached from the SW in late afternoon light. Clear-to-partly cloudy weather was expected, and requested was an oblique mapping pass to the left of the orbit track using only short lens settings for contextual information. There are very few strong landmarks or visual features to guide the crew.*

CEO photography can be studied at this “Gateway” website:
<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 7:11am EDT [= epoch]*):

Mean altitude -- 340.2 km

Apogee height -- 340.8 km

Perigee height -- 339.6 km

Period -- 91.34 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0000838

Solar Beta Angle -- 52.5 deg (magnitude decreasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 60 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53547

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

03/26/08 -- STS-123/Endeavour deorbit (on Orbit 248; 5:58pm); landing @ KSC (7:05pm).

03/27/08 -- ATV1 end of loiter; leave parking point - ~2:00am;

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking) ~10:39am EDT

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch - ~7:16am (CDR Sergei Volkov, FE Oleg Kononenko, SFP Yi So-yeon)

04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~8:43am
 04/12/08 -- **Cosmonautics Day**, with Yuri's Night (check out <http://www.yurisnight.net/2008/>)
 04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)
 05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
 05/14/08 -- Progress M-64/29P launch
 05/16/08 -- Progress M-64/29P docking (DC1)
 05/25/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS
 05/27/08 -- STS-124/Discovery/1J docking
 06/05/08 -- STS-124/Discovery/1J undocking
 08/07/08 -- ATV1 undocking
 08/12/08 -- Progress M-65/30P launch
 08/14/08 -- Progress M-65/30P docking (SM aft port)
 08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
 09/09/08 -- Progress M-64/29P undocking (from DC1)
 09/10/08 -- Progress M-66/31P launch
 09/12/08 -- Progress M-66/31P docking (DC1)
 10/01/08 -- **NASA 50 Years**
 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
 10/12/08 -- Soyuz TMA-13/17S launch
 10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
 10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
 10/18/08 -- STS-126/Discovery/ULF2 docking
 10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
 11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
 11/20/08 -- **ISS 10 Years**
 11/26/08 -- Progress M-67/32P launch
 11/28/08 -- Progress M-67/32P docking (SM aft port)
 12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
 12/06/08 -- STS-119/Discovery/15A docking
 12/15/08 -- STS-119/Discovery/15A undocking
 1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
 05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
 3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
 4QTR CY09 -- STS-130/19A - MPLM
 1QTR CY10 – STS-131/ULF4
 2QTR CY10 -- STS-132/20A – Node-3 + Cupola
 3QTR CY10 – STS-133/ULF5.

ISS On-Orbit Status 03/25/08

All ISS systems continue to function nominally, except those noted previously or below. *Off-duty day for the station crew.*

ISS work cycle today: Sleep 11:00pm (last night) –7:30am; wake 7:30am (this morning) –5:30pm.

STS-123/Endeavour and ISS are flying in separate orbits again (Flight Day 15/16 for STS-123/1J/A)

After final preparations on both sides of the hatches (closed yesterday on ISS side at 5:51pm EDT), Endeavour undocked last night at 8:25pm, 29 min late, from PMA-2 (Pressurized Mating Adapter 2) after a total docked time of 11d 20h 36m. *[For undocking, the station was turned from -XVV through ~180 deg to +XVV ZLV (+x-axis in velocity vector, z-axis in local vertical, i.e., flying Shuttle-leading again) at ~7:09pm, put briefly on free drift for the undocking, and then moded to 1J/A Stage attitude of +XVV TEA attitude. During pre-undock feathering & locking of the station's P6 solar arrays, latch #2 of the 2B BGA (Beta Gimbal Assembly) latched only at the third attempt, delaying the undocking by ~29 min.]*

After separation, Endeavour completed a 360-deg flyaround and obtained imagery of the ISS with the newly-delivered JLP (Japanese Experiment Module Experiment Logistics Module Pressurized Section) and SPDM (Special Purpose Dexterous Manipulator). *[JLP added approximately 2000 cubic feet of internal volume and 18,490 lb mass to the ISS; the SPDM added another 3440 lbm.]*

KSC landing is nominally expected on 3/26 (Wednesday) at ~7:05pm EDT. *[If the landing occurs as planned, STS-123 mission duration will be 15d 16h 37m, i.e., the longest Shuttle mission to ISS so far. Léopold Eyharts' total time in space will be 48 days, with 44 days on board ISS.]*

Before and during the undocking, FE-1 Malenchenko stood by at a laptop with a stopwatch to monitor the proper performance of automatic undocking software for the PMA-2 departure under Russian thruster attitude control. *[The procedure provides for the crewmember to take over the automatic operational attitude control sequence manually if the software does not resume control after the period of free drift a few minutes after physical separation.]*

FE-2 Garrett Reisman used the Kodak 760 digital camera and PD-100 camcorder to document the undocking, backing away & separation of the Endeavour.

Before Shuttle departure, a final 3.3 mmHg O₂ repress of the ISS stack was performed using Shuttle oxygen.

After undocking, CDR Peggy Whitson depressurized the PMA-2 to prevent humidity condensation and pressure fluctuations. Leak checking by the CDR followed after the standard one hour. Afterwards, the necessary testing equipment was torn down.

Later, the CDR also powered down the Cupola RWS (Robotics Workstation) laptop.

Reisman set up the ELITE-S2 (Elaboratore Immagini Televisive - Space 2) payload in the ER2 (EXPRESS Rack 2), swapping the experiment's IMU (Interface Management Unit) with the ISIS (International Subrack Interface Standard) Drawer. *[The transfers involved moving ELITE-S2 from ER5 to ER2 and the ISIS Drawer from ER2 to ER5. Cables were not yet connected by the crew, remaining stowed (loc. LAB1S4-B1) until needed to perform the experiment. The Italian (ASI) experiment ELITE-S2 is a human motion analysis facility for technological characterization and potential application for multifactorial movement analysis, to study the connection between brain, visualization and motion in micro-G. By recording and analyzing the three-dimensional motion of astronauts, this study should help engineers apply ergonomics into future spacecraft designs and determine the effects of weightlessness on breathing mechanisms for long-duration missions.]*

The FE-1 completed the reconfiguration of the Russian telephone/telegraph subsystem (STTS) to its post-undocking settings, from its primary string back to nominal mode on the backup string. This also severed the VHS (UHF) channel to the receding Shuttle Orbiter and restored the RSA-2 S/G (Space-to-Ground) comm configuration on Panel 3. *[The "Voskhod-M" STTS enables telephone communications between the SM, FGB, DC1 Docking Compartment and U.S. segment (USOS), and also with users on the ground over VHF channels selected by an operator at an SM comm panel, via STTS antennas on the SM's outside.]*

There are six comm panels in the SM with pushbuttons for accessing any of three audio channels, plus an intercom channel. Other modes of the STTS include telegraphy (teletype), EVA voice, emergency alarms, Packet/Email, and TORU docking support.]

After briefly activating the MKAM (Minimum Keep Active Monitor) fan in the JLP, Peggy Whitson relocated the module's PBA (Portable Breathing Apparatus) from the JLP to Columbus (because of long-term JLP ventilation deactivation), then removed & stowed the VCP J01 video cap at the Node-2 video port S3 (camcorder port), to allow camcorder ops within Node-2.

Malenchenko performed the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS (Russian Segment) hatchways, including the FGB-to-Soyuz tunnel, and the FGB-to-Node passageway.

The crew went to sleep last night at ~11:00pm. After wake-up this morning (~7:30am EDT), the crew is having an off-duty day.

CDR Whitson started her day by completing another session with the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop, as suggested on her discretionary "job jar" task list. *[To monitor the crewmember's sleep/wake patterns and light exposure, Peggy wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

For her VolSci (Voluntary Science) program tomorrow, Whitson has selected the USND (Ultrasound) and SLAMMD (Space Linear Acceleration Mass Measurement Device) experiments. In preparation for the activities, Peggy today moved the USND hardware & cooling stowage drawer to a lower location within the HRF-1 (Human Research Facility 1) rack as a final troubleshooting step. SLAMMD files were loaded onto the HRF1 laptop already on 6/5/06. *[The actual checkout of the equipment is scheduled tomorrow with the powered SLAMMD activities. SLAMMD provides an accurate means of determining the on-orbit mass of humans spanning the range from the 5th percentile Japanese female and the 95th percentile American male. The procedure, in accordance with Newton's 2nd Law of Motion, finds the mass by dividing force, generated by two springs inside the SLAMMD drawer, by acceleration measured with a precise optical instrument that detects the position versus time trajectory of the SLAMMD guide arm and a micro controller which collects the raw data and provides the precise timing. The final computation*

is done via portable laptop computer with SLAMMD unique software. To calculate their mass, crewmembers wrap their legs around a leg support assembly, align the stomach against a belly pad and either rest the head or chin on a head rest. For calibration, an 18-lbs. mass is used at different lengths from the pivot point, to simulate different mass values. Allowable crew mass range is from 90 to 240 lbs.]

Later today, Yuri will perform the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables.

Working off his “available time” task suggestions list, Malenchenko also is to –

- Conduct the daily IMS (Inventory Management System) maintenance, updating/editing of its standard “delta file” including stowage locations, for the regular weekly automated export/import to its three databases on the ground (Houston, Moscow, Baikonur),
- Support the BIO-5 Rasteniya-2 ("Plants-2") experiment, which researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}), by monitoring the greenhouse, taking pictures and downloading them to the ground,
- Perform the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder), and
- Continue Progress 28P loading, with commensurate updates of the IMS.

Spaced over the day, the crewmembers are performing their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2), TVIS treadmill (FE-1), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Peggy transfers the crew’s exercise data file to the MEC (Medical Equipment Computer) laptop for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Whitson & Reisman are scheduled for their standard periodic PMC (Private Medical Conference) via S- & Ku-band audio/video.

Earlier today, at ~9:30am, Yuri Malenchenko had his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop).

During crew sleep tonight, starting at 5:30pm, the ground will update the ISL (Integrated Station OpsLAN) Routers in the Lab & Node-2 with a new software configuration for both Switches A & B. They will be rebooted, taking the network temporarily off line.

Cabin Ventilation Update: After hatch closure, the CDR tore down the temporary 23-ft ventilation ducting from Node-2 to the Lab and reclosed panels. *[The air duct had been assembled from three separate pieces to help improve Shuttle air flow directly into the Lab for CO₂ removal.]*

JLP Update: The JLP experienced a failure of a GLA (General Luminaire Assembly, P2A), one of four lighting fixtures. Crew troubleshooting determined it was the BBA (Baseplate Ballast Assembly) that failed. There are no spare BBAs onboard ISS. *[Impact: "Just a little darker".]*

ATV Update (Flight Days 14, 15, 16): ATV "Jules Verne" continues nominal stationkeeping at the Parking point 2000 km in front of the ISS. Per the plan, the ATV did not perform any maneuvers. In addition, the SK2_1 & SK2_2 stationkeeping maneuvers that were planned for today (3/25) have been cancelled because they are not necessary for maintaining the Parking point. ATV is scheduled to leave the Parking point on 3/27 to start its ISS approach for its first Demo Day, with all demo objectives approved trilaterally (Europe, Russia, NASA). The IMMT (ISS Mission Management Team) this morning gave its Go for Demo Day 1 on 3/29. ATV-CC/Toulouse continues to see higher than expected power consumption from the pressurized module shell heaters and is working to identify the reason.

No CEO photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit *(as of this morning, 8:21am EDT [= epoch]):*

Mean altitude -- 340.3 km

Apogee height -- 340.8 km

Perigee height -- 339.7 km

Period -- 91.34 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0000845

Solar Beta Angle -- 53.3 deg (magnitude peaking)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 330 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53532

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

03/26/08 -- STS-123/Endeavour deorbit (Orbit 248; 5:59pm); landing @ KSC (7:04pm).

03/27/08 -- ATV1 end of loiter; leave parking point - ~2:00am;

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking) ~10:39am EDT

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch - ~7:16am (*CDR Sergei Volkov, FE Oleg Kononenko, SFP Yi So-yeon*)

04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~8:43am

04/12/08 -- **Cosmonautics Day**, with Yuri's Night (check out <http://www.yurisnight.net/2008/>)

04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)

05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/25/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS

05/27/08 -- STS-124/Discovery/1J docking

06/05/08 -- STS-124/Discovery/1J undocking

08/07/08 -- ATV1 undocking

08/12/08 -- Progress M-65/30P launch

08/14/08 -- Progress M-65/30P docking (SM aft port)

08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)

09/09/08 -- Progress M-64/29P undocking (from DC1)

09/10/08 -- Progress M-66/31P launch

09/12/08 -- Progress M-66/31P docking (DC1)

10/01/08 -- **NASA 50 Years**

10/11/08 -- Progress M-65/30P undocking (from SM aft port)

10/12/08 -- Soyuz TMA-13/17S launch

10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)

10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC

10/18/08 -- STS-126/Discovery/ULF2 docking

10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)

11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)

11/20/08 -- **ISS 10 Years**

11/26/08 -- Progress M-67/32P launch

11/28/08 -- Progress M-67/32P docking (SM aft port)

12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
4QTR CY09 -- STS-130/19A - MPLM
1QTR CY10 – STS-131/ULF4
2QTR CY10 -- STS-132/20A – Node-3 + Cupola
3QTR CY10 – STS-133/ULF5.

ISS On-Orbit Status 03/24/08

All ISS systems continue to function nominally, except those noted previously or below. *STS-123-J/A Flight Day (FD) 14/15. Underway: Week 23 of Increment 16. (Yesterday, 3/23, was the birthday of Wernher von Braun who would have turned 96.)*

ISS crew sleep/wake cycle today: Sleep 3:15am–11:45am; wake 11:45am–11:00pm.

After wakeup yesterday, FE-2-16 Reisman had his third session with the biomed experiment INTEGRATED IMMUNE (Validating Procedures for Monitoring Crew member Immune Function), collecting dry saliva samples. *[INTEGRATED IMMUNE protocol requires the collection to occur first thing post-sleep, before eating, drinking and brushing teeth, and all samples are stored at ambient temperature. Along with NUTRITION (Nutritional Status Assessment), IMMUNE samples & analyzes participant's blood, urine, and saliva before, during and after flight for changes related to functions like bone metabolism, oxidative damage and immune function to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects. The saliva is collected in two forms, dry and liquid. The dry samples are collected at intervals during the collection day using a specialized book that contains filter paper, all stored at ambient temperature.]*

FE-2 Leo Eyharts continued his second session with the biomed experiment INTEGRATED IMMUNE, collecting wet saliva samples first thing in post-sleep and later transferring the samples to the Shuttle for return.

Later today, after wake-up, Eyharts switched to collecting dry saliva samples, continuing the IMMUNE collection throughout the day tomorrow on the Shuttle.

FE-1 Yuri Malenchenko began his “day” by attending to the current experiment session with the Russian/German TEKh-20 Plasma Crystal-3+ (Plazmennyi-Kristall/PK-3+) payload, activating the turbopump in the Service Module (SM)’s Transfer Compartment (PkhO) for keeping the vacuum chamber (ZB) in the SM Work Compartment (RO) evacuated. Afterwards, Yuri performed the experiment in semiautomatic mode, with some manual control, then closed it down and transferred the collected data from HDD (Hard Disc Drive) for downlink to TsUP-Moscow. The turbopump was deactivated again this morning at ~3:10am EDT before sleeptime. *[Main objective of PK-3 is to study dust plasma wave propagation and dispersion ratio at a specified power of HF discharge, pressure, and a varied number of particles. The research was performed this time on particles of 3.42 micron (micrometer) diameter at pressures of 20, 40 & 60 Pa. The main purpose is to study the behavior of the structures in a constant electrical field of varying amplitudes and compare that with particle behavior when they are excited by a low-frequency alternating electrical field. Yuri’s task was to create a plasma-dust cloud with a small void in the center with the help of step-down power decrease of the RF generator. During the experiment the FE-1 performed a total of 4 runs.]*

In an attempt to increase Shuttle ventilation, CDR Peggy Whitson installed a 23-ft flexible ventilation duct, routing airflow from the Node-2 forward starboard endcone through the Node-2 aft endcone and into the Lab hatch, bypassing the IMV (Intermodular Ventilation) muffler. Ground specialists expect this configuration will improve Shuttle air flow directly into the Lab for CO₂ removal. After the installation, Peggy collected airflow and sound measurements for engineering analysis.

The CDR, with Garrett Reisman, also completed post-EVA clean-up activities, reconfiguring the Kodak 760 DCS (digital camera system) for nominal use, e.g., removing its thermal cover & flash attachment, and starting regeneration of the METOX (Metal Oxide) CO₂ filter canisters in the Airlock (A/L).

During the METOX “bake-out”, Whitson took temperature measurements around the regeneration oven and A/L CCAA (Common Cabin Air Assembly) using the Velocicalc instrument, for ground assessment. *[If the temperatures are favorable, this will alleviate the need to cold soak the A/L during METOX regenerations at high solar Beta angles (as is currently the case).]*

In the COL (Columbus Orbital Laboratory), FE-2 Eyharts conducted a status check on the MERLIN (Microgravity Experiment Research Locker Incubator II) cooler, then collected four (of eight) Experiment Containers of the WAICO-1 (Waving and Coiling of Arabidopsis Roots at Different g-levels #1) experiment from the BIOLAB TCU1 (Thermal Control Unit 1) and relocated them into the MERLIN incubator for

return to Earth on Endeavour. *[MERLIN's current temp at door closing: 4.3 deg C.]*

Eyharts also disconnected the IWIS (Internal Wireless Instrumentation System) between the accelerometer in the Shuttle and the RSU (Remote Sensor Unit) in the PMA-2 (Pressurized Mating Adapter 2) and transferred the RSU to temporary position in the Node-2 forward endcone. *[IWIS took structural dynamics measurements during yesterday's Russian thruster testing (11:52am-12:05pm).]*

FE-1 Malenchenko afterwards downloaded the IWIS data from the RSUs to an SSC (Station Support Computer) for subsequent downlink to the ground.

At the HRF1 (Human Research Facility 1) rack, Whitson deactivated the MedOps cardiac defibrillator and conducted its periodic checkout, which was to be recorded on video and later dumped to the ground (Last time done: 1/24/07). *[This routine maintenance task is scheduled as soon as possible from Expedition start and every 60 days thereafter. For the checkout, the defib is connected to the 120V outlet, equipped with its battery and then allowed to charge, for about five seconds, to a preset energy level (e.g., 100 joules). After the button-triggered discharge, a console indicator signals success or failure of the test. The pacing signal is downlinked via S-band for 1 min. The HRF was powered down afterwards.]*

The FE-1 performed the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS (Russian Segment) hatchways, including the FGB-to-Soyuz tunnel, and the FGB-to-Node passageway. *[This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons, and one of the two Russian SKV air conditioners off (SKV-1).]*

Yuri also completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables plus the weekly collection of the toilet flush counter (SPK-U), water supply (SVO) readings and POTOK parameters for calldown to TsUP/Moscow. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC (Contingency Water Container) from the Lab humidifier. Weekly SOZh reports (on Sundays) to TsUP/Moscow deal with number & dates of water and urine containers, counter readings of water consumption & urine collection, plus data and total operating time of the Russian POTOK-150MK (150 micron) air filter unit of the SOGS air revitalization subsystem.]*

The crewmembers completed most of their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR, FE-2-16), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Peggy transferred the crew's exercise data file to the MEC (Medical Equipment Computer) laptop for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Eyharts transferred his MEC exercise memory cards to the Shuttle for return.

MS3 Mike Foreman activated the RIGEX (Rigidizable Inflatable Get-Away-Special Experiment) payload. *[RIGEX is a self-contained, automated experiment intended to collect data on space inflated and rigidized structures in which inflatable tubes are heated and cooled to form structurally stiff tubes.]*

Working from the Russian "available time" suggestions list, Yuri Malenchenko performed the regular daily checkup on the Japanese experiment GCF-JAXA (Granada Crystallization Facility) in the Russian TBU incubator, maintained at +20 degC, including a temperature check on its ART (automatic temperature recorder).

A second task list item for the FE-1 for FD14 was the daily monitoring, picture-taking and downloading for the BIO-5 Rasteniya-2 ("Plants-2") experiment which researches growth and development of plants (peas) under spaceflight conditions in the Lada-12 greenhouse from IBMP (Institute of Bio-Medical Problems {Russian: IMBP}).

At ~3:50pm, Garrett Reisman had his weekly PFC (Private Family Conference) via S-band/audio and Ku-band/MS-NetMeeting application (which displays the uplinked ground video on the SSC-9 laptop).

Peggy Whitson & Leo Eyharts had their standard periodic PMC (Private Medical Conference) via S- & Ku-band audio/video.

At ~6:30pm, the CDR conducted the 15th weekly tagup with the Lead Flight Director at JSC/MCC-H via S-band/audio. *[S/G-2 (Space-to-Ground 2) phone patch via SSC-10 (Station Support Computer 10)].*

At ~11:20pm, the joint ISS & Shuttle crews participated in a well-done PAO TV news conference with U.S., Japan and France media.

Afterwards, the crewmembers joined for the traditional souvenir photographs, first all ten station residents together, then the seven Shuttle crewmembers.

Sleeptime for the ISS crew began this morning at 3:15am, for the Shuttle crew at 3:45am. For both crews workday started today at 11:45am EDT.

Main activities of today's workday (FD15):

- TEKh-20 Plasma Crystal-3+ (Plazmennyi-Kristall/PK-3+)PK-3 by FE-1 Malenchenko: turbopump activation at 11:45am, conduct experiment in semi-automatic mode, experiment deactivation & removal by 6:45pm;
- RIGEX deactivation by Mike Foreman;
- Urine transfer by Yuri from EDV-U containers (#349, #374) to the BV2 Rodnik water tank of Progress 28P for disposal *[pumping setup left in place for more urine transfers on 3/28]*;
- CDR Whitson removing the IWIS RSU from Node-2 (temporarily placed there earlier after its use in PMA-2 during the Russian thruster test);
- Whitson & Eyharts packing experiment samples from MELFI (Minus-Eighty Laboratory Freezer for ISS) in DCBs (Double Cold Bags, #1004, #1005)) plus their transfer to the Shuttle middeck;
- Standard maintenance/inspection of CEVIS by Peggy;
- Disassembly of the O₂ pre-breathe transfer equipment between Shuttle and ISS (Gorie/Johnson/Whitson);
- Final transfers as required (Foreman).

The traditional **Crew Farewell** ceremony will take place at ~5:20pm EDT, followed by air duct removal and hatch closure at ~5:50pm, handled on the ISS side by Peggy Whitson & Yuri Malenchenko. *[Afterwards, Gorie & Johnson switch attitude control authority of the mated stack from ISS CMG TA (Control Moment Gyroscope Thruster Assist) mode to Orbiter control.]*

Endeavour is scheduled to **undock** from ISS tonight at 7:56pm, two minutes after local midnight, after a total docked time of 11d 20h 7m. Sunrise will be at 8:13pm. After a one-orbit flyaround for photo imaging at 400-600 ft, starting at 8:25pm, final separation burn of Endeavour will be at 9:39pm (1.5 ft/sec, posigrade). Landing is set for Wednesday, 3/26, nominally at KSC at 7:04pm EDT. Total mission for STS-123-1J/A will then have been 15d 16h 36m. Léopold Eyharts' total time in space will be 48 days, with 44 days on board ISS.

ISS Crew Sleep Shift Planning: To synchronize the ISS crew's timeline with STS-123-1J/A docking and subsequent docked activities, Peggy's, Yuri's and Garrett's wake/sleep cycle underwent a number of shifts which started on 3/11. For the next two days, the wake/sleep shift schedule is as follows, getting the ISS crew back on

their regular schedule by Wednesday (all times EDT):

FD15	Wake: 11:45am (3/24) – 11:00pm (3/24) Sleep: 11:00pm – 7:30am (3/25)
FD16	Wake: 7:30am (3/25) – 5:30pm (3/25) Sleep: 5:30pm – 2:00am (3/26)

No CEO photo targets uplinked for today.

CEO photography can be studied at this “Gateway” website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 4:57am EDT [= epoch]*):

Mean altitude -- 340.6 km

Apogee height -- 341.5 km

Perigee height -- 339.8 km

Period -- 91.35 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0001253

Solar Beta Angle -- 53.3 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.76

Mean altitude gain in the last 24 hours -- 90 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53514

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

- 3/24 (FD15) – STS-123/Endeavour undocking (~7:56pm)
- 3/26 (FD17) – STS-123/Endeavour deorbit (Orbit 248; 5:59pm); landing @ KSC (7:04pm).

03/27/08 – ATV1 end of loiter; leave parking point - ~2:00am;

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking) ~10:39am EDT

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch - ~7:16am (*CDR Sergei Volkov, FE Oleg Kononenko, SFP Yi So-yeon*)

04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~8:43am

04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)

05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/25/08 -- STS-124/Discovery/1J launch – JEM PM “Kibo”, racks, RMS

05/27/08 -- STS-124/Discovery/1J docking

06/05/08 -- STS-124/Discovery/1J undocking
08/07/08 -- ATV1 undocking
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
4QTR CY09 -- STS-130/19A - MPLM
1QTR CY10 -- STS-131/ULF4
2QTR CY10 -- STS-132/20A – Node-3 + Cupola
3QTR CY10 -- STS-133/ULF5.

ISS On-Orbit Status 03/23/08

All ISS systems continue to function nominally, except those noted previously or below. *Sunday - J/A Flight Day (FD) 13/14. Ahead: Week 23 of Increment 16.*

HAPPY EASTER! *Congratulations, Shuttle & ISS crews: Five EVAs in a row, all successful. What a great Easter gift!*

>>>>Today at ~7:43am EDT, the ISS, specifically its FGB module, completed 53,500 orbits of the Earth, having covered a distance of 2.25 billion kilometers (1.4 billion st.miles) in 3411 days. *The 19,300 kg (42,600 lbs) Zarya ("Dawn") was launched on a Russian/Khrunichev Proton from Baikonur over nine years ago (11/20/1998) as the first element of the multi-national space station.<<<<*

Crew sleep/wake cycle today: Sleep 4:00am–12:30pm; wake 12:30pm–3:15am tomorrow.

EVA-5 was completed successfully by Bob Behnken & Mike Foreman in 6h 24m, accomplishing all of its objectives.

During the spacewalk, Behnken (EV1) & Foreman (EV2) –

1. Installed KAUs (Keep-alive Umbilicals) on the OBSS (Orbiter Boom Sensor System);
2. Stowed the OBSS on the ISS S0/S1 truss segments, powered it up and installed its cover *[OBSS will be returned on 1J]*;
3. Installed two MISSE-6 PEC (Materials International Space Station Experiment #6 Passive Experiment Containers) in the LWAPA (Light Weight Adapter Plate Assembly) on the Columbus EPF (External Payload Facility) & photographed LWAPA;
4. Inspected the Starboard SARJ (Solar Alpha Rotary Joint) covers, i.e., divot (depression) on cover 18 & photograph covers 16, 6, 8, 9 & 11 *[no debris or divots discovered here]*;

5. Clean up worksite & ingress.

Additionally, two get-ahead tasks were completed:

6. Installation of the five JLP (JEM Experiment Logistics Module Pressurized Section) & keel pin trunnion thermal covers, and
7. Stowing the general purpose cutters into the Airlock tool box #2.

Official start time of the spacewalk was 4:34pm EDT, about 49 min ahead of timeline, and it ended at 10:36am. Total EVA duration (PET = Phase Elapsed Time) was 6h 2min. It was the 109th spacewalk for ISS assembly & maintenance and the 81st from the station (59 from Quest, 22 from Pirs, 28 from Shuttle) totaling 498h 49min, the 13th for Expedition 16 (totaling 90h 57min) and the 10th so far this year. After today's EVA, a total of 139 spacewalkers (107 NASA astronauts, 21 Russians, and 11 astronauts representing Japan-1, Canada-4, France-1, Germany-2 and Sweden-3) have logged a total of 687h 11min outside the station on building, outfitting and servicing. It was also the 131st spacewalk involving U.S. astronauts.

After crew wakeup at ~12:30pm EDT yesterday, ending the 8.5-hr sleep period, the Airlock Crewlock (A/L CL) hatch was cracked at ~2:00pm for a hygiene break/with mask prebreathe for Behnken & Foreman after spending the night on 10.2 psi campout. Around 2:35pm, the hatch was closed again by Peggy Whitson, the IV (Intravehicular Crewmember) in charge, for EVA preparations in 10.2 psi, followed by EMU purge & prebreathe. Afterwards, the IV supported CL depressurization and EV1/EV2 egress (EMUs switched to batteries at 4:34pm).

As part of pre-EVA activities, FE-1 Malenchenko powered down the ham radio equipment in SM (Service Module) and FGB at ~1:53pm EDT to prevent RF interference with the EMUs during the spacewalk.

FE-1 Yuri Malenchenko began his "day" by attending to the current experiment session with the Russian/German TEKh-20 Plasma Crystal-3+ (Plazmennyyi-Kristall/PK-3+) payload, activating the turbopump in the Service Module (SM)'s Transfer Compartment (PkhO) for keeping the vacuum chamber (ZB) in the SM Work Compartment (RO) evacuated. The turbopump was then deactivated again this morning at ~3:55am EDT before sleeptime. *[Main objective of PK-3 is to study dust plasma wave propagation and dispersion ratio at a specified power of HF discharge, pressure, and a varied number of particles.]*

CDR Peggy Whitson conducted a thorough CO₂ and air exchange survey, measuring the airflow between the Lab and Node-2 IMV (Intermodular Ventilation) using the Velocicalc instrument and reporting the measurements to

MCC-Houston for analysis by ground specialists to aid in the CO₂ level

troubleshooting. *[Measurements included CO₂ readings in the Lab, Node-2 aft and forward, Shuttle middeck, Shuttle flight deck & Shuttle A/L using the CDMK (Carbon Dioxide Monitor Kit). CO₂ data indicated a 1 mmHg partial pressure*

difference between the US Lab and Node-2 (3.13 & 4.2 mmHg, resp.). The Node-2 atmosphere is a mixture from Node-2, Columbus, JLP and Orbiter, while US Lab air is a mixture from US Lab, Node-1, and A/L. Ground teams have now developed an additional path for routing air, and the crew was given the Go this morning by the IMMT (ISS Mission Management Team) for installing a 23-ft IMV duct from Node-2 to the US Lab to facilitate CO₂ removal by the CDRA.]

Later tonight, Whitson will install the 23 feet of flexible ventilation ducts from the Node-2 Forward Stbd End Cone IMV Return (bypassing the noise muffler) to the Node-2 Aft Hatch to aid in CO₂ removal. *[This configuration will bypass the stbd IMV return of the Node 2/Lab vestibule by returning air directly through the hatch.]*

FE-1 Malenchenko and FE-2 Leo Eyharts had several hours reserved for transferring more discarded cargo to the Progress 28P and stowing it according to detailed plan in the logistics spacecraft-turned-trash can, to be jettisoned on 4/7.

The FE-1 performed scheduled IFM (in-flight maintenance) on the SM's condensate water processor (SRV-K2M) by removing and replacing its water-conditioning unit purification columns (BK BKV). The old unit was disposed of in Progress 28P. (Last time done: 9/12/07) *[The SRV-K2M converts collected condensate into drinking water and dispenses the reclaimed water (warm and hot) for drinking and preparation of food and beverages.]*

Before breakfast and exercise, FE-2 Eyharts performed his second PHS (Periodic Health Status) w/Blood Labs examination. Garrett Reisman assisted in drawing blood and using the U.S. PCBA (Portable Clinical Blood Analyzer). The second part of PHS, Subjective Clinical Evaluation, was performed later in the day. *[The PHS exam, with PCBA analysis and clinical evaluation, is guided by special software (IFEP, In-Flight Examination Program) on the MEC (Medical Equipment Computer). While PCBA analyzes total blood composition, the blood's hematocrit is particularly measured by the Russian MO-10 protocol.]*

Eyharts also conducted his second session with the biomed experiment INTEGRATED IMMUNE (Validating Procedures for Monitoring Crew member

Immune Function), collecting wet saliva samples first thing in post-sleep. *[IMMUNE protocol requires the collection to occur first thing post-sleep, before eating, drinking and brushing teeth, and all samples are stored at ambient temperature. Along with NUTRITION (Nutritional Status Assessment), INTEGRATED IMMUNE samples & analyzes participant's blood, urine, and saliva before, during and after flight for changes related to functions like bone metabolism, oxidative damage and immune function to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects. The saliva is collected in two forms, dry and liquid. The liquid saliva collections require that the crewmembers soak a piece of cotton inside their mouth and place it in a salivette bag; there are four of the liquid collections during docked operations.]*

FE-2-16 Reisman had his third IMMUNE saliva collection this afternoon after wake-up (~12:30pm), this time dry samples. *[The dry samples are collected at intervals during the collection day using a specialized book that contains filter paper, all stored at ambient temperature.]*

The FE-1 performed the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS (Russian Segment) hatchways, including the FGB-to-Soyuz tunnel, and the FGB-to-Node passageway. *[This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons, and one of the two Russian SKV air conditioners off (SKV-1).],*

Yuri also completed the routine maintenance of the SOZh system (Environment Control & Life Support System, ECLSS) in the SM, including ASU toilet facilities systems/replaceables plus the weekly collection of the toilet flush counter (SPK-U), water supply (SVO) readings and POTOK parameters for calldown to TsUP/Moscow. *[Regular daily SOZh maintenance consists of replacement of the KTO & KBO solid waste containers, replacement of an EDV-SV waste water and EDV-U urine container, replacement of the KOV EDV for the Elektron-intended water, and processing U.S. condensate water as it becomes available in a filled CWC (Contingency Water Container) from the Lab humidifier. Weekly SOZh reports (on Sundays) to TsUP/Moscow deal with number & dates of water and urine containers, counter readings of water consumption & urine collection, plus data and total operating time of the Russian POTOK-150MK (150 micron) air filter unit of the SOGS air revitalization subsystem.]*

Eyharts collected a fluid sample from the Columbus module ITCS (Internal Thermal Control System) and transferred it to the Shuttle for return for ground testing & analysis.

Meanwhile, Garrett worked on the MSG (Microgravity Glovebox) rack which Peggy & Leo had relocated yesterday from the US Lab to Columbus (loc. COL1F2), today mating its power, data & fluid connectors and activating the rack.

Reisman also updated the SODF (Station Operations Data File) Emergency Books with new crew procedural instructions delivered on STS-123.

In support of last night's EVA-5, after Johnson & Reisman powered up their robotarms, the SSRMS (Space Station Remote Manipulator System) grappled the OBSS from the SRMS (Shuttle RMS) and maneuvered it to the OBSS stow position, assisting the EVA crew in attaching the OBSS to the S0/S1 truss. *[SSRMS performance was nominal throughout the stow activities. This was the last planned MSS (Mobile Servicing System) operations for the docked mission.]*

After return and ingress of Bob & Mike from EVA-5 last night at 10:36pm, CDR Whitson took charge of the usual post-EVA activities, i.e., photographing the EMU/ spacesuit gloves and overgloves while still pressurized, recharging the EMUs with water from PWR (Payload Water Reservoir), then reconnecting the LTAs (Lower Torso Assemblies) to the EMUs and capping the UIA (Umbilical Interface Assembly), initiating the discharge/recharge process on the EMU batteries in the BSA (Battery Stowage Assembly), turning around the DCS-760 EVA camera (including downloading its EVSA and glove photographs), and reconfiguring EVA tools. *[Regeneration of the METOX (Metal Oxide) CO₂ filter canisters was deferred to tonight after the duct installation because of the ongoing CO₂ troubleshooting.]*

The crewmembers completed most of their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the TVIS treadmill (FE-1, FE-2, FE-2-16), RED resistive exercise device (CDR, FE-2) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Garrett transferred the crew's exercise data file to the MEC (Medical Equipment Computer) laptop for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week). *[For Eyharts, it was the last exercise session onboard the station.]*

Sleeptime for the ISS crew began this morning at 4:00am, for the Shuttle crew at 4:30am. For both crews workday started today at 12:30pm EDT.

Main activities of current workday (FD14): Off-duty time, PK-3 (Malenchenko), handover activities (Eyharts/Reisman), joint crews news conference (11:18pm-11:58pm); joint crews photo shoot.

Transfer Status: No concern with middeck transfers – they are back on schedule. Overall transfer is 90% complete.

STS-123 Update: TPS inspection analysis is complete and Shuttle is Go for reentry on Wednesday.

ISS Crew Sleep Shift Planning: To synchronize the ISS crew's timeline with STS-123/1J/A docking and subsequent docked activities, Peggy's, Yuri's and Leo's wake/sleep cycle underwent a number of shifts which started on 3/11. For the next three days, the wake/sleep shift schedule is as follows, getting the ISS crew back on their regular schedule by Wednesday (all times EDT):

FD14	Wake: 12:30pm (3/23) – 3:15am (3/24) Sleep: 3:15am – 11:45am (3/24)
FD15	Wake: 11:45am (3/24) – 11:00pm (3/24) Sleep: 11:00pm – 7:30am (3/25)
FD16	Wake: 7:30am (3/25) – 5:30pm (3/25) Sleep: 5:30pm – 2:00am (3/26)

No CEO photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 7:43am EDT [= epoch]*):

Mean altitude -- 340.7 km

Apogee height -- 341.5 km

Perigee height -- 340.0 km

Period -- 91.35 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0001101

Solar Beta Angle -- 52.4deg (magnitude increasing)

Orbits per 24-hr. day -- 15.76

Mean altitude gain in the last 24 hours -- 36 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53500

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

- 3/23 (FD14) – Day off; handover; PAO event; crew photo
- 3/24 (FD15) – STS-123/Endeavour undocking (~7:56pm)
- 3/26 (FD17) – STS-123/Endeavour deorbit (5:59pm); landing @ KSC (7:01pm).

03/23/08 -- ISS Russian Thruster Tests (11:52am-12:05pm)
03/27/08 -- ATV1 end of loiter; leave parking point - ~2:00am;
03/29/08 -- ATV1 Demo Day 1
03/31/08 -- ATV1 Demo Day 2
04/03/08 -- ATV1 Demo Day 3 (docking) ~10:39am EDT
04/07/08 -- Progress M-63/28P undocking (DC1) & reentry
04/08/08 -- Soyuz TMA-12/16S launch - ~7:16am (*CDR Sergei Volkov, FE Oleg Kononenko, SFP Yi So-yeon*)
04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~8:43am
04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)
05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)
05/14/08 -- Progress M-64/29P launch
05/16/08 -- Progress M-64/29P docking (DC1)
05/25/08 -- STS-124/Discovery/1J launch -- JEM PM "Kibo", racks, RMS
05/27/08 -- STS-124/Discovery/1J docking
06/05/08 -- STS-124/Discovery/1J undocking
08/07/08 -- ATV1 undocking
08/12/08 -- Progress M-65/30P launch
08/14/08 -- Progress M-65/30P docking (SM aft port)
08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
09/09/08 -- Progress M-64/29P undocking (from DC1)
09/10/08 -- Progress M-66/31P launch
09/12/08 -- Progress M-66/31P docking (DC1)
10/01/08 -- **NASA 50 Years**
10/11/08 -- Progress M-65/30P undocking (from SM aft port)
10/12/08 -- Soyuz TMA-13/17S launch
10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
10/16/08 -- STS-126/Discovery/ULF2 launch -- MPLM Leonardo, LMC
10/18/08 -- STS-126/Discovery/ULF2 docking
10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
11/20/08 -- **ISS 10 Years**
11/26/08 -- Progress M-67/32P launch
11/28/08 -- Progress M-67/32P docking (SM aft port)
12/04/08 -- STS-119/Discovery/15A launch -- S6 truss segment
12/06/08 -- STS-119/Discovery/15A docking
12/15/08 -- STS-119/Discovery/15A undocking
1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
4QTR CY09 -- STS-130/19A - MPLM
1QTR CY10 -- STS-131/ULF4

2QTR CY10 -- STS-132/20A – Node-3 + Cupola
3QTR CY10 – STS-133/ULF5.

ISS On-Orbit Status 03/22/08

All ISS systems continue to function nominally, except those noted previously or below. *STS-123-1J/A Flight Day (FD) 12/13. Crew sleep/wake cycle today: Sleep 4:00am–12:30pm; wake 12:30pm–4:00am tomorrow. **HAPPY EASTER WEEKEND!***

After wakeup yesterday (~1:30pm EDT) and before breakfast, CDR Peggy Whitson completed another session with the SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight) experiment software for data logging and filling in questionnaire entries in the experiment's laptop session file on the HRF-1 laptop, as suggested on her discretionary "job jar" task list. *[To monitor the crewmember's sleep/wake patterns and light exposure, Peggy wears a special Actiwatch device which measures the light levels encountered by him as well as his patterns of sleep and activity throughout the Expedition. The log entries are done within 15 minutes of final awakening for seven consecutive days, as part of the crew's discretionary "job jar" task list.]*

FE-2-16 Garrett Reisman performed his third session with the biomed experiment INTEGRATED IMMUNE (Validating Procedures for Monitoring Crew member Immune Function), collecting wet saliva samples first thing in post-sleep. FE-2 Leo Eyharts will have his second IMMUNE saliva collection later today after wake-up (~1:30pm). *[IMMUNE protocol requires the collection to occur first thing post-sleep, before eating, drinking and brushing teeth, and all samples are stored at ambient temperature. Along with NUTRITION (Nutritional Status Assessment), INTEGRATED IMMUNE samples & analyzes participant's blood, urine, and saliva before, during and after flight for changes related to functions like bone metabolism, oxidative damage and immune function to develop and validate an immune monitoring strategy consistent with operational flight requirements and constraints. The strategy uses both long and short duration crewmembers as study subjects. The saliva is collected in two forms, dry and liquid. The dry samples are collected at intervals during the collection day using a specialized book that contains filter*

paper. The liquid saliva collections require that the crewmember soak a piece of cotton inside their mouth and place it in a salivette bag; there are four of the liquid collections during docked operations.]

Right after day's begin, FE-1 Yuri Malenchenko continued supporting the experiment session with the Russian/German TEKh-20 Plasma Crystal-3+ (Plazmennyi-Kristall/PK-3+) payload by activating the turbopump in the Service Module (SM)'s Transfer Compartment (PkhO) for keeping the vacuum chamber (ZB) in the SM Work Compartment (RO) evacuated. Afterwards, Yuri performed the experiment in semiautomatic mode, with some manual control, then closed it down and transferred the collected data from HDD (Hard Disc Drive) for downlink to TsUP-Moscow. The turbopump was deactivated this morning at ~3:55am EDT before sleeptime. *[Main objective of PK-3 is to study dust plasma wave propagation and dispersion ratio at a specified power of HF discharge, pressure, and a varied number of particles. The research is performed with particles of 6,81 microns (micrometer) diameter at pressures of 20, 40 & 60 Pa. The main purpose is to study the behavior of the structures when affected by a direct electric field of various amplitudes, and to compare their behavior when affected by low frequency alternating electric field. Yuri's task was to create a plasma-dust cloud with a small void in the center with the help of step-down power decrease of the RF generator. During the experiment the FE-1 performed a total of 3 runs.]*

CDR Peggy Whitson and FE-2 Leo Eyharts transferred the ER3 ARIS (EXPRESS-3 Active Rack Isolation System) Rack from the US Lab into the Columbus Module (location COL1A1). *[The activities included removal of the CEVIS (Cycle-Ergometer with Vibration Isolation System) from the front of the rack, disconnecting data, power and fluid rack umbilicals, disengaging the ARIS isolation plate from the rack standoff, removing both upper and lower snubber cups and detaching the rack for its transfer to COL1A1, after which the ARIS Rack was connected to COL umbilicals and the rack was successfully checked out.]*

Whitson & Eyharts also relocated the MSG (Microgravity Science Glovebox) from the US Lab (loc. LAB1S3) to Columbus (loc. COL1F2) after demating the rack umbilicals and releasing the K-BARs (Knee-Brace Assemblies) and pivot mechanisms. Final checkouts are scheduled for later in the week. *[The MSG transfer was originally scheduled for tomorrow (Sunday), but the crew decided to complete the move right away as a get-ahead to gain more time tomorrow.]*

Peggy and FE-2-16 Garrett Reisman did an outstanding job of installing & configuring additional flexible ventilation ducting from the Node-2 Stbd CCAA (Common Cabin Air Assembly) diffuser (outlet) to the Node-2 stbd aft return inlet. *[In response to slightly higher CO₂ concentrations in Node-2, Columbus & Shuttle*

than in the US Lab (a difference of ~1mmHg), probably as the result of inadequate mixing of ISS air flowing between Lab & Node-2, additional fans on Shuttle & Station were turned on, and the ducting installed by Peggy & Garrett. Whitson is scheduled tonight to conduct a CO₂ survey with CDMK (CO₂ Monitoring Kit)

readings in Shuttle & Station to help the ground determine whether the workaround was successful. The decision was made by the IMMT (ISS Mission Management Team) to keep the 13-ft ducting on the ISS for future options, instead of returning it on 1J/A.]

FE-1 Malenchenko installed the IWIS (Internal Wireless Instrumentation System) accelerometer in the Shuttle for taking structural dynamics data during the upcoming Russian thruster firing (tomorrow, 3/23, at 11:52am-12:05pm EDT). The wireless RSU (Remote Sensing Unit) was temporarily set up in PMA-2 and the IWIS arrangement photo documented. RSU remains On.

The FE-1 conducted the periodic (currently daily) checkout/verification of IP-1 airflow sensors in the various RS (Russian Segment) hatchways, including the FGB-to-Soyuz tunnel, and the FGB-to-Node passageway. *[This is especially important when the ventilation/circulation system has to cope with a larger crew on board, currently ten persons, and one of the two Russian SKV air conditioners off (SKV-1).],*

In preparation for upcoming urine transfer to the Progress M-63 (28P) Rodnik BV1 water tank, Yuri set up the “plumbing” gear for the regular six compressor test activations to inflate and pressurize the cargo ship’s BV1 tank bladder. *[The pressurization of the collapsed bladder of the Rodnik water storage tank is conducted as a leak check, lasting ~4h 30min, preparatory to the liquid waste transfer to the tank for disposal. Each of the two spherical Rodnik tanks consists of a hard shell with a soft membrane (bladder) composed of elastic fluoroplastic. The bladder is used to expel water from the tank by compressed air pumped into the tank volume surrounding the membrane.]*

Leo Eyharts readied the equipment for the US PHS (Periodic Health Status) w/ Blood Labs assessment, to be performed by him tomorrow for the second time, using the PCBA (Portable Clinical Blood Analyzer). Preparations included an electronic function test and control analysis on the PCBA in preparation for tomorrow's blood analysis activity. *[The PHS exam, with PCBA analysis and subsequent clinical evaluation, is guided by special software (IFEP, In-Flight Examination Program) on the MEC (Medical Equipment Computer).*

Leo & Garrett, the two rotating ISS-16 Flight Engineers, had another 1h 10min set aside on their schedules for generic handover activities (where crewmembers are

scheduled together to complete various designated standard tasks for familiarizing the new station resident with procedures, caveats, etc.).

The crewmembers completed most of their regular 2.5-hr. physical workout program (about half of which is used for setup & post-exercise personal hygiene) on the CEVIS cycle ergometer (CDR), TVIS treadmill (FE-1, FE-2), RED resistive exercise device (CDR, FE-2-16) and VELO bike with bungee cord load trainer (FE-1).

Afterwards, Reisman transferred the crew's exercise data file to the MEC laptop for downlinking, as well as the daily wristband HRM (Heart Rate Monitor) data of the workouts on RED, followed by their erasure on the HRM storage medium (done six times a week).

Peggy & Garrett worked in the Airlock on preparations for tonight's EVA-5. The tasks included EMU (Extra Vehicular Mobility Unit) relocation, EMU METOX (Metal Oxide) and LiOH (Lithium Hydroxide) canister replacement, EMU battery replacement, configuring EVA tools, preparing the EL (Equipment Lock), readying the EVA digital camera and charging its battery.

Before going into their sleep period this morning, the joint crew had an hour to review timeline and procedures for EVA-5. Then, EV1 Bob Behnken & EV2 Mike Foreman entered the Airlock and began the 10.2 psi mask prebreathe and overnight campout procedures.

For both crews, workday began today at 12:30pm EDT. Behnken & Foreman are currently on "Campout" (*nachalo desaturatsiy* = desaturation start) in the A/L CL (Crewlock), after hatch closure this morning at ~3:30am. The two spacewalkers performed PBA (Portable Breathing Apparatus) mask prebreathe for denitrogenation, while readying their tools & equipment, then depressed the CL from 14.7 to 10.2 psi for their sleep period. After wakeup, ending the 8.5-hr sleep period, the CL hatch was cracked at ~1:25pm for a hygiene break/with mask prebreathe. Around 2:00pm, the hatch was closed again by Peggy Whitson (who supports all Campout preps and post-EVA activities as IV/Intravehicular Crewmember) for EVA preparations in 10.2 psi, followed by EMU purge & prebreathe. Afterwards, Peggy supports CL depressurization and EV1/EV2 egress.

EVA-5 Preview: Nominally, EVA-5 begins at ~5:23pm and lasts approximately 6h 30min, ending at ~11:53pm. Its major objectives are to:

1. Install KAUs (Keep-alive Umbilicals) on the OBSS (Orbiter Boom Sensor System), including APFR (Articulated Portable Foot Restraint) & stanchion/avionics box;
2. Stow OBSS on ISS main truss (capturing inboard & outboard striker bars,

routing W21 cable harness for KAU heaters, installing OBSS cover, cleaning up);

3. Install MISSE-6 PEC containers (2) in LWAPA (Light Weight Adapter Plate Assembly) on the Columbus EPF (External Payload Facility), photograph LWAPA *[trying using the nominal ¼" PIP pins, or using 3/16" pins from Node-2 stbd vestibule, or go to contingency tie-down plan to avoid return of MISSE to the Shuttle]*;
4. Remove JLP (JEM Experiment Logistics Module Pressurized Section) trunnion covers;
5. Inspect Stbd SARJ (Solar Alpha Rotary Joint) covers, i.e., divot on cover 18 & photograph covers 16, 6, 8, 9 & 11), and
6. Clean up worksite & ingress.

Before the spacewalk, Leo & Garrett will set up the SSRMS (Space Station Remote Manipulator System) to support the EVA-5, first for OBSS grapple from the SRMS (Shuttle RMS), then hand off the OBSS to Behnken and Foreman during the KAU installation.

After post-EVA cleanup tomorrow morning, sleeptime for the ISS crew begins at ~4:00am, at ~4:30am for the Shuttle crew.

Transfer Status: Transfer is currently on schedule. As of yesterday (FD11), middeck cargo resupply is 92% complete, return cargo transfer is 69% complete, and overall transfer is 78% complete.

STS-123 Update: The OBSS inspection of the port & starboard WLE (Wing Leading Edge) and the Nose Cap RCC (Reinforced Carbon-Carbon) were completed today. Results will be reported at tomorrow's (FD13) MMT meeting.

ATV Update (Flight Day 13): ATV "Jules Verne" is at its Parking point, ~2000 km ahead of ISS. Next station-keeping maneuver is scheduled for 3/25 but may be cancelled since the orbit is stable.

ASN-M Update: RSC-Energia successfully switched the ASN-M Satellite Navigation System back to its primary NVM-1 Navigation Computer Module. No further activity planned. ASN-M is critically required for ATV docking, and both NVM computers must be functioning properly.

ISS Crew Sleep Shift Planning: To synchronize the ISS crew's timeline with STS-123/1J/A docking and subsequent docked activities, Peggy's, Yuri's and Leo's wake/sleep cycle has undergone a number of shifts which started on 3/11. For the next three days, the wake/sleep shift schedule is as follows (all times EDT):

FD13	Wake: 12:30pm (3/22) – 4:00am (3/23) Sleep: 4:00am – 12:30pm (3/23)
FD14	Wake: 12:30pm (3/23) – 3:30am (3/24) Sleep: 3:30am – 12:00pm (3/24)
FD15	Wake: 12:00pm (3/24) – 3:30am (3/25) Sleep: 3:30am – 12:00pm (3/25)

Weekly Science Update (Expedition Sixteen -- Week 22)

ALTCRISS (Alteino Long Term monitoring of Cosmic Rays on the ISS): Radiation measurements continue to be performed in the PIRS module. Radiation measurements continue to be performed in the PIRS module. Last memory card exchange took place at 3/14.

ANITA: Completed.

BCAT-3 (Binary Colloidal Alloy Test 3): Reserve.

CARDIOCOG-2: Completed.

CCISS (Cardiovascular & Cerebrovascular Control on Return from ISS): Reserve.

CFE (Capillary Flow Experiment): Reserve.

CSI-2/CGBA (CGBA Science Insert #2/Commercial Generic Bioprocessing Apparatus): In progress.

CGBA-2 (Commercial Generic Bioprocessing Apparatus 2): Complete.

CSLM-2 (Coarsening in Solid-Liquid Mixtures 2): In progress.

EarthKAM (Earth Knowledge Acquired by Middle School Students): Complete.

ELITE-S2 (Elaboratore Immagini Televisive - Space 2): Planned.

EPO (Educational Payload Operations): Reserve.

ETD (Eye Tracking Device): In progress.

EuTEF (European Technology Exposure Facility): The EuTEF platform power feeders were de-activated in preparation of the EVA-3 on 3/18. A thermal clock was triggered and the final power down period was well below it. Status of the

various instruments: - DEBIE-2: the instrument showed regular link errors. It was subjected to troubleshooting during last couple of days. No conclusive recovery yet, and currently powered off; - DOSTEL: On-going science acquisition; - EuTEMP: Currently inactive as planned; - EVC: after a successful commissioning, some difficulty was encountered to get nominal images acquisition. Under investigation if the problem comes from EVC itself or from the Columbus HRM (High Rate Multiplexer); - EXPOSE: On-going science acquisition; - FIPEX: FIPEX showed Link Errors and was further troubleshooted this week. But progressively activating the sensors in order to create an overload of the communication channel – tests are on-going; - MEDET: On-going science acquisition; - PLEGPAY: The instrument was successfully re-commissioned on 3/19; - TRIBOLAB: in Stand-by mode, awaiting to start science acquisition after ATV docking on 4/3;

Fluid Science Laboratory (FSL): The FSL Facility is awaiting further troubleshooting after 1J/A departure.

GEOFLOW: Troubleshooting on FSL LAN cable repair was successfully performed. However damage on the MIL Standard bus connector was observed where two pins are missing. The FSL Rack was successfully activated on 3/19 after a swap of the active Columbus MIL Bus A for MIL Bus B. Additional anomalies have been encountered while checking out the ODM (Optical Diagnostic Module). Additional repair activities on the LAN and MIL Bus cables are currently planned for 3/22. Start of GEOFLOW is pending further FSL troubleshooting.

IMMUNO (Neuroendocrine & Immune Responses in Humans During & After Long Term Stay at ISS): In progress.

InSPACE-2 (Investigating the Structure of Paramagnetic Aggregates from Colloidal Emulsions 2): In progress.

Integrated Immune: “Peggy, thank you for unstowing Garrett’s saliva kit and having it ready for him to begin his collections. Garrett, you have nearly completed your early Integrated Immune session. Thanks for your participation in our study. Leo, thanks for your participation in your late Integrated Immune session. You will be performing your final saliva collections and blood draw on the Shuttle ride home. Have a safe trip back and we will see you on the ground.”

KUBIK-FM1/ KUBIK-FM2 Centrifuge/Incubators: Completed.

LOCAD-PTS (Lab-on-a-Chip Application Development-Portable Test System): Complete.

MISSE (Materials ISS Experiment): Ongoing.

MTR-2 (Russian radiation measurements): Passive dosimeters measurements in DC1 "Pirs".

MULTIGEN-1: Completed.

MSG-SAME (Microgravity Science Glovebox): Complete.

NOA-2 (Nitric Oxide Analyzer): Planned.

NUTRITION/REPOSITORY: Planned.

PMDIS (Perceptual Motor Deficits in Space): Complete.

SAMS/MAMS (Space & Microgravity Acceleration Measurement Systems):
Ongoing.

SLEEP (Sleep-Wake Actigraphy & Light Exposure during Spaceflight): "Peggy, thanks for completing the additional Actiwatch download. After you complete the third week of requested Sleep logs, you will have two more download activities and an Actiwatch Doff. During your next download activity, you will download and initialize two Actiwatches (CDR and 1J/A) and initialize an Actiwatch for the KARI (South Korean) Space Flight Participant (Yi So-yeon). As always, the additional Sleep Logs are greatly appreciated."

SOLAR (Solar Monitoring Observatory): Anomaly on platform pointing mode under further investigation. No science acquisition possible so far.

SPHERES (Synchronized Position Hold, Engage, Reorient, Experimental Satellite):
In progress.

Swab (Characterization of Microorganisms & Allergens in Spacecraft): Complete.

TRAC (Test of Reaction & Adaptation Capabilities): Planned.

ULTRASOUND: In progress.

WAICO #1 (Waving and Coiling of Arabidopsis Roots at Different g-levels): The 4 Experiment Containers (ECs) from Rotor A (0-g condition) were transferred to BIOLAB TCU (Thermal Control Unit) at +4degC on 3/12 to slow down the growth. Their transfer from BIOLAB TCU#1 to the MERLIN cooler unit is currently planned for 3/24. These 4 ECs will be downloaded on 1J/A. The 4 ECs of Rotor B are yet to be retrieved by the crew from the blocked Rotor B, after the 1J/A mission.

Anomalies during WAICO-Run#1 imply major impact on science return

CEO (*Crew Earth Observation*): Ongoing.

No CEO photo targets uplinked for today.

CEO photography can be studied at this "Gateway" website:

<http://eol.jsc.nasa.gov> (as of 3/1/08, this database contained 757,605 views of the Earth from space, with 314,000 from the ISS alone).

ISS Orbit (*as of this morning, 8:44am EDT [= epoch]*):

Mean altitude -- 340.7 km

Apogee height -- 341.7 km

Perigee height -- 339.7 km

Period -- 91.35 min.

Inclination (to Equator) -- 51.64 deg

Eccentricity -- 0.0001538

Solar Beta Angle -- 50.8 deg (magnitude increasing)

Orbits per 24-hr. day -- 15.76

Mean altitude loss in the last 24 hours -- 235 m

Revolutions since FGB/Zarya launch (Nov. 98) -- 53485

Significant Events Ahead (*all dates Eastern Time, some changes possible.*):

- 3/22 (FD13) – EVA-5 to assemble OBSS KAU, stow OBSS, install MISSE-6s, remove JLP trunnion covers, inspect SARJ (~5:23pm)
- 3/23 (FD14) – Day off; MSG rack transfer to COL
- 3/24 (FD15) – STS-123/Endeavour undocking (~7:56pm)
- 3/26 (FD17) – STS-123/Endeavour deorbit (5:59pm); landing @ KSC (7:01pm).

03/23/08 -- ISS Russian Thruster Tests (11:52am-12:05pm)

03/27/08 – ATV1 end of loiter; leave parking point - ~2:00am;

03/29/08 -- ATV1 Demo Day 1

03/31/08 -- ATV1 Demo Day 2

04/03/08 -- ATV1 Demo Day 3 (docking) ~10:39am EDT

04/07/08 -- Progress M-63/28P undocking (DC1) & reentry

04/08/08 -- Soyuz TMA-12/16S launch - ~7:16am (*CDR Sergei Volkov, FE Oleg Kononenko, SFP Yi So-yeon*)

04/10/08 -- Soyuz TMA-12/16S docking (DC1) - ~8:43am

04/19/08 -- Soyuz TMA-11/15S undocking/landing (FGB nadir port)

05/10/08 -- Soyuz TMA-12/16S relocation (from DC1 to FGB nadir port)

05/14/08 -- Progress M-64/29P launch

05/16/08 -- Progress M-64/29P docking (DC1)

05/25/08 -- STS-124/Discovery/1J launch – JEM PM "Kibo", racks, RMS

05/27/08 -- STS-124/Discovery/1J docking
 06/05/08 -- STS-124/Discovery/1J undocking
 08/07/08 -- ATV1 undocking
 08/12/08 -- Progress M-65/30P launch
 08/14/08 -- Progress M-65/30P docking (SM aft port)
 08/28/08 -- STS-125/Atlantis Hubble Space Telescope Service Mission 4 (SM4)
 09/09/08 -- Progress M-64/29P undocking (from DC1)
 09/10/08 -- Progress M-66/31P launch
 09/12/08 -- Progress M-66/31P docking (DC1)
 10/01/08 -- **NASA 50 Years**
 10/11/08 -- Progress M-65/30P undocking (from SM aft port)
 10/12/08 -- Soyuz TMA-13/17S launch
 10/14/08 -- Soyuz TMA-13/17S docking (SM aft port)
 10/16/08 -- STS-126/Discovery/ULF2 launch – MPLM Leonardo, LMC
 10/18/08 -- STS-126/Discovery/ULF2 docking
 10/23/08 -- Soyuz TMA-12/16S undocking (FGB nadir)
 11/03/08 -- Soyuz TMA-13/17S relocation (from SM aft to FGB nadir)
 11/20/08 -- **ISS 10 Years**
 11/26/08 -- Progress M-67/32P launch
 11/28/08 -- Progress M-67/32P docking (SM aft port)
 12/04/08 -- STS-119/Discovery/15A launch – S6 truss segment
 12/06/08 -- STS-119/Discovery/15A docking
 12/15/08 -- STS-119/Discovery/15A undocking
 1QTR CY09 -- STS-127/2J/A launch - JEM EF, ELM-ES, ICC-VLD
 2QTR CY09 -- STS-128/17A - MPLM, last crew rotation
 05/??/09 -- **Six-person crew on ISS (following Soyuz 18S-2 docking)**
 3QTR CY09 -- STS-129/ULF3 - ELC1, ELC2
 4QTR CY09 -- STS-130/19A - MPLM
 1QTR CY10 – STS-131/ULF4
 2QTR CY10 -- STS-132/20A – Node-3 + Cupola
 3QTR CY10 – STS-133/ULF5.

ISS On-Orbit Status 03/21/08

All ISS systems continue to function nominally, except those noted previously or below. STS-123-1J/A Flight Day (FD) 11/12. Crew sleep/wake cycle today: Sleep 5:00am–1:30pm; wake 1:30pm–4:00am tomorrow.

EVA-4 was completed successfully by Bob Behnken & Mike Foreman in 6h 24m, accomplishing most of its objectives.

During the spacewalk, Behnken (EV1) & Foreman (EV2) –

- Demonstrated an on-orbit heat shield repair technique using the T-RAD (Tile Repair Ablator Dispenser) to demonstrate an Orbiter tile repair DTO (Development Test Objective) in space. *[The spacewalkers tested STA-54, a pink putty-like material consisting of two compounds that are mixed together in a pressure-driven applicator gun just before they exit the nozzle. With Foreman working the applicator, the test was completed nominally, and the test samples were stowed in the TSA (Tool Stowage Assembly in the Orbiter PLB (Payload Bay) for return and analysis; results looked good];*
- Removed RPCM (Remote Power Controller Module) S02B-D on the S0 truss and replaced it with a new unit. *[Since the RPCM controls CMG-2 (Control Moment Gyroscope #2), circuitry had to be powered down and the CMG-2 removed from the steering law beforehand. After the successful R&R, the spacewalkers attempted several times to reconfigure the Z1 patch panel, a pre-requisite for powering the new RPCM, but were unable to do so due to tough-to-reach connectors which could not be unmated. The patch panel reconfiguration currently remains incomplete, but there are no impacts to current operations];*
- Inspected the Z1 truss toolbox for MMOD (Micrometeoroid/Orbital Debris) damage and noticed several “pits”. *[Video imagery will be assessed by specialists];*
- Released Node-2 Port ACBM (Active Common Berthing Mechanism) launch locks in preparation for berthing the JEM (Japanese Experiment Module) module “Kibo” on Flight 1J next May;
